Their banks with groves of tufted trees  
adorn'd;  
Meand'ring rivers, winding smooth and slow,  
Illusive, gliding 'twixt the op'ning clouds.

Imposing thus on Reason's dormant reign,  
Harmless amusement soothes the vacant  
mind.

A light dispels the charm. We stop at Weem."

In the following passage we have another proof of that honourable love of accuracy which acknowledged Loch Lomond to be so much less than the American lakes, and which elsewhere candidly confesses that the falls of the Clyde are not so vast as those of the Rhine, and the Nile, and Niagara.

"Here too, a habitation ready reared  
Invites the enthusiast to the lone abode,  
Unmatch'd, perhaps, in Britain's happy  
isle. (P. 61.)

Mark the precision of this sentence, and the poet's scrupulous truth! This ready-built house was the pleasantest the Doctor had ever seen, and he thought it was the pleasantest in the whole island; but, not having seen every house in the island he could not positively affirm it to be so; for though the affirmation might not have been false, it would have been rash to have incurred the possibility of falsehood. The opinion is qualified by the happy word "*perhaps*," and thus all danger is avoided.

As a naturalist Dr. Crieie is indeed conspicuous; he has discovered that

"Winter comes in course,"

That

"In winter oft descends the flaky snow."  
(P. 120.)

And that trees live longer than men: for thus he sweetly sings on lamenting the Queen of Scots.

"The pow'r of vegetation kept alive  
For ages; trees that Mary must have seen,  
Beneath whose shade, perhaps, she mournful  
sat."

They do not however live for ever, for the next line tells us.

"Yet these now yield to time and fast  
decay." (P. 25.)

Yet is the Doctor no timid slave to the laws of nature. He ventures to improve them, as, when in a thunder-storm, he says,

"Rocks dash'd on rocks are heard!  
Rattling around." (P. 114.)

To proceed to the pathetic.

See there th' overhanging rock, where, dreadful fall!

While, of the precipice not well aware,  
The lady plung'd into the eddying pool.  
A friend, with eager haste her life to save,  
Swift to the gulph descends, fatal to both,  
Had not, while both alternate sink and rise,  
Suspended o'er the deep, a rock been caught,  
Which held, in dread suspense, the scales  
of fate,

While hope and fear alternate rose and fell.

What a subject was here to have been "painted in crayons and engraved at the publisher's expence!" The Lady in the Pool, a friend assisting her, the Rock holding the Scales of Fate, and Hope and Fear playing at way-jolt in them!

We have yet to examine the fancy of the poet, and the specimen shall be taken from his Loch-Kettrin, "in which, being more a work of fancy, the reins of imagination are held with a freer hand."

"Night gently drew the curtains of the sky."

Having thus put the sky to bed, the poet is at leisure to describe the texture of his curtains. They were

"Of heavenly tissue, azure starr'd with gold."

Blue and gold we should have thought sufficiently handsome. The furniture of Dr. Graham's certainly was not finer, and his is the only celestial bed which we ever recollect to have been exhibited; but the fancy of the poet varies his ornaments: they were either blue and gold,

"Or silver edged, a thin and chequer'd  
lawn."

i. e. cross-barred cambric with silver trimmings; or they were gauze,

"Transparent, swift to vanish with the  
morn;"

or they were of printed calico,

"Mottled here and there with shade opaque:"

or they were, we know not what, for

"Meantime the radiance of the silent moon  
Pierces, at times, the half-transparent veil,  
Or pours effulgence 'twixt its shifting folds."  
(P. 192.)

There is yet a finer flight of fancy in that part of the poem which is entitled Tyne-Drum to Dalmally. It is a splendid picture of the Spirit of the Storm, who steps from mountain to mountain, one foot on Jura, another on Nevis; not the Mount Jura contiguous to Switzerland, nor the West Indian island Nevis,

for that would be outstepping the modesty of personification, but two Scotch mountains so called; thence he goes on making stepping-stones of Ben Gloc, and high Ben More, and great Ben Lawrs, and Lomond, and Shihallion, and Cairngorm, there he stands and drains running stream, and standing flood, and the fresh supplies of the Atlantic, till having drank his fill the Diuretic Demon puts poor Tyne-Drum to a viler purpose than is made of Moab in the Psalms.

Lastly. We shall exhibit the poet in his prophetic character, for who knows not the double import of *Vates*? In speaking of his hero and heroine, he says,

“Low sleep strong Malmor and Imoina fair,  
Their peaceful lives, the story of their loves,  
Their hopes and fears, and happiness forgot.”

Having thus exemplified the poetical beauties of this author, we proceed to consider him as a philosopher. We have reason to believe that, with Mr. Parks, the Anti-Newtonian Lecturer, he has his doubts concerning the Copernican System, as in the following notes he calls our attention to an hypothesis which likens the universe to an onion.

“Another philosopher of the new world, has revived an old hypothesis of a vast concave orb, encompassing numberless systems, and reflecting the light of all, that it may not diverge for ever, and be lost in unlimited space. He thinks that the luminous appearance of the galaxy or milky way is occasioned by the reflexion from that orb, rather than from the blended light of telescopic stars; and that the several dark spots, or nebulae, as they have been called, in which stars appear, are openings, through which are discovered some of the scenes of various systems that revolve beyond it, within still more capacious orbs of a similar structure and design. He thinks that Saturn’s belt is a part of our system, somewhat analogous to this great orb, that bounds our view of the heavens; and that it is to this orb we owe that concave sapphire appearance which we denominate the sky.”

This Dr. Crie gives us as the system of another philosopher, but his solution of the popular superstition concerning fairies is entirely his own.

“Most of the traditional stories respecting fairies, especially such as represented them as embodied spirits, might perhaps be accounted for, upon supposing that the Druids, or rather some conquered aborigines, had fled from their enemies, and taken up their residence in those subterraneous dwellings so frequently discovered in digging in various parts of Scotland, and in some places

called Picts houses. Covered with artificial mounts, they were generally green hills. When the country came to be inhabited around them, a regard for their own safety would induce them to lie hid by day, and to come abroad only in the night: it would be of consequence, if at any time their occasions should force them abroad in day-light, that their clothing should be as like the ground as possible; hence they were always dressed in green. Their narrow dwellings kept them much confined by day; hence the exercise of dancing by moonlight must have been to them most delightful, and frequently repeated in remote glens and sequestered places. Hence also their music by night, in the open air; by day, in their dwellings, it must have betrayed them. Hence also, in dark nights, those gleams of light which were necessary to find their way to water, or any thing else they might need. Their stock of provisions might at times run short; hence their females, appearing in green gowns, borrowing oatmeal and repaying it. Their families, in that confined state of life, from putrid or infectious diseases, might become thin, or wear away; and hence their carrying off women and children to recruit their stock: hence also the return of those carried off, being permitted to depart, after several years of absence from their own families, under a promise of keeping their secret. Difficulties may be started; but such a supposition, or that of a diminutive lunar race, serves to account for stories that passed current with people, who, though superstitious, and apt to be imposed upon by their own imagination, were not indifferent with regard to what they thought to be truth, more than people of the present age. It may also be proper to remark, that the fairy tales of this country were widely different from those we generally find in books.”

We need not dilate upon the great probability of this solution; the idea is certainly novel—Dancing druids, and all in Lincoln Green.

Let us now display him as the moralist; to the end of his poem are appended these reflections.

“Singular situations call forth unusual exertions: nature operates with equal force in all ages; and the means of subsistence may be procured, where those who are accustomed to the refinements of polished life, would least expect them. Industry and contentment work wonders; but a change of manners is commonly hostile to happiness. In every situation of society, the thief and the robber, but especially the murderer, ought to be exterminated.”

This is the corollary of the poem, the condensed philosophy of the author.

Dr. Cririe must be considered, in one point of view, as the commentator of his own works.

“Accept, O Lycidas! this humble lay,  
Slightly descriptive of those rural scenes,  
And wilder charms, which, thro’ our native  
land,

Kind Nature spreads to captivate the soul,  
Instinctive form’d her beauties to admire:  
Those varied scenes I late with pleasure  
view’d,

Pleasure unmix’d with pain, save what arose  
From deep regret, through sympathy of soul,  
Excited by thine absence: oft thy name  
Was heard, and oft thy form to Fancy’s eye  
Present appear’d; and oft (for not alone  
I sought those distant solitary wilds,  
Mountains and lakes, hills, rivers, rocks, and  
woods)

Our friend, whose presence heighten’d every  
joy,

Greatly enhancing all the scen’ry round,  
Sincerely join’d your absence to deplore.”

In this passage we are referred to the notes, which the author tells us ought to be regularly consulted in the perusal, as they are necessary towards a clear understanding of the poem. The line to be elucidated is this,

“Our friend, whose presence heightened every joy.”

Whereof the Doctor has helped us to “a clear understanding,” by the depth and novelty of the following annotation. “Man is naturally fond of society, but those alone who have tasted the sweets of virtuous friendship can tell how much

participation adds to enjoyment.”—(P. 234.)

Again, the text is,

“September young had scarce begun to tinge  
With various colours, fruit and forest trees.”

The comment runs thus: “The various seasons of the year have each their distinguishing features and respective beauties.” (P. 234.) Delighted as we needs must be with the truth and profundity of this remark, may we be permitted to hint, that the talents and acumen of this commentator should be more worthily exerted? We do indeed confess, that such poetry can only be elucidated by such comments, that “none but himself can be his annotator;” yet surely neither Scottish scenery, nor his own verses can deserve the investigations of this great critic, D. D. as he is, while a cloud hangs over the apocalypse, while the number of the beast is still unexplained, while it remains to be decided, whether the man of sin be Tom Paine, or Doctor Dodd, and while we have only the authority of the newspapers and cheap pamphlets for believing Bonaparte to be Gog and Magog.

The size and exterior of this volume have provoked from us an examination, which a more appropriate appearance in foolscap might have escaped. Common trials for petty larceny are scarcely heard of beyond the precincts of the Old Bailey, but if a peer be tried as a pick-pocket, or a lady brought to the bar for shoplifting, the rank of the delinquent secures universal notoriety.

ART. XV. *A Tour throughout South Wales and Monmouthshire, comprehending a general Survey of the picturesque Scenery, Remains of Antiquity, historical Events, peculiar Manners, and commercial Situations of that interesting Portion of the British Empire.* By J. J. BARBER, F. S. A. 8vo. pp. 372. There is another Edition, with 20 *acquaint Prints, from Drawings by the Author.*

WALES has had more than her proportionate share of topographers and tourists; but though a great number of volumes have been expressly appropriated to this part of Great Britain, they have generally been so deficient in the grand essentials of information, that others continue to follow, and more are wanting to furnish a perfect and satisfactory account of the principality. In our former volume, (p. 495.) we noticed a work which professed to treat of South Wales, and were impelled to speak reprovingly of its author. The volume before us, also refers to the same part of

our island, and though it offers only a number of slight descriptive sketches, yet some of those are touched with the hand of a master. It has been too much the practice with Welsh tourists to run through the country with hasty precipitancy, make a few brief notes, slight sketches, &c.; and afterwards work up their crude materials into one or two octavo volumes. The grand mountainous scenery, with the magnificent castellated, and monastic ruins, which characterize Wales, are powerful temptations to curiosity; and fashion having pointed her finger to that part of the

island, hundreds of vacant loungers have obeyed her direction, in performing "the tour of Wales." Previous to the late war, a continental tour was deemed necessary in the routine of education: that being checked, English excursions were adopted, either with the laudable desire of improvement, or as a fashionable mode of killing time, and to furnish subject for winter *prattle*.

Mr. Barber is one of the curious, if not inquisitive, travellers. Few objects of antiquity, beauty, or grandeur, seem to have escaped his notice, or have been passed by without a brief characteristic description. Being professionally an artist, he naturally feels principally interested in the "ivy clad ruin," the "shattered castle," the "roaring cata-ract," and the beautiful, the picturesque, or the sublime scenery. These are the objects of his admiration and research, yet he is not exclusively devoted to them. Manners, customs, history, and general topography, are sometimes descanted on; and following the bad example of some preceding tourists, he has given two or three specimens of the surprising and marvellous.

The following historical particulars relating to the *general history of South Wales*, serve as an *introduction* to the volume: they are written in a concise, but eloquent style, and are highly creditable specimens of the manner of writing adopted by our tourist.

"In making the tour of South Wales and Monmouthshire," (Mr. Barber observes,) "the admirer of picturesque beauty dwells with peculiar pleasure on a tract of country, comprising the greater part of Monmouthshire, and bordering the Severn and Bristol channel, to the western limits of Pembroke-shire. In this enchanting district, a succession of bold hills, clothed with wild forests, or ornamental plantations and delightful valleys, present themselves in constant variety: many fine estuaries and rivers, picturesque towns, and princely ruins, also adorn the scene; whose charms are inconceivably heightened by the contiguity of the Bristol channel, which washes the coast; in some places receding into capacious bays; in others, advancing into rocky promontories of the most imposing grandeur. The statistical enquirer finds equal subject of gratification, in the uncommon fertility of several valleys, and the woody treasures of numerous hills, bearing myriads of oaks, and other first rate timber-trees. The mineral wealth of the country, and its convenient coast for traffic, are likewise subjects of high consideration: and while the statist applauds

the late rapid strides of manufactures and commerce in this district, he may discover sources hitherto latent for their increase.

"The historian cannot fail of being interested while treading on the ground where Britons made their latest and most vigorous efforts for independence, against successive invaders; nor the antiquary, while traversing a country replete with monuments of the Druidical ages; military works of the Romans, Britons, Saxons, and Normans; and the venerable relics of numerous religious foundations.

"Beyond this stripe of country, from ten to twenty miles in width, forming the southern extremity of Wales, and an intermixture of rich scenery, (particularly in the neighbourhood of Brecon) with prevailing dreariness: on the eastern frontier, South Wales exhibits a tedious extent of hills without majesty, valleys over-run with peat bogs, and unprofitable moors.

"Besides the superb ruins of St. David's, the course of the Tivy, near Cardigan, and the scenery about the Devil's Bridge, it has little to entice the attention of the tourist: the towns, for the most part, are miserably poor, and travelling accommodations very uncertain; the roads, too, are wretched beyond any thing that a mere English traveller ever witnessed. It is therefore, a subject of no small gratification, that the chief beauties of South Wales are found in a compact route; abounding with good towns, respectable accommodations, and very fair roads. This part of the country may be explored in a close carriage, though the better mode of travelling is certainly on horse-back. The pedestrian may claim peculiar advantages in his way of *getting on*; but I do not conceive, that a man enduring the fatigue of trudging, day after day, through miry roads, can maintain an exhilaration of spirits congenial with the beauties that surround him.

"The geographical situation, and present limits of Wales, are unnecessary to be here described. Of its history, the first certain accounts that we collect are on the invasion of the Romans, when Wales appears to have been divided into three principalities: the Silures, the Ordovices, and the Dimitæ. The Silures possessed all that tract of country bounded by the Severn, the Tame, and Towey; which comprehending the counties of Monmouth, Glamorgan, Brecknock, Radnor, Hereford, and part of Gloucester, Worcester, and Caermarthenshires, comprised the greater part of South Wales. The Dimitæ inhabited that part of South Wales, westward of the Towey; and the Ordovices, North Wales, including Anglesea.

"The Romans having subdued *Britannia Prima*, i. e. the southern part of England, advanced to the conquest of Wales, by them denominated *Britannia Secunda*; in this, however, they met with an unlooked-for opposition; the inhabitants were vigorous and brave; and the country, wildly piled toge-

ther with mountains, forests, and morasses, presented an aggregation of difficulties, that would have discouraged a people less ardent in their enterprizes; nor did they succeed, until after a long warfare and a severe loss. The Silures and Demetæ fell under the yoke in the reign of Vespasian, when they were vanquished by *Julius Frontinus*. The Ordovices were not finally subdued until the time of his successor, *Agricola*, who according to Tacitus, exterminated the whole nation.

“The Romans retained possession of this country until A. D. 408, when they withdrew their legions, and the most warlike of the British youth, for the defence of their central dominions. The inroads of the Scots and Picts, which immediately followed, do not appear to have materially affected the Welch; nor did the Saxons, though at constant war with them for several centuries, acquire any settled dominion in the country: yet they more than once partially over-ran Wales, obliging it to pay tribute; and in the reign of Edward the Confessor, Harold, at the head of a great army, entering Wales, defeated Prince Griffith, sovereign of North-Wales, and establishing himself at Gwent,\* (Monmouthshire), began a palace at Portswit, which was, however, destroyed by Griffith before its completion.

“From the departure of the Romans, in 408, to the inroads of the Anglo-Norman chieftains, in the eleventh and twelfth centuries, Wales was divided into numerous petty sovereignties, or lordships, of varying name and extent, but tributary to an imperial prince; though, sometimes that dignity was split into two or three branches. These chiefs were usually at war with each other, or with their princes, who seldom obtained tribute when their means of enforcing it was (were) questionable.

“The Anglo-Norman dominion in Wales was brought about in a manner wholly different from former conquests. William the first and his successors, finding sufficient employment in securing their English possessions, invited their chiefs, holding lands in the neighbourhood of Wales, to make incursions against the Welch lords, upon their separate interests. The Norman leaders thereupon, by creating feuds among the native powers, siding with one or the other party, and breaking with them on convenient opportunities, contrived to fix themselves in various parts of Wales; whence their conquests, extending by degrees, overspread the greater part of the country. The lands thus obtained, became the property of the conquerors, who, under the title of *lords marchers*, were allowed to exercise an uncontrolled jurisdiction within their demesnes: but power acquired on such principles could

only be retained by force: every petty despot secured himself a fortress, and hence arose the extraordinary number of CASTLES with which Wales is crowded, amounting, according to a native author,† to *one hundred and forty three*. The Welch princes still held a considerable tract of country, frequently overthrew the intruders, and even carried their arms into England; but in the defeat of the brave Llewelyn, by Edward the first, Wales lost every remnant of its independence, and became definitively united to the crown of England.

“In the reign of Henry the eighth, Wales was divided into twelve shires, and Monmouthshire was included among the English counties; the feudal despotism of the lords marchers was then abolished; and Wales participating in the equal shelter of English jurisprudence, has proved itself as zealous in defending the common interest of the empire, as it was formerly conspicuous in struggling for its particular freedom.”

Among the numerous memorials of history and antiquity which distinguish Wales, castles and religious buildings possess the chief claim to attention; and, as Wales is an admirable field for the study of the civil and military architecture that prevailed in the middle ages, Mr. Barber gives a slight sketch of the progress of those arts, so far as it seems applicable to the present purpose. This subject is highly interesting, and our author has evidently made it an object of much study.

“On the overthrow of the Romans by the Goths and Vandals,” Mr. Barber observes, “the arts vanished before the scourge of war; and the standard mode of architecture which adorned the Greek and Roman empires, could no longer be executed in its original perfection: The general forms, indeed, were imitated, but without an observance of symmetry; the execution was rough and clumsy; the pillars were excessively thick, and the arches heavy; and where ornament was attempted the performance was very uncouth. Such was the state of architecture (a mere corruption of the Roman) that succeeded the devastations of the Goths, and has been called *Saxon* and *Norman*: the term *Gothic*, however, would certainly be more appropriate.

“At the beginning of the twelfth century, a new style of architecture made its appearance, distinguished by pointed arches and clustered columns. Though at first coldly received, and but sparingly introduced among the rounded arches and massive columns, called *Saxon*, it soon gained an undisputed footing.”

\* The Saxons at this period are supposed to have occupied Monmouth, Chepstow, Caerwent, and Caerleon.

† Mr. Pennant.

Mr. Barber has subjoined a note on this subject, which we gladly extract, as partly coincident with our own ideas.

"The common appellation of this mode, Gothic, is equally improper with the preceding, as the reign of the Goths was at an end long before its introduction : indeed its origin is wrapped in obscurity. Sir Christopher Wren, and after him many architects and antiquaries, have attributed it to the Saracens, and hence called it Saracenic ; but their grounds are very questionable. Perhaps the homely conjecture, that it arose from the pointed form in the interesting Saxon arches, may be as near the truth as one derived from more laborious researches ; indeed, from the specimens of early Gothic which I have seen, I am of opinion, that cogent reasons may be adduced, to prove it rather to be of natural growth from the Saxon modes, and formed in its characteristics by gradual alteration, than a new system of remote and detached origin."

This we apprehend might be easily elucidated. It is a curious subject and requires much attention. The many wild theories, and fantastic opinions, that have been promulgated, concerning ancient architecture, are sad examples of mispent time, and perverted talents. Had the writers studied more to *inform* their readers, than merely to *amuse* themselves, we should not have had to lament the ambiguity that bewilders this subject at the present day. The term *Gothic* has long been improperly and injudiciously applied to that light and elegant architecture which characterises most of the English cathedrals : but we are happy to find that a few independent, unprejudiced writers have dared to explode the name, and have substituted the word *English*, at once creditable to the country, and, at the same time, well applied to characterise a style of building, which if it did not absolutely originate in this island, was advanced to a system and symmetry here, unknown on the Continent. We wish to be understood as applying the term *English*, to that architecture which prevailed in our ecclesiastical buildings, from the thirteenth to the sixteenth century. Sir Christopher Wren, and some contemporary architects, applied the term *Gothic* as expressive of contempt for all buildings not erected conformable to the rules of Palladio. As science and human knowledge advances, writers acquire an improved and critical accuracy of lan-

guage; and proper approved terms are employed and universally credited. By this mode, precise ideas are communicated, and for want of this critical precision, has originated much confusion, error, and bewildering uncertainty. Mr. Barber continues this subject, and observes that

"About the latter end of the reign of Henry the third, we find it acquire a more ornamental and distinct character. The pillars which before were round, and encircled with slender detached shafts, were then formed in entire reeded columns ; the arched roofs also, which only exhibited the main springers, then became intersected with numerous ramifications and transomes. The decorations continued to encrease until toward the close of Henry the eighth's reign, when the light of science again dawned over Europe, and the relics of Greece and Rome were rightly considered as models of genuine taste : the classic elegance of the five orders then appeared *intermixed with the Gothic* ; it soon became universal, and is now adopted in all *superior buildings* throughout Europe. Further characteristics of style might be pointed out, and lesser variations defined : but I do not presume to inform the antiquary ; and the distinctions already drawn will be sufficient for the cursory tourist."

"Castles appear of no generally chosen figure, except such as were founded by the Romans, who preferred that of an oblong square, unless there were special reasons to the contrary. Small castles consisted of a single court, or ward, whose sides were usually flanked by towers. The great hall, chapel, and domestic apartments, built from the outer wall into the court, occupied one or more sides. The citadel, called also the keep and dungeon, was a tower of eminent strength, wherein the garrison made their last stand, and where prisoners were sometimes confined : the citadel was often detached from the walls, and built on an artificial mound, encircled with a ditch. The barracks for the soldiers in garrison was generally a range of building near the gatehouse, or principal entrance. The latter building contained apartments for the officers of the castle, and the portal was furnished with one, two or three portcullisses\*. A wet or dry moat surrounded the whole ; and advanced before the drawbridge which crossed it, there was often an out-work called a barbican. Large castles were only a repetition of these courts, upon somewhat of a larger scale, connected with each other : (Chepstow castle consists of four). In fortresses of the first class, an extensive embattled wall sometimes encircled the mass of fortification already described, at some distance, enclosing a considerable tract of ground, as at Caerphilly in Glamorganshire.

\* An iron grate, with spikes at the bottom, which was let down after the gate was forced.

Castle walls appear in some instances built of solid masonry, but their general construction is of grout work. For this purpose, two slight walls were built parallel, from six to twelve feet asunder: the interval was then filled up with loose stones and rubbish, and the whole cemented together with a great quantity of fluid (according to some authors, boiling) mortar: the mass soon acquired a sufficient firmness, and in the present day it possesses the adhesion of solid rock. This method was used by the Romans, and adopted by succeeding ages; but the arches were turned, and the angles coigned with hewn stones, which, after the conquest, were brought from Caen in Normandy."

These observations are evident proofs that Mr. Barber has not been inattentive, or indolent, in his researches. At the same time we perceive some confusion of ideas in his description of castles, which would have been avoided had he been familiar with the works of Horsley, Roy, and King, and compared and corrected their accounts with remaining castrametations and castles. These were different places of retreat, security, and defence: many of the former were never castellated, and many have most probably been successively occupied and altered by Britons, Romans, Saxons, Danes, and English. This, like the subject of ancient architecture, has been more bewildered by theorists, than elucidated by men of science and talent. Many false and absurd descriptions and plates have been copied and re-copied, almost *ad infinitum*, tending to generate error and propagate falshood. Mr. Barber relates an instance in himself:

"Several years ago, (he observes) when I first set about castle-hunting, I endeavoured in vain to discover a relation between what I saw, and the description with a figure of an ancient castle, laid down in Grose's Antiquities, and copied by others. I have since seen the greater part of the principal ruins in South Britain; and the only castles that occur, to me as approaching to that gentleman's plan, are those of Dover and London. I mention this, because persons building a theory on the authorities above mentioned, might, among ruins, be puzzled, to no purpose, for a practical illustration."

The following description of Caermarthen will amuse those who know the town, convey some information to the stranger, and at the same time characterize the author's manner of treating this province of his work.

"The situation of CAERMARTHEN, one of the most wealthy and polite towns in Wales, can scarcely be enough admired; rising above a noble river, and commanding a full view of one of the most beautiful vales in the kingdom. Internally there is less to commend, as most of the streets are very steep, and irregularly built: yet there are many good private houses belonging to the neighbouring gentry, that resort here in the winter months; and a handsome town-hall, and some other buildings, do credit to the public spirit of the town, though a solitary church may reflect but little on its sanctity. Very small remains of the castle, now built up into a gaol, appear, or of the walls that formerly encompassed the town. The trade of the place is much facilitated by its fine river, which conveys ships of a good size up to the bridge.

"Caermarthen is the Kaervyrddin of the Britons, the Maridunum of Ptolomy, and the Muridunum of Antoninus. The ancient Britons reckoned it the capital of all Wales: here they held their parliaments, or assemblies of wise men; and here fixed their chancery and exchequer. When the Normans over-ran Wales, this town severely felt the miseries of war, being often besieged, and twice burnt by the Welsh princes. Gilbert, earl of Clare, however, at length fixed his power at Caermarthen, beyond the reach of their attempts. This place gave birth to the famous Merlin in the year 480: he appears to have been a man of extraordinary wisdom and learning, which, no doubt, occasioned him to be looked upon as a magician in that dark age, and transmitted as such to posterity by monkish writers, who always looked with an evil eye on knowledge possessed out of their craft. Here also was born Lewes Bayley, chaplain to James the First, afterwards bishop of Bangor, and author of the celebrated 'Practice of Piety.'

With the following description of the New Passage, and the historical anecdote of Charles the First connected with it, we must close our account of this tour, which has certainly afforded us much amusement, and the general execution of which is commendable.

"Proceeding through an agreeable undulating tract towards the sea-shore, we soon arrived at the New Passage, the principal entrance into Monmouthshire from the south-western counties. The breadth of water from this place to the Bristol coast, is three miles and a half, while the ferry of Aust, or the Old Passage, four or five miles higher up the Severn, is only two miles across; but this advantage is considered to be over-balanced by the more commodious landing at the former. Both these concerns, being *monopolies*, like all other monopolies, are hostile to the interest of the public; for

there being no competition for preference between the boatmen, they are extremely rude in their manners, indifferent to the accommodation of the public, and by no means unpractised in various arts of extortion. But these exclusive privileges have existed from time immemorial. The title of the *New Passage* arose from its renewal in the year 1718, after an abolition in consequence of the following remarkable incident.

"Charles the First being pursued by a strong party of his enemies through Share Newton, got into a boat at the Black Rock (the *New Passage*), and was ferried to the opposite shore. His pursuers, to the number of sixty, with drawn swords, compelled

other boatmen belonging to the passage to ferry them after him; but these being in the king's interest, landed them on a reef of rocks in the Severn, called the *English Stones*, near the Gloucestershire coast, to which they were instructed to ford: indeed, the strait was fordable at low water, but the tide flowing in very rapidly, they were all drowned in the attempt, and the king for that time escaped. Cromwell, informed of the transaction, abolished the ferry; nor was it renewed, until after a long chancery-suit between an ancestor of the present proprietor, Mr. Lewes of St. Pierre, and the guardians of his grace the duke of Beaufort, proprietor of *Aust ferry*."

ART. XVI. *Remarks upon North Wales, being the Result of Sixteen Tours through that Part of the Principality.* By W. HUTTON, F. A. S. S. &c. 8vo. pp. 236.

THIS respectable veteran author claimed our notice, and merited our praise, (vol. I. p. 468,) for his history of the Roman Wall; and we would gladly extend our commendations to the present work, if we could do it consistently with our duty to the public. As age creeps on, "second childhood" often ensues; and it is a general characteristic of cheerful old age, to be triflingly garrulous, and to make *self* the theme of almost every tale.

The volume before us abounds in tedious repetitions of events and circumstances relating *only* to the author and his family; but it contains very little of useful or engaging information concerning the history, antiquities, or scenery of North Wales. These are subjects which we were entitled to look for, and not finding them, are entitled to complain. New books should develope something useful, interesting, or entertaining, otherwise the purchaser is not only robbed of his time, but of his purchase money. Mr. Hutton seeks to supply one of these desiderata, in *extraordinary stories*, anecdotes, or laconic witticisms; but when these subjects form the principal part of a book, it should have some other title, and not be denominated a *Tour*. In the following extract is comprized the author's preface, and all his explanation about his work.

"In former ages the English rarely entered Wales, but to destroy it. Her sovereign mountains, beautiful vallies, and surprising cascades, instead of being admired, were tinged with blood. Nor was the eye of the curious fascinated with her wonders till within the last fifty years. The improvement of her roads, and particularly the daily communications between England and Ire-

land, brought her into notice. The English traveller at length ventured to climb her precipices, descend her glens, and admire her curiosities: and now the vast influx of annual visitants enrich her with their wealth.

If the fathers oppressed her, their children support her.

Though the world is frequently favoured with *WELSH tours*,

Yet the historical knowledge is but in its infancy:

If much is said,—much remains."

Mr. Hutton proceeds to say that he does not follow the footsteps of any author, but made those "remarks only which fell under his own eye, in travelling sixteen times, in various directions, through that principality." As a specimen of the author's manner of *describing* a town, we select the following, under the head of Ludlow, a large town of Shropshire:—"I thought it abounded with female beauty; but *every* place exhibits handsome women, when dressed for church on Sunday."

The following strange story Mr. H. relates as a fact: but relates it in so strange a manner as to excite our suspicion.

"In my first day's journey I passed through Machyntleth, a handsome open town, and on to Mallwyd, thirty-two miles: in my way, weary and heated, I stepped into a miserable hut, consisting of one small and black room, the floor native earth, and the sole light was admitted by the door which had just admitted me. I sat down with all the freedom of an owner, gave a smile and a nod to the master, for to speak was needless. He looked pleasant, and without a word brought me a mess of butter-milk. This I could have relished, but was too much heated. I afterwards, where I could be understood, mentioned this union of poverty

and hospitality: the reply was, 'That man is not so poor as you imagine.' In my second day's march from Mallwyd to Welsh Pool, a man darted out of a house, as if watching for me, with a 'How far are you going?' 'To Canoffice.'—'So am I.' I halted to observe a mill which I thought curious: he attended me as close as my shirt. He appeared rather shabby, not very active, but very inquisitive, without a wish to appear so; had travelled, been on board a ship, was a taylor, and was going to Llanvair to visit a son.

"You carry your coat upside down, you will lose the gold."—"There is none to lose." 'If there is none in those pockets, there is in others.' We stopped at Canoffice, and as I could make but a poor reckoning, I treated him.

"The weather being hot, we agreed to repose in the shade. 'Are your buckles silver?'—"Yes.' We were reclined upon a bank, I facing him, unbuttoned, with my eyes closed, all in silence and abstracted from the world.

"Opening my eyes, I saw with astonishment a large open clasp knife in his hand. 'What do you do with that knife?' with some emotion. 'Cut bread and cheese.'—"Why you have none to cut."

"We marched on; I treated him coldly; he saw my suspicion. I was under no fear: while my eyes were open, and he not at my heels, for I could overcome two such, though no fighter. Determined to quit my companion, I outwalked him, which seemed to disappoint him. Stopping at Llanvair to bait, he hunted me out, entered the same room where I sat alone, and drew his knife. 'Pray why do you draw that knife?' 'I always carry it to cut bread and cheese?' 'That must be a mistake, for you had none to cut either then or now; nor did you use it for any other purpose. Besides, if you come to this town to visit your son, there can be no need to enter a public house.' He closed the knife, and was silent. I paid my shot, walked on to Welch Pool, and saw him no more. I have only stated facts, that another may judge; but to this moment I am at a loss to guess whether my suspicions were just."

This specimen, we presume, will amply satisfy the reader: but if he wishes for a few more stories of the same species, we must take the liberty of referring him to the work.

**ART. XVII.** *A new Pocket Atlas and Geography of England and Wales, illustrated with fifty-five Copper-plates, shewing all the great Post Roads, with the Towns and Villages situated thereon; also, a Description of the Air, Soil, Productions, and Manufactures, as well as the Number of Hundreds, Cities, Boroughs, Market-towns, Parishes, Houses, and Inhabitants.* By JOHN LUFFMAN, Geographer. 12mo. pp. 52. Each Page containing a small circular Map, and about twelve Lines of Letter-press.

HAD this little assuming volume been executed with any degree of care, judgment or ability, it would have formed an useful epitome. It is particularly addressed to young persons; and were its execution equal to the author's promises and professions in the preface, we should gladly recommend it to public patronage. But the brief notices of each county are disgraced by vulgar and long exploded errors, which a very superficial knowledge of the subject would effectually have prevented.

"A knowledge of the geography of our own country," says the publisher, "must be

obvious to every one. With a view to this part of juvenile education, I have been induced to offer to the public the following sheets, elucidated by maps, that will at once make the public acquainted, not only with the form and situation, but with every particular relative to each county. Every effort has been made to unite elegance with utility, and to render this work equally acceptable to the traveller and student.

"JOHN LUFFMAN."

That man must be insensible of shame, and careless of contempt, who could seriously affix his name to such audacious falsehood.

**ART. XVIII.** *Tegg and Castleman's new Picture of London for 1803-4; or, a Guide to this immense Metropolis, on a Plan hitherto unattempted: containing comprehensive Descriptions of the Public Edifices, Collections of Curiosities, and Places of Entertainment; interspersed with diverting, authentic, and valuable Anecdotes, many of which are historical, and record Events which have happened several hundred Years ago.* By H. J. SARRATT. 18mo. pp. 250.

**ART. XIX.** *A View of London; or, the Stranger's Guide through the British Metropolis: containing an Account of its Curiosities, Amusements, Commerce, Public Buildings,*

and every other Object worthy the Attention of the curious Visitor, as well as the Resident in the vast Capital. 18mo.

A Specious, tempting, catching title, is the principal object of study with a certain class of book-makers, among whom the publishers of the above books are particularly distinguished. Novelty generally excites imitation; and while the man of talent endeavours to excel his original, the plodding knave catches some of its leading traits, and imposes a surreptitious copy on the public for an

improved original work. This is precisely the case with the works before us:—Mr. Phillips having published a Picture of London (see Annual Review, vol. I. page 479) which obtained an extensive circulation, the proprietors of the above works immediately had it abridged and mutilated, and foisted them upon the town as “*improved new Pictures of London.*”

**ART. XX.** *A new and accurate Description of all the direct and principal Cross-roads in England and Wales, and Part of the Roads of Scotland, with correct Routes of the Mail-Coaches, and a great Variety of new Admeasurements; also, a Table of the Heights of Mountains, and other Eminences, from the grand trigonometrical Survey of the Kingdom, under the Direction of Major Mudge; an Account of Noblemen's and Gentlemen's Seats, and other remarkable Objects near the Roads; a general Index of the Roads to the different Towns, denoting the Counties in which they are situated, their Market-days, and the Inns which supply Post-horses; an Index to the Country Seats; a List of the Rates of the Postage of Letters, &c. &c. &c. The Whole greatly augmented and improved by the Assistance of Francis Freeling, Esq. Secretary to the Post-office, and of the several Surveyors of the provincial Districts, under the Authority of the Post-master General. By Lieut. Colonel PATERSON. 8vo. pp. 570.*

THIS comprehensive title-page pretty fully explains the nature and contents of the work before us. It now claims the public patronage, under peculiar circumstances, having latterly been opposed by a rival production, whose proprietor has taken extraordinary pains to puff his own book into celebrity, and depreciate the authenticity and value of this. The history of which circumstance, and of Mr. Paterson's work, will be found in the following extract, from an introductory advertisement by Mr. Francis Newberry, the proprietor of this volume:

“In presenting to the public a new edition (being the *thirteenth*) of a book, which has attracted a general attention, from its utility, for more than thirty years; and which has been lately with-held, in consequence of a suit at law, it seems necessary to prefix a short history of this work, and of the late proceedings, for the information and satisfaction of those who have hitherto honoured it with their approbation and support.

“In the year 1771, Mr. Daniel Paterson, assistant quarter-master general of his majesty's forces, brought out the first edition of this book, which his official occupations had led him to prepare, under the title it now retains, of ‘*A new and accurate Description of the Roads of England and Wales, &c. &c.*’ It had gained so much repute, that several editions, of many thousands in number, had been sold before the year 1788, when the present proprietor became possessed of the copy

right, by the death of a relation, who had originally purchased the work. Many more editions passed off; and the eleventh, (of 10,000 number,) which was printed in 1796, was increased, by the communication of friends, to nearly treble its original size. Soon after this period, Mr. Cary, who had been employed by the post-office to make new admeasurements of some of the principal roads, solely with the view to the regulation of the mail-coaches, exhibited a printed specimen of an intended book of a similar kind. This naturally came into the hands of the proprietor of Paterson's; who observing, that instead of a new scheme, it was a direct adoption of his own plan and design, immediately called on Mr. Cary, and remonstrated against such publication as an invasion of his right.”

In spite of Mr. Newberry's remonstrances, Mr. Cary published his Travelling Directory in opposition to Paterson's, and entitled it “*Cary's new Itinerary, or an accurate Delineation of the great Roads, both direct and cross, throughout England and Wales, &c.*” Mr. Newberry proceeds to state, that not only the scheme and design of Paterson's book had been seized upon, but the greatest part of its substance had been transplanted into this new Itinerary; “often in a manner so servile,” says Mr. Newberry, “as not to disguise the plagiarisms by a change of words. It was manifestly a copy at the beginning, the

middle, and the end. In the preface, the plan of the routes, and in the indexes. The preface indeed, in some places, was borrowed verbatim, literatim, and punctuatim, with the same parentheses, and other passages, as distinguished either by Roman or by Italic types." This indeed is a broad charge of literary plagiarism, or *theft*, and such as we could scarcely have credited, had not Mr. Newberry produced ocular proof, in printing passages from the two prefaces. By an examination of the two works, it clearly appears that Mr. Cary's is composed principally from Paterson's, with a few new measurements, and some trifling additional matter; but the old work furnished the plan, routes, list of seats, cross-roads, &c. which were unreservedly copied. Under these aggravating circumstances, the proprietor of Paterson's book republished the work, with some additions, &c. avowedly extracted from Cary's. In consequence of this, Mr. Cary filed a bill in chancery, for an injunction to stop the publication of Paterson's, as a piracy from his own book. The result was given by Lord Loughborough, that the plaintiff should pay all costs to the proprietor of Paterson's book. After this decision, Mr. Cary brought an action in the court of king's bench, where he, rather singularly and unexpectedly, obtained a verdict in his favor, with one shilling damages. Since this event, both parties have republished their respective works, with considerable additions and improvements; though, by an attentive comparison, the advantages are greatly in favor of the work before us. This

has been newly edited by Mr. Keith, who has bestowed extraordinary attention and diligence in correcting and augmenting the present edition. In an appendix, Mr. Keith has given several comparative passages from Mr. Cary's and Mr. Paterson's books, proving the piracy; and also stating the great additions and improvements which the latter possesses over the former. He concludes his observations with the following passage, which shall also conclude our account of the work, and of the judicial and literary altercation that has arisen from it. Though we cannot suppress a remark, arising from an examination of the opposite decisions of two great law courts. The doubt and uncertainty which seems to involve the precise right of literary property, is a subject that strongly demands the serious consideration of the British legislature. In the present state of enlightened society, and when the book trade of the country is an object of such national importance, it is a shameful reproach that our laws on this subject are so vague and equivocal.

"The editor of Paterson's roads," observes Mr. Keith, "has been induced to draw up this appendix, merely in justification of his own conduct, and that of the proprietor of Paterson's roads, and not through any enmity to Mr. Cary; otherwise he would have considerably extended his remarks on Mr. Cary's second edition; but as all men are subject to error, it would be unjust to endeavour to deprive Mr. Cary of an advantage which the editor of Paterson's hopes to receive himself, viz. the indulgence of the public."

ART. XXI. *Cary's British Traveller; or, an abridged Edition of his new Itinerary: containing the Whole of the Roads, direct and cross, throughout England and Wales, with many of the principal Roads in Scotland, as described from his larger Work, from an actual Measurement made by Order of the Right Honourable the Post-Master General, for official Purposes, under the Direction and Inspection of Thomas Hasker, Esq. Surveyor and Superintendant of the Mail-Coaches. By JOHN CARY, Surveyor of the Roads to the General Post-Office. Calculated for the Use of those Travellers by whom the Gentlemen's Seats may not be considered essential; describing, at the Conclusion of each Rout, the Names of those Inns which supply Post-Horses and Carriages, as well as all Places which are Market or Borough Towns, and have Post-Offices for the receipt and delivery of Letters; with a List of the Packet-Boats, and their Time of sailing; accompanied with complete Indexes, both for the direct and Cross-Roads; and a Map of England and Wales, fully adapted to the Use of the Work.* 8vo. pp. 238. With Preface and Indexes, not paged.

OUR opinion of the work before us may be inferred from the preceding article: it is only necessary to state in addition, that Mr. Cary's road book is rendered cheaper than Mr. Newberry's

by the omission of the lists of gentlemen's seats, and descriptive references to the towns in the line of the various roads.

**ART. XXII.** *Wallis's Pocket Itinerary; being a new and accurate Guide to all the principal direct and cross Roads throughout England, Wales, and Scotland: containing the Roads of England and Scotland, both direct and cross; exhibiting in a progressive Series every Town, City, or remarkable Village, intersected by such Road; as also the best Inns, the Counties in which the different Cities, &c. are situated, their Market Days and Distances from London; each Borough being distinguished by appropriate Figures, shewing the Number of Members returned to Parliament; topographical Notices of Villas, together with the Names of their Proprietors, and likewise of the chief natural and artificial Curiosities occurring in each Rout; an alphabetical Table of the most distinguished Cities, Towns, &c. in Great Britain; together with their Distances from London, the Counties in which they are situated, the Rates of Postage for Letters, and the stated Days on which their respective Fairs are holden. The whole presenting to the Traveller every Information (both elegant and useful) upon a more comprehensive and portable Plan than in any similar Work hitherto published. Illustrated with accurate Maps of the Roads of England and Scotland.* 18mo. pp. 460.

IT is a painful and tiresome part of a reviewer's duty to examine and compare works like the above, where thousands of names and numbers are the only subjects to peruse. This task, however, we have performed, and are sorry to pronounce a severe sentence on this pocket itinerary. It is injudiciously arranged, written worse, and slovenly incorrect in the spelling.

To justify this sentence it may be deemed expedient for us to produce some evidence. This will be done from the *first* and *second* pages, for it will not be necessary to go farther in the work. The first rout is from London to Bath; but the reader is referred to page 117, for the road to Reading. This is very singular: as if the middle of the book was printed first. Among the errors in the second page, we adduce the follow-

ing: Chaucer's grove *was* never Chaucer's seat. It is a modern house: at least modern in comparison to Donnington castle, where one of the Chaucers resided. Littlecot park is *not* Mrs. Popham's. Tottenham park is *four* miles from Marlborough, instead of *one*. Marlborough mount is *not* converted into the *Castle inn*, but is only an object in the garden of that inn. Bagdon lodge, instead of being three miles *west* of Marlborough, is three miles *south-east* of that town. There is no such place as Bockley house as described, nor has the duke of Marlborough any seat at Lockridge. Many similar instances of inaccuracy, inattention, &c. could be adduced, but we presume these will be sufficient to guard our readers against imposition.

**ART. XXIII.** *Kearsley's Traveller's entertaining Guide through Great Britain; or, a Description of the great Roads, and principal cross Roads; marking the Distances of Places to and from London, and from each other: to which are added a Description of the principal Great Roads of Ireland; different Routes to Paris; and a Table of the Times of High Water at New and Full Moon; with a concise topographical History of the Cities, Towns, Watering Places, Chief Villages, Antiquities, Seats, &c. &c. The Whole forming a General Tour through Great Britain. The Second Edition, much enlarged and improved.* 8vo. pp. 450.

RIVALSHIP in trade is generally considered as conducive to the public good; and the best mode of counteracting monopoly, is to excite and promote competition among persons who are most addicted to this species of commercial tyranny. The present subject has lately furnished an extraordinary contest for superiority, and as is usually the case on such occasions, whilst individuals suffer, the public are benefited.

Among the numerous advantages

England enjoys above other countries, are, the ease, safety, and expedition derived by travellers. To good roads and comfortable accommodations may now be added useful and "entertaining" books, at once directing and satisfying the curiosity of the tourist. Previous to the year 1625 there was no book published on this subject; at that time John Norden compiled and printed a thin quarto volume, as a "guide for English travellers." John Ogilby improved and enlarged this in his "Itinerarium An-

glia: or Book of Roads," fo. 1675, which was succeeded by another folio volume, containing one hundred maps on copper-plates, 1698. These plates were improved, corrected, and reduced to a quarto size by John Senex, 2 vols. 1719. Next followed Ogilby's and Morgan's pocket book of the roads, which succeeded to an eleventh edition in 1752. Hollar engraved some maps of the roads in 1715, 1716, and 1718. After these followed a few other works evidently founded on their predecessors' plans and labours; and in 1771 Mr. Paterson published the first edition of a work which has as much excelled all the former in accuracy and utility, as in the extent of its sale. His is wholly composed of names of places, persons, and distances, without either history or description annexed to those places. To unite these was the object of Mr. Kearsley, or his editor, who states in the preface, that a work of this kind wanted a "compendium of topography; or an itinerary, comprehending as well what is amusing and instructive, as what is necessary and useful. The names of cities, towns, and principal seats, together with the respective distances from each, have been often presented to the public; but the design of the present compilation is to convey in a concise manner, some knowledge of the antient and present state of particular places

through which the traveller passes, without entering into dry details or tedious digressions."

If a work, according to this plan, was executed with care, fidelity, and judgment, it would be valuable and interesting, and might be justly called an "entertaining guide;" but this can only be accomplished by a person or persons amply informed in the history, antiquities, and topography of the island. The work before us is certainly superior to the generality of similar productions: yet it contains many false notices and erroneous descriptions, and many trifling places are copiously described, whilst several towns and principal objects are only mentioned by name: yet as a travelling guide it is much inferior to Paterson's, but excels all its other competitors; and for its descriptive and topographical information, stands alone among the books of this class. Its principal contents are, "a topographical description of the great roads from London, with the return routes, to every part of Great Britain. A description of two hundred and ninety-six cross-roads to and from the most considerable places. The principal direct roads of Ireland, measured to and from Dublin. Several routes to Paris. A table of the times of high water at new and full moon. And a copious index of places and seats."

ART. XXIV. *The Beauties of England and Wales: or Delineations topographical, historical, and descriptive of each County. Embellished with Engravings. By JOHN BRITTON and E. W. BRAYLEY. Vol. IV. 8vo. pp. about 600. 20 Plates.*

WE have already made some remarks on the general merits of this work, and have given a copious analysis of the third volume. (Ann. Rev. vol. I. p. 456.) Our notice, therefore, of the present, will be confined within scantier limits.

The counties described in the volume before us are Devonshire and Dorsetshire.

The general account of Devonshire is interesting, and upon the whole satisfactory; we should have been better pleased however, if the authors had been more attentive to uniformity of style, and instead of the long quotations from Mr. Marshall's Rural Economy, and Mr. Brice's History of Exeter, had taken the trouble to express, in their own language, the facts which they chose to borrow from these publications. The list of minerals, as far as it goes, is tolerably

correct; but a few pages more devoted to this and the other departments of natural history would have been a very important addition to the value of the work. In page 41, is related a curious fact concerning the conversion of hog-flesh into adipocire, absurdly called in the quotation from Mr. Polwhele, *fossil bacon*.

"An extraordinary discovery was lately made in a courtlage, on a rising ground belonging to Chapel Farm, in the parish of Cruwys Morchard, near Tiverton. The house and estate are the property of Mr. Brooks, a wealthy and respectable farmer, who resides there. It was formerly a monastery belonging to the Augustine friars; and, at the dissolution of the religious houses, fell into the hands of the Cruwys's, from whom, by various alienations, it came to the present possessor. In order to convert a very fine spring into a pond, to water the meadows below,

and also for the use of the cattle, Mr. Brooks dismantled the courtlage, the linhays, sleds, &c. and began to sink an extensive pond. When the workmen had sunk about ten feet from the surface, the strata appearing in a natural state, they came to a spongy matter; it appeared to be a very thick cuticle of a brown colour. They soon found bits of bones, and lumps of solid fat, of the same colour. Astonished at this discovery, one of them ran for his master, who, upon viewing the place, sent for Mr. Sharland, a person of great experience and practice as a farrier in the neighbourhood. It was then resolved cautiously to work round the carcase; and at last the complete body of a hog was found, reduced to the colour and substance of an Egyptian mummy: the flesh was six inches thick, and the hair upon the skin very long and elastic. As the workmen went on further, a considerable number of hogs, of various sizes, were found in different positions; in some places, two or three together; in other places singly, at a short distance. Upon the bodies being exposed in contact with the open air, they did not macerate nor reduce to powder, as is usually the case with the animal economy after lying two or three centuries divested of air: perhaps this may be occasioned by the mucilage of the bacon. This piggery continued to the depth of twelve feet, when the workmen stopped for the season, and the pond was filled with water. The oldest man in the parish had never heard that the ground had ever been broken; and, indeed, the several strata being entire, renders it impossible to conjecture from what causes this extraordinary phenomenon can be accounted for. The family of Cruwys have a complete journal of remarkable events which have happened in the parish for three centuries; and not the least mention is made of any disorder which could occasion such a number of swine to be buried in such a situation."

Exeter, the capital of the county, is treated of at considerable length; and a very minute account is given of the cathedral. The description of this venerable and elegant structure is obviously derived from personal study and inspection, and as it contains many particulars hitherto unnoticed, we shall select a part as a favourable specimen of the style and talents of the author.

"The cathedral consists of a nave, with two side aisles; two short transepts, formed by the towers already noticed; a chapter-house, a choir, with side aisles, and ten chapels, or oratories, with a room called the consistency court. The nave presents a magnificent and grand appearance on entering it from the western door; though much of its grandeur is destroyed by the seats and pews in this part of the fabric. It measures seventy-six feet in width within the walls, and 175 in length from the western door to the

organ screen. The roof is supported by fourteen massive clustered columns, from which spring sixteen pointed arches; and above them are two tiers of small open arches. On the north side, over one of the arches, is a projecting kind of stone pew, called the minstrel's gallery, which is ornamented with some figures in alto-relievo, holding different musical instruments. The choir is of the same width as the nave, and measures 128 feet in length. St. Mary's Chapel is 61 feet in length, and between that and the altar screen is a space of 25 feet. The whole cathedral measures 408 feet from east to west, including the walls; the height of the roof, or vaulting, is 69 feet; and of the Norman towers, to the top of the battlements, 130 feet.

"The stones with which the walls of this noble edifice were principally built," observes Bishop Lyttleton, "came from Bere, near Cullyton, in Devon: the vaulting stone, of which the roof is composed, from Silverton, in the same county; the pavement of the choir from *Kam*, by sea to Toppesham: quere, if not Caen in Normandy? The vestry belonging to St. Mary's chapel, rebuilt in Henry the sixth's time, of Woneford stone: all which appears by the fabric rolls. The thin fine pillars which are seen in every part of the church, and idly supposed to be artificial composition, came from the Isle of Purbeck, near Corfe, in Dorset."

"The towers, though very similar in shape and character, display some varieties in their ornaments; for the fascia, or intersecting arches, on the exterior of the north tower, are entirely different from any parts of those on the south; its upper story is more modern, and the turrets at the angles are later additions. The exterior appearance is massive grandeur: and though the architect has diversified the surface with shallow niches, numerous columns, and zig-zag mouldings to the arches, yet the beauty and lightness intended to be produced by these enrichments, are eclipsed by the style of architecture, which prevails in the windows and ornamental parts of the cathedral.

"The chapter-house is a large handsome room, of a parallelogramatic shape, and is said to have been built by Bishop Lacy in 1130; but Sir H. Englefield thinks that this prelate only built the upper part of it; as the lower part of this elegant room is so different from that of the superstructure, and so much resembling the architecture of the church, that it is highly probable that Bishop Quivil, who is recorded to have begun the cloisters, did also build, or at least begin, the chapter-house."

"The windows of the cathedral are very large, and many of them contain fine specimens of painted glass. They are all of the same shape, yet the architect has ornamented each with a studied variety of tracery, by which plan there are not two windows exactly similar on either side of the building,

though the windows which are opposite to each other correspond in almost every instance. Though all the windows are adorned with tracery and painted glass, yet the two large ones to the east and the west are more pre-eminently so. The former was repaired and beautified from the bequest of Henry Blackburn, a canon, in 1790, when an agreement was made with Lyon, of Exeter, glazier, to furnish the new glass at 1s. 8d. per foot; and that during the time employed, he was to have 3s. 4d. per week for his own work, and 2s. for his family. This window is still in good preservation, and contains nineteen whole length figures of the patriarchs Abraham, Isaac, and Jacob, with some saints and other personages. Besides several painted figures, there are also various armorial bearings of the Plantagenet and Courtenay families, and different bishops of the see. The great west window, measuring 37 feet high by 27 feet broad, was fitted up with painted glass, &c. in 1766. The lower part is divided into nine compartments, seven of which are occupied with full length figures of as many saints, that of St. Peter being in the centre. Besides various crests, coronets, mottoes, Mosaic work, and other ornaments, this elegant window is emblazoned with forty-six coats of arms, properly adorned with their fields, supporters, quarterings, &c. The upper portion consists of two circular mouldings, including several cinquefoils, quatrefoils, and trefoils, each containing a complete coat of arms; and the centre is occupied with the arms of the king of England.

"In the north tower is a curious clock, given by Bishop Courtenay to the cathedral. This is worthy of notice from the singularity of its ornaments, and the ingenuity of its mechanism. On the face or dial are two circles, marked with figures. The interior circle is marked from 1 to 30, whereby is shewn the age of the moon, which is represented by an artificial ball revolving within the circle, and which changes its aspect with the varying phases of that satellite. In the centre is a globe, representing the earth; the figures on the outer circle mark the hours of the day and night.

"On the south side of the altar are three stone seats or stalls, the canopies and ornaments of which are extremely rich and elegant. The recess, or back of each seat, forms a semi-octagon, and is adorned with enriched Mosaic work. At the top of the back of the central seat is the bust of a bishop, and in each of the lateral seats is that of a priest. The seats as they rise form the plinths for the columns, which are supported by couchant lions. The columns on each side of the centre niche are of gilt brass. In St. Mary's chapel are three stone seats of similar character to those just mentioned.

"The most elegant ornament of the choir is the *bishop's throne*; the whole of which is composed of wood, carved in a very delicate and tasteful manner, and constructed to form

a light pyramid of arches, columns, niches, pinnacles, crochets, and foliated ornaments. Its height is fifty-two feet. The screen or rood-loft, which separates the nave from the choir, is supported in front by four Purbeck-stone pillars, from which spring the groins of three flat arches; above these is a row of thirteen small arches, or niches, filled with some curious specimens of ancient paintings. These represent different events in sacred history. The screen supports a large and very grand organ, esteemed among the finest instruments of the kind in England. It was built in 1665 by John Loosemore, but has since received many improvements from Jordan and Micheau. This organ has one singularity, which we never observed in any other. Independent of the pipes inclosed in the case, it has some lateral pipes, attached to the side columns of the building. These are said to be the largest in this country, and belong to a stop called the double-diapason, which is an octave below the common pitch. The stops so well cover each other, that neither the reed stops, nor the false ones (*sesquialtera*, &c.) are distinguished. This circumstance, perhaps, may account for that purity of tone for which the instrument is famed.

"The great bell of Exeter, given by Bishop Courtenay, is an object of much notoriety. It weighs 12,500 pounds, and is still suspended at the very top of the north tower. The weight of this bell has been strangely misrepresented by different persons who have written concerning the cathedral; but as Izacke was living when it was re-cast in 1675, his authority is to be preferred. In the south tower are eleven bells, ten of which are rung in peal.

"The following chapels have been erected at different periods within the cathedral, and have generally become the burial-places of the bishops who founded them. *St. Mary's* at the east end, is appropriated to a library. *St. Mary Magdalen's* is to the north of it, and *St. Gabriel's* on the south. *St. Andrew's* is used as a vestry by the canons and prebendaries, and St. James's a vestry for the priest vicars. In each of the two last chapels were two altars. The chapel of *St. John* is under the south tower, that of *St. Paul's* under the north tower. Bishop *Grandison's* chapel is between his screen and the wall of the west front. At the south east corner of the choir is *Oldham's*, and at the opposite angle of the choir is *Spektes' Chapel*. Several of these little apartments are adorned with a great variety of sculptured ornaments.

"In concluding the account of this fabric, we shall again avail ourselves of the sentiments of Sir H. Englefield, as being strictly coincident with our own. 'It is not easy to quit the subject of this celebrated cathedral,' he observes, 'without noticing the singular felicity which attended its erection. During the long period of fifty years, no tasteless or vain prelate interfered with the

regular and elegant plan of the founder. Though the taste in architecture was continually changing, so scrupulous was the adherence to the original design, that the church seems rather to have been created at once in its perfect state, than have slowly grown to its consummate beauty. Even Grandison, who, if we may judge from his screen, had a taste florid in the extreme in architecture, chastised his ideas within the church, and felt the simple grace of Quivil's design."

The account of Torbay is singularly imperfect, being comprised in a dozen lines of quotation from Mr. Gilpin, descriptive merely of its picturesque situation. Plymouth, however, is treated of in a manner more worthy of its importance: its antient history and present state are well detailed, and the vast naval establishments at this port are mentioned with laudable minuteness. Mount Edgcombe deserves and has obtained a spirited and characteristic description; and Mr. Smeaton's interesting narrative of the building of the Eddystone lighthouse, has furnished materials for twenty very entertaining pages.

The account of Tavistock is in some respects unsatisfactory: the only employment of the inhabitants which we find mentioned is, the manufacture of serges for the East India company, which we believe is at present almost wholly superseded by the working of the copper-mines on the Cornish side of the town. The institution for the study of Saxon literature, established at this place prior to the reformation, is a very extraordinary and honourable distinction; and any notices which the authors could have procured relative to this Saxon school, would have been received by the public with eagerness and gratitude.

The best specimen of topographical description in the whole volume is the account of Tiverton, a respectable manufacturing town, remarkable for the severe misfortunes against which it has had to struggle, and a striking instance of the amazing power of commerce founded upon manufacture, in repairing the heaviest losses. In 1591, when Tiverton was the principal seat of the woollen manufacture in Devonshire, the plague was introduced by a traveller, which, in a few months, destroyed or drove away a large proportion of the population. Scarcely had this scourge passed over, when, in 1598, four hundred houses, and several places of wor-

ship, were laid in ashes, by an accidental conflagration; some of the inhabitants, and a great number of horses, lost their lives on this occasion, and the value of property destroyed was estimated at one hundred and fifty thousand pounds. Tiverton, however, continued to be the staple of the woollen trade, and in the course of a few years, had not only recovered its losses, but was become one of the most thriving towns in the west of England, two thousand pounds in ready money being expended every market-day in the purchase of wool and yarn. Its rising prosperity was laid waste in 1612, by a second fire still more destructive than the former. With the exception of the church, the schools, alms-houses, and about thirty inferior houses, the rest of the town was wholly ruined; goods and utensils were destroyed to a vast amount, and all classes of inhabitants were reduced to the utmost distress. Even after this dreadful blow the spirit of industry, though checked, was not destroyed: in 1625 the resident population amounted to six thousand persons, and at the breaking out of the civil wars was increased to eight thousand. The stormy times that ensued, and the disastrous reigns of Charles II. and James II. checked the prosperity of Tiverton, which however recovered its lost ground under William III. and Anne. In 1731, a third fire broke out, which destroyed three hundred houses, and occasioned a clause in the act for rebuilding the town, prohibiting the use of thatched roofs. The supply of the German and Brabant markets again restored the prosperity of the place: but the rivalry of Norwich, more fatal than the plague or fire, palsied the industry of the inhabitants: the woollen trade of Yorkshire then brought on the general decline of the western manufactures, in which Tiverton has borne its share; the population, according to the late enumeration, amounting only to six thousand five hundred.

Many eminent men have been natives of Devonshire; of whom various notices and anecdotes are inserted in the descriptions of the places where they were born. Among the most distinguished are, the great naval commanders Drake, Sir Richard Granville, Sir J. Hawkins, and Sir W. Raleigh; the poets Gay and W. Browne; Granger, the biographer; and Sir Joshua Reynolds; Judge Bracton, Dr. Thomas Bod-

ley, the founder of the Bodleian library at Oxford: the Duke of Marlborough, Archbishop Wake, and Dr. Sydenham.

The latter part of the volume before us is occupied by an account of Dorsetshire; which, if not so interesting as that of Devonshire, is rather to be attributed to the deficiency of important or curious objects of research, than to any want of industry and attention in the editors. Dorchester, the capital of the county, furnishes an entertaining article; it is singular, however, that no notice is taken of the breweries in this place, the ale of Dorchester being its staple manufacture. We have also observed an inconsistency that calls for explanation or correction. In the general account of Dorsetshire, it is mentioned, that the number of sheep and lambs kept within eight miles of Dorchester, amounts to one hundred and seventy thousand; but in the description of Dorchester, it is said, that the number of sheep within *six* miles of the town exceeds six hundred thousand. The antiquarian remains in its neighbourhood, especially the Roman amphitheatre called Maumbury, Poundbury camp, and Maiden castle, are extremely well described. A similar praise may be extended to Corfe castle, the residence of Queen Elfrida, rendered still more illustrious by its gallant defence in the civil wars, under the direction of Lady Banks, wife of the lord chief justice, against the parliamentarians. A monument to the memory of Mr. Henry Hastings, at Horton, gives an opportunity to the authors of introducing an account of this singular character, supposed to have been written by Lord Shaftsbury, which we shall extract for the entertainment of our readers.

“ In the year 1638 lived Mr. Hastings, by his quality, son, brother, and uncle, to the Earls of Huntingdon. He was, peradventure, an original in our age, or rather the copy of our ancient nobility, in hunting, not in warlike times. He was low, very strong, and very active, of a reddish flaxen hair; his clothes always green cloth, and never worth, when new, five pounds. His house was perfectly of the old fashion, in the midst of a large park, well stocked with deer; and near the house, rabbits for his kitchen; many fish-ponds; great store of wood and timber; a bowling-green in it, long but narrow, full of high ridges, it being never levelled since it was ploughed: they use round sand bowles; and it had a banquetting house like a stand,

a large one built in a tree. He kept all manner of sport hounds, that ran buck, fox, hare, otter, and badger; and hawks, long and short winged. He had all sorts of nets for fish. He had a walk in the New Forest, and the manor of Christ Church; this last supplied him with red deer, sea and river fish; and, indeed, all his neighbour's grounds and royalties were free to him, who bestowed all his time on these sports, but what he borrowed to caress his neighbours' wives and daughters, there being not a woman in all his walks, of the degree of a yeoman's wife, or under, and under the age of forty, but it was her own fault if he was not intimately acquainted with her. This made him very popular; always speaking kindly to the husband, brother, or father, who was to boot very welcome to his house. Whenever he came there he found beef, pudding, and small beer, in great plenty; the house not so neatly kept as to shame him or his dirty shoes; the great hall strewn with marrow-bones, full of hawks, perches, hounds, spaniels and terriers; the upper side of the hall hung with fox-skins, of this or the last year's killing; here and there a polecat intermixed; game-keeper's and hunter's poles in great abundance. The parlour was a large green room, as properly furnished. On a great hearth, paved with brick, lay some terriers, and the choicest hounds and spaniels. Seldom but two of the great chairs had litters of cats in them, which were not to be disturbed, he having always three or four attending him at dinner; and a little white stick, of fourteen inches long, lying by his trencher, that he might defend such meat as he had no mind to part with to them. The windows, which were very large, served for places to lay his arrows, cross-bows, and stone-bows, and such like accoutrements; the corners of the room full of the best chosen hunting or hawking-poles; his oyster table at the lower end, which was of constant use, for he never failed to eat oysters all seasons, both dinner and supper: the neighbouring town of Pool supplied him with them. The upper part of the room had two tables and a desk, on the one side of which was a church Bible, and on the other side the Book of Martyrs: on the table were hawke's hoods, bells, and such like; two or three old hats, with their crowns thrust in, so as to hold ten or a dozen eggs, which were of the pheasant kind of poultry: these he took much care of and fed himself. Tables, dice, cards, and boxes, were not wanting. In the hole of the desk were store of tobacco-pipes that had been used. On one side of this end of the room was the door of a closet wherein stood the strong beer, and the wine, which never came from thence but in single glasses, that being the rule of the house exactly observed, for he never exceeded in drink, or permitted it in others. On the other side was the door of an old chapel, not used for devotion; the pulpit as the safest place, was never wanting of: cold chine of beef, venison pasty, gammon o

bacon, or a great apple-pye with thick crust, extremely baked. His table cost him not much though it was good to eat at. His sports supplied all but beef or mutton, except Fridays, when he had the best of salt fish, as well as other fish he could get; and this was the day his neighbours of best quality visited him. He never wanted a London pudding, and always sung in eating it, 'with my pert eyes there in a' (my *part* lies there in a, it should be.) He drank a glass or two of wine at meals, very often put syrup of gillyflowers in his sack, and had always a tumbler, without feet, stood by him, holding a pint of small beer, which he often stirred with rosemary. He was well natured but soon angry, calling his servants bastards, and cuckoldy knaves, in one of which he often spoke truth to his own knowledge, and sometimes in both, though of the same man. He lived to be an hundred, and never lost his eyesight, but always wrote and read without spectacles, and got on horseback without help. Until past fourscore, he rode to the death of the stag as well as any."

The account of Shaftsbury, celebrated in popish times for its magnificent ecclesiastical institutions, particularly the shrine of St. Edward the Martyr, and notorious in modern days for the venality of its representation, is both interesting and well drawn up. Sherborne also furnishes a remarkably curious article, both on account of the architec-

tural details, and the insight which it affords of the enormous depredations which the courtiers of Elizabeth were allowed to commit with impunity, on the property of the church. Among the monuments of Sherborne church is one to the memory of the son and daughter of Lord Digby, for whom Pope wrote the best of his epitaphs, beginning

"Go fair example of untainted youth," &c.

The island, or rather peninsula, of Portland, closes the volume: the account of its celebrated stone quarries is extracted without alteration from Mr. Smeaton's account of the Eddystone lighthouse; and an accurate description of the Chesil bank, a ridge of shingle seventeen miles in length, is given from Dr. Maton's tour.

We have derived, upon the whole, considerable pleasure from the perusal of this volume: too large a proportion, however, in our opinion, is occupied by antiquities, and too little notice has been bestowed on the proper topography and modern statistics of the counties. We would recommend also a greater degree of personal inspection, as essentially requisite for the permanent value of the work.

ART. XXV. *England Delineated: or, a Geographical Description of every County in England and Wales: with a concise Account of its most important Products, natural and artificial; for the Use of young Persons. With outline Maps of all the Counties. Fifth Edition, considerably improved. 8vo. pp. 400.*

THE original plan of Dr. Aikin was to condense in a moderate compass the most important objects in the natural and civil geography of England and Wales; together with such accounts of the cultivation, trade, and manufactures of the country, as might render the work both interesting and instructive to young persons in general. As an elegant epitome of the present state of England in these particulars, the volume before us is as yet unrivalled. The preceding edition (the 4th) was enriched

and corrected principally from the county reports published by the Board of Agriculture: in the present, the author has availed himself of the late enumeration of the inhabitants, and of some modern tours, to introduce various particulars which, without adding to the size, have enriched the work very materially. The plates of some of the maps begin to be worn, and we would recommend them to be re-engraved with corrections, for the next edition.

ART. XXVI. *A Guide to all the Watering and Sea-Bathing Places; with a Description of the Lakes; and a Sketch of a Tour in Wales; and Itineraries. Illustrated with Maps and Views. By the Editor of the Picture of London. 18mo. pp. 434.*

IN the composition of this work, says the editor, "an incredible number of publications have been consulted, and in no instance has the last edition of the

various local guides been neglected. The editor has been repeatedly induced to visit most of the places described, and made his observations on the spot;"

added to which, proof-sheets have been sent to the principal places, and submitted to the revision of intelligent friends. These advantages entitle the editor "to the confidence of the public;" and he is encouraged to hope that "his labours on the present occasion will be honoured with a degree of approbation equally flattering and extensive to that conferred on his universally read and approved books—*The Picture of London, and Guide to Paris.*"

The title-page is the best written part of this volume, since it is addressed to every individual of the summer swarm, which migrates in hot weather from the metropolis, and disperses itself through the fashionable and romantic retreats of England and Wales. Is a family party going from the city to perform their ablutions at Margate or

Ramsgate, where can they find a better "guide" to the ordinaries and lodging houses, the auctions and ass-races, and the many curious objects both of nature and art, than this compendious little manual, adorned with plates and illustrated with maps? Is an excursion to Derbyshire, or the Lakes, or a tour through Wales in contemplation? the guide is ready soliciting their attention, and, without any other assistance, will engage to conduct them to every place worth notice. The editor, however, with very little more trouble, might have comprehended both Scotland and Ireland, and thus have produced *The new, accurate, IMPERIAL Guide to ALL the Watering and Sea-bathing Places and ALL the picturesque and fashionable Resorts in the BRITISH ISLANDS!*

ART. XXVII. *The Juvenile Tourist; or, Excursions through various Parts of the Island of Great Britain; including the West of England, the Midland Counties, and the Whole of Kent. Illustrated with Maps, and interspersed with Anecdotes and poetical Extracts, for the Improvement of the rising Generation. In a Series of Letters to a Pupil. By JOHN EVANS, A. M. 12mo. pp. 450.*

MR. Evans informs us that he is "master of a limited number of pupils at Islington," and, in order to relieve the anxieties of a laborious profession, that he has been accustomed during the summer vacations to visit "some pleasant parts of this highly favoured island." The journal of his observations on these tours was first inserted in a series of numbers of the *Monthly Visitor*, which meeting with "a flattering

reception among his friends," induced him to re-arrange the whole with considerable alterations and improvements, and publish them in the present volume." In other words, Mr. Evans, not satisfied with pleasure, wished also to obtain profit from his excursions: he has accordingly, by the help of much quotation, contrived to manufacture a book which, we doubt not, is by this time totally and deservedly forgotten.

## CHAPTER VI.

## ANCIENT CLASSICS.

THE late year has not been distinguished in England by the publication of a single edition of any ancient author, of critical note. To works of this nature indeed the times are unfavourable ; *silent inter arma Musa*. Yet notwithstanding this aspect of affairs, we have reason to hope that the present year will afford us some valuable acquisitions of this nature. The arrival of foreign editions has probably been suspended by the tumults of war, which have greatly impeded the direct intercourse with the continent. Mr. Forster's *Anacreon* is chiefly valuable as a specimen of beautiful typography.

In the department of translation, the Dublin press has furnished the *Apollonius Rhodius* of Mr. Preston, who is also known as an occasional contributor to the *Transactions of the Royal Irish Academy*. The merits and demerits of this work we have endeavoured to distinguish in our review of it. An anonymous author has been making experiments in a version of *Horace*, the reception of which from the public, will not, we believe, be very flattering. Dr. Girdlestone has added another name to the translators of *Anacreon*. We dare not, however, say, that he has eclipsed the labours of his predecessors.

The literary treasures of this country, have been lately increased by the accession of some important manuscripts, collected during a journey in Greece and the adjoining islands by two adventurous travellers, members of the university of Cambridge. Their success may perhaps encourage others to explore more carefully, the mouldering repositories of learning, which are still scattered through some parts of those once happy regions. A fragment of a statue of *Ceres*, which formerly attracted veneration from the initiated at Eleusis, and was even, in modern superstition, supposed to communicate a fructifying influence to the neighbouring fields, has been gratefully dedicated by them in the vestibule of the temple of their Alma Mater, the public library at Cambridge. A short account of the evidence of former travellers respecting the existence of this statue, of the hypotheses which have been formed respecting it, and the means used in procuring its removal, has been published anonymously.

Mr. Faber has been engaged in a voyage, almost as adventurous as that of the ark, without sails, rudder, or compass, in quest of the helio-arkite mysteries, amidst the darkness of ancient mythology. The result of his discoveries he has communicated to the public, which incredulous readers will, however, we fear, be inclined to class with the "true history" of *Lucian*.

## EDITIONS.

ART. I. *Anacreontis Odaria, ad Textus Barnesiani fidem emendata accedunt varia Lectiones, curâ EDVARDI FORSTER, A. M.* 8vo. pp. 130.

ANACREON is an author who has in several instances been selected by eminent printers, as a subject for their exhibition of the beauties of the typographic art; and the small size of the volume, and the sprightly gracefulness and popularity of the pieces of which it consists, render it very well adapted for this purpose. The readings of this edition do not differ, except in a very few instances, from those of Barnes; but it

is an exquisite specimen of typographical skill. The letters are oblique, like the Italic form of the Latin letters. The only fault which we have to find is, that the circumflex accent approaches too nearly to a straight line, so as sometimes to be scarcely distinguishable from it without minute attention. This edition is correctly printed, though it is not, what some pains should have been taken to render it, absolutely immaculate.

## TRANSLATIONS.

ART. II. *The Argonautics of Apollonius Rhodius, translated into English Verse, with Notes critical, historical, and explanatory, and Dissertations, by WILLIAM PRESTON, Esq. M. R. I. A.* In Three Vols. 8vo.

APOLLONIUS, author of the *Argonautics*, was a writer of considerable merit in the Alexandrian school, which flourished in Egypt with great reputation under the dynasty of the Ptolemies. He is by some authors ranked among the seven poets of pre-eminent rank, who were considered as worthy to compose a constellation of genius under the name of the Pleiades. The particulars of his history, which have reached us, are scanty. The short Greek lives which are sometimes prefixed to his poem, inform us that he was by birth an Alexandrian; that he studied under the direction of the poet Callimachus, and at an early period of life published the first edition of the *Argonautics*, which was so unfavourably received, that unable to support the disgrace, which he considered as consequent upon his failure, he retreated to Rhodes; from his residence in which island he probably assumed or derived his surname. Having here employed himself in a careful revision of his work, he published it a second time; and in this amended form it experienced from the Rhodians a reception so favourable as to procure for its author the honours of the state. He is said to have afterwards returned to his native city; to have lived there in great reputation, and to have succeeded Eratosthenes in the charge of the Alexandrian library. We are told, that at one period of his life he was engaged in a bitter contest with Callima-

chus his master. This enmity was, however, probably either extinguished during the lives of the two poets, or the death of Callimachus effaced from the mind of his surviving rival, the traces of his resentment, if, according to one of the anonymous biographers, the ashes of the disciple were deposited in the same tomb with those of his master.

Apollonius appears to have been a man of great learning. Several of his works are mentioned by the ancients, of which only the poem of the *Argonautics* has descended to the present time. An epigram of two lines is extant, which is attributed to this author, and appears to have been written during his contention with Callimachus. A few verses of the original edition of the *Argonautics* are scattered among the Greek scholia.

These are nearly all the circumstances respecting the life of the poet, of which we are in possession; and the supplementary essays, which are annexed to the present work, are extended by the aid of reflections, the introduction of contemporary anecdote, the description of the circumstances and manners of the age, and other similar topics, into a narrative of almost thirty closely printed pages.

The poem of the *Argonautics*, from the judgments of Quintilian and Longinus, does not appear to have been very popular with the ancients; and the superior merit and great facility of Homer have caused him to be comparatively neglected by modern critics and

readers. Nor do the two translations of this work into our own language, which have preceded the present, appear, from whatever cause, to have attracted much attention from the public. Quintilian characterizes it as a work not contemptible, written in a kind of equal mediocrity; and Longinus quotes our author as an instance of those writers, who escape great faults by not aiming at great excellencies. Yet it may be fairly questioned, whether a careful perusal of his poem will not incline and authorize a candid reader to form a more favourable estimate of its merits. This has at least been the opinion of most of those modern critics, who have mentioned the subject, and may be considered as most competent to pronounce a judgment respecting it. Nor are the frequent, and sometimes close imitations which occur in Virgil, to be considered as slight testimonies of praise from an authority which all will acknowledge to be beyond exception.

A learned commentator on Longinus, in extenuation of the sentence of that critic, remarks in the first place in favour of Apollonius, that he adheres closely to his subject; that he accurately follows the order of place and time as established by tradition; that the episodes grew out of the work, and scarcely wear the appearance of digression; and that the events both of a common and marvellous nature, are related with probability, if we refer them to the sentiments and belief of the age. Thus he characterizes the fable of the poem; this is, however, a praise which scarcely rises above the faultless mediocrity to which the ancient critics would reduce it; and it must be acknowledged that the fable is in a great degree destitute of some of the higher excellencies of an epic story. It is deficient in unity. It relates a series of adventures in chronological order, many of which have no greater connection with each other than the successive assaults, victories, and defeats, of the Greeks in the siege of Troy. In this he has chosen to imitate the practice of the cyclic writers, rather than that of the great parent of epic song. Half the poem is spent before the heroes anchor in the Phasis. In the construction of his fable the poet has certainly displayed no art, though it is not, perhaps, in itself, of a nature sufficiently ample to admit a better method of exhibition.

The characters display some degree of discrimination, though the poet has by no means reached consummate excellence in this department of his art. Jason and Medea are necessarily the two most prominent figures. Jason is always brave and prudent, and may, perhaps, be placed on a level with Æneas. The reader cannot, however, forgive the base treachery by which the murder of Absyrtus is accomplished. Medea, though the delineation of her character is very far from being destitute of skill, will appear but a feeble archetype of Dido, drawn by the Roman poet with a force and beauty which transcend our praise. The sentiments which the poet attributes, are generally assigned with propriety, and appear to be supplied by a cultivated and well-furnished mind.

The diction of the narrative is often wrought with great elegance, sweetness, and precision, though the style is frequently obscure, in comparison with that of Homer, in consequence of its more artificial structure, and sometimes by long and involved clauses, the employment of unusual words, and the allusions which are perpetually recurring to the mythological and antiquarian learning of his age. Though Apollonius does not frequently transport his reader, by any powerful or exalted feelings, yet instances indubitably occur of passages both sublime and pathetic, to a high degree of excellence.

The most characteristic parts of the Alexandrian bard, are, perhaps, the descriptions and the similitudes. The descriptions are usually laboured with great care and accuracy, if not minuteness, and frequently with great success. The comparisons are often possessed of a great degree of originality and beauty, and are, in some instances, transplanted by Virgil. Apollonius abounds more than most poets in circumstances drawn from common life, which are frequently applied with great felicity. A striking example of the difference of the manners of the Greek and Roman poets, may be supplied by the well-known descriptions of night, in the third book of Apollonius, and the fourth of Virgil; the latter of which passages is confessedly an imitation of the former. The lines of Virgil are familiar to most readers; we however transcribe them for the sake of comparison, without the trouble of reference.

"Nox erat, et placidum carpebant fessa  
soporem  
Corpora per terras, silvæque et sæva quierant  
Aequora, quum medio volvuntur sidera  
lapsu,  
Quum tacet omnis ager; pecudes, pictæque  
volucres,  
Quæque tenent lacus liquidos, quæque  
aspera dumis  
Rura tenent, somno positæ sub nocte silenti  
Lenibant curas, et corda oblita laborum.  
At non infelix animi Phoenissa, &c."

*Æn. iv. 522.*

The picture of Virgil is taken from the great features of nature, into which man is not admitted with any distinction from other objects of the scene, and is drawn with the greatest majesty and grace; that of Apollonius is principally derived from subjects of human concern and employment, from cities and men in their various occupations on sea and land, and if it yield in dignity, is perhaps more touching to the mind than that of his imitator. The following is a literal translation; "Night then brought darkness on the earth, the sailors on the sea were looking from their ships on the Bear, and the constellation of Orion; the traveller and the watchman of the gates now longed for sleep; and deep lethargic slumbers encompassed the mother of dead children, nor was the barking of dogs or the busy hum heard within the city, but silence held the blackened shades: yet did not sweet sleep take possession of Medea." There is perhaps this impropriety in the first circumstance introduced by Apollonius, that it does not present an image of absolute repose; the rest of the creation, though tranquil, is not in this picture wholly dead. Without deciding between their merits, it may be said that few passages in any writers are more striking than these kindred and rival descriptions, on a subject most favourably calculated for poetical display.

From Apollonius we pass to his translator, and shall introduce him as giving to his reader the following account of his undertaking.

"I shall not presume to say how the English translators of Apollonius, who have gone before me, have succeeded in their task. It would ill become me, to speak in degrading terms of those gentlemen, whose taste led them to precede me, in the meritorious province of endeavouring to do justice to this delightful, and too much neglected, writer. Their performances are before the public; and it is the privilege of the public, to ap-

preciate the labours of writers. It may appear to many, that a new translation of an author, who has been twice translated, might well be spared—yet, in one point of view, I hope my attempt will appear allowable, and free from the imputation of vanity. Whatever may be the demerits of the present translation; I flatter myself they will find indulgence and pardon from the candid reader; for the sake of the concomitants, of which this version is introductory. He will find large extracts from the Greek scholia, which deserve to be well known to the classical reader—a variety of hints, critical, historical, and explanatory, some few of them extracted from those of Fawkes, and the Oxford editor, but, for the most part, wholly new, of which some may not be altogether unacceptable, even to those who read Apollonius, in the original text.—And, lastly, certain essays, which if they shall succeed in making the reader an admirer of this delightful poet, they will have contributed to an act of justice.

"It is but fair to apprise the reader, with respect to the translation, which I now, with much diffidence, offer to his hand; that he will find it, in general, rather paraphrastic than strict; in many places, more redundant than I could wish. I must own, that I have endeavoured to follow rather the spirit than the letter of the original. But, I hope, I have not been unfaithful to the general sense, to the substance of what the Greek text meant to say. Shall I own it?—I sometimes had the vanity of aiming at another sort of translation—a kind of portrait translation:—a version, not of the matter merely, but of the style and manner of my original. How I may have succeeded in this—alas, I fear—I feel—but the reader, who is capable of comparing the version with the text, must judge for himself.—And, in judging, the test is, if the version reads, in English, like an original work."

From the perusal of his work we judge Mr. Preston to be a liberal scholar, much attached to literature, and especially to poetical studies, and extensively acquainted with writers of this description, in his own tongue, as well as in other languages, both ancient and modern. Of the Greek he appears to be a sufficient master to have apprehended in general, though not uniformly, the meaning of his author. His translation is in many places by much too paraphrastic and diffuse; in many others sufficiently close and faithful, while it still possesses a due degree of ease and freedom. We regard it as in general of unequal execution; its tenor is frequently fluent and unconstrained, there are sometimes passages which aspire to excellence; while, on the other hand, instances too frequently occur of

apparent negligence, impropriety, and false taste. We do not consider Mr. Preston as possessed of a poetical style, sufficiently individual, uniform, and classical; we sometimes trace the imitation of one author, and sometimes of another; different ages are intermixed; modern refinements and sentiments are blended with ancient simplicity and severity. While we feel ourselves compelled to make these deductions (which we shall proceed to exemplify) from the praise of the present work, we are at the same time equally ready, in many parts, to concede to it a considerable degree of merit.

We have said that Mr. Preston does not appear to us to have always apprehended with accuracy the meaning of his author. Some instances, from others which we have noted, we shall now specify in the order in which they occur.

(P. 5.) "For Æson's sister was his youthful bride."

The original says, that the sister of Iphiclus was the bride of Æson.

In the same page, the marvellous story of Cœneus, as related by Apollonius, is, that the Centaurs, finding him impenetrable to their wounds, oppressed him with a load of trees, and beat him down, otherwise unhurt, into the earth. The miracle disappears from Mr. Preston's version of the passage.

"The baffled foes resort to missive war,  
And fill the groaning air with weights from far,  
The darted pine, and oak's enormous trunk,  
O'erwhelm'd, but unsubdued, the warrior sunk."

(P. 6.) "O wretched man, how transient is thy breath,  
Inevitably doom'd to pain and death!  
On Lybia's burning sands their tombs remain,  
A scene far distant from their native plain,  
As the gay scenes of Phœbus' dawning light,  
From the pale precincts of approaching night."

The original of this passage is in part obscure, and probably corrupt, but what Apollonius says is not a scene far distant from their native plain, but a scene far distant from Colchios, as the west from the east; Lybia and Colchios are mentioned as the opposite boundaries of the Argonautic course.

In page 25, a remarkable omission occurs. Forty-seven verses of the original, including the song of Orpheus,

are here untranslated, of which no explanation, so far as we have observed, is given, nor any other indication, than that the numeration of the verses proceeds at once from 758, to 829.

(P. 61.) "The men of Trachin still the custom hold."

Nothing is said in the original respecting any custom of the Trachinians, inhabitants of Greece, but of the Ciani, inhabitants of Asia, who still, says the poet, prolong the search for Hylas, and retain their concern for Trachin, where the hostages given by their ancestors to Hercules were deposited.

(P. 64.) "As at the ship he question'd their descent,  
Their place of birth, and whither they were bent."

Apollonius (speaking of Amycus) says that he asked none of these questions, as indeed appears from Mr. Preston's succeeding translation of his speech. The order of the original passage, which is rather involved, is the following, υπερβασιστην ατισσιν ερεσθαι μιν χρειν ναυτιλης, διττειν; the translation, "he haughtily despised to ask them the occasion of their voyage, and who they were."

(P. 88, 89.) The passage of Argo through the Symplegades affords a good instance of the descriptive powers of Apollonius. It does not however appear to have been throughout exactly apprehended by Mr. Preston. The following passage is certainly misconceived, and a sense given to the words which they will by no means bear.

"Far as a youthful crew, with labouring oars,  
Speed, at a stroke, the vessel from the shores,  
That distance twice their bark the Minyæ send."

The literal translation is as follows: "as much as the vessel yielded to the impulse of the rowers, twice so much it was carried back; i. e. by the force of the reflux wave." The interpretation which Mr. Preston gives, is indeed given by one of the Greek scholiasts, but cannot be extracted from the words of the original; and another of the commentators, or the same commentator, judging better, immediately afterwards supplies the true interpretation. The reading of the common editions in this

passage is emended by Brunck from a manuscript.

(P. 126.) "In prospect wide the vast of ocean lies,  
And seems to mingle with surrounding skies."

This translation must have been given from a hasty and imperfect inspection of the original; the meaning is, that the ocean was displayed in wide prospect to the god, as he moved through the long tract of air.

(P. 161.) The meaning of Medea, in her speech to Jason, is considerably misapprehended.

"But, when Iolcus' tow'rs rejoice thy sight;  
Remember me. Be some few sighs consign'd

To the poor victim, that remains behind.  
For me; no pow'r shall tear thee from my soul,

Nor mother's voice, nor father's stern controul.

May fame the tidings of thy welfare bring.  
Some bird propitious waft them on his wing.  
To bear me, might the favouring breezes rise,  
And o'er the seas transport, and through the skies!

While round thee all the sports and pleasures flow,

That affluence, ease, and kindred can bestow;  
Before thee might I stand a sudden guest,  
And say—through me these raptures fill thy breast?—

Oh might I soon be plac'd, and long remain,  
A favour'd inmate, with thy household train."

The purport of the words of Apollonius is this, "when you shall have come to Iolcos think on me as I also will think on you, though against the will of my parents; but should you forget me, may some voice, or some informing bird, come to me from far, or may the rapid winds bear me hence over the sea to Iolcos, that urging irresistible accusation in your presence, I may remind you that you were saved by my counsel; then might I stand an unexpected guest in your palace!"

(P. 193.) The island Peuce, formed by the mouths of the Danube, is in the translation, though not in the original, placed in the Ionian, or in the geography of Apollonius, the Adriatic sea. Some other considerable errors occur in this part of the translation, which we will not stay to enumerate.

This catalogue of errata might have been easily increased, but perhaps the instances which we have adduced are al-

ready more than sufficient. At the same time difficult passages are so often well translated by Mr. Preston, that we are surprised when those which are easy are mis-translated, and in fact, in some of the instances which we have just produced, we trace negligence rather than ignorance.

In the remainder of our remarks we must be more sparing of examples.

The following passage is scarcely intelligible to the English reader,

"——— Forbear to glide  
A bird ill omen'd, as we seek the tide." I. 499.

The word *ovis*, in its primary sense, a bird, evidently means in this passage, by a secondary signification, nothing more than an omen.

(P. 199.) "Which heavenly charities for Bacchus wove."

In the place of charities should be substituted a proper name, Charites, or the Graces.

(P. 133.) The two last lines of the following passage are, to say no more, very obscure. Similar instances might be added.

"If generous thoughts the precious fleece may yield,  
No force they meditate, no listed field.  
Supreme in all things shall thy pleasure sway,  
And ample gifts for the possession pay."

Of diffuseness, from many others, we select one example, occurring in the first page. The words, "he rendered offering to father Neptune and the other gods, but neglected Pelasgian Juno," are here thus paraphrased.

"The hallow'd banquet was to Neptune given,  
And all the immortal habitants of heaven,  
Save one. With bold contempt the wife of Jove,  
Selected seem'd, the irreverent slight to prove.  
To Juno, goddess of Pelasgic ground,  
Nor vows are paid, nor pealing hymns resound."

Additions to the sense are sometimes unjustifiably inserted.

(P. 93.) "Best off'ring now, an unpolluted mind."

Of this sentiment not a vestige, either in direct expressions, or by implication, exists in Apollonius.

In the following page the poet is presented with a new machinery.

"The straining timbers with the whirlwind  
groan'd,  
And through the shrouds the stormy dæmons  
moan'd."

(P. 70.) The style of classical and Grecian purity and simplicity is violated by an imitation of a very modern school of poetry.

"To the sweet lyre the silent shores rejoice:  
The list'ning breezes *fold the gauzy wing*,  
While thee, Laconian son of Jove, they sing."

Words which are unnecessary, and scarcely classical, are sometimes found. The translator seems much attached to words of termination like the following: heapy, steepy, sweepy, shrilly, paty, vasty: some of these words may indeed be vindicated by obsolete authority, but few of them are needed.

Expressions feeble, mean, ludicrous, or affected, sometimes occur.

(P. 122.) "Then with soft smiles that search the heart of heart."

The author is so much pleased with this expression, that it occurs again in page 166.

"To search the secret of the heart of heart."

The following is the periphrasis of butchers;

"Like those that fell stout oxen to the ground."

(P. 4.) The property of feeding is given to thirst.

"Whose tuneful soul the thirst of glory fed."

In a work published in the metropolis of Ireland, it is unfortunate that such an expression as the following should occur.

"First Castor slew the slain." (P. 68.)

These are no *verba ardentia*, like the same expression in Dryden's ode, but a direct and unaccountable blunder.

In the preceding quotations we have given specimens of nearly all the classes of Mr. Preston's faults: it remains to add a few words respecting the merit of his version, and to furnish some longer and more pleasing extracts.

Mr. Preston has himself made it the test of the excellence of a version, if it read like an original work. This merit he has in a considerable degree attained. His style is in general easy and fluent, and many passages may be selected entitled to the praise of all the qualities desirable in a version. As a whole, after making

deduction for numerous faults, it may still be read with pleasure, and the author has done enough to convince us, that with more care he could have done much better.

We shall now add a few extracts without any further remarks. The following is the translation of the night-piece in the third book.

"Now, night o'er earth her ample veil  
display'd;  
And sailors, from the deep, the stars survey'd,  
Orion, and the greater bear; that guide  
The nightly path of vessels, through the tide.  
Sleep on the weary travellers' senses crept.  
Ev'n in the tower the careful warder slept.  
Subdued by rest the mother ceas'd to mourn  
Her darling infants, clos'd within their urn.  
The busy hum of crowded streets was still;  
And still the watch-dog's larum loud and shrill.  
The queen of darkness trod her awful round;  
Her ears untroubled, by a vagrant sound.—  
Medea's couch refus'd the soft controul;  
For love and Jason agoniz'd her soul.—

\* \* \* \*

"The youth pursuing, with intrepid  
breast,  
And footsteps firm, the path of danger prest.  
With hand unsparing, onward as he past,  
O'er the plough'd land the dragon's teeth he  
cast;  
And oft he turn'd—oft anxious ey'd the soil;  
Lest giant harvest should prevent his toil,  
While pressing onward, o'er the stubborn  
plain,  
The brazen footed bulls their toil sustain.—  
When three full portions of the time were  
spent,  
From dawn of morning to the sun's descent;  
And gladsome now their weary task to leave,  
The workmen hail the sweet approach of eve;  
Th' unwearyed ploughman triumph'd in his  
toil,  
O'er all the large allotted space of soil.—  
Four acres lay upturn'd, the share beneath,  
All fully saturate with dragon's teeth—  
The fiery monsters from the yoke he freed;  
And drove them terrified along the mead.  
He gaz'd around.—The furrows still remain  
A blank, unpeopled by the giant train.—  
The ship he sought, and join'd the gallant  
crew;  
Then in his helm the cooling beverage drew.  
Gladly the youth indulg'd in transient rest;  
With words of hope his comrades cheer'd  
his breast.  
His heart expanded, with increasing might,  
Like the fierce boar impatient for the fight,  
Who whets his tusks, and musters all his  
wrath,  
And foaming waits the hunter in his path.

" But now the land its horrid harvest  
 brings.  
 A giant arm'd from every furrow springs:  
 And helms, and shields, and lances, all  
 around,  
 Like bearded corn, rose bristling o'er the  
 ground,  
 The sacred space of Mars, the scourge of  
 man.—  
 To Heaven's high vaults the gleaming splen-  
 dours ran.  
 When wintry storms, surcharg'd with va-  
 pours, flow,  
 And heap along the ground the drifted snow,  
 The clouds disperse, and thro' the gloom of  
 night,  
 The starry train emerge, in dazzling light;  
 Thus, sudden brightness shot along the land.  
 Admonish'd by the virgin's wise command,  
 A circling stone, of mighty weight and size,  
 A disk for dreadful Mars the youth espies;  
 Scarce could four men th' enormous mass  
 sustain.  
 With ease the hero rais'd it from the plain;  
 Then, rushing forward, with a sudden bound,  
 Aloft in air he hurl'd it, round and round.  
 Distant it fell amid th' embattled field.  
 The youth collected shrunk behind his  
 shield,  
 Yet with intrepid heart.—The Colchians  
 roar,  
 Like billows, when they lash the rocky  
 shore.—  
 With mute and blank amaze their king be-  
 held,  
 What force stupendous the huge disk im-  
 pell'd.—  
 In combat loud, as barking dogs engage,  
 Those earth-born brothers round that discus  
 rage,  
 With hideous din; and by each other's hand,  
 Pierc'd thro' with spears, they sunk, along  
 the land.  
 Like oaks, uprooted by the whirlwind's  
 sway,  
 Or mountain pines o'erturn'd in ranks, they  
 lay.  
 As shoots a star portentous to mankind,  
 And falling draws a train of light behind;  
 So bright, at once, and terrible to view,  
 The youthful warrior on the giants flew.  
 The naked falchion lighten'd in his hand;  
 And wounds promiscuous fell'd the rising  
 band.  
 Some, half ascended into life he found;  
 Some to the breast yet struggling in the  
 ground;  
 Some newly freed stood upright on the soil.  
 Some, forward rush'd to claim the martial  
 toil.—  
 As when a land becomes the seat of war,  
 The farmer marks the foe's approach from  
 far;  
 And lest the spoilers should possess the grain,  
 Anticipates the harvest of the plain;  
 The curving sickle newly edg'd he bears,  
 And o'er the furrows fall th' unripen'd ears;

He bears the corn, with fearful haste, away;  
 Ere yet its tinge bespeaks the solar ray;  
 Dire harvest, Jason reap'd that earth-born  
 brood;  
 And all th' o'erflowing furrows boil'd with  
 blood.  
 Swell'd by continual rains, as torrents spread,  
 Despise their banks, and inundate the mead.  
 In various postures they resign'd their breath,  
 And grim and diverse were the forms of  
 death.—  
 Some bit the empurpled earth, and prostrate  
 lay;  
 Some backward fell, and breath'd their souls  
 away;  
 Some lean'd half-rais'd, and panted to the  
 wind;  
 Some sidelong writh'd, in agonies reclin'd;  
 Træn, sunk, extended in eternal sleep;  
 Like mighty whales, that slumber o'er the  
 deep.—  
 Entangled some, fast rooted in the ground,  
 With head inclining droop'd beneath the  
 wound;  
 High as erewhile to heav'n they rear'd the  
 crest,  
 So low they sunk, with damps of death op-  
 press;  
 Thus youthful plants, surcharg'd with storm  
 and rain,  
 Hang their moist heads, and languish to the  
 plain,  
 Bent from the roots; the gardener, in de-  
 spair,  
 Surveys the prostrate offspring of his care:  
 And weeps his toils defrauded of their scope,  
 The pride of autumn lost, Pomona's ra-  
 vish'd hope.—  
 Such grief and rage the monarch's bosom  
 knew,  
 As o'er th' expiring train he cast his view.  
 He sought the city, with the Colchian  
 throng,  
 Resolving vengeance, as he mov'd along.—  
 The second conflict with the day was clos'd.  
 The sun declin'd, and all the train repos'd."

The second volume of this work con-  
 sists of notes and observations on the  
 poem, in part extracted from the former  
 commentators, and the Greek scholiasts,  
 and in part supplied from the author's  
 personal reading and judgment. The  
 third volume comprises translations,  
 from the bibliotheca of Apollodorus,  
 and the Argonautics, which bear the  
 name of Orpheus, with the following  
 essays, the first on the life of Apollonius  
 Rhodius, the second on the Argonautic  
 expedition, the third, on the manners of  
 the heroic ages, considered with a re-  
 ference to poetry, the fourth, on the poe-  
 tical character of Apollonius Rhodius,  
 the fifth, Apollonius Rhodius and Vir-  
 gil compared, the sixth, on the geogra-

phy of Apollonius Rhodius, the seventh, on the Hesperides and their gardens.

On these subsidiary parts of the work we shall not offer many remarks. Most readers will perhaps be inclined to consider two volumes of illustrations as too many for one volume of poetry. They however display a very considerable extent of elegant and useful reading. The style of Mr. Preston's criticism we think liable to great objection. The judicious and useful observations which it contains, and such observations are by no means wanting, are almost hidden under a cloud of declamation. Take, as a specimen, the third paragraph, which is a kind of table of contents to the fourth essay.

"When we come to consider the poem of Apollonius Rhodius, we may trace the following excellencies—a knowledge of the human heart, and a display of the feelings—powers of exhibiting the impassioned, the tender, and pathetic—a certain retired and chaste majesty, not unaccompanied with a genius for producing the great and terrible—an elaborate and romantic invention, such as bears more traces of poetical device, and approaches nearer to the fictions of romance, in modern times, than most of the compositions of antiquity—a spirit of elegance and refinement, in sentiment and manner, something more *recherché*, and removed, from common apprehension, at the same time, that they are recognised to be perfectly conformable to nature—a graphical distinctness and accuracy of description—a precision in representing both spiritual and material nature—argumentative and declamatory powers—a chastised and musical ear, producing an

uncommon sweetness and pomp of numbers—a curious felicity of expression; and elegance of diction—descriptive powers—the appositeness and beauty of his similitudes."

In a metrical disquisition (iii. 241.) Mr. Preston observes, "that in a verse composed wholly of monosyllables there can be no *cæsura*, and consequently that such a verse can scarcely be admitted in correct composition." This we conceive to be so far from self-evident, that it is not even the fact. A *cæsura* is nothing more than a pause accommodated to the nature of the verse, and a pause may certainly succeed a monosyllable, as in the following verse of Ausonius.

"Perdere si quis in his dignabitur otia musis."

Dryden is quoted as remarking that a line of monosyllables is always harsh. Dryden's observation is not, we believe, made universally, but generally. He himself quotes two exceptions (to which many others might be added) one from Creech, and one from his own translation of Virgil.

"Nor could the world have borne so fierce a flame.

Arms and the man I sing, who forc'd by fate."—

The true reason why a line composed of monosyllables is frequently harsh, is to be found in the number of consonants which such words usually contain.

ART. III. *The Odes of Anacreon, translated from the Greek into English Verse.* By THOMAS GIRDLESTONE, M.D. 8vo. pp. 104.

LAHARPE, in a passage quoted in the preface of the work before us, exclaims, "that we shall never see Anacreon translated." Dr. Girdlestone appears to be a man of reading, who laudably employs many of those hours, which the duties of his profession leave vacant, in the gratification of a literary turn. We are not, however, able to flatter him, that in his present undertaking he has succeeded more happily than his predecessors. His versions are deficient in that ease and liveliness which characterize the original. Uncouth inversions of language sometimes occur; and a forced and unnatural accentuation is sometimes necessary to reduce the verses to their proper cadence. The article is occa-

sionally omitted with injurious effect, as in the following instances:

"You to post of honour wing,"—page 43.

"As his sword of Hector wav'd,"—page 51.

We insert the fifteenth ode as a specimen of the work:

"Far from Gyges' cares I fly  
What for Cræsus' wealth care I?  
Gold in me no contests breeds,  
Me no king with envy feeds:  
Odours sweet around me strew,  
With perfumes my beard bedew.  
Round my head fresh roses twine,  
These these cares are cares of mine.  
Pleasure flies on this day's wings,  
Who knows what to-morrow brings?

While the days serenely glide,  
Sport the dice, throw cares aside;  
Let's enjoy with Bacchus these,  
And the flying moments seize;  
Least disease shou'd haste and cry,  
'Thou must these libations fly!'

In judging of versification, Dr. Girdlestone must certainly be in the habit of employing his eye more than his ear. He asks, where is the ear which, without the assistance of the eye, would detect the open vowels in that line of Pope's essay—

" 'Though oft the ear the open vowels tire.'"

We presume to say, that there are very few ears accustomed to the perception of poetical melody, which would not, in similar instances, detect them, and be of-

fended by them; though we mean not to say, that every instance of hiatus in English verse is absolutely productive of displeasing effect. In the lines which are immediately afterwards produced, as affording specimens of open vowels without offence, the fact is, that very few such specimens occur. Those which Dr. Girdlestone considers as such, are commonly produced by the final and mute *e*, in one word, followed by a vowel at the beginning of the next. In words thus terminating, the final vowel, by one of those anomalies which deform our language, has no other power than that of prolonging the preceding vowel, or modifying its sound; and such words, as to all purposes of speech, are to be considered as closing with a consonant.

ART. IV. *The Lyrics of Horace; comprising his Odes, Epodes, and secular Odes, in English Verse, with the Latin Text revised and subjoined.* 8vo. 2 vols.

WHAT service this translator can imagine that he has conferred upon the cause of literature, we find it difficult to conjecture. To have rendered Horace into such lines as occur in many of these versions, is an act of treason against the Muses, which the writer will not expiate, till, like Milton, guilty in one instance of a similar crime, he shall have produced a "Paradise Lost." What literal prose translation would not be preferable to the following attempt at poetry?

"By all the gods, pray tell,  
Why Sybaris with love you to his ruin haste!  
Why, Lydia, does he shun  
The Sunny Field\*, to dust and heat habitu-

ated?  
Why soldier-like not ride  
Among his compeers, or the mouths of Gal-

lic steeds  
Break in with bitted reins?  
Why does he dread to feel the yellow Tiber?

why  
Like viper's blood avoid  
Cautious the wrestler's oil? Nor livid are his

arms  
With weapons borne; who, fan'd,  
The discus oft, the spear beyond its bound

oft threw.  
Why doth he lie conceal'd,  
As sea-born Thetis' son was said to do, ere

Troy's  
Lamented fun'ral; lest  
Man's garb should force him to the fight, and  
Lycian bands?"

This is one of nineteen odes, corresponding to as many different species of Horatian metre, which the translator informs us that he has executed in blank verse, of the same measure as the Latin, as nearly as the English language would allow, for the purpose, we suppose, of affording to his readers, who are ignorant of the originals, some knowledge of the beauty of their versification. We must, however, in justice say, that these are usually the worst specimens of the translator's skill; and for the purpose of impartiality, we insert one of rather better note:

"Wherefore does the bard this day  
To consecrated Phœbus pray?  
What does he ask, while at his shrine  
He pours profuse his early wine?  
Not the harvests to obtain,  
Which load Sardinia's fertile plain;  
Not the gladsome flocks, which feed  
On hot Calabria's sunny mead;  
Nor gold, nor Indian ivory;  
Nor yet those rural scenes which lie  
Near where the peaceful Lyris strays,  
Sapping its way with silent ease.

Calenian culture wait the vines  
Of those who boast their costly wines;  
And let the thrifty merchant pour  
The foreign cask's delicious store,  
For which his Syrian wares he sold,  
Into capacious cups of gold,  
That merchant to the gods most dear,  
Since thrice, nay four times ev'ry year,

"\* The Campus Martius."

O'er th' Atlantic flood he sails,  
Wasted safe by prosp'rous gales;  
While lenient mallows nurture me,  
With olives, and wild succory.  
"Latonian progeny, then grant

One only boon, 'tis all I want;  
Let me enjoy the good I find  
With perfect health, and perfect mind;  
Respected be my hoary age,  
And let the lyre my latest hours engage!"

## ANTIQUITIES AND MYTHOLOGY.

ART. V. *Testimonies of different Authors, respecting the colossal Statue of Ceres, placed in the Vestibule of the public Library at Cambridge.* 8vo. pp. 25.

THE author of this pamphlet, we presume to be Mr. Clarke, of the university of Cambridge; who, accompanied by another gentleman of the same university, was lately engaged in a tour in Greece, and the neighbouring islands, from which they returned with a collection of literary and antique monuments of great value, procured in the course of their progress. Among these was a fragment of a statue of colossal size, found among the ruins of the celebrated temple of Ceres, at Eleusis, and supposed to represent the goddess herself. The object of this pamphlet is to collect the testimonies of former travellers respecting the existence of this bust or statue; to ascertain the object which it was intended to represent; and to give a narrative of the means used to procure this ancient monument, and the difficulties which attended its removal. The former writers, whose testimonies are here quoted, are Wheler, Spon, Pococke, and Chandler. To these authorities is added that of Montfaucon. The *Καλαδίον*, or holy basket on the head of this statue, has given rise, we are told, to an opinion, that it was intended, not for the goddess Ceres, but a canephora. This hypothesis is, we think, satisfactorily disproved by the observations adduced by the author of the pamphlet. The passage which will prove most interesting to general readers, is that which describes the difficulties accompanying the removal of the statue, which are thus related:

"The difficulties to be encountered were not trivial. It was first necessary to purchase the statue from the waiwode, or governor of Athens, who alone had power to dispose of it". A firman was then to be obtained for its removal; the attendance of a Turkish officer to enforce the order; and a vessel capable of conveying it away. The old quay of Eleusis, consisting of immense blocks of

marble, broken and disordered, required reparation. Across the chasms, where the stones were wanting, it was necessary to place pieces of timber, as temporary bridges, that the statue might be conveyed to the utmost extremity of the quay, where a sufficient depth of water would admit the approach of large boats.

"When all these preliminaries were adjusted, which required equal promptness and secrecy, amidst the opposition to be expected from a herd of idle and mercenary Greeks, acting as consuls to different nations; in what manner could a foreigner, without any mechanical aid, expect to raise a mass of that magnitude, and convey it over rocks and ruins from its station at Eleusis to the sea?

"Athens afforded a rope of twisted herbs, and a few large nails. A small saw about six inches in length, an axe, and some long poles, were found at Eleusis. The stoutest of these poles were cut in pieces and nailed in a triangular form, having transverse beams at the vertex and base. Weak as this machine was, it acquired considerable strength by the weight of the statue when placed on the transverse beams. With the remainder of the poles were made rollers, over which the machine might move. The rope was then made fast to each extremity of the transverse beams at the vertex. Simple as this contrivance was, it succeeded, when perhaps more complicate machinery might have failed; and a mass of marble, weighing near two tons, was moved over the brow of the hill; or Acropolis of Eleusis, and from thence to the sea, in about nine hours.

"An hundred peasants were collected from the village and neighbourhood of Eleusis, and near fifty boys. The peasants were ranged forty on each side to work at the ropes, the rest being employed with levers to raise the machine when rocks or large stones opposed its progress. The boys who were not strong enough to work at the ropes and levers, were employed in taking up the rollers as fast as the machine left them, and in placing them again in front.

"But the superstition of the inhabitants of Eleusis, respecting an idol, which they all regarded as the protectress of their fields, was

"• Those who have visited Turkey, know the difficulty of making such a purchase. Among other absurd notions which the Turks, and even some of the Greeks, have about foreigners, they believe such stones are only sought for the gold they contain; and this gold, not in the form of ore, but ready coined fine glittering sequins."

not the least obstacle to be overcome. On the evening preceding the removal of the statue, an accident happened which had nearly put an end to the undertaking. While the inhabitants were conversing with the Turkish officer who brought the firman from the waiwode of Athens, an ox, loosed from its yoke, came and placed itself before the statue; and after butting with its horns for some time against the marble, ran off with considerable speed bellowing into the plain of Eleusis. Instantly a general murmur prevailed; and several women joining in the clamour, it was with difficulty any proposal could be made. 'They had been always,' they said, 'famous for their corn; and the fertility of the land would cease when the statue was removed.' These are exactly the words of Cicero with respect to the Sicilians, when Verres removed the statue of Ceres: '*Quód Ceres violatá, omnes cultus fructúsque Cereris, in his locis interísse arbitrantur*\*."

"At length, however, these scruples were removed; and on the following morning, November the 22d, 1801, the priest of Eleusis, arrayed in his vestments as for high

mass, descended into the hollow in which the statue was partially buried, to strike the first blow with a pickaxe for the removal of the rubbish, that the people might be convinced no calamity would befall the labourers. At mid-day the statue had reached the summit of the hill above Eleusis; and as the sun was setting, by the additional assistance of the crew of a Casiot vessel, hired to convey it away, was placed at the extremity of the ancient quay of the port.

"The next day, November 23, boats were placed parallel to each other from the quay to the vessel; and planks being laid over them, a kind of stage was formed, on which the crew could more easily work the blocks of the ship. These being all brought to act at once upon the marble, it was raised and let into the hold. The vessel then sailed to Smyrna, where the statue was again moved into the Princessa merchantman, Capt. Lee. In her passage home this vessel was wrecked and lost near Beachy Head; but the statue was recovered, and has finally reached its destination."

ART. VI. *A Dissertation on the Mysteries of the Cabiri.* By GEORGE STANLEY FABER, Fellow of Lincoln College. Svo. 2 vols. pp. about 900.

THOSE persons, to whom Mr. Faber's book is only known by the title of a Dissertation on the Mysteries of the Cabiri, will possess but a very faint idea of the multiplicity of topics to which it extends. It is, in short, nothing less than an attempt to prove, that the whole circle of the heathen mythology is reducible to two united sources of superstition: the worship of the heavenly bodies, and that of the ark of Noah, with the persons and personified circumstances connected with it. Before we proceed any further, it may be proper to give a general account of this system in the words of the author.

"We have no reason to think, that the idolatry of the Gentile world was of a merely arbitrary contrivance; on the contrary, it seems to have been built, almost universally, upon a traditional remembrance of certain real events. These events I apprehend to be the destruction of the first race of mankind by the waters of the deluge, and the introduction of the Sabian superstition by Nimrod.

"It is scarcely possible, that all recollection of the flood could have been very soon erased from the minds of the Noachidæ; hence it is natural to suppose, that the anniversary either of its commencement, or of

its termination, would be duly commemorated by a solemn religious festival. Such a commemoration, in its primitive simplicity, would doubtless be not only innocent, but even serviceable to the cause of piety and morality; but at the same time it would be liable to gross abuse, which in the result proved unhappily to be the case. The commemorative festival, however irreprehensible it might originally have been, was but too soon corrupted; Noah and his family were elevated to the rank of demons or hero-gods; and at length unblushing obscenity usurped the name and garb of religion.

"The antediluvian worship appears to have been of a totally different sort. 'In the days of Enos the son of Seth,' says Maimonides, 'men fell into grievous errors, and even Enos himself partook of their infatuation. Their language was, that since God had placed on high the heavenly bodies, and used them as his ministers, it was evidently his will, that they should receive from men the same veneration, as the servants of a great prince justly claim from the subject multitude. Impressed with this notion, they began to build temples to the stars, to sacrifice to them, and to worship them, in the vain expectation, that they should thus please the Creator of all things. At first indeed, they did not suppose the stars to be the only deities, but adored in conjunction with them the Lord God Omnipotent. In

\* Cicero in Verr. lib. 4. c. 51. The removal of the statues of Ceres and Triptolemus from the Temple at Enna, by Verres, is particularly applicable. '*His pulchritudo periculo, amplitudo salutis fuit, quód eorum demolitio, atque asportatio perdifficilis videbatur.*' Lib. 4. c. 49.

process of time, however, that great and venerable name was totally forgotten; and the whole human race retained no other religion, than the idolatrous worship of the host of heaven.

“With this superstition the patriarch Ham seems to have been tainted, and to have conveyed the knowledge of it to his own particular descendants. Although he had been mercifully preserved in the ark, along with the other members of his family, yet his subsequent conduct plainly shewed, that he was not only ignorant of the sanctifying influence of pure religion, but that he was a stranger to the laws even of common decency. This leaven of the ancient idolatry lay secretly working in the bosoms of his posterity, during the space of near 400 years; but was prevented from openly shewing itself by the dread of Noah, who was still living. At length that venerable patriarch was removed by the hand of death; and the mighty hunter of men, the tyrannical Nimrod, rose, like a baleful comet, above the political horizon. He was the grandson of Ham, and the son of Cush; and he appears to have been the first avowed postdiluvian apostate. We are informed by the sacred historian, that ‘the beginning of his kingdom was Babel, and Erech, and Accad, and Calneh in the land of Shinar.’ Here he attempted to establish an universal monarchy, and an universal religion; which produced a struggle between him, and the descendants of Ashur, whose dominions he had invaded. The result of the contest was, that Ashur was compelled to quit his territory, and to provide for himself elsewhere. ‘Out of that land went forth Ashur, and builded Nineveh, and the city Rehoboth, and Calah, and Resen, between Nineveh and Calah.’

“The very name indeed of Nimrod, which apparently signifies a rebellious panther, points out the nature of his offence; and we are justified in concluding, that the first postdiluvian idolatry was openly established at his metropolis Babylon, because that city, when its name is mystically applied to papal Rome, is styled the mother of harlots and abominations of the earth. The analogy is obvious: as the pure worship of the patriarchs was first authoritatively corrupted at Babel, so was the divine religion of Christ at Rome.

“Previous to the building of the tower then, I conceive, that all mankind were accustomed solemnly to commemorate the catastrophe of the deluge; but, at the same time, I think it probable, that they had now begun to entertain too excessive a veneration for their arkite ancestors. This veneration was by the degenerate Nimrod soon perverted into gross idolatry, and blended with the antediluvian worship of the host of heaven. Noah and the sun were henceforth regarded as one divine object; and the ark, in which he was preserved, was profanely revered in conjunction with the moon. The Chal-

dæans soon became famous throughout the world for their astronomical researches; and, while they marshalled the stars in a variety of distinct constellations, they contrived to depict upon their sphere the principal events, which are narrated in the history of the deluge.

“Noah however was not the only patriarch worshipped along with the sun; in subsequent ages Ham not unfrequently obtained the same honour. I may here, therefore, with propriety notice a singular sort of confusion, which will be found very generally to pervade the mythology of the heathens. Noah and his triple offspring are continually represented to us under the character of an ancient deity and his three sons; and yet every one of these three sons is, upon various occasions, confounded with his father. Thus Saturn, Jupiter, Neptune, and Pluto, taken conjointly, are evidently Noah, Ham, Japhet, and Shem; nevertheless, as will hereafter sufficiently appear, Saturn, Jupiter, and Pluto, when considered separately, are all equally the solar Noah, while Neptune very frequently seems to be the same patriarch adored as a diluvian god. This remark will equally apply to the Cronus of Sanchoniatho, and his three sons, Cronus the younger, Jupiter-Belus, and Apollo; to the Brachmè of Hindostan, and his children Brahma, Vishnou, and Seeva; and to the Bore of Scandinavia, and his triple offspring Odin, Vile, and Ve. Many observations, in the course of the present work will be built upon this curious, though to my own conviction at least undoubted, circumstance.

“That the moon and the ark were worshipped together will abundantly appear in the sequel. It is not improbable, that this peculiar kind of idolatry might have originated from the following circumstance. When the two great superstitions were united, and when Noah began to be adored along with the sun, the Chaldæan astronomers, having observed the resemblance of a crescent to a boat, thought that the waning moon was no unapt symbol of the ark. Hence they were revered conjointly; and hence we find, that the very same goddess was sometimes a personification of the one, and sometimes of the other. Varro accordingly asserts, that the moon, when in the form of a crescent, was called Jana; but Janus is the scriptural Noah, consequently Jana is the Noetic ark or crescent.

“This I apprehend to be the only key, that can unlock the hidden meaning of the mysterious polytheism of the antients. Osiris, Bacchus, Cronus, Pluto, Adonis, and Hercules, taken in one point of view, as will be shewn at large hereafter, are all equally the sun; but, if we examine their respective histories, and attentively consider the actions, which are ascribed to them, we shall be convinced, that, in their human capacity, they can each be no other than the great patriarch. In a similar manner, the various god-

desses of paganism seem to be all one and the same mythological character; though they sometimes represent the moon, sometimes the ark, and sometimes the globe of the earth emerging from the waters of the deluge.

"From this union of the two primitive superstitions originated the custom of bestowing the names of the hero-gods upon the celestial catasterisms. Modern astronomy still continues to retain the same titles; and Nimrod himself, the founder of this compound idolatry, still holds a conspicuous place in the sphere, and still overlooks the affairs of mortals from the brilliant constellation of Orion. The servile flattery of more recent times translated the deified spirit of the first Cesar into the *Julium Sidus*; and a great astronomer of the present day, adopting the classical compliment without the classical impiety, has given the appellation of the *Georgium Sidus* to his newly discovered planet.

"The attempt of Nimrod, to force his abominations upon the reluctant consciences of mankind, produced a war between his followers, and those, who still persevered in commemorating the event of the deluge, and who rejected with horror the profane reveries of Sabianism. The issue of it was such as I have mentioned; the arkite festival was perverted into a superstitious idolatry, and was for ever united with the worship of the heavenly bodies. The mysteries of the Cabiri are in fact nothing more than a mythological account of these events; and they will be found throughout to refer at once to the catastrophe of the deluge, and to the impious rites of that Sabianism, which was united by Nimrod with the arkite superstition."

From this extract our readers will have already begun to suspect, that Mr. Faber is an adept of no mean proficiency in that school of criticism, which if not established by Mr. Bryant, has, at least, received from his labours its greatest share of celebrity and illustration. This opinion will need no further confirmation, when they are informed that in some of the most important of the circumstances, in which the present writer has departed from the system delivered in the analysis of ancient mythology, the veteran author of that work had himself already seen reason to change his own sentiments. We must, therefore, listen to our author with the respect due from the uninitiated to a hierophant of acknowledged skill in these solemn mysteries.

In the imagination of Mr. Faber, the memorials of the deluge are imprinted not less indelibly in the languages, customs, and traditions of all the nations

of the earth, than its physical effects are impressed on the structure of the globe itself. In one place, the appearance of convulsed nature attests to the admiring spectator that awful season, when "the fountains of the great deep were broken up;" and in another, with no less certainty, some fragment of a Hebrew word, or some diluvian symbol, has perpetuated through the dark succession of ages, an uninjured memorial of the same event. Even in this remote island, the philosopher has often traced, in imagination, the impetuous course of the overflowing waters; but what conviction is contained in the name of the country itself, *Britannia*, as we corruptly write it, but more truly, *Brit-tan-nu-aia*, or "the land of the fish-god, Noah the covenanter?" The author, however, candidly observes, that Bochart gives a different derivation of *Britannia*.

The inherent improbability of a system, founded principally on such etymologies, must be so obvious to almost every reader, that a laboured refutation of it would be as superfluous as the hypothesis itself is groundless. We shall only bestow a few words on the nature of the calculus employed by Mr. Faber and similar writers, to shew, what needs but little proof, how utterly inapplicable it is to the investigation of historic truth.

Not only are his particular derivations of words opposite, in most instances, to all probability, but his whole system of etymology contradicts, in our opinion, every established principle of language. Nothing appears to us more clear, than that languages are reducible to several classes, radically distinct from each other, whose differences are almost universal, and their instances of agreement rare, particular, or accidental. Such classes, in the opinion of the most skilful judges of language, are the Celtic, the Teutonic, and the Slavonic, with others which might be mentioned. If this system be true, all etymological hypothesis which violates these fixed barriers, must, except in some particular instances, be wholly nugatory. That all languages have many sounds in common, proves nothing. As all speech is capable of being reduced to a few articulations of voice, which admit of expression by letters, so all languages must be capable of being analyzed into a certain, though considerably greater, number of common syllables, which, however, in different languages have no

other communion of properties than that of simple sound. In the system of Mr. Faber, however, the Hebrew language and its cognate dialects, instead of being confined to the south-west of Asia, have been diffused over the globe with a dispersion far more extensive than that to which the Jewish exiles have been doomed.

*Omnibus in terris, quæ sunt a gadibus usque Auroram et Gangem.*

In short, the great talisman, with which all the magical wonders of these volumes are wrought, is a vocabulary consisting principally of two or three hundred oriental roots, chiefly monosyllables, one or other of which it is hard if a skilful artist cannot detect in most words proposed to his examination, and contrive in some way, direct or indirect, to connect with the deluge, or the host of heaven.

Mr. Faber, however, assumes still greater licences of derivation. His words are often put together, in the most arbitrary order, to complete the sense which he wishes to extract; a connecting link is sometimes requisite to be supplied; and sometimes a single letter, in defiance of grammar, is made to stand for a whole root. In more than one instance, the letter N signifies the patriarch Noah. *Cylindrus*, for example, is *Cula-nah-ador*, "the illustrious arkite Noah." Different languages are not unfrequently united in the same appellation.

Thus ductile are words to the touch of our author. With equal success he finds means of adapting them to his subject. For this purpose he has collected a number of objects, which he considers as symbols of the heavenly bodies, or of the deluge and its concomitant circumstances. We extract the following catalogue. "The most usual symbols of the sun were a lion and a serpent; those of Noah, a bull, a horse, and a fish united with a man; those of the ark, a heifer, a mare, a fish united with a woman, a ram, a boar, a cup, a sea-monster, and a beautiful female, who was sometimes described as a virgin, and sometimes represented as the mother of the gods, and as the consort, the daughter, the parent, or the sister, of the principal arkite deity." If therefore any syllables of a word, pruned or extended into any similitude to Mr. Faber's monosyllables, bear any reference to

any of these objects, it is immediately pressed into the service of the helio-arkite mysteries.

Mr. Faber reduces all the personages of ancient mythology to a very small number of archetypes. He is sometimes informed by an obscure scholiast, that certain different names are only different appellations of the same god or hero. Where this information is wanting, he does not scruple, if necessary for his object, to confound genealogies, and to represent the son, and the grandson, and a whole line of descendants, as the same person with their progenitor. In the course of this work, Noah has perhaps fifty different names bestowed on him, and the ark and the dove, (to borrow an expression from our author,) a proportionate polyonymy. Thus another advantage is gained, that what is not found applicable to the purpose under one name or character, may be found under another; and thus from the whole encyclopedia of fable, a tolerable narrative of the diluvian events may be at length compiled.

Such are the principal features of the system here devised for the discovery of remote and long-forgotten facts. If this key can be employed with success in opening the close repositories of historical truth, may we not hope that, in the progress of discovery, arguments may be developed by machinery, and poems constructed by engines?

To give the system an appearance of consistency and arrangement, a number of technical terms has been adopted, such as the arkite ogdoad, and the helio-arkite worship.

To say much respecting the subordinate parts of an hypothesis, in its fundamental principles so outrageous to all probability, would be needless. The vocabulary is collected somewhat arbitrarily from different languages, Hebrew, Coptic, Greek, and Gothic. To do all that Mr. Faber has done in this work, nothing more than the slightest degree of acquaintance with the oriental languages is requisite, though we mean to say that his knowledge is not really more extensive. To analyze his work, which is often defective and obscure in arrangement, would be also difficult. We shall only mention some of the chief topics. The first chapter consists of preliminary observations, intended to illustrate the system and the principles on which it is constructed. The second

is devoted to an analysis of the supposed Phenician history of Sanchoniatho, and an explication of it on the principles of the author. He then proceeds to establish the identity of the Cabiri, Corybantes, Curetes, Dioscori, Anactes, Dii Magni, Idei Dactyli, Telchines, Ilares, Plenates, Manes, Titans, and Aletæ, the polyonymy of the sun, and the connection of the fabulous Hades with the mysteries of the Cabiri. The various countries devoted to the Cabiric superstition are then investigated: Italy, Crete, Samothrace, and Troas. The second volume opens with an illustration of four convenient monosyllables, occupying nearly 70 pages, and proceeds to the history of the Argonautic voyage, the war of the Titans, and the identity and import of the mysteries of Isis, Ceres, Mithras, &c. &c. Such is nearly the table of contents.

We add another short extract for the purpose of illustrating more fully our author's etymological propensities, and take it at hazard.

"I have mentioned, upon the authority of Tzetzes, that Italy received its name from a person called Italus or Taurus. This person is evidently no other than the Talus, Italotus, or Taurus of Crete; whence it will follow, that the word Italia is compounded of Ital-Aia, or Ait-Al-Aia, the land of Italus or Talus, the solar bull. In a similar manner Talium or Italium, in the territory of the Samnites, and Italica, in the island of Eubœa, the country of the Corybantes, both equally derived their respective appellations from the worship of Talus. The same remark may be applied to the Teleboæ, the ancient inhabitants of the isle of Taphos. These are said by the scholiast upon Apollonius to have originally inhabited Acarnania; and he describes them as coming to Argos, and fighting with Electryon, the father of Alcmene, for his oxen. Electryon was the son of Perseus and Andromeda; from Hippothoë, the daughter of his brother Mestor, and Neptune, sprung Pterelas; and from Pterelas, Taphius, and Teleboas the father of the Teleboæ. Alcmene afterwards married Amphitryon, and at length became the mother of Hercules by Jupiter. All these names are significant. Teleboas is compounded of Tel-Ob-Bou, the helio-tauric serpent; and Electryon is derived from El-Oc-Tor-Ion, the divine tauric dove of the ocean. In a similar manner, Alcmene is Al-Oc-Mena, the lunar deity of the sea; Amphitryon is Am-Phi-Tor-Ion, the oracular god of the bull and the dove; Mestor is M'Es-Tor, the great solar bull; Pterelas is P'Tor-El-As, the bull the god of fire; and Hippothoë, the concubine of Neptune, is Hippo-Thea, the divine Hip-

pian Ark. The contest, in short, was between the votaries of the two great superstitions, and was that which preceded their final union. A colony of these Teleboæ, according to Virgil, formerly inhabited Capreæ in the bay of Naples; and he mentions one of their ancient sovereigns named Telon, who was the father of Oebalus.

Nec tu carminibus nostris indictus abibis  
Oebale, quem generasse Telon Sebethide  
nympha

Fertur: Teleboun Capreas cum regna  
teneret

Jam senior.—

Telon or Tel-On is the sun; and his supposed offspring Oebalus is Ob-Al, the serpent deity."

To say what the heathen mythology is not, in opposition at least to such systems as that of the present work, is easy; to determine what it is, is happily as unimportant as the question is difficult; or perhaps, more properly speaking, incapable of resolution. In its origin we conceive it to have been partly symbolical, and partly to consist of disguised narrations of facts which really happened; the mythology of different countries we believe to have been chiefly local. It was said by a former, though much less daring, adventurer in the same field, that "the heathen mythology is a free and open chase, where men of letters are privileged to sport and pursue the game, each according to his fancy." We have only one objection to this account, that the game, generally speaking, is not worth the pursuit. "The fables," says Hume, "which are commonly employed to supply the place of true history, ought entirely to be disregarded; or if any exception be admitted to this general rule, it can only be in favour of the ancient Grecian fictions, which are so celebrated and so agreeable, that they will ever be the objects of the attention of mankind." And to apply even these fictions to the investigation of history, appears to us a labour as fruitless as that of Sisyphus himself, who, according to the old poet,

— — — versat

Saxum sudans nitendo, neque proficit hilum.

While we cannot but disapprove entirely of his system, we are both willing and desirous to make a favourable distinction between Mr. Faber's learning, and what appears to us his erroneous application of it. He is extensively

acquainted with the works of antient and modern literature, his style is correct and classical, and he writes with temper and moderation, and without any appearance of that contempt, usual to system-makers, for those who have not seen facts in the light in which they are viewed by themselves. It appears to have been a great object of Mr. Faber's work, to contribute something to the evidences of the Mosaic history, and thus to the cause of religion; that he has been in any degree successful, it is

not in our power to say; had his learning and labour received a different direction, it would have given us much satisfaction to have been able to join his name to those of Marsh and Paley; as the case at present is, we must express a hope that he will not represent his system as of essential moment to the establishment of the truth of revelation, as we are afraid that with superficial observers, such a declaration would rather tend to make unbelievers, than to produce converts.

### SCHOOL BOOKS.

ART. VII. *Elegantie Latine; or Rules and Exercises, illustrative of elegant Latin Style, intended for the Use of the higher Classes of Grammar Schools.* 8vo. pp. 220.

FROM our knowledge of Dr. Valpy's former works of elementary instruction, we have long been induced to regard him as a very able and diligent teacher of classical learning. The present work forms a very suitable companion to his former publications, and is of a description which was much wanted in our schools. We have looked it over with attention, and can without hesitation recommend it as containing many judicious observations, respecting an important, but, except in our great schools, too generally neglected branch of classical education. Dr. Valpy thus explains the nature of his object.

"During twenty years in which I have been engaged in the arduous but important task of teaching the classics, it has never failed to excite my wonder and sorrow, that in the many attempts, which have been made to smooth the difficulties, with which the road to classical excellence is attended, no method tending to facilitate Latin composition has been successively pursued from the first introduction of youth into the ele-

mentary exercises, to his arrival into the flowery fields of correct elegance and dignity of style. The greatest care is usually taken in conducting him to a certain point: when he understands the plain application of his rules of syntax, he is then thrown upon the wide world of elegant latinity, in which the range he is to take, though stripped of the thorns of grammatical analysis, is still very precarious; his progress is still *ascensu difficilis*. For unless the master is at liberty to point out very minutely the particular words, or arrangement of words which constitute elegance, he must greatly depend upon his own judgment and observation for the knowledge of them. And there is as great a difference between the mere grammatical structure of a sentence, and the elegant usage and collocation of words, as between the rude sketch of an imperfect outline, and the fine colouring of a finished painting."

We are ourselves so strongly convinced of the importance of composition, for the purpose of acquiring a familiar perception of the elegancies of any language, that we give this little book our hearty recommendation.

ART. VIII. *A new Dictionary of Antient Geography.* By CHARLES PYE. 8vo.

THIS is a work which contains some internal evidence of having been compiled in the manner which the author describes. Whenever in the course of his reading he met with any geographical illustration, he had recourse, he informs us, to his common-place book, from which the information was afterwards copied in alphabetical order, but without any view to publication. In process of time, however, the manuscript became voluminous, and he then began to incorporate it with other alphabetical works on the same subject. All the

utility, to which by its nature it can aspire, is that of a book of reference in the perusal of ancient history, for the use of such readers as do not make geography a direct and professed study; and this purpose we presume, from the degree of examination which we have bestowed upon it, that it is in general sufficiently correct to answer. The articles are very numerous, and many of them, though the book bears the title of a dictionary of ancient history, relate to subjects entirely modern.

ART. IX. *A Mythological Dictionary, with an Essay on the Sacrifices to Heathen Deities.*  
12mo.

THIS is one of those ephemeral publications, which have their day, and are then replaced by some other work of the same kind, in a newer form, without perhaps a greater share of merit. The humility of the compiler, may be estimated by the profound respect, and distant admiration with which he regards Mr. Lempriere's useful publication on a

similar subject, but larger scale, as a work which will immortalize its author. Mr. Lempriere's book is a very serviceable companion to the young student; but we apprehend that immortality was the object which he had least in view in the compilation of it. The execution of the work before us we can in very few respects commend.

ART. X. *Skeleton of the Latin Accidence, in eight Tables.*

A Neat exhibition of the paradigmata of Latin nouns and verbs, and very likely to prove acceptable and useful to children engaged in learning the rudiments. The examples are well selected, and contain some varieties which are not

noticed in common grammars. Care is taken by the manner of printing them, to distinguish the essential from the variable parts of words. We believe that we are indebted to Dr. Carey for this useful little work.

ART. XI. *Progressive Exercises, adapted to the Eton Accidence.* Svo. pp. 30.

THIS is a useful initiatory book, evidently compiled by some person who has been engaged in the practice, or who has considered the theory of learning. It consists of two parts, one intended to

exercise boys in the variations of single words and the simplest rules of construction; the other, to conduct them to the analysis of complete sentences.

## CHAPTER VII,

## MODERN LANGUAGES.

THE only new works in this department, which the British press has produced during the last year, are three publications by Signor Graglia, introductory to a knowledge of the Italian language. A new edition of Lindley Murray's English Grammar and Exercises (See Ann. Rev. vol. I. p. 556) with a few additions and corrections, has also made its appearance.

ART. I. *New Guide to the Italian Language.* By G. A. GRAGLIA. 8vo. pp. 250.

THE learner will find this a useful grammar. To each person in every tense of every verb some sentence is affixed to explain their various significations and uses.

ART. II. *Continuation of the New Guide to the Italian Language.* 8vo. pp. 116.

THE novelty of this plan, which is that of giving lessons in false syntax, that the learner may rectify it, we shall not so readily acknowledge as the utility. It is not often that any thing amusing can be selected from a book of exercises, yet we think the reader will be amused to see how Signor Graglia has contrived to teach his pupils mythology and poetry in a sonnet of his own in praise of the musical talents and voice of a lady. First comes the sonnet itself, then its simple syntax, then this translation.

"Thou, O Phœbus, who darrest thy rays  
upon the poles,  
Thou, O Apollo, who shakest thy sublime  
fire on poets,  
Thou, O Neptune, call all the living ones at  
these scenes,  
With thy roaring command.

Thou, O Mercury, messenger of the gods,  
Redouble thy wings to acquaint the nations,  
Tell them, that harmony and sweet complaints  
Came down from heaven into the British em-  
pire.

You, O Nereides, leave the fountains,  
Hamadryades, forget the forests,  
And you, Oreades, forsake the mountains.

O ye Naiads, come all out from the waves,

Exalted Pleiades, descend to the singing  
among the sons of Mars,  
And Pallases, so renowned in our land."

An exposition of the fable follows. I have introduced, says the author, this easy specimen of verses of mine, in order to close these exercises with something unexpected from the scholar, and at the same time to show how poetry should be explained or taught to a beginner.

"Now the learner being provided with my Italian and English Pocket Dictionary, with my New Guide to the Italian Languages, and these Exercises, will, with great facility and little expence, procure to himself the knowledge of this beautiful, harmonious, and fashionable language."

We see no reason to gainsay this assertion, but Signor Graglia we trust will not be offended if we add, that a few of his lessons will greatly facilitate the labour.

The method adopted in the latter part of this work, of mingling English with Italian, that the learner may fit in the fragments wanting of either language, is certainly useful; and will be of the same assistance in acquiring Italian conversationally, as dissected maps are found to be in teaching children the ruder parts of geography.

ART. III. *Raccolta di Lettere Istorico-Mitologiche e Morale.* Da G. A. GRAGLIA.  
8vo. pp. 200.

THE author shall declare his own object in this selection.

"In giving to the public these letters, it may appear to some too presumptuous an attempt to range myself in the copious number of eminent writers upon the same subject; and to others, to be a labour almost needless, considering the few who, (comparatively speaking) will read them. In the first place, I shall say, if the matter is rightly considered, every tongue, every way, and every method ought to be tried, if not to destroy (an attempt almost impossible) at least to diminish the evil, which the many depraved productions, under various colours and forms, disgrace the art of printing, with so much detriment to young people, thus undermining their good morals, in order to blow up, as it were, that education, which their friends had given them with so much zeal; they being conscious that the principal riches of a state, and the cause of the welfare of families, chiefly depend on the good education given to children; and is to the mind what agriculture is to the earth; and as we are by our corrupt nature more prone to evil than inclined to good; and, blindly, more lulled by present pleasures, than engaged by thoughts of future happiness; wherefore, if the fear of God should not come in aid of good advice, where should we not be led by those profane

writers! As it is so, I have selected in these letters, subjects, if not of the most sublime kind, at least, the easiest to be put in practice, and the more adapted to the circumstances of the times, and the most general, in order to oppose the vices that are also most general; therefore, in them will be inculcated, that the mind ought to be guided by reason; that, to use provoking words, is often the cause of great evils; that the passionate man hurts himself more than others; that virtue never grows old nor loses strength; that those who are habituated to afflictions bear them more calmly; that before one makes any one his friend, one ought to examine him carefully, before trusting him with a secret; that the flatterer flies from the virtuous man, and attaches himself to the presumptuous one; but, to avoid prolixity, I shall only add, that too great a prosperity, as well as too great an adversity, are equally dangerous; and peace in families, and subordination in subjects, are the fruits of virtue alone, without which, neither a state nor a family can long prosper, but it must of necessity decay and fall, as a tree with withered roots."

We have only to remark that the selection seems well adapted for the designed purpose, and that the Signor's Italian is somewhat less confused than his English.

## CHAPTER VIII.

## EDUCATION AND SCHOOL BOOKS.

THERE is no department of Literature in which the inferiority of the last to the preceding year is so strongly marked as that which is treated of in the present chapter. Of the works relating to the science of Education there is not one whose very title will not be forgotten in the course of a twelvemonth; and the books intended for the use of young persons will probably share the same fate, with the exception perhaps of Messrs. Bruce's Introduction to Geography.

ART. I. *Friendly Admonitions to Parents, and the Female Sex in general; with Reflections on Moral and Religious Subjects; intended for the Benefit of the rising Generation.* By CHARLOTTE BADGER, late CHARLOTTE WAINWRIGHT. 8vo. pp. 162.

IN these unassuming pages will be found some sensible and useful reflections on the present system of female education. The exclusion of domestic concerns from the modern system of instruction is justly condemned, and the evil consequences represented, which those more particularly in inferior stations of life must experience from a cultivation of exterior ornamental accom-

plishments to the neglect of solid and essential duties. Among various topics which are touched upon, Mrs. Wainwright dwells on the palpable incompetency of a large proportion of those who assume the character of governesses, to the arduous and responsible task of tuition: her advice to parents on this subject is particularly worth attending to.

ART. II. *Letters on the Importance of the Female Sex; with Observations on their Manners and Education.* By Miss HATFIELD. 8vo. pp. 157.

THIS little rigmarole volume contains one passage so truly original that we will preserve it. It is an apology for Eve, showing that she was right in eating the apple.

"By the creation of woman, the great design was accomplished—the universal system was harmonised.—Happiness and innocence reigned together: but, unacquainted with the nature or existence of evil—conscious only of good, and imagining that all were of that essence around her—without the advantages of the tradition of fore-fathers to relate, or of ancient records to hand down, Eve was fatally and necessarily ignorant of the rebellious disobedience of the fallen angels, and of their invisible vigilance and combination to accomplish the destruction of the new favourites of heaven.

"In so momentous an event as that which has ever been exclusively imputed to her, neither her virtue nor her prudence ought to be suspected: and there is little reason to doubt that, if the same temptations had been offered to her husband, under the

same appearances, but he also would have acquiesced in the commission of this act of disobedience.

"Eve's attention was attracted by the manner in which the serpent first made his attack: he had the gift of speech, which she must have observed to be a faculty peculiar to themselves. This appeared an evidence of something supernatural. The wily tempter chose also the form of the serpent to assist his design, as not only in wisdom and sagacity that creature surpassed all others, but his figure was also erect and beautiful; for it was not until the offended justice of God denounced the curse, that the serpent's crest was humbled to the dust.

"During this extraordinary interview it is evident, that Eve felt a full impression of the divine command, which she repeated to the tempter at the time of his solicitations. She told him, they were not to eat of *that* tree:—'And the woman said unto the serpent, We may eat of the fruit of the trees of the garden, but of the fruit of the tree that is in the midst of the garden; God said, ye shall not eat of it, neither shall ye touch it,

lest ye die.' But the serpent opposed her arguments with sophistry and promises.—'He said unto the woman, Ye shall not surely die, but shall be as gods!'—What an idea to a mortal!—Such an image astonished her!—It was not the gross impulses of greedy appetite that urged her, but a nobler motive that induced her to examine the consequences of the act.—She was to be better and happier—to exchange a mortal for an angelic nature: Her motive was great, virtuous, irresistible. Might she not have felt herself awed and inspired with a belief of a divine order?—Upon examination, she

found it was to produce a greater good than as mortals they could enjoy: this impression excited a desire to possess that good; and that desire determined her will, and the future destiny of a world."

Mr. Todd, no doubt, will notice this in the next edition of his *Paradise Lost*, as an idea which escaped Milton. We recommend it also to the attention of all biblical commentators, if indeed it should not be appended as a supplement to the first chapters of *Genesis*.

ART. III. *Letters of Advice from a Mother to her Son.* 8vo. pp. 450.

AMONG the peculiar characteristics of the present age of literature is the propensity of our female writers to publish sermons upon education, in the shape of letters, essays, and treatises; thinking that the only requisite stock in trade to set up with is pen, ink, paper, and plenty of words.

This Mrs. Crespigny talks as confidently of Spinoza as if she could read his works, and confutes his opinions with as much self-complacency as if she could understand them. To her and to all such as her we have only to wish more sense, or more diffidence.

"I pray you, woman, being weak, seem so."

ART. IV. *Anthropæidein; or, a Treatise on General Education.* By ANDREW COWAN, M. D. 8vo. Two vols. pp. about 500.

IN these well-meant volumes there is much good sense. The author concludes with a brief retrospect of their contents, which will answer the purpose of a more laboured analysis.

"The necessity of accompanying instruction in all its departments with the emotion of pleasure, points out to us the propriety and utility of reforming all the different instruments which are employed to cultivate the human mind, since in their existing state pain is uniformly attendant upon their employment. We have formerly divided the principal artificial means to be used in education, into two great divisions, calculated to cultivate and improve the two principal faculties of the mind, imagination and judgment. The first of these divisions comprehends all the various departments of literature; the second includes all those which may be denominated scientific. The great object, then, of what is usually termed education, is properly to select all the useful parts, both of literature and of science, and to render their study as pleasing as possible to the mind. We have, in the first volume of this work, laid down what we conceived to be a comprehensive and just plan of a general education, enumerating the different departments of study, that properly belong to each division, with the order in which they should naturally succeed each other. We shall therefore, in this place, endeavour to point out the means by which the study of all these classes of knowledge may be rendered most pleasing, and, in consequence, most beneficial to the mind.

"To all those who are at all acquainted with the principles of human nature, it will be superfluous to adduce proofs to demonstrate, that whatever knowledge or information of acknowledged importance and interest is acquired with ease, its study is accompanied universally with a degree of pleasure. In order to render the acquisition of knowledge pleasant, it must be made both interesting and easy of comprehension. Keeping these two truths always in view, we conceive it practicable, and that even without much difficulty, to transform both science and literature, into pleasing and delightful studies.

"We shall begin with the consideration of literature, which naturally first engages our attention. With a view of making the study of language agreeable and pleasant, particularly to boys, it is necessary that the subject on which students are employed to read, be interesting. The judicious teacher can easily collect authors, in almost every language, whose writings are calculated to arrest and interest the mind at an early period of life. In order, however, to render the study and comprehension of such works easy, difficult passages should always be satisfactorily explained in the student's vernacular tongue by notes, and they should, to beginners, be accompanied with literal translations.

"In the reformation of science the same general principles must always regulate our conduct. Mathematics, the great and indispensable foundation of all scientific knowledge, do not admit of that method of treatment which is most fascinating. Each pro-

position must be concisely and closely demonstrated, without admitting those analogies which are best fitted to please the youthful mind. But if the propositions themselves require such rigorous abstraction, we are at full liberty to illustrate them, in any manner we imagine to be most pleasing. Corollaries therefore should always accompany mathematical propositions, and these should be calculated to engage the affections and please the mind. Experimental philosophy requires no additional ornaments, to render it delightful to the human heart.

“Whosoever keeps these principles constantly in view, and reforms in pursuance of them any department of literature or of science, may claim to himself the title of a benefactor to humanity. The author of this work intends to devote a large portion of his time to this truly momentous and interesting subject, directing his attention more especially to the abstract sciences. He shall however be glad to find himself anticipated by more able hands, whose powers may be better adapted for this undertaking. The highest object of his ambition is, to be enumerated as one among the first to assert the rights of human nature, and the last to relinquish them.”

We think the work might advantageously be compressed, for Dr. Cowan has too often expended his time in proving what no reader would be disposed to deny or doubt. We would also recommend to him more prudence: he speaks of all persons employed in tuition with an indiscriminating and illiberal asperity, and the reasonable disgust which such passages must excite, cannot fail to occasion a general prejudice against the rest of his treatise. His remarks on the practice of physic savour equally of youth and presumption. But the most extraordinary part of the book is his scheme for public worship.

“I consider music to be the only rational means which can be used in public worship to excite true devotion. Articulate language is quite inadequate to produce this end. It tends to arrest the attention to the contemplation of sounds degraded by vulgar use, and to those objects which are little calculated to kindle in the breast the pure flame of devotion. Music, when employed in public worship, possesses the important ad-

vantage peculiar to itself, that all men, of whatever sect or denomination, may equally participate its influence. No particular creed which a person may happen to entertain can unfit him for enjoying this mode of worship, in case he entertains no particular prejudice against it. This species of public worship seems more conformable to the spirit of Christianity than any other which ever can be adopted. Christianity tends directly to level all religious distinctions among men, and to render true devotion the genuine offspring of the heart. Music excites all the finer and more noble feelings of the soul, and affords that enjoyment which cannot be augmented or diminished by the opinions or influence of men. For this reason it tends to allay the furious spirit of sectarianism, whose influence goes directly to pervert and destroy the heart, and unqualify her for the enjoyment of every refined and every heavenly emotion.”

The exceeding oddity of this passage disarms all resentment for its absurdity. Dr. Cowan is for taking the people by the ears, supposing, we presume, that they have been too long led by the nose. Were our hierarchy to be reformed upon this truly original idea, Mrs. Billington would without dispute be made Archbishop of Canterbury, and Inledon appointed to the see of York. The other sees would be filled from the Opera-house, and this would afford a happy opening for a reconciliation with the church of Rome, as no objection would be made on the part of the new bishops to the celibacy of the clergy. There would indeed be some difficulty in disposing of the present bench. It cannot be expected that any one of them should qualify himself for first fiddle, but some might appropriately beat the drum or sound the trumpet, others be furnished with tinkling cymbals, others again be employed as bellows-blowers, having been used to blow the coals, and beyond all doubt, all might very soon be taught to join readily in chorus. The admission of the bag-pipes would destroy presbyterianism, the children of Israel would be converted by the Jews-harp, and we might hope to see the church in harmony.

ART. V. *Improvements in Education, as it respects the industrious Classes of the Community.* By JOSEPH LANCASTER. 8vo. pp. 66.

JOSEPH Lancaster is the Count Rumford of schoolmasters; his main objects are to save time and expence in educating the children of the poor, and these

he seems successfully to have accomplished.

“Supply twenty boys with slates and pencils, and pronounce any word for them to

write, suppose it is the word 'ab-so-lu-ti-on;' they are obliged to listen with attention, to catch the sound of every letter as it falls from their teacher's lips; again, they have to retrace the idea of every letter, and the pronunciation of the word, as they write it on the slates. If we examine ourselves, when we write letters, we shall find that writing is so much associated and connected with orthography, that we cannot write a word without spelling as we write, and involuntarily correcting any inaccuracy that may occur.

"Now these twenty boys, if they were at a common school, would each have a book, and, one at a time, would read or spell to their teacher, while the other nineteen were looking at their books, or about them, as they pleased; or, if their eyes are rivetted on their books, by terror and coercion, can we be sure that the attention of their minds is engaged as appearance seems to speak it is? On the contrary, when they have slates, the twentieth boy may read to the teacher, while the other nineteen are spelling words on the slate, instead of sitting idle. The class, by this means, will spell, write, and read at the same instant of time. In addition to this, the same trouble which teaches twenty will suffice to teach sixty or a hundred, by employing some of the senior boys to inspect the slates of the others, they not omitting to spell the word themselves, and on a signal given by them to the principal teacher, that the word is finished by all the boys they overlook, he is informed when to dictate another to the class. This experiment has been repeatedly practised by 112 and 128 boys at once; and judicious persons, good judges on the subject of education, who were present, were convinced, that the same trouble was

sufficient to teach 200 boys, or more, on the same plan.

"But if the individual advantage derived from this method in tuition is great, what must the aggregate be? If 20 boys spell 200 words each, the same number spelt by 60 boys must produce a great increase of total.

"Each boy can spell 100 words in a morning: if 100 scholars do this 200 mornings yearly, the following will be the total of their efforts towards improvement:

100 words  
200 mornings

20,000 words each boy per ann.  
100 boys

2,000,000 Total words spelt by 100 boys per ann."

This financial aggregate is rather ludicrous, but the plan is not the less praiseworthy. The younger boys, who have not yet learnt to write, are made to print the word in sand.

The mode of cyphering is similar; all the boys of a class write down a sum upon their slate as the monitor reads it to them, the whole process in words and figures.

Mr. Lancaster has 300 scholars, and expresses himself fully satisfied with the effects of this plan. We earnestly recommend his pamphlet to the attention of all persons concerned in the education of the poor. The Society for bettering the Condition of the Poor would do well in circulating his plan. It might be fully stated in a hand-bill.

ART. VI. *An Essay on the Beauties of the Universe: selected from the most eminent Authors, illustrated with Notes, containing the choicest Thoughts of the best English Poets. To which are added, suitable Reflections designed for the Amusement of Youth.* 12mo. pp. 183.

THE attention of children cannot be too early or too frequently directed to the beauties of the universe; these beauties, which open upon them every morning as they rise, are, from the very circumstance of their familiarity, too frequently unheeded. The object of these pages is to awaken the dormant

sensibilities of young persons, by reminding them, that every insect which crawls on the ground, every blade of grass which grows, every shower and every sun-beam, proclaim at once the omnipotence and universal benevolence of God.

ART. VII. *Holidays at Home; written for the Amusement of Young Persons.* By CHARLOTTE SAUNDERS. 12mo. pp. 309.

AMUSING stories, which may safely be put into the hands of children. The writings of Dr. Aikin, Mrs. Barbauld, Miss Edgeworth, and one or two others,

have made us somewhat fastidious; but we must not expect to meet with rival excellence every day.

ART. VIII. *Preludes to Knowledge; or, amusing and instructive Conversations on History, Astronomy, Geography, Optics, and the Division of Time in different Countries. Interspersed with Stories moral and entertaining.* By ELIZABETH SOMERVILLE: Author of "James Manners and his Dog Bluff." 18mo. pp. 194.

THESE stories are above the capacity of children to whom they are addressed, and are too superficial for children of more advanced age. The volume abounds in typographical errors, which is an unpardonable fault.

ART. IX. *The History of Man.* 12mo.

WE should think that children would find this little compilation dull and wearisome: anecdotes of men and manners are wanting to enliven dry descriptions of dress.

ART. X. *The Life of Moses; designed for the Amusement and Instruction of Youth.* By a Lady. 8vo. pp. 75.

THE writer of these pages prefers two claims upon the public, which are never urged in vain. "*She is young and in adversity, scarcely yet entered her twenty-second year; she has drunk deep of the fountain of human affliction, nor has hitherto been permitted to refuse the bitter draught of keen disappointment.*" This little work is not destitute of merit, either in point of plan or execution.

ART. XI. *The Elegant Preceptor: or, an Introduction to the Knowledge of the World; containing Instructions in Morality, and useful and ornamental Accomplishments, selected from the Works of the most eminent Writers.* 18mo. pp. 136.

SCRAPS of morality from Blair, Rousseau, Madame Genlis, *cum multis aliis quæ nunc prescribere longum est.*

ART. XII. *Lessons of Fenelon, late Archbishop of Cambray, selected from his Works, for the Instruction of Youth.* By M. DE LEVISAC. The whole translated from the most recent Editions of the Author's Works. 8vo. pp. 322.

THE Abbé Lévisac published last year a selection from the works of the Archbishop of Cambray, entitled *Leçons de Fenelon*, of which an account was given in our former volume, p. 587.—By translating these "lessons" into English, the whole value of the book is totally destroyed. There is no scarcity of excellent books for young people in our own language, but the number of French works adapted to the same purpose, and from the purity of their style serving also as exercises in that language, is but small. The explanatory notes of the Abbé are totally omitted in this version, nor do we see any use to which it can be applied, except that of saving idle boys the trouble of turning over their dictionary, and thus injuring themselves and deceiving their masters and parents.

ART. XIII. *Evenings Rationally Employed; or, Moral and Entertaining Incentives to Virtue and Improvement.* By W. HELME. 8vo. pp. 270.

WE have no fault to find with the moral tendency of this little volume, except that it now and then inculcates that sickly nervous sensibility which is too much the characteristic of the present age. In every other respect, however, the book is wholly worthless. The style is wretched; a large proportion of the facts recorded are vulgar and long exploded errors; and the proper names of persons, places, and things, betray gross ignorance or shameful carelessness.

ART. XIV. *An Introduction to Philosophical and Physical Geography: in which all the Operations and Appearances of Nature are demonstrated to be the Result of natural Causes. Likewise the Cause and Origin of Mountains, Rivers, the Properties of the Sea, Springs, Mineral Waters, Hot Baths, &c. explained. To which is added, an Explanation of the different Lengths of Days and Nights, the Vicissitudes of the Seasons, &c.* 8vo. pp. 124. One plate.

IT will not be supposed that a satisfactory explanation of the subjects mentioned in the ample title page, which we have just transcribed, can possibly be

given in the short compass of 124 pages. The author, however, has found an effectual way of reconciling us to his bre-

vity, by evincing the most deplorable ignorance of the science which he has undertaken to demonstrate.

ART. XV. *An Introduction to Geography and Astronomy, by the Use of the Globes and Maps. To which are added, the Construction of Maps, and a Table of the Latitudes and Longitudes of the Places mentioned in the Work.* By E. and J. BRUCE. 8vo. pp. 250.

THIS useful little work consists of two parts: the first contains thirty-six problems to be resolved by the terrestrial globe; the second contains thirty problems, adapted to the celestial globe. —The writings of Dr. Hutton, Professor Vince, Dr. Herschell, and other

able mathematicians, have been judiciously had recourse to; and the modern discoveries are inserted in their proper places. The whole forms a very complete treatise, superior in many respects to most of its predecessors on the same subject.

ART. XVI. *An Easy Grammar of Geography: intended as a Companion and Introduction to the "Geography for the Use of Schools," by the same Author. With Maps.* By the Rev. J. GOLDSMITH. 18mo. pp. 144.

THE manner in which this introduction is executed, can only be known by a specimen; take one any where:

*"Of the United Kingdom of Great Britain and Ireland.*

"The island of Great Britain is divided into England, Wales, and Scotland. It is six hundred miles long, and three hundred broad; and contains about twelve millions of inhabitants.

"The advantages of its climates are thus described by a modern poet:

"A fairer isle than Britain, never sun  
View'd in his wide career! A lovely spot  
For all that life can ask! —Salubrious! —mild!  
Its hills are green! its woods and prospects  
fair!

Its meadows fertile! and, to crown the whole  
In one delightful word,—it is our home—  
Our native isle."

"To the above it may be added, that Great Britain is the undisputed mistress of the seas, which are every where covered with her ships. Her wealth, the value of her manufactures, and the extent of her commerce are unequalled. The industry and intelligence of her inhabitants, the excellent form of her political constitution, the just administration of her laws, and the independence arising from her insular situation, combine to render her an object of admiration to all other nations.

"England contains forty counties or shires, situated in the following order, taken from north to south.

<i>Counties.</i>	<i>Chief Towns.</i>
Northumberland	Newcastle
Durham	Durham
Cumberland	Carlisle
Westmoreland	Appleby
Yorkshire	York
Lancashire	Lancaster
Cheshire	Chester
Shropshire	Shrewsbury

<i>Counties.</i>	<i>Chief Towns.</i>
Derbyshire	Derby
Nottinghamshire	Nottingham
Lincolnshire	Lincoln
Rutland	Oakham
Leicestershire	Leicester
Staffordshire	Stafford
Warwickshire	Warwick
Worcestershire	Worcester
Herefordshire	Hereford
Monmouthshire	Monmouth
Gloucestershire	Gloucester
Oxfordshire	Oxford
Buckinghamshire	Aylesbury
Northamptonshire	Northampton
Bedfordshire	Bedford
Huntingdonshire	Huntingdon
Cambridgeshire	Cambridge
Norfolk	Norwich
Suffolk	Bury
Essex	Chelmsford
Hertfordshire	Hertford
Middlesex	London
Kent	Canterbury
Surrey	Guildford
Sussex	Chichester
Berkshire	Reading
Hampshire	Winchester
Wiltshire	Salisbury
Dorsetshire	Dorset
Somersetshire	Wells
Devonshire	Exeter
Cornwall	Launceston

"London contains nearly a million of inhabitants, is twenty miles in circumference, and is the largest and most opulent city in the world."

After giving such an account as this is of almost every country in the globe, Mr. Goldsmith gives some geographical questions, problems and questions on the use of the globes, and a vocabulary of the proper names of places, divided and accented in the way in which they are usually pronounced,

ART. XVII. *Practical Arithmetic; or the Definitions and Rules in whole Numbers, Fractions Vulgar and Decimal, exemplified by a large Collection of Questions relating to Business: including Rules and Examples of Mental Calculations and Abbreviations in most Parts of Arithmetic. The whole combining Theory with Practice: with Notes. By J. RICHARDS. 8vo. pp. 160.*

THE multiplication table used by Mr. Richards extends as far as  $12 \times 19$ ; by means of which and the common pence table, most of the calculations requisite in the common routine of retail business, and in making out bills, may be effected with accuracy and expedition, without the use of the pen. In almost all cases the habit is acquired even at

present by long and frequent practice, but the rules here laid down will considerably promote this desirable facility. The abbreviations of the common rules we do not much approve of; they are thus rendered less intelligible to the learner, and no other advantage can counterbalance this defect.

## CHAPTER IX.

## BIOGRAPHY.

THE richness of the Biographical Department, in the literary history of the last year, atones, in a considerable degree, for the deficiencies and worthlessness which unfortunately characterise some of the other divisions. Not only have the lives of several eminent character, already known and recorded, been written afresh, and presented to the public in a new light, and with additional circumstances of interest; but some of the distinguished moderns, lately deceased, have, during the last twelvemonth, been worthily recorded, and associated with the illustrious of former ages, who, by general consent, have been selected to serve as models and examples of human nature.

If we estimate the merit by the degree of interest excited, Mr. Hayley's *Life of Cowper* undoubtedly demands the earliest notice. It must not be concealed, however, that this is less owing to the abilities of the biographer, than to the touching and melancholy circumstances in the life of the author, the tender sprightliness which distinguishes his numerous letters, and the uncommon pathos that breathes in some of the poetical pieces, which are here for the first time laid before the public. The late Dr. Geddes has found a worthy memorialist in Mr. Good; whose congeniality of attachment to oriental literature, has peculiarly qualified him to estimate the merit of his friend on those topics, upon which his future reputation must mainly depend. The uneventful, though by no means useless life of Dr. Reid, has been sketched by Professor Stewart; who has, at the same time, vindicated his metaphysical system, from the general objections that have been urged against it. The life of the gallant Admiral Earl Howe, has been written by Mr. Mason; and we are indebted to a female pen for a particular and highly interesting biography of General Zieten, one of the ablest warriors of the great Frederick of Prussia, and no less distinguished for his moral worth than his military talents. The publication of Lady Wortley Montague's *Correspondence*, by Mr. Dallaway, has not only established the complete authenticity of her celebrated letters from Turkey, but has raised her to the very highest rank among the epistolary writers of Europe, for the combination of brilliant wit, glowing description, and sound sagacious observation on life and manners. Mr. Godwin has written the *Life of Chaucer* on a new plan, which we trust will for ever remain unique. Dr. Aikin has furnished a large and valuable contribution to Biographical History, by the publication of the fourth volume of his *General Biography*; and our *Annual List* is swelled, though not greatly increased in value by the *Revolutionary Plutarch*, *Public Characters* for 1803, &c. &c.

ART. I. *The Life and posthumous Writings of William Cowper, Esq.* By WILLIAM HAYLEY, Esq. 2 vols. 4to.

GENIUS and virtue in union, never fail to excite the interest of all who contemplate them; and when misfortune is added, all the sympathetic emotions are irresistibly called into action. This concurrence was exemplified in an uncommon degree in the late *William Cowper*; whose poetical talents broke forth with a lustre that astonished all readers, while the tokens displayed in his works of exalted piety and warm benevolence on the one hand, and of a deeply wounded spirit on the other, inspired general esteem and regret. Curiosity was powerfully awakened to the history of such a man; and as it was imperfectly gratified during his life, the public impatiently expected fuller information after his decease. Every one was apprised, that various reasons of delicacy existed, which might prohibit an undisguised narrative of all that concerned him; but it was hoped, that enough of the veil might be drawn aside, to exhibit the true features of his singular character, and the principal circumstances by which it was formed. When it was understood that the office of his biographer had devolved upon an eminent writer, who had enjoyed a great share of his intimacy, and might be supposed to have obtained access to all existing memorials respecting him, little doubt was entertained that a valuable and interesting publication would be the result. It is our business to consider in what degree the general expectation has been fulfilled in the work before us.

Mr. Hayley has adopted a mode of biographical writing, which has proved popular in some late instances, and certainly possesses some advantages, that of making the subject, in a great measure, his own historian, by interweaving in the narrative all his familiar letters, which relate the events of his life, or display the sentiments of his mind. This method is lively and entertaining, and carries with it a strong impression of authenticity; it has, however, obvious defects. Frequently, no one is less to be depended upon in the representation of incidents, or of principles and motives, than the person to whom they belong; and it is from the sagacious and impartial biographer alone, that we can expect such a statement, as shows the man as he

really is, stript of the mask of self love. Further, the thread of narrative is broken, and all due proportion of length, to importance of matter, destroyed by such an intermixture. On the whole, we cannot consider it as a just model of this species of composition; and we are persuaded, that it will seldom be employed, unless where the biographer is conscious of a paucity of materials for his own share of the work, or of some nice and delicate points in the story, upon which he does not choose to express himself with the responsibility of an author. That the familiar letters of men of eminence are, of themselves, highly pleasing, no one will call in question; or that they form excellent matter for the use of the biographer, who may, with great advantage, introduce portions of them, as illustrations of character and incident. It is only to this chequered mode of mingling them entire, with the staple of the writer's narration, that we venture to propose our objections.

We have no right to suppose that Mr. Hayley has designedly sunk any information relative to the early history of the subject of his memoirs; but we must lament that this period of his life is passed over with a rapidity which leaves us in the dark, with respect to the most essential points in the formation of his extraordinary character. We are told of an extreme modesty and reserve in his nature, of a shyness and delicacy of feeling, that rendered a public school a scene of terror and torment to him; yet he passed with credit through this school, formed connections with such men as Colman, Lloyd, and Thornton, and, as we have reason to believe, mingled in the pleasures and gaieties of the metropolis, rather distinguished by uncommon mirth and vivacity, than marked with the impress of pensive diffidence. Are we then to imagine that it was the influence of mere *natural temper*, which, at the mature age of thirty-one, rendered the idea of appearing, in an official station, at the bar of the house of lords, so distressing to his mind, as entirely to overwhelm his reason; or rather, to conclude, that some *previous* circumstance had so debilitated and deranged his nervous system, as to reduce him to the brink of that unhappy condition,

into which the above incident precipitated him? Surely the latter supposition is most agreeable to what we know of the nature of mental affections, yet we have only vague conjecture to confirm it. Was not compunction for youthful irregularities, probably enhanced by the austerity of a gloomy religious system, the great predisposing cause? Is not this idea inculcated by the mention of an "undescribable load of religious despondency," which clouded his faculties, while under the care of Dr. Cotton, at Saint Alban's? Pity if the *delicacy* of the biographer (which is, indeed, one of his conspicuous features) has, in this instance, precluded the reader's instruction!

The "reviving invalid," after leaving Dr. Cotton's, took up his residence at Huntingdon, where he soon became an inmate of the family of Unwin. This family possessed many qualities, which commanded both affection and esteem; but we cannot think that their opinions and mode of life were calculated to restore Cowper to that calm and reasonable state of mind, which might heal the remaining wounds of his spirit, and settle him in the equanimity of rational piety.—Notwithstanding his biographer speaks of the "lustre of comfort and delight," which succeeded his first gloom, his letters to his relation, Mrs. Cowper, after being domesticated at Mr. Unwin's, imply sentiments which would make the duration of this happy state very precarious. Of the manner in which he passed his time with that family, we shall copy his own account.

"As to amusements, I mean what the world calls such; we have none: the place indeed swarms with them; and cards and dancing are the professed business of almost all the *gentle* inhabitants of Huntingdon.—We refuse to take part in them, or, to be accessaries to this way of murdering our time, and by so doing have acquired the name of methodists. Having told you how we do not spend our time, I will next say how we do. We breakfast commonly between eight and nine; till eleven, we read either the scripture, or the sermons of some faithful preacher of these holy mysteries: at eleven we attend divine service, which is performed here twice every day, and from twelve to three we separate, and amuse ourselves as we please. During that interval I either read in my own apartment, or walk, or ride, or work in the garden. We seldom sit an hour after dinner, but, if the weather permits, adjourn to the garden, where with Mrs. Un-

win, and her son, I have generally the pleasure of religious conversation till tea time! If it rains, or is too windy for walking, we either converse within doors, or sing some hymns of Martin's collection, and by the help of Mrs. Unwin's harpsichord make up a tolerable concert; in which our hearts, I hope, are the best and most musical performers. After tea we sally forth to walk in good earnest. Mrs. Unwin is a good walker, and we have generally travelled about four miles before we see home again. When the days are short, we make this excursion in the former part of the day, between church time and dinner. At night we read and converse as before, till supper, and commonly finish the evening either with hymns, or a sermon; and last of all the family are called to prayers."

We trust we shall not, by any judicious reader, be reckoned hostile to the spirit of rational devotion, if we give it as our opinion, that such a perpetual recurrence of the same ideas; and those, according to the system adopted by this class of religionists, chiefly of the awful, alarming, self-debasing kind, could not fail of overwhelming such a mind as that of Cowper, naturally prone to timid apprehension, and still infirm from the relics of late derangement. A philosophical biographer, not shackled by the necessity or the inclination of acting the encomiast on every occasion, might have found a fertile and interesting source of reflection in the incidents of this period of Cowper's life. Mr. Hayley, however, has ventured only once slightly to touch on the topic of devotional excesses; he has not even been warmed to any expression of indignant pity, on the circumstance of Cowper's falling under the direction, literary as well as religious, of a person who may deserve the epithet of a "benevolent and animated pastor;" but certainly was not the man, in point of education or abilities, to whom the custody of a mind, rich in the stores of learning, and animated with pure poetic fire, ought to have been committed. It appears that such a genius was suffered for years to discontinue all proper means of intellectual improvement, and to waste its efforts upon methodistical hymns, and versions of the reveries of quietism!

Mr. Hayley's extreme caution upon this subject, is shown by his passing over without remark, one of the most striking exemplifications of that state of religious opinion, in which Cowper had settled, and which was so manifestly instrumental in producing the dreadful despond-

ence under which he so long laboured. This was the narrative which he drew up, and which Mr. Newton thought fit to publish, of the sickness and death of his brother, the Rev. John Cowper.—This brother, who is recorded in the *Task*, as

“A man of worth,  
A man of letters, and of manners too!  
Of manners, sweet as virtue always wears,  
When gay good-humour dresses her in smiles,”

was persecuted on his death-bed by his truly affectionate but deluded relative, in order to alarm him with the desperate state of his soul, because he had not yet been impressed with that sense of his own vileness, and of the exclusive efficacy of the Redeemer's blood to avert the wrath of God, which his sect supposes essential to salvation. We confess that this narrative, which Mr. Hayley represents as “so likely to awaken sentiments of piety, where it may be most desirable to have them awakened,” affected us with a more humiliating and shuddering sense of the dangerous nature of enthusiasm, than almost any thing we had before perused; nor could we in the least wonder, that a mind so haunted by terrific images, soon again fell into a state of derangement, which rendered a long period of years a series of the most exquisite sufferings.

His recovery, or rather the remission of his paroxysm (for, poor man! he never recovered), was marked by the composition of those poems which form his first volume. They exhibit both the negligence of an earnest and full-fraught mind, and the gloom and bile of religious austerity; yet they display a fund of poetical powers which Mr. Hayley has justly appreciated, and which must henceforth secure them from that neglect which they at first experienced from the public.

A new æra in the poet's life commences from his acquaintance with the lively Lady Austen, the inspirer of “the *Task*,” and “John Gilpin.” We cannot but wonder that the biographer, notwithstanding his systematic care to offend nobody, could forbear, on the manifest change in the spirits and pursuits of Cowper, when he enjoyed a social intercourse with this lady, Lady Hesketh, the Throgmortons, and other persons of polished and liberal manners, to speculate a little on the probable difference in his character and fate, had he

fortunately, on his first recovery from mental derangement, escaped the gloom of methodism, and soberly partaken of the ordinary pleasures of cultivated society. That he would ever have been a tranquilly happy man, we do not suppose; his spirits were naturally too infirm and variable, for the attainment of equanimity; but that horrid phantom of final reprobation, which never, but at intervals, was absent from his fancy, would probably not have existed under a different course of mental discipline. It seems, however, for a considerable time to have faded before the sunshine of cheerful converse and literary reputation; and his letters, at this period, are illuminated with that pleasantry and sportive humour, which formed a radical part of his singular composition.

The most fortunate change in his situation and circumstances, was occasioned by the kindness and attachment of his cousin, Lady Hesketh; who, after having long lost sight of him in a residence abroad, and the performance of domestic duties, was reminded of him by the celebrity he was acquiring from the publication of his second volume of poems. She was now a widow, in affluent circumstances; and by a very kind letter, recommenced the frank and affectionate intercourse which had subsisted between them in their juvenile years. Of all the admirable letters of the poet, with which this publication is enriched (and which, indeed, constitute its chief value), none are more pleasing than those written to this amiable and worthy relative. We shall transcribe part of one, as the most delightful display we ever remember to have seen, of the feelings of a noble mind in accepting a generous offer. We trust we have no readers, whose hearts will not beat with affection both to the giver and the receiver.

“My dearest cousin,

“Whose last most affectionate letter, has run in my head ever since I received it, and which I now sit down to answer two days sooner than the post will serve me. I thank you for it, and with a warmth for which I am sure you will give me credit, though I do not spend many words in describing it. I do not seek new friends, not being altogether sure that I should find them, but have unspeakable pleasure in being still beloved by an old one. I hope that now our correspondence has suffered its last interruption, and that we shall go down together to the grave, chatting

and chirping as merrily as such a scene of things as this will permit.

"I am happy that my poems have pleased you. My volume has afforded me no such pleasure at any time, either while I was writing it, or since its publication, as I have derived from yours, and my uncle's opinion of it. I make certain allowances for partiality, and for that peculiar quickness of taste, with which you both relish what you like, and after all draw-backs upon those accounts duly made, find myself rich in the measure of your approbation that still remains. But above all I honour John Gilpin, since it was he who first encouraged you to write. I made him on purpose to laugh at, and he served his purpose well; but I am now in debt to him for a more valuable acquisition than all the laughter in the world amounts to, the recovery of my intercourse with you, which is to me inestimable. My benevolent and generous cousin, when I was once asked if I wanted any thing, and given delicately enough to understand that the enquirer was ready to supply all my occasions, I thankfully and civilly, but positively declined the favour. I neither suffer, nor have suffered any such inconveniencies as I had not much rather endure, than come under obligations of that sort to a person comparatively with yourself a stranger to me. But to you I answer otherwise. I know you thoroughly, and the liberality of your disposition; and have that consummate confidence in the sincerity of your wish to serve me, that delivers me from all awkward constraint, and from all fear of trespassing by acceptance. To you, therefore, I reply, yes. Whensoever, and whatsoever, and in what manner soever you please; and add moreover, that my affection for the giver is such, as will encrease to me tenfold the satisfaction that I shall have in receiving. It is necessary however that I should let you a little into the state of my finances, that you may not suppose them more narrowly circumscribed than they are. Since Mrs. Unwin and I have lived at Olney, we have had but one purse; although during the whole of that time, till lately, her income was nearly double mine. Her revenues indeed are now in some measure reduced, and do not much exceed my own; the worst consequence of this is, that we are forced to deny ourselves some things which hitherto we have been better able to afford, but they are such things as neither life, nor the well being of life depend upon. My own income has been better than it is, but when it was best, it would not have enabled me to live as my connexions demanded that I should, had it not been combined with a better than itself, at least at this end of the kingdom. Of this I had full proof during three months that I spent in lodgings at Huntingdon, in which time by the help of good management, and a clear notion of economical matters, I contrived to spend the income of a twelve month. Now,

my beloved cousin, you are in possession of the whole case as it stands. Strain no points to your own inconvenience, or hurt, for there is no need of it; but indulge yourself in communicating (no matter what) that you can spare without missing it, since by so doing you will be sure to add to the comforts of my life, one of the sweetest that I can enjoy, a token and proof of your affection."

Every subsequent letter expresses increasing pleasure in this renewed connexion, which was soon to be augmented by the lady's personal presence. How sweetly tender and playful is the following, just before her arrival!

"Ah! my Cousin, you begin already to fear and quake. What a hero am I, compared with you. I have no fears of you. On the contrary, I am as bold as a lion. I wish that your carriage were even now at the door. You should soon see with how much courage I would face you. But what cause have you for fear? Am I not your cousin, with whom you have wandered in the fields of Freemantle, and at Bevis's Mount? Who used to read to you, to laugh with you, till our sides have ached, at any thing, or nothing? And am I in these respects at all altered? You will not find me so, but just as ready to laugh and to wander as you ever knew me. A cloud perhaps may come over me now and then, for a few hours, but from clouds I was never exempted. And are not you the identical Cousin with whom I have performed all these feats? The very Harriet whom I saw, for the first time, at De Grey's, in Norfolk Street? (it was on a Sunday, when you came with my Uncle and Aunt to drink tea there, and I had dined there, and was just going back to Westminster.) If these things are so, and I am sure that you cannot gainsay a syllable of them all, then this consequence follows; that I do not promise myself more pleasure from your company than I shall be sure to find. Then you are my Cousin, in whom I always delighted, and in whom I doubt not that I shall delight, even to my latest hour. But this wicked coach-maker has sunk my spirits. What a miserable thing it is to depend, in any degree, for the accomplishment of a wish, and that wish so fervent, on the punctuality of a creature, who I suppose was never punctual in his life! Do tell him, my dear, in order to quicken him, that if he performs his promise, he shall make my coach when I want one, and that if he performs it not, I will most assuredly employ some other man."

By Lady Hesketh's means, Cowper with Mrs. Unwin were removed from Olney to a much more eligible situation, at the neighbouring village of Weston, where he seems to have passed the happiest years of his declining life, occupied with his translation of Homer, and in

habits of free intercourse with polite and friendly neighbours.

Another relation is also at this period introduced on the scene, destined to be the poet's most assiduous and affectionate comforter when he most stood in need of domestic consolation, and highly interesting to the reader wherever he appears. This was Mr. John Johnson, of Norfolk, a student at Cambridge, and afterwards a clergyman. Cowper seems to have regarded him with a love that made his company always a cordial to him. It is thus expressed in one of the earliest letters to him:

"My Boy, I long to see thee again. It has happened some way or other, that Mrs. Unwin and I have conceived a great affection for thee. That I should, is the less to be wondered at, (because thou art a shred of my own mother); neither is the wonder great, that she should fall into the same predicament; for she loves every thing that I love. You will observe, that your own personal right to be beloved makes no part of the consideration. There is nothing that I touch with so much tenderness as the vanity of a young man; because, I know how extremely susceptible he is of impressions that might hurt him in that particular part of his composition. If you should ever prove a coxcomb, from which character you stand just now at a greater distance than any young man I know, it shall never be said that I have made you one; no, you will gain nothing by me but the honour of being much valued by a poor poet, who can do you no good while he lives, and has nothing to leave you when he dies. If you can be contented to be dear to me on these conditions, so you shall; but other terms, more advantageous than these, or more inviting, none have I to propose."

All the other letters to this young man, are so compounded of easy hilarity and cordial affection, that they inspire the most amiable ideas both of the writer and his correspondent.

In 1792, the acquaintance commenced between Cowper and his biographer, with a complimentary sonnet and letter on the part of the latter. It was maintained with great cordiality on both sides; and Mr. Hayley deserves much esteem for the solid and effectual friendship he manifested on various trying occasions towards his brother poet, to whose genius he always pays the warmest homage. He prevailed on Cowper and Mrs. Unwin to visit him at his delightful seat of Earham; and omitted no

thing that the kindest and most delicate attention could suggest, to render it pleasing and salutary to both. His relation of the circumstances of this visit is one of the most agreeable passages of the biography.

Two years more did not elapse before the gloom began again to gather thick round the distempered mind of Cowper, and the remainder of his history is scarcely any thing but a picture of varied woe. The kindest attention of friends (and few men have ever inspired more kindness), the public applause, and the honourable and substantial testimony to his merit displayed in the royal grant of a pension of 300*l.* per annum, were unable to raise him from that fixed depression into which he was plunged by the horrors of religious despair. He first saw his aged and beloved companion reduced to second childhood, and daily sinking to the tomb. The manner in which he was affected by this spectacle is described by him in some simple and artless stanzas, perhaps the most exquisitely tender that were ever written. When, however, she was finally taken away, he was too far gone in self-affliction to shew much sensibility. He still, however, exercised his pen on various subjects, and attended with some diligence to the correction of his *Homer*. His intellectual faculties therefore were not decayed, though the tone of his spirits was destroyed. His last original composition was evidently dictated by the pangs of inward distress: it is entitled "*The Castaway*," and relates the pathetic story, from Anson's Voyage, of a seaman fallen over-board and necessarily left to perish. The concluding stanza points the application.

"No voice divine the storm allay'd,  
No light propitious shone,  
When snatch'd from all effectual aid,  
We perish'd, each alone;  
But I beneath a rougher sea,  
And whelm'd in deeper gulphs than he."

A gradual decline in his health attended his mental sufferings, under which he tranquilly sunk on April 25, 1800.

We have already given our opinion on the deficiencies of the biographical part of this work, and we are persuaded they will be felt by every one who expected that the obscurity which hung upon that part of Cowper's life, which

permanently influenced his character and fortune, would have been cleared up by his friend. It would, however, be an injustice to Mr. Hayley to deny that his narrative is in many respects highly interesting, and that he has succeeded in impressing upon the reader's mind a very lively as well as captivating image of the excellent person whom he commemorates. As a painter he has, indeed, one defect. Not only his principal figure, but all the accessory ones, are set off with such a glare of showy colouring, that distinction of feature is almost lost in the general lustre. To speak without a metaphor—we might imagine that when he sat down to compose, he had provided himself with a list of all the laudatory and ornamental epithets in the English language, on which he rang the changes in conjunction with every name that occurred. It would not be easy to find a single person mentioned without some panegyric addition; and this perpetual strain of compliment throws a finical and artificial air over his language, totally repugnant to the tone of manly sincerity.

We have already said that the great

value of this publication consists in the letters of Cowper, which are, indeed, some of the most exquisite specimens of the true epistolary style that our language affords; and it is truly wonderful, that a man of a shy and retired disposition, long buried in an obscure retreat, and absorbed in deep melancholy, should have been capable of a graceful and polished familiarity of address, scarcely equalled by any of those who have been most conversant with the world. The humour, vivacity, elegance and ease of these artless effusions have scarcely ever been surpassed; and the honest affectionate heart that animates them is a perpetual charm. Were this the sole present which the editor had made to the public, he would merit its gratitude. But he has likewise collected many other fugitive compositions of his friend which will give pleasure to the admirers of Cowper, light and careless as many of them are. Upon the whole, it cannot be doubted but that these volumes will not only engage the present curiosity of the public, but make a permanent addition to English literature.

ART. II. *Life of Geoffrey Chaucer, the early English Poet, including Memoirs of his near Friend and Kinsman, John of Gaunt, Duke of Lancaster, &c.* By W. GODWIN. 4to. 2 vols.

BEFORE we proceed to examine these volumes, it is necessary to state the design with which they were written. This should always, if possible, be related in the author's own words.

“The first and direct object of this work, is to erect a monument to his name, and, as far as the writer was capable of doing it, to produce an interesting and amusing book, in modern English, enabling the reader, who might shrink from the labour of mastering the phraseology of Chaucer, to do justice to his illustrious countryman. It seemed probable also that, if the author were successful in making a popular work, many might by its means be induced to study the language of our ancestors, and the elements and history of our vernacular speech; a study at least as improving as that of the language of Greece and Rome.

“A further idea, which was continually present to the mind of the author while writing, obviously contributed to give animation to his labours, and importance to his undertaking. The full and complete life of a poet would include an extensive survey of the manners, the opinions, the arts, and the literature of the age in which the poet lived.—

This is the only way in which we can become truly acquainted with the history of his mind, and the causes which made him what he was. We must observe what Chaucer felt and saw, how he was educated, what species of learning he pursued, and what were the objects, the events, and the persons successively presented to his view, before we can strictly and philosophically understand his biography. To delineate the state of England, such as Chaucer saw it, in every point of view in which it can be delineated, is the subject of this book.

“But while engaged in this study, the reader may expect to gain an additional advantage, beside that of understanding the poet. If the knowledge of contemporary objects is the biography of Chaucer, the converse of the proposition will also be true, and the biography of Chaucer will be the picture of a certain portion of the literary, political, and domestic history of our country. The person of Chaucer may in this view be considered as the central figure in a miscellaneous painting, giving unity and individual application to the otherwise disjointed particulars with which the canvas is diversified. No man of moral sentiment or of taste will affirm, that a more becoming central figure to

the delineation of England in the fourteenth century can be found, than the Englishman who gives name to these volumes.

"I can pretend only to have written a superficial work. My studies, if any thing of mine deserves so serious a name, have chiefly been engaged upon other subjects; and I came in a manner a novice to the present undertaking. Had the circumstances under which I have written been different, I should have been anxious to investigate to the bottom the various topics of which I have treated.

"Perhaps, however, I have not wholly failed in the execution of my design. I was desirous of convincing my countrymen, that there existed mines of instruction and delight, with which they had hitherto little acquaintance. I have led my readers, with however unconfirmed a speech and inadequate powers, to the different sources of information; and, if I have been unable to present what should satisfy a vigorous and earnest curiosity, I have wished to say enough to awaken their enquiries, and communicate to them some image of men and times, which have long since been no more.

"It was my purpose to produce a work of a new species. Antiquities have too generally been regarded as the province of men of cold tempers and sterile imaginations, writers who by their phlegmatic and desultory industry have brought discredit upon a science, which is perhaps beyond all others fraught with wisdom, moral instruction, and intellectual improvement. Their books may indeed be considerably useful to the patient enquirer, who would delineate the picture of past times for himself; but they can scarcely incite enquiry; and their contents are put together with such narrow views, so total an absence of discrimination, and such an unsuspecting ignorance of the materials of which man is made, that the perusal of them tends for the most part to stupify the sense, and to imbue the soul with moping and lifeless dejection.

"It was my wish, had my power held equal pace with my strong inclination, to carry the workings of fancy and the spirit of philosophy into the investigation of ages past. I was anxious to rescue for a moment the illustrious dead from the jaws of the grave, to make them pass in review before me, to question their spirits and record their answers. I wished to make myself their master of the ceremonies, to introduce my reader to their familiar speech, and to enable him to feel for the instant as if he had lived with Chaucer."

A dissertation upon the *period* (as Mr. Godwin chuses to call it) of the birth of Chaucer, precedes the work. It is satisfactory and curious, proving, or at least seeming to prove, that when the poet declared himself upon a trial to be forty

years old and upward, he was in reality fifty-eight.

Chaucer was born in London, 1328, and it may, says his biographer, with some plausibility be inferred, that his father was a merchant. Now, he having been born in London, it is proper to examine what sort of a city London was at that time; therefore, the first chapter of Mr. Godwin's Life of Chaucer, is a history and description of the city of London!

The second chapter is upon the state of learning in England, under the Norman and Plantagenet princes, with reference to Chaucer's education. The third professes to treat of the school-boy amusements of Chaucer, the whole information upon which important topic is comprised in this sentence, "there were other authors who it can scarcely be questioned, furnished some of the favourite recreations of his boyish years; these were the writers of romance:" therefore, Chaucer having read romances, and romances being connected with chivalry, and chivalry having grown out of the feudal system, Mr. Godwin tells us *all he knows* concerning the feudal system, chivalry, and romance, in all which the reader, who has read the commonest modern books upon these subjects, will find nothing that he did not know before.

"After the consideration of the scene in which a man has spent his boyish years, and the studies and modes of imagination to which his early attention has been directed, there is nothing which can be of more importance in moulding the youthful mind, than the religious sentiments which in our tender age have been communicated to us. As we have no direct information as to this particular in the education of Chaucer, it is fair to fix our ideas respecting him at the middle point, and to believe that he was brought up in all that institution which, relative to the times when he was born, was regarded as seemly, decent, and venerable, neither deviating into the excesses of libertinism on the one hand, nor of a minute and slavish spirit of devotion on the other."

It is indeed *probable* that Chaucer was brought up in what his biographer calls the holy "apostolical Roman Catholic faith;" for as there existed in England nothing but Jews and Catholics, and as we know he was not a Jew, it may perhaps be affirmed that he was, or, to use the historian's favourite tense of induc-

tion, that he must have been a Catholic. —Proceeding, therefore, upon this supposition, Mr. Godwin describes, in his fourth chapter, the establishments and practices of the church of England in the fourteenth century.

When the poet was a young man he must have heard the minstrels: so Chaucer and the minstrels are the fifth chapter. This leads to a dissertation on the origin of the English stage, profane dramas, miracle plays, pageants, mysteries, and masks, in which not a single fact is added to the information contained in Warton and Henry.

The feast of fools and the feast of the ass, feasts and pageants, hunting and hawking, archery, athletic exercises, robbery and tournaments fill another long chapter; because all these must have affected the tone of manners and the popular mind in the days of Chaucer.

Chaucer must have seen castles and cathedrals and palaces: so the eighth chapter is upon Gothic architecture, and contains a full description of a castle, from Grose! And the ninth chapter treats upon sculpture and painting, metallic arts, embroidery and music; because the state of all these arts must have influenced the mind of Chaucer.

In the tenth chapter we find Chaucer at Cambridge; and here, having travelled over 185 pages, we hoped we had arrived at the subject of the book; but here we find the state of the universities, the monastic and mendicant orders, the schoolmen, and the natural philosophy of the fourteenth century. At the end of this comes a recapitulation.

“It was the good fortune of Chaucer that he had led the early years of his life in scenes of concourse and variety, that he was condemned to no premature and compulsory solitude, and that his mind was not suffered to vegetate in that indolence and vacancy which, when they occupy an extensive portion of human life, are so destructive and deadly to the intellectual powers. He was born in London. In the midst of this famous and flourishing metropolis he was, as he expresses it, ‘forth grown.’ His father was probably a merchant; and Chaucer was furnished, from his earliest hours of observation, with an opportunity of remarking upon the insensible growth of that new rank of men, the burgesses, which about this time gave a new face to the political constitutions of Europe. Private and domestic education had scarcely any where been heard of; and Chaucer, in all probability, frequented some of those populous and tumultuary schools so

circumstantially described by William Fitzstephen. Here his mind was excited by example, and stimulated by rivalry; he passed much of his time in the society of his equals, observed their passions, and acted, and was acted upon in turn, by their sentiments and pursuits. When he had finished his classes here, he was removed to Cambridge, where six thousand fellow-students waited to receive him. He had no difficulty in finding solitude when his inclination prompted him to seek it; and we may be certain that a mind which relished so exquisitely the beauties of nature, sought it often; but he was never palled with it. The effect of both these circumstances is conspicuous in his writings. He is fond of allegories and reveries, for oft the poet

— ‘brush’d with hasty step the dews  
away,  
‘To meet the sun;’

and he is the poet of manners, because he frequented the haunts of men, and was acquainted with his species in all their varieties of modification.”

Some centuries ago, when an author was about to write a book, he considered that all his readers were unlearned; that they who should read his volume, had perhaps never read another; and, therefore, he usually gave them the whole stock of his knowledge, beginning generally with Adam, and so proceeding regularly down to his own subject. This is the case with Mr. Godwin: he came “in a manner a novice to the present undertaking;” and taking it for granted that all those who read his book were to be as ignorant as he was himself when he began to write it, he has therefore told them all he knows. In all these chapters which we have noticed, there is positively nothing but what is to be found in modern authors; in Warton, in Henry, in Grose, in St. Palaye, Percy, Ritson, and Ellis; books which are in every private library, at least in every library where two quarto volumes upon the life of Chaucer can be expected to find a place.

“Before we enter upon a particular examination of any of Chaucer’s poems, it is proper that we should pay some attention to the circumstance of their being written in the English tongue. This language, as has already been remarked, after the accession of the Norman race to the throne of our island, was consigned to oblivion and contempt, driven from the seats and refinement of learning, and confined for the most part to the cottages of the peasantry. Before the period of Chaucer, we had already had

poets; Wace and Benoit may most properly be considered as ours, and the English monarchs were among the most conspicuous and munificent in the list of patrons of the literature of that age. But Wace and Benoit wrote the language of the Northern French. English indeed, or Saxon (for our ideas on this subject will be rendered more accurate by our considering these as two names for the same thing), had always continued the language of the bulk of the inhabitants of this island; and a few efforts from time to time show themselves to perpetuate our native tongue in the form of poetry. Layamon, an English monk, translated the Brut of Wace in no long time after it was written; and Robert of Gloucester, and Robert Manning, composed certain rhyming chronicles of the history of England, about the end of the thirteenth century. But none of these attempts were much calculated to excite the ardor and ambition of their contemporaries: the English continued to be the language of barbarity and rudeness; while the French had in its favour the fashion which countenanced it, the refinement of those who wrote it, and the variety and multitude of their productions and inventions."

This passage contains many errors: to consider Saxon and English as two names for the same thing, would be as absurd as to consider the Norman French and English, or Latin and Italian, as the same thing. The translation of Layamon is in simple and unmixed, though very barbarous Saxon. These are the words of Mr. Ellis, whose assertions as usual are substantiated by proof; and this same work of Wace was translated into English by Robert Manning, or as he is commonly called Robert de Brunne.

"Chaucer saw immediately in which way the path of fame was most open to his access; that it was by the cultivation of his native tongue: and his seeing this at the early age of eighteen, is no common proof of the magnitude of his powers. It has been well observed that the English language rose with the rise of the Commons; an event which first discovered itself in the reign of John, and which was attained and fixed under Edward I. Chaucer perhaps perceived, and was the first to perceive, that from this era the English tongue must necessarily advance in purity, in popularity, and in dignity, and finally triumph over every competitor within the circuit of its native soil. The poet, therefore, in the realm of England, who wrote for permanence, was bound by the most urgent motives to write in this language.

"Nor was the prosperous career our language was about to run, by any means the only, or the strongest argument for recurring to the use of it. For the poet to attempt to

express his thoughts in French, was for him voluntarily to subject himself to many of the disadvantages which attend the attempt to write poetry in a dead language. What is so written can scarcely be entirely worthy of the name of poetry. It can but weakly convey the facility of our thoughts, or the freshness of our impressions. Chaucer was a genuine Englishman, a native of our island, hitherto confined within our shores, and born in the class of our burgesses and merchants. French was to him probably like a foreign language: all his boyish feelings had been expressed in English. English words were mingled and associated with all the scenes he had beheld, and all the images he had conceived. For a man to communicate the thoughts he has formed in one language in the words of another, is a position not less unfortunate, than to be condemned to contemplate a beautiful woman, not by turning our eyes immediately upon her person, but by regarding her figure as shadowed in a mirror.

"To master any language is a task too great for the narrow space of human life. It is perfectly true, however paradoxical it may sound, that the man never yet existed who was completely possessed of the treasures of his native tongue. Many delicacies and shades of meaning, many happy combinations and arrangements of words, are familiar to one man, of which his neighbour is ignorant; while, on the other hand, his neighbour possesses stores of a similar sort, to which he is a stranger. Those also which have once been observed by any man, obviously divide themselves into two classes; one which he has always at hand, and may be conceived in a certain sense as making part of himself; and the other, phrases and expressions which he once knew and comprehended, but which now he rarely remembers or has totally forgotten. If then no man ever yet possessed the treasures of his native tongue, what presumption or fatuity ought it to be accounted, for him voluntarily to undergo the disadvantage of expressing himself in another? Add to which; even when we have mastered the supposed foreign language, we can still give it no more than the copy of the words of our early years, words which relatively to us may almost be considered as the ideas themselves."

The question is next considered whether Chaucer or Gower were the earlier English writer, and it is decided that Chaucer "is well entitled to be considered as original in his attempt to model his native tongue to the language of poetry." That Chaucer was our first great poet, and is one of our few great poets, will not be disputed; but the praise which is here claimed for him, is without foundation: he took the language as he found it, and improved it

as every man of genius writing in a rude language has done and must do in every country. Monks, and minstrels, and ballad-singers, had preceded him; and the metrical romances to which he refers in his *Rime of Sir Thopas*, however inferior in many other respects, are written in language as nearly, or more nearly, resembling modern English, and in metres more intricate and more harmonious, than any of his productions. The remainder of this chapter is employed upon the French, Provençal, and Italian poets.

In the next chapter, the Court of Love is analyzed. This was the poet's first production. The faults and beauties of the plan are fairly appreciated, and some deductions inferred relative to the author himself. This is followed by some remarks upon ancient and modern English poetry.

"Nothing can be more pernicious than the opinion which idleness and an incurious temper alone have hitherto sufficed to maintain, that the modern writers of verse in any country are to be styled the poets of that country. This absurdity was never carried to a greater extreme than in the book entitled *Johnson's Lives of the most eminent English Poets*. The first poet in his series is Cowley; and, if the title of his book were properly filled up, it would stand, *Lives of the most eminent English poets, from the decline of poetry in England to the time of the author*.—The brilliant and astonishing ages of our poetry are wholly omitted. Milton is the only author in Johnson's series, who can lay claim to a true sublimity of conception, and an inexhaustible storehouse of imagery. Pope is an elegant writer, and expresses himself with admirable neatness and compression; Dryden is a man of an ardent and giant mind, who pours out his sentiments in a fervour and tumult of eloquence, and imparts an electricity of pleasure to every reader capable of understanding his excellence. But it is not in Dryden and Pope, in their contemporaries and successors, that we are told to look for the peculiar and appropriate features of poetry, for that which separates and distinguishes poetry from every other species of composition. It is Spenser, it is Shakespeare, it is Fletcher, with some of their contemporaries and predecessors, who are our genuine poets, who are the men that an Englishman of a poetical soul would gather round him when he challenges all the world, and stands up and proudly asks where, in all the ages of literature and refinement, he is to find their competitors and rivals?

"It is easy to perceive, and has been verified in the example of all ages and climates, that poetry has been the genuine associate of the earlier stages of literature.—

There is then a freshness in language admirably adapted to those emotions which poetry delights to produce. Our words are then the images of things, the representatives of visible and audible impressions: after a while, too many of our words become cold and scientific, perfectly suited to the topics of reasoning, but unfitted for imagery and passion; and dealing in abstractions and generalities, instead of presenting to us afresh the impressions of sense.

"The attempts of the poet are boldest and most successful when the whole field is open to him, when he must seek for models in distant ages and countries, not when the excellence to which he aspires is pre-occupied by poets in his own language, whose merits and reputation he cannot hope to equal.—Criticism too, though it may make many judges, never perhaps ripened one genius. It is a deadly foe to bold and adventurous attempts, and scarcely leaves any hope of success, but to him who aspires to please us, just as we have been pleased an hundred times before.

"One circumstance which has contributed to the neglect into which the works of Chaucer have fallen, is the supposition that his language is obsolete. It is not obsolete. It is not more obscure than the language of Spenser, and scarcely more than that of Shakespeare. Most of the English writers, from the death of Chaucer to the times of Elizabeth, are more obscure than our poet. The English tongue underwent little alteration till the reign of that princess.

"Chaucer's style, in his principal works, is easy, flowing, and unaffected; and such a style, whatever may have been the circumstances of the writer, can almost never be obscure. We take ten times more pains to familiarise ourselves with the idioms of Italy and France, than would be necessary to master that of the old English writers; while this latter acquisition would be forty times more useful, since, in addition to the intrinsic merits of their works, we should cultivate the fine poetical and moral feeling annexed to the contemplation of a venerable antiquity; and since it is only by observing the progressive stages of a language, that we can become thoroughly acquainted with its genius, its characteristic features, and its resources. All that repels us in the language of Chaucer is merely superficial appearance and first impression: contemplate it only with a little perseverance, and what seemed to be deformity will, in many instances, be converted into beauty. A fortnight's application would be sufficient to make us feel ourselves perfectly at home with this patriarch of our poetry."

With the opinion here expressed, we most fully and unequivocally agree. Mr. Godwin has, however, fallen into a very common but very unaccountable mistake, in asserting that the language of

Chaucer is not more obscure than the language of Spenser: Spenser has given an appearance of antiquity to his words by frequent ellisions, and by a forced orthography; but the words which actually require a reference to the glossary are so few, that neither man, woman, or child, of common understanding and common attainments, will ever feel obstructed by them in the perusal. The different size of the glossaries to the two poets will alone decide the question. We will venture to affirm, that a woman will experience more verbal difficulties in the *Paradise Lost*, and ten-fold more in the macaronic prose of Dr. Johnson, than in the *Faery Queen*. With regard to Shakespere, Chaucer is certainly far less obscure,—but who does not think himself capable of understanding Shakespere? His obscurity lies in intricacy of syntax, in remoteness of allusion, in rapid association, in profound thought or profounder feeling,—not in words; and that the mass of mankind, if they understand the words singly, will take it for granted that they understand their collective meaning, whether they have a meaning or no, is a fact upon which the reputation of many a modern writer is founded.

To our astonishment we find that the next chapter is entirely devoted to the plague of London in 1349! because it must have “produced a great effect upon Chaucer!” Doubtless when in the year 2200 of the vulgar era, (if the vulgar era shall so long last) some future philosopher shall write the life of William Godwin, in quarto or in folio: that the work may be proportioned in magnitude to his fame, he will insert the history of *La Grippe*, presuming that that influenza must have “produced a great effect” upon Mr. Godwin. And we do therefore exhort Mr. Godwin carefully to preserve and deposit the receipts or prescriptions from which he derived most benefit in that complaint, recollecting what enthusiastic pleasure he should himself have felt, had he encountered such a document for his memoirs of Geoffrey Chaucer.

We now come to the *Troilus and Creseide*. Chaucer had referred to Lollius as the original author, from whom he had translated this tale; and Lydgate expressly mentions, that the title of the original work was *Trophe*. But no such author as Lollius is elsewhere mentioned, or known to have existed; and as

the same tale is the subject of Boccaccio's *Filostrato*, Tyrwhit has supposed the English poem to have been taken from the Italian. In refutation of this opinion, Mr. Godwin offers some judicious remarks.

“Mr. Tyrwhit seems inclined to consider Lollius as the name of a man who had no other existence than in the forgery of Chaucer. But this is a strange hypothesis. What motive had Chaucer for such a forgery? The poem of *Troilus and Creseide* was certainly not written by Lollius Nibicus, a Roman historian of the third century, to whom it is thoughtlessly ascribed in Speght's and Urry's editions; since it is interspersed with ideas of chivalry, which did not exist till long after that period: and Mr. Tyrwhit perhaps had never heard of any other Lollius. It is surely, however, too hasty a conclusion, because his name has not reached us from any other quarter, to say that he never existed. How many authors, with their memories, even to their very names, may we reasonably suppose to have been lost in the darkness of the middle ages! Not to travel out of the present subject for an illustration, if the *Filostrato*, a considerable poem of so celebrated an author as Boccaccio, had so nearly perished, who will wonder that the original work, and the name of the author from whom Boccaccio translated it, have now sunk into total oblivion?

“There is a further very strong evidence of the real existence of Lollius, which occurs in the writings of Chaucer. One of our poet's most considerable works is entitled the *House of Fame*; and in this poem, among a cluster of worthies, he introduces the writers who had recorded the story of Troy. They are as follow: Homer, Dares, Titus (or Dictys) Lollius, Guido dalla Colonna, and Geoffrey of Monmouth.

“Boccaccio is known to have been frequently a translator. Very many of the tales in the *Decamerone*, that of *Grisildis* for example, to which we shall soon have occasion to refer, existed before his time. He assures us himself that he translated the *Teseide* from a Latin original. Is it not more than probable that the *Filostrato* came from the same source? Is it not obvious to imagine that Chaucer and Boccaccio copied from one original? Translation was peculiarly the employment of the first revivers of learning: nor did they hold it otherwise than in the highest degree honourable, to open to their unlearned countrymen the sacred fountains of knowledge, which had so long been consigned to obscurity and neglect.

“After all, however, the *Troilus* is by no means the exact counterpart of the *Filostrato*. To omit minuter differences, the *Filostrato* is divided into ten books; and the *Troilus* into only five. Add to which, the *Troilus*, which consists of about eight thousand lines, contains three thousand more than the *Filos-*

trato. Chaucer is supposed, by Tyrwhit and Warton, to have taken his Knight's Tale from the Teseide of Boccaccio. What has he done in this case? Most materially abridged his original. The Teseide is a poem of about ten thousand lines, and Chaucer has told the same story in little more than two thousand. It is not improbable, indeed, as a poem of Palamon and Arcite, the heroes of the Teseide, was one of Chaucer's early productions, that he first translated the Teseide, and afterward compressed it as we find it in the Canterbury Tales. Abridgment is infinitely a more natural operation in such cases than paraphrase. When a man of taste, divested of the partialities of a parent, surveys critically a poem of length, one of the things most likely to strike him is, that the poem contains superfluities which, with advantage to the general effect, might be lopped away. These considerations, even independently of the direct evidence of Chaucer and Lydgate, would induce an accurate impartial observer to adopt the hypothesis here maintained, that Chaucer in his Troilus went to Boccaccio's original, and not to Boccaccio, for the materials upon which he worked."

These arguments are sensible, and fairly advanced. But Mr. Godwin next proceeds to guess at the age of Lollius; for Lollius having existed, must have existed at some particular period, and therefore may with some degree of probability be assigned to the twelfth century, and considered as the contemporary of Wace and Thomas of Becket, because "there is a propensity in human affairs to ripen minds of nearly the same class and character in different places at the same time!" It is not indeed directly asserted, that Lollius wrote his Trophe at the very time when Joseph of Exeter produced his *De Bello Trojano*, but it is said to be probable,—a thing that may be believed,—in the same diffident tone in which we are told that Chaucer was probably brought up as a Roman Catholic!

The two ensuing chapters are employed in examining the poem of Troilus and Creseide, and the subsequent productions to which it has given birth. A specimen of Sir Francis Kynaston's Latin rhymed translation, might have well been inserted here: it is excellently done, and the effect, singular as it is, very pleasing.

The moral Gower, and philosophical Strode, form the subjects of the next examination. Of Strode little can be known; and nothing added to what is known, till his works shall have been examined, which we here find, according

to Tanner, were (at least in part) printed at Venice, with the comments of Alexander Sermoneta, in 1517. Gower's manuscripts are among the many treasures which, to the shame of England, will be suffered to moulder away.

Mr. Godwin now discusses the question whether Chaucer belonged to the Society of the Inner Temple, and concludes by saying that much stress cannot be laid upon the supposition. But tho' the discussion is thus concluded, we must not suppose that the biographer concludes the subject also. No! he has told us that there is little or no reason to believe that Chaucer did study the law; but suppose he had studied the law, what "effect would have been produced upon his mind by this study?" Then comes the history of law in the fourteenth century, as far as Mr. Godwin understands it; and having spent ten pages upon this, he takes up the supposition on which he had before assured us no stress was to be laid, in order to try the effect of this study upon poor Chaucer, whose mind Mr. Godwin chuses to submit to as many experiments as we have seen inflicted upon a *subject*, by Messrs. Pegge and West, at Oxford.

"Chaucer is supposed to have been bred to the bar. If he practised in the profession, for however short a time, he must have contracted some habits of thinking and acting peculiarly appropriated to the man of laws. If he never entered upon actual practice, yet having had the profession in prospect, and frequenting the courts of law for the purpose of observing and commenting upon those modes of proceeding in which he was shortly to engage, he must have experienced some of the same effects.

"It may be amusing to the fancy of a reader of Chaucer's works, to represent to himself the young poet, accoutred in the robes of a lawyer, examining a witness, fixing upon him the keenness of his eye, addressing himself with anxiety and expectation to a jury, or exercising the subtlety of his wit and judgment in the developement of one of those quirks, by which a client was to be rescued from the rigour of strict and unfavouring justice. Perhaps Chaucer, in the course of his legal life, saved a thief from the gallows, and gave him a new chance of becoming a decent and useful member of society; perhaps, by his penetration he discerned and demonstrated that innocence, which to a less able pleader would never have been evident, and which a less able pleader would never have succeeded in restoring triumphant to its place in the community and its fair fame. Perhaps Chaucer pleaded before Tresilian or Brember, and

lived to know that those men, whose fiat had silenced his argument, or to whose inferiority of understanding, it may be, he was obliged to veil his honoured head, were led to the basest species of execution, amidst the shouts of a brutish and ignorant multitude.

"We have a right, however, to conclude, from his having early quitted the profession, that he did not love it. The objections which might present themselves to his mind, are serious and weighty. It has an unhappy effect upon the human understanding and temper, for a man to be compelled, in his gravest investigation of an argument, to consider not what is true, but what is convenient. The lawyer never yet existed, who has not boldly urged an objection which he knew to be fallacious, or endeavoured to pass off a weak reason for a strong one. Intellect is the greatest and most sacred of all endowments; and no man ever trifled with it, defending an action to-day which he had arraigned yesterday, or extenuating an offence on one occasion, which, soon after, he painted in the most atrocious colours, with absolute impunity." Above all, the poet, whose judgment should be clear, whose feelings should be uniform and sound, whose sense should be alive to every impression and hardened to none, who is the legislator of generations and the moral instructor of the world, ought never to have been a practising lawyer, or ought speedily to have quitted so dangerous an engagement."

The first part of this extract exemplifies Mr. Godwin's design of carrying "the workings of fancy into the investigation of ages past." The latter part contains so much sound morality, that it is lamentable to see it tacked on to the tail of such trash and nonsense.

To this period of Chaucer's life, Palamon and Arcite is with some probability attributed, and the translation of Boethius. We next find him at Woodstock, and patronised by Edward III. It is unpleasant to observe with how indecorous and invidious a spirit this writer always speaks of Tyrwhit, to whom the venerable poet is under far more lasting obligations than he will ever be to his present biographer. At the commencement of the work it is said that his father was probably a merchant, this is now assumed, and it is inferred, that as he was the son of a merchant, he probably received a competent paternal inheritance.

From this point the work begins to improve. Hitherto we have been toiling through pages of common place matter—we now arrive at history, though it is not the history of Chaucer. Mr. God-

win has now laid aside Henry and Warton, for Walsingham, Froissart, and Joshua Barnes, and enters upon the history of John of Gaunt, whom by a grand mistake he calls Chaucer's *kinsman*, because they married two sisters. A song inserted in the Book of the Duchess, is extracted as the composition of this prince, and such it certainly appears to be by Chaucer's expressions.

This circumstance has escaped the notice of Lord Orford, and of all former commentators.

In the second volume, Mr. Godwin enters upon the romance of the Rose, "a poem which, he says, may justly be regarded as the predecessor and progenitor of all that is most admirable in the effusions of modern, in contradistinction to the chivalrous poetry." An opinion more foolish, and unsupported by any fact, or shadow of fact, was, we believe, never hazarded in the history of literature.

What the biographer calls modern, in contradistinction to chivalrous poetry, is to be traced to Petrarca himself, if to any individual writer. This is notorious, and modern poetry is as regularly dated from Petrarca, as the Roman empire from Augustus.

The chapters, however, upon the romance of the Rose form, in our judgment, the best part of the present work. Mr. Godwin has perused the poem with enthusiasm; but his praise is sometimes strangely inapplicable. He recommends a discourse upon the art of love in this romance, to every one who is inquisitive respecting the manners of distant ages; whereas, in the whole eight hundred lines, all that relates to manners is comprized in the thirty which Mr. Ellis has quoted. As to the great discovery that men had the same passions and humours four hundred years ago that they have now,—it did not require an extract of eight hundred lines from Chaucer to convince any body of this.

We now enter upon the affairs of Spain, in which John of Gaunt, who is indeed the great hero of this work, bore so principal a part. Mr. Godwin seems not to have been aware that there exists a History of Peter the Cruel, by Mr. Dillon, drawn from purer sources than those to which he has had access.—Chaucer's Book of the Duchess, is next examined: from this poem Mr. Godwin infers some particulars respecting the marriage of the poet.

"The circumstances here recited may further shew us, what were the motives which so long delayed the accomplishment of Chaucer's wishes. The lady who was honoured with his addresses may be presumed not to have been entirely indifferent to his person, his character, or accomplishments. But she could not resolve to quit the service of her royal mistress. This seems to be highly honourable to the queen. Chaucer, however, no doubt still promised himself, that he should be able to induce her to surmount this scruple of delicacy; especially as his addresses are said (and he has insinuated as much in the poem of the *Dream*) to have been countenanced by the Duke and Duchess of Lancaster, and perhaps by the queen herself. The lady, however, though mild (it may be, a little encouraging in her refusal,) still continued to elude the conclusion of his suit. At length, the main topic of her objections having been removed by the lamented death of the queen, we may naturally infer that their nuptials were celebrated, as soon as the general laws of decorum, and the ideas of female delicacy would allow: and we shall see reason hereafter to believe, that Chaucer's marriage could not have taken place later than the year 1370."

Pursuing these 'workings of fancy,' the philosophic biographer informs us, that though Chaucer was "a ten years suitor, we may be well assured that this circumstance was in him no indication of a whining and feeble temper, defective in discrimination, or nerveless and impotent to resolve." This is a pattern of the fine fustian which Mr. Godwin has introduced in his patch-work.

We pass over the intermediate chapters of ecclesiastical history. The next point of importance in the life of Chaucer is his mission to Genoa and visit to Petrarca. Here we have more workings of fancy!

"It is not possible for us at this distance of time, to ascertain whether Chaucer travelled across the northern part of Italy, from the Mediterranean Sea to the Adriatic, principally to visit the great laureated poet of that country, whose fame during his own lifetime was perhaps louder and more awe-inspiring than ever fell to the lot of any other mortal; or whether he was partly moved by the desire of beholding the other great maritime state of the fourteenth century; the rival of Genoa the proud, Venice, which was only twenty-two miles distant from the residence of Petrarca. On the road, also, he might visit Mantua, the birth-place of Virgil; Verona, which had given existence to Claudian; and many other places profusely adorned with the witchery of nature, or rendered mysteriously interesting by the association of former times. The visit to Petrarca, how-

ever, is the only incident of this journey which Chaucer has thought fit to transmit to posterity.

"Petrarca was at this time nearly seventy years of age, and he survived only by twelve months the visit of the English poet. It must have been a striking object to Chaucer to behold this grey-headed, yet impassioned, poet, in a period when the gift of poetry was so exceedingly rare; this correspondent of popes, of states, and of emperors; this poet who had been crowned by Paris and Rome, and from whose compositions Chaucer's infant lips had perhaps first drunk in the numerousness of verse. Petrarca was interesting to Chaucer, because Chaucer saw in him as it were the lineal descendant of the Ciceros, the Virgils, and the Ovids of Italy, in the days of its classical greatness. Chaucer was interesting to Petrarca for a different reason. He came from the *ultima Thule*, the *penitus toto divisos orbe Britannos*; that country which the wantonness of more genial climates among the antients had represented as perpetually enveloped in fogs and darkness. To later times the literature and poetical genius of Britain is familiar; no tongue so barbarous, as not to confess us the equals, while in reality we are in intellectual eminence the masters, of mankind.—But this was a spectacle altogether unknown in the times of Petrarca. The discovery he made was scarcely less astonishing than that of Columbus, when he reconnoitred the shores of the western world. He interrogated his guest; he proposed to him his most trying and difficult criterions; he exchanged with him the glances of mind, and the flashes of a poet's eye. Chaucer had already written his *Troilus* and *Criseide*, and many of his most meritorious productions; he was more than forty years of age: we may imagine how he answered the ordeal of the Italian, and stood up to him with the sober and manly consciousness of a poet to a poet. Petrarca hesitated, suspected, and at length became wholly a convert; he embraced the wondrous stranger from a frozen clime, and foresaw, with that sort of inspiration which attends the closing period of departing genius, the future glories of a Spenser, a Shakespear, and a Milton."

From his grant of a pitcher of wine per day, Mr. Godwin argues that Chaucer was a man of gay and convivial temper, "who, it may be presumed, seldom sat down to the principal refreshment of the day, without the society of two or three chosen friends, whose manners and topics of conversation were congenial to his own!" From this fact he also deduces the following calculation of the poet's income.

"The circumstance of Chaucer's receiving his allowance of wine daily, seems to

afford a considerable presumption that it was consumed from day to day as it was received. From this fact we may derive a reasonable inference as to the extent of Chaucer's fortune. We find him consuming four pipes of wine annually, the price of which, stated in modern denominations of money, was 180*l.* or 45*l.* per pipe.—The question then which it is necessary for us to examine is, what may be taken to be the whole annual expenditure of a man, whose consumption is to this amount in the single article of wine? It seems to be the height of absurdity to suppose, that Chaucer's disbursements under every other article were comprehended within the limits of his pension of twenty marks, that is, of 240*l.* of modern money. Proceeding upon this datum of his grant of wine, we cannot with probability take his entire revenue at this period at a lower valuation than 1000*l.* of modern money, which, reduced into the denominations of Chaucer's time, is 55*l.* 11*s.* 1*d.*

“Where then were the items of which this income was composed? Beside his pension and his grant of wine, he had also the grant of a house near the royal manor-house at Woodstock. Taking the rent of the house a man lives in at the tenth part of his income, Chaucer's house at Woodstock may be estimated, in modern denominations of money, at the value of 100*l.* per annum.—This, with his annuity at 240*l.* and his grant of wine at 180*l.* per annum, constitute a revenue of 520*l.* It is also not unfrequent for the grant of a house to be accompanied by certain other perquisites, tending to assist the holder in his means of subsistence. Still, however, there will remain considerable resources to be supplied, to raise Chaucer's income to the amount above specified.—These, as was hinted on a former occasion, may most obviously be supplied by the supposition that Chaucer inherited a paternal fortune, adequate to the ordinary purposes of subsistence. Nine years elapsed between the time when we know that Chaucer occupied the house granted him by his sovereign on the verge of Woodstock Park, and the date of his first pension: and we must perceive it to be impossible that Chaucer should have tenanted a house, which we have found equal in accommodations to a modern house of the rent of 100*l.* per annum, at a time when he was destitute in other respects of the necessities of life.”

The next poem which comes under consideration is the House of Fame, in which Chaucer very honestly expresses a wish that all those who dislike that production may be hanged. We have then sundry historical chapters, which carry on the work to 1378, when the poet is supposed, by his present commentator, to have written the Complaint of the Black Knight, on occasion of the calum-

nies and popular outcries against John of Gaunt. Former critics had conjectured that it was composed for the same prince, during his courtship of the princess Blanche. The opinion now advanced seems most conformable to the tenor of the poem.

In the next chapter comes the whole history of Wat Tyler, though in the former volume the author had told us that it was too well known to be recited. But it seems “this was the state of society which Chaucer saw, and which could not but occasion to him many profound reflections.”

“He was a poet; and no man can be worthy of that name, who has not attentively studied the sensations and modes of feeling which various external impressions are calculated to produce in the human mind. He was the poet of character and manners; such he eminently appears in his last and most considerable work, the *Canterbury Tales*.—He was a statesman, closely connected with, and deeply interested in, the changing fortunes of the first prince of the blood. From all these reasons we may be convinced, that he was no careless and indifferent spectator of what was acting on the great theatre of public affairs. If John of Gaunt had not foreseen the tumults of this period, we may well believe that Chaucer foresaw them.—Not exactly in time and place; for that is not the province of human sagacity: but he saw the posture of society; he saw what was passing in the minds of men; he heard the low, indistinct, murmuring, pent up sound, that preceded this memorable crash of the elements of the moral world. He perceived the oppressed and fettered multitude shaking their chains, and noted their quick impatient pants after freedom and happiness. Like every good man, and every true lover of his species, it is reasonable to suppose, that he sympathised in their cause, and wished success to their aims, till he saw them conducting themselves in such a manner, as was no less destructive to themselves and calamitous to their lords, and as led to the introduction of universal ignorance and barbarism.”

Before Mr. Godwin begins another history, we exhort him to *work off* his fancy.—By its violent workings we should conjecture, that on these extraordinary occasions he had adopted the wild painter's evening diet of raw pork or toasted cheese. Mr. Bayes's receipt of stewed prunes would suit his temperament better. It is the business of the historian to inform us what has been; we can guess for ourselves.

The Legend of Gode Women ap-  
H h 4

pears to have been written at the suggestion of Anne of Bohemia, Richard's queen. Here is introduced an account of the worship of the daisy, a whimsical affectation, of which, by some antiquarians Froissart is said to have been the author. It is much to be wished that the numerous poems of this admirable old writer were printed. The Flower and the Leaf is also analyzed here; a tale so well known in the translation by Dryden. Is Mr. Godwin accurate in asserting that our Roundel is the Rondeau of the French? If so, it is singular that no specimen should remain. Indeed we remember none earlier than that of Pope's, in which he replied to the foolish jest of a woman upon his size; by obscenity far more unpardonable. The Roundel may perhaps be derived from the *Redondilla* of the Spaniards: a word of similar import, though why so called is not easily discovered, as it seems to require nothing but a regular recurrence of stanza. If this be the case, many of Chaucer's *balades* may be *Roundels*; and that title may have been disused from its affinity to the French, which implied a species of poem altogether different.

The last work of the poet's which is examined in these volumes, is his Testament of Love, written after his return from exile, and during his imprisonment. In commenting upon the difficult allegory of this composition, Mr. Godwin observes, that Shakespere has composed more than one hundred and fifty sonnets, which, in their literal sense, are addressed to a man, with all the forms and expressions of the passion of love; but which probably cover some secret meaning that no critic has hitherto been so fortunate as to penetrate." Let Mr. Godwin read these sonnets: the assertion as it now stands is not more inaccurate, than it would be to say that Shakespere had written more than thirty plays upon Sir John Falstaff. For Chaucer's impeachment of his old political associates some palliating circumstances are pleaded: the most interesting circumstance in this sad transaction is, that it would not now be known that Chaucer had acted amiss, if he had not written his own apology!

The remainder of the work is chiefly political history: it represents, however, the cheerful picture of Chaucer restored to prosperity, and living happily to the good old age of seventy-two. The

Canterbury Tales are lightly touched upon, because the author was limited to two volumes, and had run to the end of his tether before he arrived at them. This is not to be regretted, as little could have been added to what had already been done by Warton and Tyrwhit.—The omission of any remarks on his Treatise on the Astrolabe is far more culpable; for it was the business of his biographer to have studied that treatise, and appreciated the scientific knowledge of Chaucer: but this was a *hard look*, so Mr. Godwin "skipt and went on."

By attempting too many things in this work, the author has failed in all. His time and labour would have been well employed, had he digested into one unbroken narrative all the facts which he could collect concerning Chaucer's life, and then proceeded to a chronological examination of his works. He should have compared his translations with the originals, and pointed out what were the main deviations, what the characteristic improvements, and failures; so to have exemplified the "mind of Chaucer." He should not have swollen his volumes with idle compilations upon chivalry, law, and the feudal system.—Instead of heaping together old information concerning the manners of the fourteenth century, because they must have produced an effect upon Chaucer, he should have elucidated those manners from his poems, and have endeavoured to shew what effect Chaucer produced upon his age, instead of what effect his age produced upon him. Some other vehicle should have been chosen for a history of Edward III., the Black Prince, Richard II. and John of Gaunt.—Chaucer is too important a personage to be made their gentleman usher. The consequence of blending all these subjects has been, that all are imperfect, confused, and interrupted: the book is neither history, nor biography, nor criticism; but a heterogeneous mixture of all three.

The language is often bloated by attempts at eloquence, and often disfigured by the vile affectation of using common words in an uncommon sense; such as "encountering discoveries," "neighbouring the throne," and calling a man's death his *catastrophe*.

Having thus insisted upon the faults of the work, we should state what are its merits. The reign of Richard II. is perhaps better represented than in our common historians, though with too

pleader-like a partiality for John of Gaunt. Much light is thrown upon the minor poems of Chaucer; their chronological order seems satisfactorily arranged, and their design ascertained with as much precision or probability as could on so remote a subject be expected. Some facts also respecting his life have been recovered from public records, which, if not of material importance, at least attest the diligence of the biographer, and appear in their proper place.

Should Mr. Godwin undertake any other history, (and he has *now* some ca-

pital to begin with,) we advise him to recollect that *unity* is of as much importance in history as in the drama. He should also regulate the size of his work by his materials, and not his materials by the size of the work. Books which are made by the piece, will never be made well. The work for which these late studies have best qualified him, and for which perhaps the public would be most indebted to him, would be an edition of the works of Chaucer, exclusive of the Canterbury Tales. This would really be an acquisition to English literature.

ART. III. *Memoirs of the Life and Writings of the Reverend Alexander Geddes, LL. D.*  
By JOHN MASON GOOD. 8vo. pp. 580.

THE late Dr. Geddes was certainly one of those characters of superior interest, who not only acquire during their lives a portion of celebrity, but are entitled to more permanent commemoration, and justly claim a place in the records of posthumous fame. He was not merely the tranquil and retired scholar or philosopher, whose life glides away with little diversity of event, and little scope for observation; his mind presented bold and prominent features, worthy of the examination and analysis of the moralist; and his fortune and connexions placed him in situations more various and less common than usually fall to the lot of men of letters. The loss of the detailed biography of such a man would have caused a deficiency in the history of literature, which would have been justly the subject of regret.

Dr. Geddes has had the fortune to have met with a biographer worthy of him, in a man of learning and taste, versed in those studies, the pursuit of which had been the principal object of his own literary labours. The claims of Mr. Good to public notice, were not to be first established by his present work: as a poet and linguist he has already displayed powers and attainments of a highly respectable order. He possessed also the singular advantage of intimate acquaintance with the subject of his narration; his work therefore contains all the requisite materials of authenticity and important information, which fully vindicate him in having presented it to public notice, and which gave indeed to the public a sort of claim upon his labour.

Alexander Geddes was a native of

Scotland. He was born in the year 1737, of parents in a humble station of life, his father being the tenant of a small farm in the county of Banff, and in religious profession a roman catholic. In a remote village of Scotland, "*extra anni solisque vias*," under the instruction of a village-matron, the future biblical critic received his first rudiments of learning. In the scanty library which his father's cottage might be expected to afford, the principal volume was an English bible. In opposition to the common prejudice, that vernacular translations have been uniformly discouraged by the catholics, this volume he was taught by his parents to read with reverence and attention. It is a very admissible speculation of his biographer, that to this accidental circumstance may be traced, in some measure, the future complexion of his literary life.

From the humble species of instruction, of which alone he had hitherto enjoyed the opportunity, he was transferred gratuitously and liberally to the more useful care of a tutor, employed by the laird of the district in the education of his own sons. From this tuition he was removed to Scalan, an obscure seminary in the highlands, limited to the education of youths intended for the clerical office in the roman catholic church, whose education is to be completed in some foreign university. This college, not less melancholy than the paraclete of Abelard, is described as situated in a vale, "so deeply excavated and overhung with surrounding hills, as to require almost as constant a use of the lamp, as the subterranean cell of Demosthenes."

The merits of this seminary appear to have been as scanty as its fame is obscure, if a knowledge of the bible in the vulgar Latin were all the proficiency made in it by a pupil, certainly not indisposed to literature or diligence. From this inhospitable climate, however, at the age of twenty-one, he emerged into the bright region of Paris, and was entered as a member of the Scotch college in that city. Here, under able teachers, and with every advantage for study, he appears to have made the most rapid progress in those branches of learning to which his attention was directed, and the acquisitions which he here formed were all subservient to those critical pursuits, for which by this time his mind had received a decided inclination.

Having completed his course of study, he was invited by professor L'Avocat to remain in Paris, and take a share in the public labours of the college. This proposal he declined, and returned to Scotland in 1764, where he was shortly afterwards instituted to the office of a priest among the catholics of the county of Angus. Scarcely had he entered into this situation, when he received an offer more congenial to his wishes and objects of pursuit, of becoming a resident in the family of lord Traquair; and in the leisure and opportunities of this situation, began to meditate and prepare a new translation of the scriptures. His continuance in this asylum was however interrupted by an incident of rather a romantic complexion, related with delicacy and propriety by his biographer. Feeling in his mind the progress of a growing affection, which he thought it his duty to repress, he snatched himself precipitately from danger, and again visited Paris. After such a residence in that city as we may presume to have been effectual for the attainment of its purpose, he revisited his native country in the spring of 1769.

We shall here introduce the biographer, continuing his narrative more at large in his own words.

"In returning a second time to his native country, Mr. Geddes dared not entrust himself to the fascinating spot, or re-engage in the domestic situation from which, in the preceding year, he had found it so necessary to fly. He accepted therefore of the charge of a catholic congregation at Auchinhalrig in the county of Banff, not far distant from the place of his nativity. This congregation, though numerous, laboured under a variety

of disadvantages, and at the time in which the subject of this biography was elected to the pastoral office, was equally diminishing in zeal and number. The members of whom it consisted were, for the most part, poor; their chapel was in a state of irreparable dilapidation; the condition of the parsonage house was but little better, and the most unchristian rancour had long subsisted between themselves and their more wealthy, as well as more numerous, brethren of the protestant community.

"Never was there a man better qualified for correcting the whole of these evils than Alexander Geddes, and never did man apply himself with more ardour to their removal. Activity and liberality were indeed the characteristic principles of his soul: much worldly prudence he never possessed, but his heart overflowed with the milk of human kindness, and his nerves, when in their utmost state of diseased irritability, still vibrated with benevolence. He proposed that the old chapel should be pulled down; he projected a new one; he rebuilt it on the spot which the former had occupied. He repaired the dilapidations of the parsonage-house; he ornamented it with fresh improvements, and rendered it one of the pleasantest and most convenient in his country. He not only, indeed, superintended these buildings, but laboured at them himself, being as ready a carpenter, and as expert in the use of the saw and plane, as if he had been professedly brought up to the trade. Gardening and carpentering were in reality at all times favourite amusements with him; they constituted his chief relaxations from the severity of study to the last moment of his life; and I have frequently rallied him, when at work, upon the multiplicity of his tools, which, in the article of planes of different mouldings, were more numerous than those of many professed artists, and on the dexterity with which he handled them.

"To his humble, but neat and hospitable cottage, it is to be expected therefore that he added the luxury of a good garden. Mr. Geddes had drawn his knowledge of botany rather from practice than theory, which, nevertheless, he had not altogether neglected. Satisfied with the indigenous bounties, as well as beauties of nature, he did not largely seek for exotic ornaments; nor would the paucity of his means have admitted of any considerable indulgence in this respect, had he even possessed the inclination. But his flower, his fruit, and his kitchen-garden, though little boastful of foreign productions, were each of them perfect in its kind, and the admiration of his flock, who were generously supplied, according to their respective wants, from the abundance it afforded:

—*Dapibus mensas onerabat inemptis.*

VIRG. Georg. iv. 133.

He piled their tables with unpurchased stores.

"Never indeed was there a man more liberal in diffusing to others the little of which he was possessed, than himself; never was a priest better beloved by the members of his congregation. I did not know him myself till many years afterwards: but I have been credibly informed by a variety of persons who did know him at the time we are now speaking of, and were intimately acquainted with his situation, that he seemed to live in the hearts of every one of his hearers, that his kindness and affability excited their affection, his punctilious attention to the duties of his office their veneration, and his extensive reputation for learning their implicit confidence in his opinions.

"I have said, that at the time of his fixing at Auchinhalrig, he found a high degree of rancour and illiberality subsisting, and mutually fomented, between his own congregation and the surrounding community of protestants. To correct this evil, than which a greater cannot exist, nor one more hostile to the spirit of the sacred pages, to which both parties reciprocally appeal, he laboured with all his might. By an extensive study and a deep knowledge of ecclesiastical history, he had freed himself completely from the bigotry which still attaches, in no inconsiderable degree, to the more ignorant of his own persuasion. He knew as well, and was ready to admit as largely as any protestant whatever, the alternate systems of force and fraud, by which the see of Rome has endeavoured to obtain an unjust temporal supremacy over the great body of the catholic church itself, to enslave the consciences of the laity to its own views of speculation and power, and to exercise, in a variety of highly important concerns, an authority which had never been officially conceded to it, and concerning which the reader will meet with a more detailed account, when we advance to an analysis of the controversial writings into which he was shortly afterwards compelled. Free and independent in his own mind, he took the sacred scriptures alone as his standard of faith, and exhorted every member of his congregation to do the same, to study for himself, and to submit to no foreign controul, excepting in matters fairly decided by the catholic church at large, assembled in general councils. He could ridicule the infallibility of the pope, and laugh at images and relics, at rosaries, scapulars, Agnus Deis, blessed medals, indulgencies, obits, and dirges, as much as the most inveterate protestant in his neighbourhood, and could as abundantly abhor the old-fashioned and iniquitous doctrine, that faith ought not to be held with heretics. Claiming the fullest liberty of conscience for himself, he was ever ready to extend it in an equal degree to others, and could therefore, with the utmost cordiality, embrace the protestant as well as the catholic. Honesty of heart was the only passport necessary to ensure his esteem, and

where this was conspicuous, he never hesitated to offer the right hand of fellowship."

The liberality and merit of Mr. Geddes here introduced him to the acquaintance of many of those protestants, most distinguished in rank and literature, of whom Scotland could at that time boast. But even at this early period, he became an object for the exercise of that bigotry from his roman catholic brethren, which, in the subsequent course of his life, he was doomed to experience still more bitterly. Religious bigotry, however, in this country, can in general manifest itself only by petty exercises of private malice. A more serious evil, in which our divine was soon afterwards involved, was the embarrassment of his finances, resulting from the improvidence of his inexperience and generosity, from which he was relieved by the assistance of the late Duke of Norfolk. To prevent the recurrence of this embarrassment, he engaged with sanguine expectations in an agricultural speculation, the only consequence of which was, to plunge him in a few years still more deeply into distress. To retrieve this second failure of his hopes, he ventured on a new experiment, in the publication of "Select Satires of Horace translated into English verse, and for the most part adapted to the present times and manners." This work was so favourably received by the public, that its profits, added to some incidental assistance of his friends, were sufficient to extricate him once more from the difficulties in which he had suffered himself to be involved.

The success of his first literary work emboldened him to try his fortunes in the capital, a theatre better suited to the activity and talents of his mind, than the obscure situations to which he had hitherto been attached. This resolution was aided by the fresh persecutions which his liberality had drawn upon him, from his bigoted religious superiors in Scotland; and he accordingly removed to London in the year 1779, with the satisfaction of having experienced from the congregation which he had lately superintended, the most lively testimonies of affectionate regard. In the ensuing year, by an act of liberality worthy of commemoration, he received from the university of Aberdeen, the diploma, by which he was created doctor of laws.

His first appointment, after his arrival

in the metropolis, was to the situation of an officiating priest in the chapel of the Imperial ambassador. The literary advantages afforded by his leisure, and the use of the libraries of London, now encouraged him to resume his favourite project of accomplishing an improved translation of the Bible. Under the munificent patronage of the late Lord Petre, a distinguished nobleman of the catholic persuasion, who engaged to allow him a yearly salary of 200*l.* and to furnish his library with whatever books he should deem requisite for his purpose, his labours first began to advance towards maturity. A sketch of his proposed scheme he immediately published, and that he might engage with greater advantage in the execution of it, he soon withdrew himself from every other stated engagement. The ardent mind of Dr. Geddes could not, however, be expected to abstract itself wholly from the political circumstances of the period; and events at this time occurred sufficient to rouse his warmest feelings into exercise. These were the disgraceful riots which took place in many parts of England, and especially in London, on occasion of a bill introduced into the house of commons by Sir George Savile, the object of which was to relieve the roman catholics, who appear to yield to no class of their fellow-subjects in patriotism and loyalty, from certain penalties and disabilities to which they were legally subject. At this period he wrote a work, which was not however published till nearly twenty years afterwards, under the title of "A Modest Apology for the Roman Catholics of Great Britain, &c."

Notwithstanding these occasional deviations, arising from temporary causes, the great plan of translating the scriptures was never long relinquished, except from unavoidable causes, from the first moment in which it was seriously commenced. In 1783, he was introduced to the acquaintance of the celebrated biblical scholar, Dr. Kennicott, and by his means to that of the venerable prelate, bishop Lowth, to whom he communicated the particulars of his plan, and whose advice and instruction he solicited. With every encouragement from that distinguished scholar, the nature of his undertaking was disclosed at large to the public in the beginning of the year 1786, in a pro-

spectus of his version. This we consider as one of the most interesting of the publications of Dr. Geddes; it is highly spirited, and discovers a great extent of critical and biblical knowledge. An analysis of it, and some ample extracts, are introduced by the biographer.

An interval of six years elapsed between the publication of this work, and the appearance of the first volume of the translation. This period was not, however, wholly occupied by the execution of the greater work in which he was engaged. In the chronological series of his publications, almost each of these years is marked by some production of his prolific pen. Of these, several relate to his version, some to the catholic controversies of the day, and other topics of theological polemics, others were occasioned by political events, and some were merely sportive effusions of his wit. Without entering into any minute account of these publications, we shall extract from this part of the work the relation of the circumstances by which Mr. Good was introduced to the acquaintance of Dr. Geddes, as it contains, with some just reflections, a portrait, the fidelity of which to the original will be recognized by all to whom he was known.

"It was about the year 1793, I first became acquainted with Dr. Geddes. I met him accidentally at the house of Miss Hamilton, who has lately acquired a just reputation for her excellent letters on education: and I freely confess that at the first interview I was by no means pleased with him. I beheld a man of about five feet five inches high, in a black dress, put on with uncommon negligence, and apparently never fitted to his form; his figure was lank, his face meagre, his hair black, long, and loose, without having been sufficiently submitted to the operations of the toilet, and his eyes, though quick and vivid, sparkling at that time rather with irritability than benevolence. He was disputing with one of the company when I entered, and the rapidity with which at this moment he left his chair, and rushed, with an elevated tone of voice and uncourtly dogmatism of manner, towards his opponent, instantaneously persuaded me that the subject upon which the debate turned was of the utmost moment. I listened with all the attention I could command, and in a few minutes learned, to my astonishment, that it related to nothing more than the distance of his own house in the New Road, Paddington, from the place of our meeting, which was in Guildford-street.

The debate being at length concluded, or rather worn out, the Doctor took possession of the next chair to that in which I was seated, and united with myself and a friend, who sat on my other side, in discoursing upon the politics of the day. On this topic we proceeded smoothly and accordantly for some time; till at length disagreeing with us upon some point as trivial as the former, he again rose abruptly from his seat, traversed the room in every direction, with as indeterminate a parallax as that of a comet, loudly and with increase of voice maintaining his position at every step he took. Not wishing to prolong the dispute, we yielded to him without further interruption; and in the course of a few minutes after he had closed his harangue, he again approached us, retook possession of his chair, and was all playfulness, good humour, and genuine wit.

“Upon his retirement I enquired of our amiable hostess, whether this were a specimen of his common disposition, or whether any thing had particularly occurred to excite his irascibility. From her I learned that, with one of the best and most benevolent hearts in the world, he was naturally very irritable; but that his irritability was, at the present period, exacerbated by a slight degree of fever which had for some time affected his spirits, and which had probably been produced by a considerable degree of very unmerited ill usage and disappointment. I instantly regarded him in a different light: I sought his friendship, and I obtained it; and it was not long before I myself witnessed in his actions a series of benevolence and charitable exertions, often beyond what prudence and a regard to his own limited income would have dictated, that stamped a higher esteem for him upon my heart, than all the general information and profound learning he was universally known to possess, and which gave him more promptitude upon every subject that happened to be started, than I ever beheld in any other person. I saw him irritable; but it was the harmless corruscation of a summer evening's Aurora, — it no sooner appeared than it was spent, and no mischief ensued: and when I reflected that it was this very irritability of nerve that excited him to a thousand acts of kindness, and prompted him to debar himself of a thousand little gratifications, that he might relieve the distressed and comfort the sorrowful, I could scarcely lament that he possessed it; or, at least, I could not avoid contending that it carried a very ample apology along with it.”

In 1792 appeared the first volume of his version under the title of “the Holy Bible, or the books accounted sacred by Jews and Christians; otherwise called the books of the old and new covenant's faith: fully translated from corrected texts of the originals, with various read-

ings, explanatory notes, and critical remarks.” This work, if completed on the same scale, must have extended to eight volumes in quarto, a formidable prospect for an author who had attained his fifty-sixth year at the publication of the first. A second volume appeared in 1797, and a volume of critical remarks in 1800. These were all which the author himself lived to publish, but we are informed that a part of his translation of the Psalms will make its appearance in another form.

The peculiarity of the religious creed of Dr. Geddes, in denying the divine legation of Moses, while he was a sincere and zealous advocate for that of Christ, is well known. It has found, and is likely to find, few abettors; least of all has it found one in the person of his biographer. It is to be regretted that Dr. Geddes disclosed his ideas on this subject so freely and so early, as they were by no means necessarily connected with the nature of his plan, and were calculated to give to the public at large that degree of offence which was likely materially to impede the encouragement, and ultimately the execution of his work. To combat the error of his opinions, where they are erroneous, is justifiable and laudable; but to refuse the writer the title of a christian, while he zealously maintains the divine authority of Christ's mission, on account of the apparent extravagancies of some other parts of his creed, is illiberal and absurd. These censures were however abundantly poured on him from every quarter; protestant and papist joined in the cry, not of heretic, but of infidel; and the declining days of this laborious and excellent scholar were embittered by unmerited odium and calumny.

By the protestant part of the community his undertaking had, in its early stages, been very generally and liberally patronized. The singularity of a new version of the scriptures, by a roman catholic divine, on the principles of rational criticism and enlarged judgment, attracted attention; and the acknowledged talents and qualifications of the author, gave encouragement to hope for his eminent success in this difficult and important task, the necessity of which now began to be generally acknowledged.

The more liberal part of the roman catholics distinguished themselves by an equally ready and generous support of this great undertaking. But by many

of that persuasion it was from the very first looked on with an eye of suspicion. "The English catholic community, which is divided into four districts, instead of dioceses, the London, or, as it is sometimes called, the southern, the middle, the northern, and the western, had at this time for their four official prelates, or vicars apostolic, James Talbot, superintendant of the first, Thomas Talbot of the second, Matthew Gibson of the third, and Charles Walmsley of the fourth; and as in almost every heretical country, except Ireland, which still retains a regular and independent hierarchy, the old prelatic titles have been dropped, and new ones adopted in their stead, taken from the unconverted regions of Africa or Asia, where hopes are entertained that churches may hereafter be formed:—the first of these vicars apostolic was dignified, by the papal chair, with that of the bishop of Birta, the second of Accone, the third of Comana, and the fourth of Rama." Of these prelates, the two former appear to have been men of liberal minds; the two latter to have been actuated by the narrow prejudices which have hitherto been too generally attached to their profession. Dr. Geddes was not without anxiety to gain the countenance of these spiritual superiors. For this purpose, he had at an early period communicated his design to bishop James Talbot, soliciting at the same time his approbation and patronage of it. By this prelate he was informed, that though he should be very far from opposing this design, two reasons would prevent him from publicly patronizing it: the fear of censure from the prejudiced part of the catholics, and the thoughts which he and his brethren entertained of publishing a revised edition of the Douay translation; declaring also at different times that he withheld his name from the subscription, only lest his official approbation of the work should thence be inferred. Bishop Talbot, however, after having seen the proposals, prospectus, and specimens of the author, died before the publication of the first volume, and was succeeded by Mr. Douglas, titular bishop of Centurix, appointed to this office by the papal court, in opposition to Mr. Berington, who had been strongly supported by the wishes of the more liberal part of the English catholics. Douglas, in conjunc-

tion with his colleagues, Walmsley and Gibson, commenced their persecution by citing the author, before the publication of his work, to their tribunal, to reply to a charge of maintaining doctrines contrary to the catholic faith. Dr. Geddes, with due deference to the observances of his church, obeyed the summons, and in reply to their examinations, which extended not only to his theological, but political creed, conducted himself with so much spirit and dexterity, that his judges, in all probability much against their inclination, were compelled to declare themselves satisfied. On the publication of his work, he transmitted a copy of it to Douglas, as the apostolical superintendant of his district, accompanied with a suitable letter. On the bishop's part a haughty silence was observed; the circulation of the work was obstructed in every way; and shortly afterwards a fulminating mandate was issued, setting forth, that "as the church of God has at all times watched with a jealous care over the heavenly treasure of the sacred scriptures, and has condemned the practice of printing the said scriptures, or any expositions of, or annotations upon the same, unless they have been severally examined and approved of by due ecclesiastical authority: hence it is incumbent on us to warn the faithful committed to our care, against the use and reception of a certain work of this kind, as far as it has yet appeared, which is destitute of these requisites, &c." From this encyclical prohibition, as it is called, bishop Thomas Talbot had the sense and justice to withhold his name: it was subscribed by the three other vicars. Under this attack Dr. Geddes did not remain passive. His intention of publicly repelling it he signified in a letter to Douglas; and in consequence of this contumacy, he was informed by his vicar apostolic, that, unless his submissions to the injunctions of the church were speedily offered, his suspension from the exercise of his orders in that district would be declared. Dr. Geddes in the course of a few hours returned a spirited reply, setting the menaced blow at defiance, which, in consequence, was suffered to fall with all its weight upon his head. An ample vengeance was however taken, by a pamphlet, which appeared after the expiration of the year, entitled, "A Letter from the Reverend

Alexander Geddes, LL. D. to the right reverend John Douglas, Bishop of Cuthbert."

The consequence of these persecutions was more serious to Dr. Geddes, than it would have been to a man of less irritable frame. He was seized with a lingering fever, brought on by the anxiety of his mind, from the effects of which it was nearly a twelvemonth before he was completely recovered. The last ten years of his life, though embittered by these contests, were, in other respects, nearly of the same complexion with those which preceded them, occupied in the diligent execution of his work, with occasional deviations, as any temporary object seized the attention of his excursive mind. The dates at which the subsequent volumes of his bible made their appearance we have already noticed. The most remarkable of his other publications, within this period, were three secular odes in Latin, celebrating the French revolution, a free translation of the *Ver-vert* of Gresset, and especially his "Modest Apology" already mentioned, "addressed to all moderate protestants, particularly to the members of both houses of parliament." A list of thirty-five publications, some on serious, and some on lighter topics, besides many occasional contributions to periodical works, comprized within the space of little more than twenty years, marks the industrious career of this indefatigable scholar.

The closing years of his life were rather of a melancholy cast. From the expensive nature of his great undertaking, without adequate support, he was again involved in pecuniary difficulties. Great anxiety of mind must have been endured before he disclosed them to his friends: that disclosure however was followed by prompt relief. A severe loss was sustained by the death of his noble patron, whose place however, in munificence, his son generously came forward to sustain. A most painful, and ultimately fatal, disease, arising from a cancerous affection of the rectum, now made its appearance; his gradual decline was sensible to himself; and visible to his friends, and bowed down by accumulated suffering, he expired on the 26th February 1802. The last act of bigoted persecution was to forbid the performance of public mass for the deceased.

A shameless attempt was made to

spread the belief, that on his death-bed Dr. Geddes had recanted what were termed his heretical opinions; and that this recantation was studiously concealed. This falshood, if it were worth refutation, there is direct evidence sufficient to refute.

Respecting the literary merit of Dr. Geddes's publications, it is not within our province to offer any detailed opinion. The force of his mind will perhaps be better estimated from the perusal of a narrative like the present, which collects his energies into one view, than from any of his single works. He often composed, as his biographer observes, precipitately, and occasionally in a state of high mental irritation. In all his works, therefore, with much to admire, a fastidious taste will probably find something to condemn. Of his poetry, either in Latin or English, we have seen little which we have been induced to place in a very high rank; nor does it indeed appear that any of his performances of this nature were considered by himself as more than relaxations from his severer studies. His Latin verses have all the appearance of having been written with great fluency, but they do not often remind us of classical antiquity. In polemics, his powers both of attack and defence appear to have been of the most formidable order; he was an acute logician, but in some of his arguments betrays perhaps the school in which his education was received. His critical attainments are unquestionable; in the grand requisites of fidelity of translation and approximation to the genuine reading of the text, his version, in all probability, greatly excels any which preceded it, but to its style something might perhaps be objected. To the general eulogium of his character, which is made by Mr. Good, no liberal mind will refuse its assent: "He was a benevolent man, an accomplished scholar, an indefatigable friend, and a sincere christian."

For much additional information respecting this distinguished character, as well as much curious matter incidentally connected with his life and writings, we refer our readers to the work of Mr. Good. His office of biographer we consider him as having, on the whole, very ably discharged. He is learned; he writes with elegance and ease, and his account is stamped, we had almost said, if that attainment be possible, with marks of absolute impartiality. The

appendix contains three Latin letters of Dr. Geddes's literary correspondence, the two first from MM. Paulus and

Eichhorn, the last a reply of Dr. Geddes to M. Eichhorn.

ART. IV. *The Life of General de Zieten, Colonel of the Royal Prussian Regiment of Hussar Life Guards, Knight of the Order of the Black Eagle, &c.* By Madame de Blumenthal, first Lady of the Bed-chamber to her Royal Highness the Dowager Princess Henry of Prussia. Translated from the German by the Rev. B. BERESFORD, P. D. 2 vols. 8vo. pp. 680.

THE subject of the present biographical memoir, was one of the greatest generals of one of the wisest monarchs and ablest warriors that the world ever saw, Frederick the Great. To professional men these pages will be found peculiarly interesting, as the frequent narrative of important military operations, occasionally illustrated by plans, is clear and instructive. To the young unfriended soldier, they teach a lesson of confidence; they encourage him to repose on his own courage and good conduct; and bid him hope, that into whatever situation he is thrown, and whatever present obstacles are opposed to his promotion, valour will ultimately be rewarded.

John Joachim de Zieten was born on the 18th of May, 1699, at Wustrau, a village belonging to his family, within a few miles of Berlin. His father was a man of small fortune; and in his house the son was totally unprovided with the means of instruction and culture. In very early life, Joachim displayed that military enthusiasm which became the leading character of his life. At the age of fourteen, without patron, friend, or fortune, low of stature, feeble of voice, puny and unhealthy of appearance, he left his paternal roof, and entered into the service of Frederick William I. His father obtained for him the post of standard-bearer in the regiment of General de Schwendy, with whom he had some slight acquaintance. Young Zieten introduced himself to the general, and on this ground solicited his patronage. He was received with an air of such insufferable pride, superciliousness, and superiority, that he rushed from the room, and took no pains to conceal his indignation. Young Zieten took an early opportunity, by his courage, to efface the unfavourable impression which his diminutive person and undignified appearance inspired. The first person he chastised was a veteran serjeant, who had behaved improperly to him; he wounded him desperately in the face, and escaped unhurt himself. Soon after this,

he crippled one of his comrades. After a continuance in the service of some years, he was appointed ensign (July 20, 1720); but the regiment was afterwards given to the Count de Schwerin, a native of the dutchy of Mecklenburg, who admitted into it several of his own countrymen, to the prejudice of the senior officers, and of Zieten in particular, whom he disliked on account of his low stature; and the shrillness of his voice, which, he said, was not formed to give the word of command. Zieten finding himself repeatedly superseded to make way for others, demanded his dismissal, and immediately obtained it. This retirement was of great value to him: it was here that he laid the foundation of those moral virtues, which distinguished him in future life as a son, a father, and a husband. His chagrin and mortification were extreme; but

Sweet are the uses of adversity,  
Which, like the toad, ugly and venomous,  
Wears still a precious jewel in its head.

In his retirement, he congratulated himself on escaping from that vortex of debauchery, into which he would probably have been drawn by his fellow officers, who at this time were particularly intemperate in their sensual pursuits: he was thus better prepared to resist the allurements of vice in maturer years. He reflected also, that he must rely on his own resources only, on his own genius and resolution alone, for his future success. Zieten's father died in the year 1719: the young man now retired to his paternal estate; extricated his affairs from the complicated law-suits in which his father had left them involved, and made provision for his mother and sisters. His military ardor, however, abated not; and at the end of two years, Frederick William I. who had frequently seen him in regimentals at parade, enquired concerning him, and made him the offer, which was very eagerly accepted, of a new commission, indemnifying him in point of rank for the time he

lost in his retreat, which had been provoked by General Schwerin's partiality to the Mecklenburg officers.

Zieten joined his regiment, and endeavoured to make himself perfect master as well of the theory as the practice of his profession. The superior genius of the young man, together with his frank and noble deportment, gained him the esteem of all his brother officers, the second captain of the colonel-squadron excepted, to which he belonged. This man, jealous of the superior genius of his lieutenant, during two years, took every opportunity to thwart and mortify him. The smothered flame at length burst out: Zieten challenged his superior officer, was tried by a court martial, and condemned to one year's imprisonment in the fortress of Friedericksbourg, whither he was sent at the end of the year 1720. At the expiration of his imprisonment, Zieten again joined the regiment; and, if the bravery of her hero has not seduced his fair biographer into too flattering a sketch, behaved with the greatest propriety and decorum. All the officers sided with Zieten; the conduct of his captain was considered as the effect of cowardice, he was shunned and despised, and meditated some deep revenge. Several attempts appear to have been intended upon the person of Zieten; one was at length executed: the young hero was unexpectedly attacked by his enemy, and had scarcely time to draw his sword, that he might parry the first blow. In the conflict Zieten's sword broke; he knew his enemy too well to confide in his generosity; and saved his own life by throwing the hilt in his face, with a violence that felled him to the ground. By partial representations to the king, who was taught to consider Zieten as of a quarrelsome and ungovernable temper, this affair proved more serious than the former: the captain was condemned to suffer three months imprisonment for drawing the first, and Zieten was broke for having thrown the hilt of his sword in the captain's face.

Zieten now retired to Wustraw, where he passed several months in a seclusion, which at length became perfectly intolerable: he was induced to solicit the intercession of two general officers, who lived on familiar terms with the king, Marshal de Bundenbrock and General de Flantz, in order that he might be reinstated. These officers, aware of Zieten's merit, overcame his majesty's repugnance to

admit the suppliant. Frederick William, in the year 1722, had created two companies of hussars; and in 1730, he was anxious to organize a third at Berlin, to be composed of the finest men of the Bayreuth company, a company which the Margrave of Bayreuth, his son-in-law, had given him, and of the flower of the two already formed companies of Prussian hussars. The king had named the captain and the cornet, and Zieten, at the earnest solicitation of his two friends, Bundenbrock and Flantz, was appointed lieutenant; "on condition," were his majesty's words, "that he should behave himself in an orderly manner, and that his superior officer would keep a watchful eye over him." The impression which this humiliating interview with his majesty, in the presence of his brother officers, made in the mind of Zieten, was not effaced at the latest period of his life. He was at this time thirty-one years of age; and it was with the greatest impatience that he bore the frequent contumely of his superior officer, Captain de Benekendorf, who forgot no part of the instructions of his majesty.

Frederick William was so much pleased with his hussars, that at the end of the first year he created two additional companies; and at the end of the second, he increased them to three squadrons, which he composed of the flower of the youth, and of the choicest men of every other regiment. Zieten, who daily rose in the estimation of his majesty, was appointed captain of the second company, on the 1st of March, 1731. The king, proud of being in some sort the founder of his hussars, was anxious that, by seeing service, they should emulate his grenadiers. In the year 1736, he ordered sixty *body hussars*, as this corps was now called, and an equal number of those of Prussia, to join the Austrian army, and gave the command of them to Captain de Zieten, whom he recommended in very strong terms to General de Baronay, in whose school he imagined they might be perfected in their discipline.

Zieten's march lay through Weimar: at Buttstädt, a small town belonging to that principality, he received such exuberant hospitality from the duke, that his hussars and himself got drunk to the health of their host, and the most serious consequences were on the point of taking effect, but for the timely recovery of Zieten from his intemperance. A vio-

lent animosity prevailed in the detachment, which, as was just said, was composed of Berliners and Prussians, against each other. At the desire of the duke, they were to perform an evolution on the following morning, and a sham combat was to be exhibited. At the signal for firing, however, the two parties loaded with balls, and many were wounded on both sides. Zieten from this time resolved never again to be seduced into intemperance, and his resolution was not taken in vain.

On the 12th of May he arrived with his detachment at the Austrian camp, and was quartered in the neighbourhood of Mentz: his tutor, M. de Baronay, was not slow to discern the merit of his pupil. After having assisted in several desultory skirmishes against the French, Zieten imparted his wish of trying the strength and courage of his squadron to the general, who, pleased with his impatience, entrusted him with three hundred Austrian hussars to join the Prussians, and charged him with an enterprize of considerable importance. The object was to turn the enemy, by passing through a defile, to flank them, to alarm their quarters, and to retreat before they could collect their forces. The disinclination of his hussars to obey the latter part of the instructions, had well nigh been fatal to them: the skill and prudence, however, which Zieten displayed on the occasion, were so flattering to his military character, that they were reported to the king, who immediately advanced him (January 29, 1736) to the rank of a major. At the conclusion of peace, Major Zieten quitted the imperial army with the reputation of a good officer, and returned to Berlin, where the reception he met with from his majesty was extremely flattering.

During his absence, the king had been pleased to give M. de Benckendorf his dismissal, and to appoint Lieutenant-Colonel de Wurm in his stead. This gentleman seems to have put the temper of Zieten to as severe trials as any officer under whom he had served. Zieten, however, soothed his irritated mind in the cultivation of domestic affections. About this time he married Leopoldine Judith de Jurgas, of the house of Ganzer, and of the family of his own mother; a lady, says our biographer, alike distinguished for her beauty and good sense,

her virtues, and her amiable and dignified demeanour.

"The charms of domestic life continued for a while to temper the vexations with which the colonel strove to embitter it, yet, what was easy enough to foresee, at last took place. The unremitting malevolence of that officer at length tired out his major's patience, and they had recourse to the most violent measures. The distribution of a supply of horses was the immediate cause of their quarrel. The colonel had chosen the best for his own squadron, although it was customary to draw lots, for the more equal accommodation of the troops. The moment he was apprised of this innovation, Zieten conceived it to be his duty to expostulate with the colonel on the business. He took care to wait on him before the parade began, and stating the inconveniences that would attend this new manner of selection, earnestly entreated him to suffer things to remain on their old footing. The despotic officer felt himself offended at this advice, fell into a passion, and grew rude. Zieten, who, when the interests of the service were at stake, was utterly incapable of giving way, answered him in the like tone. The dispute became serious, they fastened the door, and drew upon each other. Their quarrel, which had been so long stifled and concentrated, broke out with mutual violence, and they fought with equal fury. The colonel, however, had soon reason to be astonished at finding in Zieten an adversary who seemed to be a match for him, and over whom he was not likely to gain the least advantage. Notwithstanding the low stature and apparent weakness of the major, he stoutly sustained the assault of his colossal foe. They were both wounded: the colonel in the head, and Zieten in the right hand. M. de Wurm now suddenly broke off the combat, with a view of carrying it on in another manner. He laid hold of his pistols, and presented one of them to Zieten; who, more wise and moderate than he, replied, "We have both of us lost blood considerably, let us in the first place have our wounds dressed, and dispatch the business of the parade, which waits for us; when we are cured, I shall expect to hear from you, and I shall leave to yourself the choice of weapons." These words, which were uttered in a cool and resolute manner, had their proper effect; the colonel grew calm, and a surgeon was immediately sent for. The guard was duly mounted, and the horses distributed by lot. The grudge, however, still rankled in the colonel's heart, and only wanted a favourable occasion to break into explosion. An occasion soon happened, as we shall see in the sequel, and which made him pay dearly for his eagerness to take advantage of it."

In the year 1740.\* Frederick William I. died; in him Zieten lost a prince

\* He died, May 31.—Rev.

whom he loved and respected, and whose dislike towards himself he had converted into esteem. A short time after the accession of Frederick II. the decease of the Emperor Charles VI. took place: \* he was the last male heir of the House of Austria; but by virtue of the pragmatic sanction, his hereditary dominions devolved upon his eldest daughter, the Arch-duchess Maria Theresa. The inheritance of the Austrian dominions was not likely to slide quietly into the hands of a female, although the pragmatic sanction had been guaranteed by almost all the powers of Europe. No sooner was the emperor dead, than four claimants, Charles Albert, Elector of Bavaria, Augustus III. King of Poland, the King of Spain, and the King of Sardinia came forward with pretensions to the inheritance. Maria Theresa, notwithstanding, took possession of her territories, when a more artful, treacherous, and powerful claimant started up: this was the King of Prussia; who, in order to prevent Silesia from being attacked by other potentates, *without the slightest intention*, as he expressed himself in his manifesto, *of violating* the interests of her majesty, the Queen of Hungary, to whom he professed the strictest friendship, sent his troops into the duchy of Silesia. The three squadrons of body hussars, under the command of Colonel de Wurm, accompanied the army; and the Prussian hussars still remained in their quarters. The occupation of Silesia was effected almost without resistance, and the hussars had no opportunity of displaying themselves in this successful campaign. During the repose of winter, Frederick had leisure to estimate the advantages of these light troops; he formed a body of regulations for them, and communicated it to their principal officers. At the opening of the second campaign, Zieten received orders to break up his winter quarters, and join the king's army. The hussars, who had now, for the first time, the honour of composing the van, surprised a party of the enemy, who lost forty men, and these were the first prisoners which the Prussian hussars had ever taken. M. de Wurm had not forgotten his rencontre with Zieten, and an opportunity occurred in the early part of this campaign, which he thought would terminate the career of his antagonist. As de Wurm was reconnoitring the po-

sition of the enemy, he met a patrolle of some hundred hussars, whom he attacked and dispersed; pursuing them to the entrance of a defile, the latter faced about, and harassed him considerably without opposition. Zieten, enraged at the audacity of the Austrians, and the inactivity of his commander, pushed forward and cried out, "Colonel, will you not put these fellows to flight?" "Why don't you do it yourself since you are so bold?" "With all my heart," said Zieten, "if you will support me." Zieten instantly marched and pursued his advantage, expecting that his retreat was secured by de Wurm, who, leaving him to his fate, had perfidiously retired to a neighbouring village. Zieten was in imminent peril; he nevertheless secured his prisoners, and effected his escape without the loss of a single man. On his return to the village, he demanded satisfaction of his colonel for his cowardly desertion. De Wurm, exasperated at the escape, and still more at the success of Zieten, replied by drawing his sword. The combatants were soon separated by an aid-de-camp, but de Wurm was wounded; he was confined to his tent, and Zieten as next in rank took the command. At this time he received orders from the king to repair with the whole corps to head-quarters, on business of an expedition then in agitation. Frederick reviewed every squadron; and in testimony of his regard for Zieten, raised him to the rank of lieutenant-colonel.

"Some days after this, the king determined upon dislodging the enemy from the post of Rothschild, from whence they had made frequent excursions, and laid the country under contribution. He entrusted the enterprize to Colonel de Winterfield, his adjutant-general, who put himself at the head of some battalions of grenadiers, and the hussars of Wurm and Prussia under the command of Zieten. The ency was strong, and their position almost impregnable. Before them they had a deep and extensive marsh, crossed by a long and narrow causeway, that lay in the face of a battery. Zieten began the onset, advanced at full speed along the causeway, and under a quick fire forced the passage, threw the enemy, who little expected to be attacked in front, into disorder, repulsed them after a vigorous resistance, and drove them close to a mill, along the side of a rapid stream, the bridge of which had been broken down. All retreat was thus cut off from the Austrians, while colonel de Winterfield was still engaging the infantry, and Zieten made a whole

regiment of cavalry prisoners. But how great was his surprise, as well as his triumph, when he discovered he had been coping with the celebrated General de Baronay, his former preceptor in the art of war! The scholar not only surpassed the master, but had likewise taken him prisoner, had he not crossed the stream by the timely assistance of a plank, and immediately betaken himself to flight. The general the next day carried his justice and generosity so far, as to write the most obliging letter to his conqueror, in which he confessed himself vanquished, and observed that the master was but too happy in having been able to escape at all from so formidable a scholar."

Frederick was soon informed of this brilliant exploit of the hussars, which produced an universal sensation throughout the camp, and appointed Zieten to the rank of colonel. De Wurm now resolved at all events to retrieve his character: an opportunity offered, but his incapacity was so great, that, but for Zieten, both himself and followers would have fallen inevitable victims. Frederick dismissed him the service on a small pension, and named Zieten to be the chief officer of his hussars, after having united the six squadrons of Berlin and Prussia into a single regiment. About this time also, he was decorated with the order of military merit. The name of the hussars now began to be formidable; Zieten had the merit of being the father of all the heroes who succeeded him in this line of duty, as his regiment had that of being the model of all that were formed after him. In the course of this campaign, they signalized themselves on various occasions, but in no instance proved of more essential service than in aiding the splendid retreat of the Prince of Anhalt before Charles of Lorraine: Zieten covered the baggage, and led the vanguard, and acquitted himself with so much vigilance, ability and success, that when the Prussian army, retreating from the walls of Olmutz, arrived in Upper Silesia, they had scarcely sustained any loss. Soon after this, preliminaries of peace were signed at Breslaw, the Elector of Bavaria was chosen Emperor of Germany, by the name of Charles VII. and Silesia was ceded in full and perpetual sovereignty to Prussia.

In the brief biographical abstract which we are now making, it must be mentioned, that at the end of these two campaigns Zieten returned as poor as he had set out: frequent occasions of enriching himself had occurred; he had overrun Bohemia and Moravia at the head of his light troops, and had penetrated into Austria and Hungary. The king himself had hinted to him, in some letters, which are given in these volumes, that if his officers "should be able to procure any extraordinary emoluments, he should not examine the matter very nearly, provided they did not push things too far, &c.;" in short, he certainly had it in his power to amass considerable wealth with perfect impunity; but Zieten thought it his duty to check any spirit of plunder and unnecessary devastation which might appear among his troops.\*

During the peace, Zieten divided his time between the enjoyment of his family, and the duties of his profession; he employed the interval between the first and second Silesian wars in improving his regiment, and perfecting their discipline. At the king's command, he tried the effects of various evolutions practised by the Austrian hussars, and adopted those which appeared to be best:—himself and his officers too, made dispositions in writing on subjects which the king had given them, and which his majesty revised, in order to estimate their respective military knowledge.

Zieten was, at this time, a little hurt that the king, who had invited several Hungarian officers into his service, should suffer some of them to take precedence of him.

In the year 1743, his lady bore him a son, the only one he had by this marriage. The birth of a son, however, did not induce him to pay any attention to the improvement of his fortune. He trusted the management of his farm, and all his domestic concerns to his wife, totally regardless of the produce.

Prussia now enjoyed two years of peace; at the expiration of this time, Frederick, in order to support the tottering fortunes of the emperor, again took the field, and in conjunction with France, prepared to direct his operations once

\* The goodness of Zieten's heart was, at this time, eminently displayed in favour of the captain, who had persecuted him so unrelentingly in Prussia, and who had even induced Frederick William to cashier him. The captain had been dismissed the regiment for cowardice: he was compelled to lead a wandering life, despised by every body. Reduced to extreme necessity, at length he had recourse to Zieten, who raised the old man from the ground, assured him of his pardon, and from that moment became his avowed benefactor.

more against the Queen of Hungary. The order to march found Zieten ill in bed; the fatigue of service, to which he had submitted like the meanest subaltern, had made sad inroads upon his delicate constitution; the tender assiduities of Madame de Zieten could never induce him to alter his plan. In her letters, she had gently chid him for sleeping on the ground, exposed to the damps of night: and entreated him, as the greatest proof of love he could shew her, to be more careful of his health. But to no purpose: he was now in an alarming state; Frederick's command to march, however, was more efficacious than all the prescriptions of his physician. It was thought that he would not have lived to reach the place of rendezvous; he recovered, however, and was the first who met the enemy, whom in various recounters he defeated. The campaign opened prosperously: Prague surrendered to the Prussian arms, and its garrison of 12,000 men were made prisoners of war: Budweis was taken by the valour, chiefly of the hussars, and Frederick immediately raised Zieten to the rank of major general, ordering his commission to be ante-dated eight months. At the battle of Tein, General Zieten gained laurels at a time when the Prussian army was dispirited by a toilsome and distressing retreat: himself, with his handful of hussars, performed prodigies of valour; and Frederick, when he heard of the engagement, was so delighted at the splendour of an achievement which had effected the deliverance of his rear, that he instantly mounted his horse, and met the conquering heroes on their way: he applauded their valour, spoke of their leader in terms of consideration and gratitude, and placing himself at their head, led them in triumph through the whole camp. Every man rushed out of his tent to see them pass by, and the camp resounded with "Long live the king!" "Long live Zieten and his troops!"

This campaign of 1744 was disastrous. In his "military instructions for the generals of his army," Frederick acknowledges it to be so, and takes his own share of the disgrace. A stop was put to the progress of his arms by the courage, conduct, and activity of Prince Charles of Lorrain.\* Frederick was obliged to abandon Prague, and the other

places of which he had taken possession in Bohemia, and make a precipitate retreat into Silesia. Zieten covered the retreat; and at the disastrous conflict on the banks of the Elbe, which were not to be defended against the superiority of the Austrians, gained himself immortal honour. Madame de Blumenthal asserts, that the "evacuation of Bohemia was executed without any loss, and that the troops marched in two columns, one of which the king commanded in person." Dr. Russel, in his *History of Modern Europe* (see vol. v. page 111) says, that "the Prussians, in their retreat, lost above thirty thousand men, with all their heavy baggage, artillery, and waggons loaded with provisions and plunder."

Thus terminated the campaign; at the end of which Frederick, in consideration of the eminent services of de Zieten, gave him a pension of twelve hundred dollars. The Empress of Russia too, notwithstanding the principles of neutrality she had adopted, presented his regiment, in compliment to their bravery, with three hundred valuable horses.

The king had now learnt the danger of venturing too far into the defiles of Bohemia; in the beginning of the campaign of 1745, Silesia therefore was again made the theatre of war. Zieten was here employed on a very delicate and perilous business: his regiment was, with the king's main army, between Patzkaw and Frankenstein. The Margrave Charles covered Upper Silesia, and occupied Jägerndorf and Troppaw. The Austrians took advantage of this inconsiderate division of the army, and separating into two parties, one encamped between the king and the margrave, and occupied all the posts of communication; whilst the other, encamping along the bank of the Oder, environed the latter. The king, seeing himself on the verge of a general engagement, resolved to recall the margrave; but the Austrians had guarded every avenue, and were so vigilant, that even couriers, chasseurs and spies, were immediately taken. The difficulty of communicating his orders seemed almost insuperable. Zieten was selected to execute this daring enterprise; an enterprise of so much peril in the eyes of Frederick himself, that in his instruction to the general he desired him to proclaim the order to the whole regiment, that in

\* In this sketch, it will be discovered, that we frequently consult Dr. Towers's "Memoirs of the King of Prussia." It is necessary to compare the two narratives.—REV.

case they should not be able to make their way sword in hand through the Austrian posts, each hussar that *escaped* might inform the margrave of his majesty's intentions. Zieten, before he set off, persuaded his lady, who had followed him to winter quarters, to return to Berlin, as something of a very important nature was about to take place.

The unparalleled boldness of the stratagem which de Zieten adopted, was crowned with the success it deserved. To force his way through the enemy was clearly impossible.

“During the course of the last campaign, and even during the winter excursion in Upper Silesia, his regiment had worn their summer dress, which consisted of red mantles and felt caps. Their full accoutrements had not arrived from Berlin before the campaign had already closed; hence the Austrians were not as yet acquainted with that part of their regimentals, which moreover greatly resembled those worn by the hussars of Spleng, at this time making part of the division posted at Leobschutz. Zieten, who was aware of the latter circumstance, founded upon it his hopes of deceiving the enemy, by making his own hussars pass for theirs, and leading his Prussians in broad day light through their army.”

He marched with affected carelessness and unconcern through the enemy's camp, followed one of their columns, under the appearance of making part of it, and made a colonel who, mistaking him for an Austrian, came to inform that his dragoons were close behind, a prisoner of war in the centre of his own camp! The alarm was given, but it was too late; and Zieten, with very inconsiderable loss, reached Jägerndorf, where he entered in triumph, and where he was received by the margrave with all the joy and admiration due to his courage and good fortune. The margrave immediately broke up his camp, and with the assistance of Zieten effected his march, and joined the king's army, notwithstanding that the Austrians made a variety of desperate and well concerted assaults to intercept this brilliant and victorious passage.

After this junction the whole army was eager to engage the Austrians: Frederick suffered not their impatience to subside, but gained a terrible and bloody victory over the enemy on the 4th of June, 1745, at Hohen-Friedberg. Having driven his enemies out of Silesia, he now entered Bohemia. In this battle general Zieten rescued general de Kiew from the hands of the enemy: this officer had scarcely

passed the Strigaw, with the first ten squadrons of his brigade, when the bridge broke down. Zieten saw him on the point of being surrounded without the possibility of retreat, but he had anticipated and prepared for the accident: he had tried the depth of the stream, and now forded it with his corps of reserve, fell upon the enemy, and routed them.

The two hostile armies now lay so near each other, that they seemed to form but a single camp; they kept this position for near three months, perpetually engaged in desultory skirmishes. In one of these Zieten was of eminent service: two officers, with whose intemperate courage he was well acquainted, formed a design to carry off a whole regiment of Austrian Uhlans; Zieten, aware of the danger of the enterprise, followed them with his regiment without their knowledge, and lay in ambush in a wood. His friends succeeded in their attack; but eagerly pursuing the advantage they had gained, were on the point of being cut off, when the wary general sprung from his concealment, and effected their delivery, with the capture of some prisoners.

After the battle at Sohr, where Frederick gained a complete victory; but where, says he, honestly enough, “I should have been beaten, as I deserved, if the abilities of my generals and the intrepidity of my troops had not saved me from that misfortune;” he broke up his camp, and returned to Berlin, which he entered in a sort of triumph, having in his train the cannon which had been taken in the last campaign, together with standards and colours, the trophies of his victories at Hohen-Friedberg and Sohr. He had not been here long, however, before he received information from Prince Leopold of Anhalt-Dessau, that Prince Charles had not put his army into winter quarters, as he had succeeded in inducing Frederick to believe; but that a body of 10,000 Austrians, under the command of Count de Grunn, was marching towards Saxony. The king instantly quitted his capital, and put himself at the head of his army in Silesia: the battle of Hennesdorf decided the fate of Prussia, and may be considered as the preliminary to the peace of Dresden. To the success of this battle Zieten materially contributed: the king entered Lusatia, without knowing precisely what posts were occupied by the enemy; the two central columns

of the army were composed of infantry, the two other of cavalry; the king led the first of the centre, and Zieten, at the head of his regiment, marched in the van. Zieten passing through a forest which led to Hennersdorf, discovered that that village was occupied by three regiments of Saxon cavalry, and one of infantry. The king's column, with the heavy artillery, had been misled into a marsh, and could give no support to Zieten, whose resolution, however, was instantly taken. He sent an officer to Frederick, informing him of the discovery, and saying that he would be before-hand with the enemy, for that he would attack them and keep them employed till his majesty should be able to assist him. Zieten found the garrison in motion, and the regiment of Saxe-Gotha ready to receive them with artillery; he immediately charged them, and was received with great coolness and resolution. Extraordinary efforts were necessary; Zieten was successful, and the whole regiment was cut to pieces. The regiment of Obyern suffered almost as much as that of Saxe-Gotha: each lost four field-pieces, all their colours and standards, with five kettle-drums, before the arrival of a third regiment of Prussian cavalry, and a part of the infantry. This rendered the victory complete: Frederick entered the town and established his camp here, and presented the regiments of general de Zieten and general de Ruesch each with two of the kettle-drums, as an accompaniment to their military music. The rest of the cavalry have not any; but every time these regiments take the field, their kettle-drums are deposited with great ceremony in the arsenal of Berlin. Zieten was accidentally wounded in this action, by the carelessness of one of his own soldiers, and was disabled during the remainder of the war.

The king of Prussia's account of this affair is not altogether so favourable as Madame de Blumenthal's: he says that the hussars, instead of improving their first success, were busied in plunder at one end of the village, (which was a very long one,) and gave the Saxons time to form at the other. These stood their ground, and probably might have retired with little loss, if Frederick had not detached ten squadrons of cuirassiers and ten battalions of grenadiers to their support.

The treaty of Dresden was signed Dec. 25, 1745, and the seven years' war began 1756. Notwithstanding this long period of inaction, the narrative of Madame de Blumenthal flows in an unbroken current. To us, indeed, who take but little delight in the bustle and bloodshed of a battle, this part of her biography is as interesting as any other. It exhibits the picture of a valiant warrior in the midst of his family, caressing his children, and enjoying the society of an amiable, prudent, and affectionate wife. Zieten, retired to his country seat, now determined to rear a suitable mansion for his residence: like every one who engages in it, he had a passion for building, and with that carelessness about money concerns, which ever distinguished him; he laid the foundation of a mansion, to complete which his resources were very insufficient. Frederick made him a present of the timber and mortar; but Zieten, with an obstinate perseverance, from which his anxious wife could not divert him, borrowed loan upon loan, regardless of futurity.

In this period of his retirement, too, we see the mortifying picture of a high-minded man degraded in the eyes of an ungrateful sovereign, and bearing in manly silence his cold neglect and sullen alienation. Towards the conclusion of the war, Frederick had shewn some pointed preferences to general de Winterfeldt, and Zieten had, in a letter, remonstrated with his majesty on some occasion, wherein he conceived his own services undervalued.

Winterfeldt, perhaps, was made acquainted with the contents of this letter; at any rate, from this time he became the concealed, but most formidable rival and persevering enemy that Zieten ever had. He took every opportunity to insinuate that Zieten's military talents were very inferior; that he owed his fame to the good fortune of some rash and dangerous enterprises; and that in the calm of peace he had neglected to preserve the discipline of his hussars, who were extremely inferior to those of the Austrians, although the latter, unprepared for his mad assaults, had occasionally been confounded and defeated. Zieten, in the full consciousness of his past services, and of his present unabated zeal for the strict discipline and superiority of his troops, scorned to bow the

knee or solicit an explanation, and the triumph which his dignified conduct eventually gained was complete.

When Frederick saw the political horizon of Prussia again begin to darken; when he saw those vast preparations for hostility, which, on the eve of the seven years' war, threatened his kingdom with destruction, he remembered Zieten. The great Frederick had his littlenesses: he could listen to the idle slanders of envious flatterers, and in the day of trouble was not ashamed to court the man who had eminently contributed to that period of prosperity, during which he had the baseness to neglect and depreciate him. General Zieten's health had so materially suffered from the death of his wife and only son, and from the constant vexation he had experienced by the ingratitude of his king, that he expressed a desire to obtain his discharge.

If Frederick was not stung with remorse, at least he was not indifferent to his interests: an impending war, and the apprehension of losing one of his best officers, restored him to himself. He made every possible advance to reconcile the offended warrior; but the steps which he at first took, were not those to conciliate such a man as Zieten. His kind enquiries after the health of Zieten were thrown away, and all his smiles were laughed at. Frederick was so imprudent as to employ de Winterfield himself, the man who had done him so much injury, to conciliate him. He was received with coolness, and dismissed with dignity: but Zieten's return to the service was necessary to Frederick, and he resolved to call upon him himself, and alone. At first he attempted to make him acknowledge *his faults*, and was desirous to persuade him that he himself had been the sole cause of the misunderstanding, and closed his harangue with a promise of forgetting every thing that had passed, holding out his hand in token of reconciliation. Zieten receded—he scorned to acknowledge faults of which he had not been guilty, and

“These few words triumphed over the firmness of our hero, and found the way to his heart. He threw himself at the monarch's feet, and vowed to shed the last drop of his blood in his service.”

Before the opening of the campaign, the king raised him to the rank of major-general, and the reconciliation now effected produced a zealous friendship between the monarch and his officer, which never abated to the hour of their death.

Throughout her narrative, the partiality of Madame de Blumenthal to the hero of her story has led her to speak contemptuously of general Winterfield: if he employed those artifices which are here attributed to him, in order to intercept the rays of royalty, and prevent them from illuminating the retreat of Zieten, he is justly censurable. But it ought to be mentioned, that after Frederick's reconciliation with his general, who had not concealed from him his suspicion as to the malicious interference of certain individuals, Frederick to the last continued his attachment to Winterfield, whom he considered as an officer of great talent and courage. Winterfield was killed by a cannon ball in the campaign of 1757, as he was leading up succours to some battalions who were engaged with the enemy: the king was much affected at his death; “I may find resources,” said he, “against the multitude of my enemies, but how few men are to be found equal to Winterfield!” Madame de Blumenthal's enthusiasm requires considerable abatement.

We are now come to the seven years' war; a war nominally undertaken for the recovery of Silesia, in favour of the house of Austria, but, in fact, as it is observed here, to palsy a political body, which the creative genius of its sovereign had indued with such energy as to excite perpetual jealousy and alarm. Zieten was as remarkable for his prudence and foresight as he was for his gallantry, and to enumerate the instances in which he displayed the one and the other, would be to detail the events of the war. We must refer our readers to the historians of that bloody period; contenting ourselves with noticing a very few only of those scenes in which he was engaged. He covered the Prussian army in their dangerous passage of the Moldaw, and turned the fortune of the day in favour of the Prussians at the celebrated battle

“—The moment of reconciliation began to appear more distant than ever, when the good genius of Prussia prompted the king with the following words: ‘No; it cannot be possible that Zieten, my faithful general, on the approach of a perilous war, should abandon his king and his country, whose confidence he so fully possesses!’

of Prague. Zieten had the command of the corps of reserve; the Austrians had actually broken the infantry, and put the cavalry to flight, when this able general, who anticipated the disaster from some error which he had detected in the plan, rallied the fugitives, and by his spirit and presence of mind greatly contributed to the victory. The king of Prussia, in his account of this battle, acknowledges that he lost 18,000 men, and estimates the loss of the Austrians at 24,000! Marshal Schwerin's death, to use his own expression, withered the laurels of his victory; at the age of eighty-two this warrior rushed with the rallying cavalry, and was pierced with several bullets.

After the battle of Prague, Zieten joined the duke of Beverne, in order to prevent Marshal Daun from marching to the relief of the prince of Lorrain, who had thrown himself into Prague with 40,000 of the routed army; with an inferior force they kept the marshal at bay. The face of affairs, however, soon changed in consequence of the unaccountable obstinacy of the king of Prussia, who discredited the uniform and reiterated intelligence of his generals as to the situation of the enemy; and who was brought to unexpected action before Colin, where he was completely beaten. On this day general Zieten performed prodigies of valour, and by his address and foresight frequently frustrated some particular manœuvres of the enemy. The line was broken in so many points, that prince Maurice and general Zieten thought it proper to fill up the chasm with their own squadrons; the fire of a formidable and well-served battery, however, was so destructive that it was necessary to get rid of it. Prince Maurice engaged Zieten to put himself at the head of four regiments of heavy horse, and attempt to carry it: this daring and most desperate attempt was twice made, but in the second onset Zieten was struck with a grape-shot, and fainted on his horse. The troops, who a moment before had braved the mouths of the cannon, were now panic-struck at the loss of their general, and fled. The ball grazed his head, and carried away his cap; a second discharge of grape-shot killed his horse, and Zieten owed his life to the activity of M. de Berge, a cornet in another regiment, who placed him on his own horse, and conducted him to a

place of safety. The general recovered, and his deliverer was an object of envy throughout the army.

At the retreat of the Duke of Beverne, General Zieten covered the rear, and after the disastrous battle of Breslaw, and the capture of the duke, completely saved the wreck of the army, by opposing the precipitate and pusillanimous retreat which his superior officers had commanded. He received the thanks of Frederick, and those officers, Generals Lestaitz, Kiow, and Katte, were put under arrest, while Zieten was appointed commander in chief to conduct the shattered army.

At Leuthen the carnage again was dreadful: victory decided in favour of Prussia; the Austrians were routed, and Zieten executed the fatiguing and perilous task of driving them before him for fifteen successive days, and recovering the complete possession of Silesia!

Moravia was the seat of the campaign in 1758, and here it was that General Laudohn had the honour of beating General Zieten, near Dohmstadt. In this engagement, of nine hundred new recruits, all in the flower of their age and vigor of life, who were enlisted for the purpose of completing the regiment of Prince Ferdinand, not one hundred survived the affray; the rest, together with the gallant officer who commanded them, were left dead on the spot! This defeat brought on the loss of a convoy, consisting of between two and three thousand waggons loaded with provisions, military stores, and arms for the king's camp, and obliged him to raise the siege of Olmutz. It is thought that by his expedition into Moravia, and his ill-advised siege of Olmutz, Frederick lost the advantages which he might have derived from his victory of Leuthen; for the Austrian army, which was completely disorganized in the preceding winter, now availed itself of the time which the king lost before Olmutz to recover its complement and vigor.

According to the account before us, General Zieten was the cause that the disaster at Hochkirchen, bad as it was, was not still worse. The security into which Frederick was lulled, it seems was effected by one of his own spies who had been detected by General Daun, and compelled by him to continue his reports to the Prussians, and lead them astray. Frederick would not believe the reports of his generals that a suspicious move-

ment was making in the Austrian camp, and gave orders to the hussars to unsaddle their horses: Zieten contermanded the orders of his sovereign, and in half an hour afterwards had them re-saddled. The Prussians had been guilty of an oversight; they had neglected to occupy the heights that commanded the village of Hochkirchen. The Austrian troops set out at midnight, on a dark foggy night, took possession of the hill, and poured into the Prussian camp, where the carnage of sleeping and half naked soldiers was immense. Zieten's corps was prepared for the attack, and the retreat of Frederick over slaughtered thousands has always been considered as a remarkably fine one. He pitched his camp within half a league of the enemy, who dared not attack him, but on the contrary declined an action to which the king vainly endeavoured to provoke them. Madame de Blumenthal says, that Frederick lost all his artillery. Other historians, however, assert, with greater plausibility, that he performed his retreat under the fire of a part of his own artillery which was saved, and placed in the centre of his van. Frederick was slightly wounded in this affair: and the campaign had made such havock in Zieten's corps, that he was under the necessity of requesting the king's leave to select such officers as he found in the several regiments of the army who were proper for the hussar service. But the loss of the gallant and accomplished Colonel de Seelen, who was mortally wounded in the surprize of Hochkirchen, was irreparable.

The military talent and genius of Zieten was never more conspicuous than in his splendid retreat before Marshal Daun, from Soraw, in the campaign of 1759: the marshal, who was a very competent judge in such cases, had anticipated the defeat of his enemy, and could not—he did not desire to withhold his admiration at the courage and skill of a manœuvre which utterly disappointed his most sanguine expectations.

At the commencement of the campaign of 1760, the affairs of the king of Prussia were in a very critical state: 80,000 Russians approached Glogaw to assist the operations of the Austrians, and their junction seemed inevitable; 90,000 Austrians pressed him closely, and Zieten's march from the bank of the Elbe to the town of Lignitz, in opposition to the united forces of Daun and

Laudohn, was one of the most painful and perilous that had been undertaken during the whole war. The king encamped at Lignitz: and the night before the battle took place which extricated him from his desperate situation, he knew not that the Russians were in his neighbourhood, or that the Austrians intended an attack. The army lay at rest: Major de Hund with Lieutenant de Wolfrath at day-break discovered the columns of Laudohn. They flew to apprize the king and found him with the Margrave Charles and General Zieten, in a small wood, round a fire, fallen asleep. In the battle, Laudohn lost 10,000 men; Frederick 6000 killed and 12,000 wounded. Frederick and Zieten had passed the night together beside a watch-fire; "uncertain," says our biographer, "of the hazards they were going to incur, they had suddenly separated at the alarm given by Major de Hund. The one and the other had fought for glory and their country, and they met again on the field of battle, crowned with victory. Zieten congratulated the king; the king embraced Zieten, and advanced him to the rank of general of cavalry."

The last battle in which either Zieten or Frederick was personally engaged, was when they divided the command between them and stormed the heights of Siptitz at Torgau: it is remarkable too, that this was the only one in which Zieten stained his sabre with the blood of the enemy—in this action he is said to have made very violent and desperate use of it.

In the campaign of 1761, Zieten was sent to prevent the junction of the Russian army with that of the Austrians: it had taken place however before his arrival. In this campaign he was generally near the king's person, who in all cases of difficulty consulted him, and frequently in the dead of night, overwhelmed with despair or chagrin, sought his general's quarters, and received from him consolation, hope, and assistance. The last time that General Zieten beheld the fire of an enemy was at Schweidnitz, which, with its garrison of 11,000 men, surrendered to the Russian arms on the 19th of October, 1762: he frequently visited the trenches, exposed himself to the shells of the enemy, and saw them fall at his feet without any apparent concern. On the 16th of February following, the peace of Hubertsbourg termi-

nated the seven years' war—a war which established the military preeminence of Prussia, and made the king immortal.

Concerning this great general, a small portion of whose feats only we have been able to sketch with this rapid pen, it will be interesting to add something illustrative of his private character. Zieten is represented as benevolent and humane, pious from feeling and from principle; in the day of adversity he found consolation in religion: "I have lost every thing," said he over the cold remains of his wife; "beauty, virtue, prudence, piety, all these she possessed, but it is the Almighty who hath taken her from me." Neither forgot he his Creator in the day of prosperity: it was his constant custom, as soon as he was dressed, to order his valet to leave him. He then said his prayers, a duty which he was never known to neglect, even during his severest indispositions.

Zieten was a severe disciplinarian, but he was the father of every soldier under his command; he saw with his own eyes that they enjoyed every comfort which their situation admitted when duty was over, and by such offices of kindness and attention he won the affection of every hussar in his regiment. Unenvious of the merit of another, he was the first to do it honour, and frequently dissipated those capricious prejudices which Frederick conceived against individual officers, and even corps. In war he united wisdom with courage,

"— contempt of danger with perseverance, dexterity with presence of mind, and activity with the most perfect command of temper; he conceived his plans with the progressiveness of the rising storm, and executed them with the rapidity of the thunderbolt. Unruffled in the heat of battle; singularly accurate and concise in giving his orders; foreseeing every thing, prepared for every thing; he was invariably able to turn the circumstances of the moment to advantage. His military glance was correct and infallible; he was equally admirable in attack and defence; capable of the most daring enterprises, and losing every idea of personal safety when his duty called him to engage in them, he never failed to acquit himself with success."

In his principles he was firm, and his probity was invincible: perfectly disinterested, he never enriched himself by illicit means.

"To general admiration and esteem were joined sentiments of a more tender kind and more congenial to his nature—the affection

and confidence of his brother-officers and hussars. In the midst of the tumults of war he had ever preserved those social virtues which had marked the early period of his life. Guided and sustained by rational piety, his moral character still shone with undiminished lustre, while his talents, his faculties, his religious principles, acquired new force as he advanced in his brilliant career. The pernicious maxim, the maxim of his day, that the duty of a soldier superceded that of a man, was never adopted by him. The horrors of war, to which he had been inured, never steeled his heart to the softer calls of humanity; and such feelings he considered not only as far from degrading his profession, but even as one of its most noble appendages. Severe in the field, and inexorable in whatever regarded the duties of the military life, (because he himself was the first to set the example, and had no errors nor neglect on his own part to call for indulgence in favour of such as were guilty of either,) he was in all other respects remarkable for the gentleness and even the complaisantness of his manners. He was ever ready to accommodate those whom he commanded, to the utmost of his power, or to lighten with a kind word, a look, a smile, the burdens they had indispensably to sustain. His officers, his private soldiers, whom he loved with paternal affection, never solicited his counsel, his interposition, his succour in vain. Just and impartial in the extreme, he tolerated no oppression, no persecution; and though exact in the infliction of punishments, he was still more so in recompensing every noble, every liberal action.

"He had always acted with feeling and equity towards the hostile nations during the various incursions he had made among them. The laws of war never induced him to overlook the sacred rights of man. Far from countenancing any kind of exactions, he was the friend, the protector, the father of the unfortunate inhabitants of the places which became the immediate seat of war. Whenever he received orders to pillage an hostile country on leaving it, his custom was to observe the form only; he would cause a few windows to be broken, throw down a few stoves, displace or overturn the furniture of a house or two; but was never known to deprive the inhabitant of what was absolutely necessary to him, or to commit a single act of barbarity. The soldier loved him still more than he feared him. In every place his preservation was the object of universal concern. Not only his own country, but the nations who had known him as their enemy only, did ample justice to his disinterestedness and greatness of mind."

This does not appear to be a random panegyric on imaginary virtues; it is justified by a variety of anecdotes which are related in the work.

After the termination of his military career, which ended with the seven years' war, General Zieten lived twenty-six years in the full enjoyment of all the honour and glory which he had so arduously earned :

"His sovereign continued studiously attentive to distinguish him by fresh marks of his esteem, his friendship, it may almost be said, his veneration. The princes of the blood were eager to imitate the example of Frederick. Henry, Ferdinand, the presumptive heir to the crown, thought themselves honoured by the zeal they shewed to do justice to the merits of Zieten. The court, the strangers that visited Berlin, equally admired the attention which was shewn to this hero by those whose birth and rank were so far above his own; and, it was a fine spectacle for the whole country, to see the subject so noted and caressed by his master, and by the family of his king.

"These distinctions, for which Zieten was indebted to his merits only, were no longer imbibed by envy. His enemies had disappeared, and among the witnesses of his glory he could only reckon applauders and friends. His countrymen in general, whether in civil or military capacities, whether inhabitants of towns or villages, esteemed him, cherished him, and looked upon him as a father, revered him as a hero, and considered themselves in some degree as partakers of his glory."

The pleasure which Zieten experienced on returning to his favourite villa at Wustrau, after the perils of seven long campaigns, was heightened by a circumstance which did great honour to the Swedish troops. In one of their campaigns they had penetrated as far as this village, when hearing that it was the property of Zieten, *who was then waging war against them and their allies*, they not only refrained from touching any thing that belonged to him, but manifested the high respect they bore him, by placing sentinels before his house, examining his portrait with admiration, and by many other flattering attentions.

The general now went to Carlsbad for the recovery of his health: the inhabitants of every town he passed through gave him the most honourable reception, and testified, by the most unequivocal evidence, that in his career of victory he had treated Saxony and Lusatia more like a benefactor than an enemy. At Carlsbad he met Laudohn and several Austrian generals with whom he had recently fought: Laudohn and Zieten became inseparable friends.

At the age of sixty-five General

Zieten paid Frederick the compliment of requesting his consent to a projected marriage: his majesty sent the following answer:

"My dear General de Zieten,

"By your letter of the 4th instant, you ask my consent to your marriage with Mlle. de Platen. I grant it with great pleasure, and wish you all possible happiness on the occasion. If I knew where the nuptials are to be celebrated, I should not fail to be with you, on purpose to dance with the bride. I remain your affectionate king,

FREDERICK."

The following year his lady presented him with a son: Frederick came from Potsdam to Berlin on purpose to be present at the ceremony of baptism, and stood sponsor for the infant, whom he immediately raised to the rank and pay of a cornet in his father's own regiment. Zieten, however, would never suffer him to rise, even to the rank of second lieutenant, till he was of age sufficient to do the duties of his station; he repeatedly and inflexibly resisted every offer of the royal bounty!

In the seventy-ninth year of his age, Zieten experienced one of the most painful trials he had ever met with in the course of his life. It was in 1778: the Bavarian war had just broke out, and the troops had received orders to march; his equipments were ready, and himself was prepared, when he was informed that the king was going to make the campaign without him. No solicitations could avail: Frederick peremptorily insisted that the old warrior should rest from his fatigues. When the regiment left Berlin, he took leave of his pupils and companions, exhorting them in a short and pathetic speech to be mindful of what they owed to their country, their profession, and their reputation. The old man shed tears, nor was the regiment less affected on the occasion: in deep distress he returned to his home after their departure, and after a long silence and with a deep sigh exclaimed—"Alas, I have now nothing to do but raise a regiment of women!"

"At length he could no longer bear to reside in Berlin: he went to Wustrau, but unaccompanied with the ardour and activity which had hitherto attended him there. He caused several tables to be placed together in his dining-room, covered them with the best maps he could procure of the theatre of the war, and passed whole hours in poring over them. In a short time, he began to recover his former tranquillity of mind, be-

came more gay and communicative; and, at this time it was, that the grateful woman, whom he honoured with his friendship and his confidence, and who has since ventured to compile these memoirs; attentive to these recitals, snatched from oblivion such particulars as discretion permitted him to impart to her, and has incorporated them in the monument she has raised to her hero."

General Zieten lived, as we have already said, twenty-six years with his second wife: by her he had two children. The family was a family of love; caressing and caressed, each seems to have anticipated the wishes of the other: as he advanced in years he became more gentle, communicative, sociable, and indulgent. Frederick, at the age of seventy, would often pay his general, at fourscore, an unexpected visit. The princes of the blood, and all the Prussian generals were proud to imitate the example.

In December 1785, the king had returned to Berlin, in bad health. Zieten, who had not seen the king for some months, at the age of eighty-six went to the palace to pay his respects. The moment Frederick saw him,

"What, my good old Zieten! are you there?" said his majesty. "How sorry am I, that you have had the trouble of walking up the staircase. I should have called upon you myself. How have you been of late?" "Sire," answered Zieten, "my health is not amiss, my appetite is good; but my strength! my strength!" "This account," replied the king, "makes me happy by halves only; but you must be tired—I shall have a chair for you." A chair was quickly brought. Zieten, however, declared that he was not at all fatigued: the king maintained that he was. "Sit down, good father:" continued his majesty, "I will have it so; for I cannot allow you to be inconvenienced under my own roof." The old general obeyed, and Frederick the Great remained standing before him, in the midst of a brilliant circle that had thronged around them. After asking him many questions respecting his hearing, his memory, and the general state of his health, he at length took leave of him in these words; "Adieu, my dear Zieten (it was his last adieu!) take care not to catch cold: nurse yourself well, and live as long as you can, that I may often have the pleasure of seeing you." After having said this, the king, instead of speaking to the other generals and walking through the saloons as usual, retired abruptly, and shut himself up in his closet."

Zieten preserved his faculties to the last: his sight and hearing had been for some time impaired, but his general state of health was good; he

"Sunk to the grave with unperceiv'd decay,  
While resignation gently slop'd the way."

He died on the 26th of January, 1786, in his eighty-sixth year:

"How sleep the brave, who sink to rest  
By all their country's wishes blest!  
When Spring with dewy fingers cold  
Returns to deck their hallow'd mould,  
She there shall dress a sweeter sod  
Than Fancy's feet have ever trod;  
By Fairy hands their knell is rung,  
By forms unseen their dirge is sung;  
There Honour comes, a pilgrim grey,  
To bless the turf that wraps their clay;  
And Freedom shall awhile repair,  
To dwell, a weeping hermit, there." \*

The finances of Zieten had been considerably decayed by his liberalities: in short he died poor! Frederick, who survived him but a few months, made a present to his widow and children of ten thousand dollars. The successor of Frederick raised a noble statue to the general's memory: it is considered as a fine piece of sculpture, and is the production of M. Schadow of Berlin. A plate and description of it are given in these volumes.

"Zieten was low of stature, meagre, but well-built; his face was oval, his hair dark-brown, his forehead flat, his eyes large and blue. His mouth was somewhat wide, his lips thick, and the under one marked with a deep scar. His features were strong; his countenance masculine and somewhat harsh, though not deficient in harmony. His looks were steady, his eyes full of expression and fire, and his face highly characteristic of seriousness and dignity.

"His attitude was erect, his gait free and easy. He was brisk in his motions, could use his sword in either hand, a circumstance that proved advantageous to him on several occasions. He danced with singular grace, rode boldly and with great ease; and to the very end of his life, he preferred the lightest and most mettlesome steed to any other. Whether on horseback or on foot, all his movements were alert: on all other occasions they were sedate and slow; and he who saw him in his chamber engaged in his domestic affairs, could hardly suppose him to be endowed with that degree of activity, resolution, and boldness which always characterised him in public.

"Averse to loquacity, he could say much.

\* Mr. Beresford has with great taste selected these appropriate lines as a motto to the work.

in few words. His answers were just and precise; his replies not deficient in point and smartness. His voice was rough and manly: he gave the word of command with peculiar distinctness. His whole person announced serenity, experience, and firmness of character; commanded attention, obedience, and respect."

These volumes contain a great many

letters of Frederick the Great: they are written by a lady of high rank, and who enjoyed the personal friendship of Zieten, from whose lips she received a large portion of the materials for his biography. The style of the translation is easy and fluent: the work is printed at Berlin, and abounds with typographical errors.

ART. V. *The Cambrian Biography, or Historical Notice of celebrated Men among the Ancient Britons.* By WILLIAM OWEN, F. A. S. Small 8vo. pp. 345.

CONSIDERING ourselves as literary purveyors, whose duty it is to select, with caution, from the promiscuous banquet offered to the public, a sample of every article which we think productive of nutriment, or likely to gratify, without vitiating the taste; we are apt to be upon our guard against those *quintessences*, and *elixirs*, and *epitomes*, which are frequently exposed to sale, as containing a marvellous compression and condensation of knowledge, and professing to supersede the necessity for that more material and voluminous nourishment which is commonly prepared by legitimate cookery. With this impression on our minds, we first took up this little volume of *Cambrian Biography*.

The principality of Wales, it is true, presents to the eye of the geographer a small and insignificant spot, when compared with the extent of Great Britain: yet if we consider that it is the native country of genealogies, and that in its history, the arrival of the Saxons, whom we consider as our remote ancestors, is almost a modern event; it must appear strange that a duodecimo volume of less than 350 pages should be presented to the public as containing an adequate account of *Cambrian biography*.

Strange however as it does seem, we must in justice confess, that in our references to this little work we have never been disappointed; that we have found as many "historical notices" respecting every name with which we were acquainted, as Welsh history, or even Welsh tradition, could be reasonably expected to furnish; that many of the articles contain hints which, when properly followed up, appear likely to throw much new light on the obscurest parts of literature; and that in general the *Cambrian Biography* bears fresh testimony of the learning, the candour, and the modesty of the industrious author of the *Welsh Dictionary*.

Mr. Owen professes to have given in the present work, a mere outline of Welsh biography; and says, in his preface, "at some future period, and in other hands, such a meagre skeleton, perhaps, may grow into a form more consistent with its appellation. But, in the first instance, it was of importance to bring together all the names deserving of remembrance, though the small extent of the plan might admit of nothing more than barely recording the greater portion of them, so as to leave room for such memorials as related to the most important characters connected with history."

We are aware that nothing can be more unjust, though nothing is more common, than to criticise an author for not doing what he never professed to do. We therefore can only lament that Mr. Owen's avocations are likely to preclude him from completing the edifice, after having employed so much labour and research in the collection of materials. But, as every book of reference is of some value, inasmuch as it tends to abridge the labour of the student, and as Welsh literature appears likely to attract, in this inquisitive age, much more attention than has been hitherto bestowed upon it, we think it our duty to recommend a few obvious improvements which may be introduced into a future edition of this book, with little trouble to the author, and with great convenience to the reader.

1st, As this dictionary is principally intended for the advantage of those who are strangers to the Welsh language, we think that the name by which any character is familiarly known to the English, should always be entered in its place, with a reference to the articles under which it is afterwards more fully described. Thus *Caractacus*, *Cassibellaunus*, &c. ought to stand in their natural order, because the ignorant reader is very likely to overlook them under

the titles of Caradog and Caswallen. In many instances this caution is still more necessary. What Englishman, for instance, would look for Geoffrey of Monmouth under the very unusual appellation of Guffydd ab Arthur?

2d, It were much to be wished that Mr. Owen would always quote his authorities, particularly in dubious cases. For instance; the following is his account of the famous Walter de Mapes, of facetious memory.

"Walter de Mapes, an eminent writer who flourished in the middle of the twelfth century, and who was chaplain to Henry I. He was the son of Blondel de Mapes, who came with Robert Fitzhamon to Glamorgan, and obtained the lands of Gweirydd ab Seisyllt Lord of Llancarvan; but he had the generosity to marry Flur, the only child of Gweirydd, that was living; and by whom he had two sons, Hubert and Walter. Hubert dying without heirs, Walter inherited, after his brother, and built the village of Trevwalter, with a mansion for himself. He restored most of the lands which he became possessed of to the original proprietors; and he built the church of Llancarvan, as it now stands. He translated the British Chronicle into Latin; and he made a Welsh version of Geoffrey's florid paraphrase. He also wrote a treatise on agriculture in Welsh, which is extant in several manuscripts."

Now Geoffrey himself professes to have translated into Latin the British Chronicle from the original (whether Welsh or Armorican) which was put into his hands by Walter, archdeacon of Oxford: if so, why should Walter de Mapes, who became archdeacon about half a century later, attempt to supplant, by a new translation, the popular work of Geoffrey, unless he meant

to prove the "the florid" paraphrase was untasteful? And if he disapproved of that paraphrase, why did he translate it into Welsh, and thus contribute to give it more extended currency?

The following article will perhaps be thought to stand no less in need of vouchers.

"Plennydd, one of the three who first reduced bardism into a regular institution, enjoying rights and privileges, under the sanction of the nation. This was an event that took place far beyond the scope of all historical records, except the triadic traditions, which used to be repeated in all solemn meetings of the bards, druids, and ovates; it happened probably above a thousand years before the Christian era."

The probability of this date is certainly not obvious; and those who doubt, without ridiculing its correctness, deserve to have their doubts removed either by arguments or by ancient authorities.

We do not mean, by selecting these, which we consider as among the most exceptionable articles, to depreciate the general merit of this small but valuable work, or to retract the favourable opinion of it which we have already expressed. We recommend it as containing a clear, correct, and, in general, a temperate account of the most striking events in Welsh history, and as contributing many curious particulars respecting the mythology and traditions of a nation which is interesting in many points of view, and whose opinions had perhaps an influence on the manners of the middle ages, which has been too much overlooked by common historians.

#### ART. VI. *Public Characters of 1803-1804.* 8vo. pp. 567.

QUALIS ab incepto! Englishmen seem to have lost that healthy appetite for which their forefathers were famed; they must now have something stimulant in order to make it palatable: for plain diet they have no relish. It is very well known in the trade that a book sells best when it satirizes with unusual severity, or when it flatters with extraordinary

fulsomeness. The fragrant censer is applied to the nose of every individual biographized in this work. What we said in our notice of the former volume we repeat here: 'The book is compiled to satisfy vulgar curiosity, and the execution is in general as creditable as the design.'

#### ART. VII. *A Defence of the Character and Conduct of the late Mary Wollstonecraft Godwin, founded on Principles of Nature and Reason, as applied to the peculiar Circumstances of her Case; in a Series of Letters to a Lady.* 12mo. pp. 160.

In forming a just estimate of so singular a character as that of Mary Woll-

stonecraft Godwin, it will be requisite to recur to something more, says the au-

thor of these letters, than a few single occurrences of her eventful life. Certainly: but why limit the proposition to "so singular a character" as that of Mrs. Godwin? The application of it is universal, for no character can be justly estimated by a few single occurrences. Not only her sentiments and views, he continues, ought to be maturely weighed in the balance of unprejudiced reason, but the circumstances which gave them birth should be also fairly investigated, and allowed to have their natural influence upon the subsequent events of her life. In delineating her character, therefore, the author has attempted to trace the circumstances that formed it, with the hope, as he expresses himself, of thus finding the best apology that can be made for certain individual points of her conduct, over which every reflecting and sympathizing heart would desire to throw an oblivious shade for ever. Surely there is more than a little inconsistency in bringing forward to public investigation "certain individual points" of the conduct of Mrs. Godwin, over which the author himself acknowledges it would be more charitable to throw the shade of oblivion! It is one among a hundred other suspicious circumstances belonging to these pages.

In another part of his volume, the author tells us that he does not pretend to vindicate the whole of her conduct, but that his object is, merely to explain it upon her own principles, and to shew upon what foundation those principles were raised. Now the conduct of Mrs. Godwin was too obviously explicable on her own principles to stand in need of illustration; and the foundation upon which those principles were raised is scarcely less open to observation. Her contempt of the opinion of the world arose from a too flattering estimate of those abilities which she was compelled to exercise by the unkindness of her family; in early life she called them into action for a maintenance; they were luxuriant but wild; they bore fruit, but she mistook the nature of it. She mistook genius for judgment: of the former she had abundance, of the latter little; but nevertheless had the rashness to oppose that little to the accumulated stock, which age, experience, and wisdom united, had produced.

But if the author does not vindicate

the whole of Mrs. Godwin's conduct, he may almost as well leave the task of vindication unattempted; there were but few parts of Mrs. Godwin's conduct indifferently good or indifferently bad: all her deviations from the established standard of morality were wide and glaring, and these only are those parts of her conduct which require vindication. But the fact is, that he leaves no part of it unapologized.

Uncharitable as the insinuation may seem, a suspicion has come across our mind on the perusal of these pages, that more is meant by them than meets the eye: the panegyric which pervades them of the moral character of this "amiable," this "incomparable" woman, as she is continually called, is extravagant; it is certainly unbecoming and unwise in the part of an advocate thus to extol a client, whose character he acknowledges stands in need of apology: it is suspicious. We find some inconsistencies in the defence too, which, notwithstanding the adducement of extenuating circumstances, is not such a defence, we suspect, as Mrs. Godwin would herself have made, or have suffered another to have made for her.

The first object of Mrs. Godwin's \* affections was Mr. Fuseli; or, as it is coarsely expressed here, "the first sexual attachment that is plainly avowed," was towards that celebrated gentleman, whom she was in the habit of meeting at the hospitable table of Mr. Johnson. Mr. Fuseli was married; and Mrs. Godwin no sooner discovered the impression which his fascinating conversation and manners had made on her too susceptible heart, than to avoid the consequences which might ensue from an unequal conflict with her passions, she nobly resolved to leave the country: she remembered the poet's praise of him

"Who quits a 'scene' where strong temptations try,

And since 'tis hard to combat, learns to fly:"

she profited by the praise, and dearly earned it for herself.

Mrs. Godwin left London; she went to France, where she resided between two and three years. At Paris she became acquainted with a man, the letters even of whose name it gives us pain to trace, Mr. Imlay, who at that time was enjoying considerable reputation on account

\* To avoid confusion of names we shall confine ourselves to that which she carried to the grave.

of his publication on the state of Kentucky. Mrs. Godwin's strong prejudices against the indissolubility of marriages, as being a condition of union inconsistent with the nature of man, were in all probability strengthened at this particular time: for it will be recollected, first, that her connexion with Mr. Imlay took place in France; and, secondly, that it took place at a period when the subject of marriage was discussed in the national councils of that country, the discussion producing throughout the republic a very material, and certainly a very lamentable change in the opinion of people on this serious and important subject. Her prejudices then, already strong, it will be acknowledged were probably strengthened by the almost universal coincidence of the public opinion with her own as to the dissolubility of the marriage union. To these prejudices was superadded a reason why she should not marry Mr. Imlay: she was in some pecuniary difficulties, and the generosity of her nature shrunk from the idea of involving the object of her attachment in her own embarrassments.

The author of the little volume before us dwells on this last circumstance; now he must very well know, that it affords not the shadow of an excuse for Mrs. Godwin's connection with Mr. Imlay, although it was a very sufficient and honourable reason why she ought not to marry him; and he disclaims the former as an extenuating circumstance, namely, the consideration of the country where, and the period when, the intimacy took place, on the false ground, that "as a foreigner, Mrs. Godwin could in no way be influenced by the wild theories of an insane people to condemn legal sanctions, if she had deemed such essentially requisite, to confirm the morality of her connexion." Foreigners are as subject to the laws of the country, in which they chuse to reside, as natives; but the statement, it is very obvious, has nothing to do with the case: for although marriages in France are now more easily dissoluble than they were formerly, no laws were ever passed in that country to prevent marriages from being solemnized. The extenuating circumstance is the increased confidence in her previously conceived opinions on the subject of marriage, which Mrs. Godwin derived from the prevalence of similar opinions, among those with whom she

ANN. REV. VOL. II.

was in the daily habit of conversing, and this, which is properly the only extenuating circumstance, the *defender* of Mrs. Godwin has thought proper to disclaim, while he dwelt upon another which he knew had no connexion with the question!

How does this gallant defender then apologize for the unsanctioned intercourse which took place between Mr. Imlay and Mrs. Godwin? As Mr. Imlay eventually proved to be the most unfeeling and cold-hearted of all cold-hearted and unfeeling men, our author sagaciously supposes that, in order to have won the affections of Mrs. Godwin, he concealed the deformity of his mind, "that he either assumed a character that was not natural to him, in order to impose upon her generous unsuspecting heart, or that she viewed him through a very fallacious medium." It is not very likely, indeed, that any woman should fall in love with a monster undisguised. Now for the apology; "when Mary Wollstonecraft gave to this second person an interest in her heart, she seems to have adopted the most efficacious mode of removing all traces of her former attachment, and of obviating its recurrence. I am induced to believe that she admitted the acquaintance of the latter person, in order to fix her affections, *in consequence of her relation to him*, rather than imagine that her affections were transferred from Mr. F. to him, prior to the commencement of their intimacy."

We are by no means certain that we comprehend the meaning of this exculpatory statement, the words which we have printed in italics are to us utterly unintelligible; in order to avoid misconception, we shall state our conception or misconception of its general meaning. In the first place, Mrs. Godwin is represented as having formed a connection with Mr. Imlay as the most efficacious mode of removing all traces of her former attachment to Mr. F. If this is true, what a compliment she paid Mr. Imlay! Himself is not the object of her affections, but she *tries* to love him for the purpose of obliterating a dearer attachment; but whether true or not, what an idea does the apologist convey of the delicacy of Mrs. Godwin's sentiments, and the refinement of her feelings!

We by no means intend to vindicate the conduct of this lady, with respect to her

Kk

intercourse with Mr. Imlay, or the gentleman to whom she was afterwards legally united; but we cannot sit in silence when motives are imputed to her which would have excited her utmost scorn and indignation. This article is already extended to a length which we did not foresee at the commencement of it, and we now feel it necessary to apologize for a still further extension of it.

The little book before us is entitled "*A Defence of the Character and Conduct of Mrs. Godwin*:" in the course of his labour the author seems to have discovered, that a defence and an apology are two distinct things, but he does not appear to be sufficiently aware, that the conduct which requires an apology cannot be defended, and that the conduct which is defensible very rarely requires an apology. We have more than once hinted our suspicion, that the author of this defence, or apology—call it which you will—is not so sincere in his regard for that character which he has summoned from the grave to stand a second time, as it were, before the bar of the public, as he affects to be; if, however, we are mistaken, if he is really and honestly anxious that the sentence which has been passed upon that ill-fortuned female should be revised and be reversed, he will think that our treatment of him requires an *apology*, although it is perfectly *defensible*. The feebleness of his defence is the strength of ours: it is that, connected with some inconsistencies that we have noticed, which first excited our suspicions; if we are mistaken, however, it is with great pleasure that we acknowledge and apologize. Let us now return from this digression.

Mrs. Godwin, it is universally allowed, was a very original thinker; she prided herself, foolishly enough perhaps, in thinking differently from other people. She was not, however, singular in her opinion, that those ill-sorted matches of convenience, where the heart is not interested, are so many prostitutions of the person, to which the law gives currency. Sexual intercourse is common to the birds of the air and the beasts of the field: in man only is that connexion ennobled by the feelings of the heart and the affections of the mind, and it is these feelings alone and these affections which distinguish it from mere animal intercourse. Where they are wanting the parties become brutified and degrade the

dignity of their superior nature. To such extravagant and unwarrantable excess did Mrs. Godwin carry this delicacy of sentiment, that as the ceremony of marriage cannot in the eye of reason sanction a mere sensual connexion, so neither did she conceive that a connection refined by sentiment and purified by all the affections of the heart, required the ceremony of marriage to stamp it with the seal of innocence. And yet this is the lady who is represented by her *apologist* as having deliberately, and after mature calculation, "commenced an intimacy" with Mr. Imlay—not because, exquisite as her feelings were, he had excited them in his favour, not because she experienced any tender emotions, any mental attachment towards him—no: the connexion *preceded* the transfer of her affections, and was calmly set about with a philosophic view to fix them!

Our author, however, thinks after all, that Mrs. Godwin's best apology for neglecting the marriage ceremony must be sought for in the exercise of her private judgment, and he introduces her as pleading her own cause before an imaginary *Custos Morum*, who calls her to account for having despised the ordinances of the law. A miserable defence she makes of it.

We had noted down some other circumstances of weakness and inconsistency in the defence, which tend to corroborate our suspicions, particularly where the conduct of Mr. Godwin is censured for some passages in the memoirs of his wife. But the article is already long, and enough has been said, we trust, to shew the weak and imprudent manner, to say the least of it, in which this defence is conducted. Our object has been not to defend Mrs. Godwin, nor even to apologize for her conduct: it has been merely to do her justice, to repel the imputation of improbable and dishonourable motives when others are to be found, less objectionable in their nature, and more probable because more consonant with her character and sentiments.

Most true, indeed, it is, that there are certain individual points in the conduct of Mrs. Godwin, "over which every reflecting and sympathizing heart would desire to throw an oblivious shade for ever!" Knowing the generosity of her heart, the warmth of her affections, the superlative ardour and heroism of her

friendship,\* and the steadiness of her principles, it is deeply to be regretted that her conduct in many material particulars can never be held up to imitation; it was of a nature, indeed, so fraught with injury to civil society, that even those circumstances of palliation which might be adduced in her favour individually by the man who is disposed to temper the severity of justice with the tenderness of humanity, can scarcely be

brought forward with impunity. But in enumerating her faults, let us forget not to contemplate her transcendent virtues! Of the one and of the other, she is now called to give an account at the tribunal of heaven; let *us*, therefore,

“No further seek her merits to disclose,  
Or draw her frailties from their dread abode;  
There they alike in trembling hope repose,  
The bosom of her father and her God.”

ART. VIII. *The Life of Richard Earl Howe.* By GEORGE MASON. Svo. pp. 111.

MR. Mason's motto to this little volume would form a fine text for a funeral oration:

“Let us now praise famous men,  
The Lord hath wrought great glory by them,  
through his great power, from the beginning:

There be of them, that have left a name behind them, that their praises might be reported,

Their seed shall remain for ever, and their glory shall not be blotted out.”

We need not enter into the details of this life; those parts which do not belong to the History of England, are such as are common to all men; a few anecdotes, that characterise the individual, may be selected:

Mr. Howe served on board the *Burford*, Captain Lushington, in 1743, when an attempt was made on the town of *Ila Guitta*, upon the coast of *Curacoa*.

“The attack was made; the *Burford* suffered considerably; and the captain was killed in the action. This attempt having failed, a court-martial was held, relative to the conduct of the *Burford*. Young Howe was particularly called on for his evidence. He gave it in a clear and collected manner, till he came to relate the death of his captain. He could then proceed no farther; but burst into tears, and retired. There subsists a more intimate alliance between steady courage and sensibility, than the generality of men are aware of.

“In 1761, he acted as Captain to Rear-Admiral his Royal Highness the Duke of York, on board the *Princess Amelia* of 80 guns at Spithead. In this situation he con-

tinued during the remainder of the war; the Duke of York being always second in command to a senior admiral. Once, when he was in this service, the lieutenant of the watch went to him at midnight, and awaked him, saying, ‘My lord, don’t be frightened, the ship is on fire close to the magazine.’ He sprung up, and replied in an angry tone, ‘What do you mean by that, sir? I never was frightened in my life. I will be with you in a moment: but, in the mean time, give directions that nobody attempts to disturb his royal highness.’ He went down instantly, and ordered wet swabs, and other proper remedies to quench the fire. He then went again upon deck, and, seeing all quiet, retired to sleep with his usual composure. This anecdote is so egregiously mis-reported in the *Naval Chronicle*, that the writer thought it his duty to correct that statement from Mr. L’Epine’s *Memoir*.”

We recollect a somewhat similar anecdote of Lord Bridport, and relate it with the more pleasure, as that excellent admiral of the true old English school is still living. During the action of the first of June, one of his people came to inform him that the water was entering the ship fast. “Well, sir,” said the old seaman, never altering his deliberate manner of speaking, “they may sink us, but they must not make us haul down that flag.”

Mr. Mason, with commendable warmth, notices the conduct of administration towards Lord Howe in 1793.

“He always declared himself averse to the system of blocking up ports: he said, it was frequently ruinous to the shipping, and that,

\* We allude to her noble conduct towards Miss Fanny Blood: the health of this lady being on a decline, her physicians recommended her to go to Lisbon. At this time Mrs. Godwin kept a school for her support: she heard that her friend was likely to die in a foreign country, when, spurning every interested and prudential consideration, she borrowed a sum of money and instantly set off for Lisbon to catch the last breath of her expiring friend! Say ye, “whose clay-cold heads and luke-warm hearts can argue down, or mask” your feelings, what would you have done? On her return, Mrs. Godwin found that her school had materially suffered by her absence. The author of the *Defence*, instead of dwelling on such a noble trait of Mrs. Godwin’s character, has contented himself with glancing at it,

from the uncertainty of winds; the possibility of adhering to such a plan was by no means to be relied on. (This part of his remark was pretty strongly verified in last war, when the French squadron got out of Brest, and landed troops in Ireland.) He thought it was much better to let the fleet lie ready in some sheltered situation, whence it might proceed to sea with almost any wind whatsoever: and he asserted, that the place he had described was Torbay. The writer of the foregoing sentences is perfectly unqualified for entering into any dispute on the subject; he barely reports the professional opinion of so established a character for naval knowledge, as Earl Howe. Let us now proceed to the history of our admiral's movements with his fleet in 1793. Hoisting the union flag at the main, he began his cruize off Brest, and in the bay, July 14th. Near a month after, he got sight of the French fleet, and chased them into Brest. He then returned into the Channel August 10th, and anchored in Torbay. On November 18th, while cruising in the bay, he saw a squadron, to which chase was given, but they effected their escape. What was there in all this, to impeach the well-grounded high reputation of a veteran officer? Yet censure grew loud: he had anchored too much in Torbay. Surely he knew his own business, better than such wise land-men could teach it him. Yes, he wanted not knowledge, but heartiness. Good fortune had damped his spirit, or it was worn out. This was talking idly indeed. At no time of his life could he have been properly styled, brave through necessity. His income was always superior to his wants, as a single man; and when he married, he married an heiress; and anteriorly to that heroic instance of his cool intrepidity displayed at the shore of St. Cas, his family estate had fallen to him. If in his 68th year a youthful ardency might be deemed to have abated, the manly firmness of his soul was the more established in proportion. Whoever suspected him of backwardness, must have known little of the individual; his intimates saw to demonstration, that the most effectual performance of his duty was the ruling passion of his heart. This tumour of slander is a blotch upon Britons, an excrescence from the front of their liberty, but by no means

*'Ense recidendum:—ne pars sincera trahatur.'*

Ov. Met. l. v. 191.

We shall see the foul eruption strike in again; even though ministers nourished the growth of it—by their silence. They could say, after the memorable first of June, that they had always confided in their admiral; but they chose not to say so now. This is no reflection of my own: they are the words of Earl Howe that I repeat. He had experienced the skulking principles of the same abettors in 1788."

With the same feeling he comments upon their depriving him of the garter.

"Public report asserted, that, antecedently to this visit, his Majesty of his own free will had offered his victorious admiral a vacant blue ribband, or order of the garter; and that this offer so graciously made, had been as thankfully accepted. For this I quote only report, because I never heard it in terms direct from the victor's own mouth. It was not the practice of Lord Howe, to divulge what had been imparted to him by his royal master. Yet neither did he contradict the report; and what he really said relative to the minister's behaviour on the occasion, to my own apprehension absolutely confirms it. The minister, it seems (unknown to his majesty) had already disposed of the vacant garter elsewhere."

Mr. Mason is indeed no friend to the late minister. After sketching with no friendly hand the character of Mr. Fox, he thus proceeds to delineate the man who, to the disgrace of England, has rivalled him in the struggle of power, and to the misfortune of the world, has succeeded in that rivalry:

"The other competitor for the prize has given remarkable proofs of his intimate acquaintance with the grand outlines of the British constitution. This he has manifestly evinced on the most trying occasions. He has zealously maintained the doctrines of our established government against its potent enemies—whether designing or declared.—That he has equally adhered to such doctrines in his own ministerial practice, is more than a hermit's slight social habitude with men enables him to vouch for. The writer must observe a total silence with regard to the deference peculiarly due from this exalted character to the prescriptive rights, and known regulations of the elected body of legislature; he can say nothing at all of the constitutional probity with which this duty has been performed. But for the same person's rhetorical abilities, he seems to have manifested them, not only in a different manner from that of his rival, but different too from what has been, and is conspicuous in the most eloquent speakers of very modern date. His natal genius did not endow him with that reach of imagination, which beamed so surprisingly on the auditors of Mr. Powis, afterwards Lord Lilford; and which still shines forth with but little inferiority of lustre in the elegant orations of Mr. Wyndham. Nor is he in any degree a match for the singular poignancy of Mr. Sheridan (if we may argue from the only printed copies of his speeches which are given to the public). Nor does he equal one much younger than himself, (Lord Hawkesbury,) in clear details of facts, conveyed in an unvitiated style. But by spinning the thread of discourse to an almost immeasurable length without absolutely lulling to satiety the patient attention of an audience, by thus making a declamation serve the pur-

pose of confounding and leading astray the comprehension of those that are spoken to, and (lastly) by bedecking periods with a completer coat of varnish than any other colourist's of the age, the declaimer relies on a brilliant fluency of sentences, as the substitute for depth of knowledge in almost every business that comes under consideration.

"It was long imagined by Britons in general, that one of these two competitors, or at least some eloquent person of similar disposition (that is, always ready to deliver his opinion in public upon all subjects whatever, within his cognizance or not) was an indispensable prop for supporting state-matters in their progress through a house of commons. But the closing period of the lately dissolved one should convince us, that a real man of

business, good common sense, and plain elocution, may be better adapted to the purpose. Let us encourage then a sanguine hope, that the time has come, and the day at length shone forth, when our representatives are finally disenchanted from the hold of an Athenian insanity; and that they will never be fascinated more into the delirium of personal idolaters, either at the striking up of sounding brass, or of a tinkling cymbal."

We do not like this work the less for the author's occasional references to himself and his own opinions. Mr. Mason has the caustic tone of an old man and an invalid; but his understanding is healthy, and he writes like an able and honest man.

**ART. IX.** *Lives of the Ancient Philosophers: comprehending a choice Selection of their best Maxims; written for the Education of a Prince, by the Author of Telemachus. Translated from the French, illustrated with Notes, and preceded by a Life of Fenelon. By JOHN CORMACK. 12mo. 2 vols. about 280 pages each.*

WE are glad to see a translation of this instructive work in our own language; young persons will read it, and indeed will read every thing which has come from the chaste pen of Fenelon, with amusement and advantage.

The biographical sketch which Mr.

Cormack has prefixed to these volumes, is chiefly taken from Chevalier's life of Fenelon, and from D'Alembert's Eloge. The few notes which are added by the translator, will be found extremely useful.

**ART. X.** *Eccentric Biography; or, Memoirs of remarkable Female Characters, Antient and Modern: including Actresses, Adventurers, Authoresses, Fortune-Tellers, Gipsies, Dwarfs, Swindlers, Vagrants; and others who have distinguished themselves by their Chastity, Dissipation, Intrepidity, Learning, Abstinence, Credulity, &c. &c. alphabetically arranged; forming a pleasing Mirror of Reflection to the Female Mind. Ornamented with Portraits of the most singular Characters in the Work. 18mo. pp. 348.*

WE are by no means disposed to encourage the publication of such meagre memoirs, such scraps of biography as these; they cannot affect to serve any purpose of utility. The lives of courtesans, fortune-tellers, adventurers, &c. are not likely to improve the morals of the rising generation, or to afford them even a very rational amusement; they too often disseminate a poison, which no an-

tidote will reach, and obtain a disgraceful sale from the stimulant nature of the narrative, or the licentiousness of the language. We have carefully looked over some of those lives, where we dreaded to find the narrative unchaste; but the compiler deserves praise for having admitted no indecent anecdote, and having employed no improper language.

**ART. XI.** *Lives of illustrious Seamen; to whose Intrepidity and good Conduct the English are indebted for the Victories of their Fleets, the Increase of their Dominions, the Extension of their Commerce, and their Pre-eminence on the Ocean; including several Hundred Naval Characters, alphabetically arranged. To which is prefixed, a brief History of the Rise and Progress of the British Navy, and other important Particulars relative to the Subject. 18mo. pp. 436.*

THE same general objections of meagreness and insufficiency, which we urged against the subject of the preceding article, very obviously apply to the present; where, within the compass of four hundred and thirty-six octo-

decimo pages, are compressed the lives of several hundred naval characters, and a history of the rise and progress of the British navy! If any one wants to know when an admiral or a captain was born, when promoted, in what actions he

signalised himself, and when he died, he may refer to this little pocket volume, and probably have his enquiries correctly answered; if he expects any thing more

he will be disappointed. The book is ornamented with portraits of a few of the most celebrated characters. *Fronti nulla fides!*

ART. XII. *The Works of the Right Honourable Lady Mary Wortley Montagu. Including her Correspondence, Poems, and Essays. Published by Permission from her Genuine Papers.* 5 vols. crown 8vo.

THE letters of Lady Mary Wortley, during her travels and residence in Turkey, have been long and universally admired as the best models in that kind of composition which our language affords. The liberality of her grandson, the marquis of Bute, therefore, in permitting the present enlarged collection of her epistolary writings to meet the public eye, must ensure for him the gratitude of every friend to polite literature.

Mr. Dallaway, the editor of these volumes, has prefaced them with "Memoirs" of the author, which yield to few similar performances in meagreness of information and tediousness of digression. The few facts we were able to collect from them, we shall lay before our readers as a necessary introduction to our subsequent remarks.

Lady Mary Pierrepont, daughter of Evelyn, duke of Kingston, was born at Thorsby in Nottinghamshire, about the year 1690. Her father was induced by the early promise of her genius to bestow on her a classical education. — Under the same masters with her brother, she acquired the rudiments of Latin, Greek, and French; and her further studies were superintended by bishop Burnet, who did not fail to discover and applaud her superior talents. Her youth was principally spent in literary retirement; and it was not till 1714, two years after her marriage, that she blazed upon the court in the meridian of wit and beauty, and formed intimacies with Addison, Pope, and the other wits of the age. In 1717, she accompanied her husband on his embassy to the Porte, whence she wrote those admirable letters, to the accuracy of which, in the delineation of Turkish manners, and description of Turkish scenes, Mr. Dallaway has been enabled by local knowledge to bear the fullest testimony. In 1718, she returned to England, and entitled herself to the lasting gratitude of her country by introducing the practice of inoculation.

Her difference with Pope which ter-

minated in an open and irreconcilable enmity, about the year 27, was the most important event of many subsequent years of Lady Mary's life, and was certainly the origin of most of those tales unfavourable to her reputation, which appear to have obtained too much credit both with her contemporaries and with posterity. Pope, mortified at finding himself, after all his fulsome adulation, superseded by the Herveys in the good graces of Lady Mary, and eclipsed in conversation by her wit, was provoked, after several skirmishes of petulant repartee, in which he appears to have gained no advantage, to recur to that cruel and dishonourable mode of attack by which any woman, however respectable, may be overcome by any man, however despicable. Female honour is a structure so easy to be assaulted, so difficult to be defended, so impossible to be repaired, that to a mean ungenerous adversary (and such was Pope) it offers irresistible opportunities of inflicting injuries which cannot be retaliated.

How far any levities in her ladyship's conduct might give a plausible colour to scandal, which envy, vice, and folly were glad to believe of a beauty, a wit, and a satirist; but which unbiassed posterity will be loth to credit on the word of an enemy, contrary to many presumptions, cannot now be ascertained. The reasons which induced her to leave her native country in the year 1739, with a resolution of passing the rest of her life in Italy, are equally involved in mystery:—it is by no means probable that the decline of her health, the motive assigned by Mr. Dallaway, was the real, or, at least, the only one. Her return to England in 61, immediately on Mr. Wortley's death, seems to point at a separation from her husband as the true cause of her expatriation, but that this parting was amicable, and by mutual consent, is fully proved by the intimate epistolary intercourse kept up between them during the remainder of their lives. After an absence of twenty-two years, Lady Mary returned at the

solicitation of her daughter, the countess of Bute, to her native land, where she died in August 62.

The first of these volumes, besides the "Memoirs" and a translation of the *Enchiridion* of Epictetus, made by Lady Mary in her youth, which was scarcely worth publishing, contains such of her letters as were written before the year 1717. These are chiefly addressed to Mrs. Wortley, afterwards her mother-in-law, and to Mr. E. Wortley Montagu. Those to Mrs. Wortley are written in pure and elegant language, and afford many indications of the sprightly wit, some of the sarcastic humour, for which she was afterwards so eminent. But she had not yet completely thrown off the shackles of dull formality, and substituted her own inimitable ease and artless grace, in place of that style of high-flown compliment and affected humility then in vogue, which she herself afterwards did so much to bring into discredit.

Her correspondence with Mr. W. Montagu before their marriage, presents perhaps the most curious specimen of love letters ever disclosed to public view. The gentleman appears to have been much enamoured of her, but fearful that she had too little preference of him, and too great a love of general admiration and gay life, to make a good wife. "If I have you," he tells her; "I shall act against my own opinion." Quite opposite was the case of the lady: she greatly esteemed and respected Mr. Wortley, and was eager for the connexion, without being actuated, apparently, by any thing like passion. She calmly endeavours to convince him that he mistakes her character, that her taste is entirely domestic, and that an union would ensure the happiness of them both: at the same time she remonstrates with spirit against his suspicion and indecision; shows him that she does not lie at his mercy, and more than once bids him farewell for ever.

*To E. W. Montagu, Esq.*

"Indeed I do not at all wonder that absence, and variety of new faces, should make you forget me; but I am a little surprised at your curiosity to know what passes in my heart, (a thing wholly insignificant to you,) except you propose to yourself a piece of ill-natured satisfaction, in finding me very much disquieted. Pray which way would you see into my heart? you can frame no guesses about it from either my speaking

or writing; and supposing I should attempt to shew it you, I know no other way.

"I begin to be tired of my humility: I have carried my complaisance to you farther than I ought. You make new scruples: you have a great deal of fancy; and your distrusts being all of your own making, are more immovable than if there were some real ground for them. Our aunts and grandmothers always tell us, that men are a sort of animals, that if ever they are constant, 'tis only where they are ill used. 'Twas a kind of paradox I could not believe: experience has taught me the truth of it. You are the first I ever had a correspondence with, and I thank God I have done with it for all my life. You needed not to have told me you are not what you have been: one must be stupid not to find a difference in your letters. You seem, in one part of your last, to excuse yourself from having done me any injury in point of fortune. Do I accuse you of any?

"I have not spirits to dispute any longer with you. You say you are not yet determined: let me determine for you, and save you the trouble of writing again. Adieu for ever:—make no answer. I wish among the variety of acquaintance, you may find some one to please you; and can't help the vanity of thinking, should you try them all, you won't find one that will be so sincere in their treatment, though a thousand more deserving, and every one happier. 'Tis a piece of vanity and injustice I never forgive a woman, to delight to give pain; what must I think of a man who takes pleasure in making me uneasy? After the folly of letting you know it is in your power, I ought in prudence to let this go no farther, except I thought you had good nature enough never to make use of that power. I have no reason to think so: however, I am willing, you see, to do you the highest obligation 'tis possible for me to do; that is, to give you a fair occasion of being rid of me.

"M. P."

How this singular couple contrived to make a match at last does not appear: but married they were, without the consent of her father.

The second and almost half the third volume of the present collection, are occupied by the well known "Letters during Mr. Wortley's embassy," of which it is needless for us to speak. The letters to the countess of Mar which succeed, contain much of the tittle-tattle of a licentious court, and many sagacious remarks on life and manners, of which her ladyship was a curious observer and sharp-sighted critic. We are compelled to pronounce these letters the most entertaining that ever were written, though we must at the

same time confess, that they contain several expressions which, even in an age less delicate than the present, must have appeared too bold to escape a female pen; and breathe a spirit of libertine levity, which it may be difficult to avoid inhaling in the corrupt atmosphere of a court, but which imparts a taint that neither wit the most brilliant, nor good sense the most admirable, can disguise or palliate. That woman must have been more than a saint who could refrain from talking scandal, when she was capable of clothing it in such a style as this!

“Poor Lady G—— is parting from her discreet spouse for a mere trifle. She had a mind to take the air this spring in a new yacht (which Lord Hillsborough built for many good uses, and which has been the scene of much pleasure and pain): she went in company with his lordship, Fabrice, Mr. Cook, Lady Litchfield, and her sister, as far as Greenwich, and from thence as far as the mouth of the Nore; when to the great surprize of the good company, who thought it impossible the wind should not be so fair to bring them back as it was to carry them thither, they found there was no possibility of returning that night. Lady G——, in all the concern of a good wife, desired her lord might be informed of her safety, and that she was no way blameable in staying out all night. Fabrice wrote a most gallant letter to Lord G——; concluding that Mr. Cook presents his humble service to him, and let him know (in case of necessity) his wife was in town: but his lordship not liking the change, I suppose, carried the letter straight to the king’s majesty, who not being at leisure to give an audience, he sent it in open by Mahomet; though it is hard to guess what sort of redress he intended to petition for—the nature of the thing being such, that had he complained he was no cuckold, his majesty at least might have prevailed that some of his court might confer that dignity upon him; but if he was, neither king, council, nor the two houses of parliament, could make it null and of none effect. This public rupture is succeeded by a treaty of separation, and here is all the scandal that is uppermost in my head. I should be glad to contribute any way to your entertainment, and am very sorry you stand in so much need of it. I am ever yours,

“M. W. MONTAGU.”

But Lady Mary, with all her sprightliness, had certainly too much good sense, probably too many right feelings, to be happy in such a continued scene of

vice and folly; and the spleen of the following letter does her more honour than all the wit of the former.

“This is a vile world, dear sister, and I can easily comprehend, that whether one is at Paris or London, one is stifled with a certain mixture of fool and knave, which most people are composed of. I would have patience with a parcel of polite rogues, or downright honest fools; but father Adam shines through his whole progeny. So much for our inside; then our outward is so liable to ugliness and distempers, that we are perpetually plagued with feeling our own decays and seeing those of other people. Yet, sixpennyworth of common sense, divided among a whole nation, would make our lives roll away glibly enough; but then we make laws, and we follow customs: by the first we cut off our own pleasures; and by the second we are answerable for the faults and extravagance of others. All these things, and five hundred more, convince me (as I have the most profound veneration for the author of nature) I am satisfied I have been one of the *condemned* ever since I was born; and in submission to the divine justice, I have no doubt but I deserved it in some pre-existent state. I will still hope that I am only in purgatory; and that after whining and pining a certain number of years, I shall be translated to some more happy sphere; where virtue will be natural and custom reasonable; that is, in short, where common sense will reign. I grow very devout, as you see, and place all my hopes in the next life, being totally persuaded of the nothingness of this. Don’t you remember how miserable we were in the little parlour at Thoresby? we then thought marrying would put us at once into possession of all we wanted. Then came—, though, after all, I am still of opinion, that it is extremely silly to submit to ill-fortune. One should pluck up a spirit, and live upon cordials when one can have no other nourishment. These are my present endeavours, and I run about, though I have five thousand pins and needles in my heart. I try to console myself with a small damsel,\* who is at present every thing I like—but, alas! she is yet in a white frock. At fourteen, she may run away with the butler:—there’s one of the blessed effects of disappointment; you are not only hurt by the thing present, but it cuts off all future hope, and makes your very expectations melancholy. *Quelie vie!*

“M. W. M.”

The letters written to her husband and daughter during her last residence abroad, exhibit this extraordinary woman in yet another point of view. They show her, after passing the meridian of

\* “Her daughter, afterwards countess of Bute.”

life in all the splendours and frivolities of the great and busy world, again retiring to a rural privacy, resembling that of her early years, once more recurring to the studies which had then occupied her thoughts and formed her chief enjoyment; soothing the pains of exile by philosophic reflection, by the contemplation of the beauties of nature in the delicious climate of Italy, and by the pleasing pursuits of agriculture and gardening. Not as formerly, amusing herself with the dreams of hope and delusions of fancy, but calmly imparting to her posterity the lessons of grey experience, and the results of extensive reading and sober meditation: and whilst her wit, instead of arming with its lightnings the uplifted hand of satire, now gilds the brow of wisdom with bright, but lambent, glories. Her pictures of the world are indeed somewhat dark and uninviting;—but when have knowledge and sagacity been employed in making discoveries entirely to the advantage of human nature? From volumes so rich in striking passages, it is no robbery to select a few, for the confirmation of our remarks, and the entertainment of our readers. The following observation is so just, that it is strange it should be so new:

“I find tar-water has succeeded to Ward’s drop: it is possible by this time that some other quackery has taken place of that; the English are easier than any other nation infatuated by the prospect of universal medicines; nor is there any country in the world where the doctors raise such immense fortunes. I attribute it to the fond credulity which is in all mankind. We have no longer faith in miracles and reliques, and, therefore, with the same fury, run after receipts and physicians: the same money which, three hundred years ago, was given for the health of the soul, is now given for the health of the body, and by the same sort of people, women and half-witted men: in the country, where they have shrines and images, quacks are despised, and monks and confessors find their account in managing the fear and hope which rule the actions of the multitude.”

Among many excellent observations on female education, in her ideas on which subject Lady Mary anticipated the present age, we meet with these:

“I cannot help writing a sort of apology for my last letter, foreseeing that you will think it wrong, or at least Lord Bute will be extremely shocked, at the proposal of a learned education for daughters, which the

generality of men believe to be as great a profanation, as the clergy would do, if the laity should presume to exercise the functions of the priesthood. I desire you would take notice, I would not have learning enjoined them as a task, but permitted as a pleasure, if their genius leads them naturally to it. I look upon my grand-daughters as a sort of lay nuns: destiny may have laid up other things for them, but they have no reason to expect to pass their time otherwise, than their aunts do at present; and I know, by experience, it is in the power of study not only to make solitude tolerable, but agreeable. I have now lived almost seven years in a stricter retirement than yours in the isle of Bute, and can assure you, I have never had half an hour heavy on my hands, for want of something to do. Whoever will cultivate their own mind, will find full employment. Every virtue does not only require great care in the planting, but as much daily solicitude in cherishing, as exotic fruits and flowers. The vices and passions (which I am afraid are the natural product of the soil) demand perpetual weeding. Add to this the search after knowledge (every branch of which is entertaining), and the longest life is too short for the pursuit of it; which, though in some regard confined to very straight limits, leaves still a vast variety of amusements to those capable of tasting them, which is utterly impossible to be attained by those that are blinded by prejudice, the certain effect of an ignorant education. My own was one of the worst in the world, being exactly the same as Clarissa Harlow’s: her pious Mrs. Norton, so perfectly resembling my governess, who had been nurse to my mother, I could almost fancy the author was acquainted with her, she took so much pains, from my infancy, to fill my head with superstitious tales and false notions. It was none of her fault, that I am not at this day afraid of witches and hobgoblins, or turned methodist. Almost all girls are bred after this manner. I believe you are the only woman (perhaps, I might say, person) that never was either frightened or cheated into any thing by your parents. I can truly affirm, I never deceived any body in my life, excepting (which I confess has often happened undesigned) by speaking plainly, as Earl Stanhope used to say (during his ministry) he always imposed on the foreign ministers by telling them the naked truth, which, as they thought impossible to come from the mouth of a statesman, they never failed to write information to their respective courts directly contrary to the assurances he gave them. Most people confound the ideas of sense and cunning, though there are really no two things in nature more opposite: it is in part, from this false reasoning, the unjust custom prevails of debarring our sex from the advantage of learning, the men fancying the improvement of our understandings would only furnish

us with more art to deceive them, which is directly contrary to the truth. Fools are always enterprising, not seeing the difficulties of deceit, or the ill consequences of detection. I could give many examples of ladies whose conduct has been very notorious, which has been owing to that ignorance, which has exposed them to idleness, which is justly called the mother of mischief. There is nothing so like the education of a woman of quality as that of a prince: they are taught to dance, and the exterior part of what is called good breeding; which, if they attain, they are extraordinary creatures in their kind; and have all the accomplishments required by their directors. The same characters are formed by the same lessons, which inclines me to think (if I dare say it) that nature has not placed us in an inferior rank to men, no more than the females of other animals, where we see no distinction of capacity; though, I am persuaded, if there was a commonwealth of rational horses (as Doctor Swift has supposed), it would be an established maxim among them, that a mare could not be taught to pace. I could add a great deal on this subject, but I am not now endeavouring to remove the prejudices of mankind; my only design is to point out to my grand-daughters the method of being contented with that retreat, to which unforeseen circumstances may oblige them, and which is perhaps preferable to all the show of public life."

"I can't forbear saying something in relation to my grand-daughters, who are very near my heart. If any of them are fond of reading, I would not advise you to hinder them (chiefly because it is impossible) seeing poetry, plays, or romances; but accustom them to talk over what they read, and point out to them, as you are very capable of doing, the absurdity often concealed under fine expressions, where the sound is apt to engage the admiration of young people. I was so much charmed at fourteen, with the dialogue of Henry and Emma, I can say it by heart to this day, without reflecting on the monstrous folly of the story in plain prose, where a young heiress to a fond father, is represented falling in love with a fellow she had only seen as a huntsman, a falconer, and a beggar, and who confesses, without any circumstance of excuse, that he is obliged to run his country, having newly committed a murder. She ought reasonably to have supposed him, at best, a highwayman; yet the virtuous virgin resolves to run away with him, to live among the banditti, and wait upon his trollop, if she had no other way of enjoying his company. This senseless tale is, however, so well varnished with melody of words, and pomp of sentiments, I am convinced it has hurt more girls than ever were injured by the worst poems extant."

On the authors of the day her remarks

are always shrewd, and often sarcastic. For instance,

"I own I have small regard for Lord Bolingbroke as an author, and the highest contempt for him as a man. He came into the world greatly favoured both by nature and fortune, blest with a noble birth, heir to a large estate, endowed with a strong constitution, and, as I have heard, a beautiful figure, high spirits, a good memory, and a lively apprehension, which was cultivated by a learned education; all these glorious advantages being left to the direction of a judgment stifled by unbounded vanity, he dishonoured his birth, lost his estate, ruined his reputation, and destroyed his health, by a wild pursuit of eminence even in vice and trifles."

"His confederacy with Swift and Pope puts me in mind of that of Bessus and his sword men, in the King and no King, who endeavour to support themselves by giving certificates of each other's merit. Pope has triumphantly declared that they may do and say whatever silly things they please, they will still be the greatest geniuses nature ever exhibited. I am delighted with the comparison given of their benevolence, which is indeed most aptly figured by a circle in the water, which widens till it comes to nothing at all."

Fielding was her relation and friend: she blamed his dissolute manners, but pitied the poverty which compelled him "to throw into the world what he ought to have thrown into the fire." She thus draws his character:

"I am sorry for H. Fielding's death, not only as I shall read no more of his writings, but I believe he lost more than others, as no man enjoyed life more than he did, though few had less reason to do so, the highest of his preferment being raking in the lowest sinks of vice and misery. I should think it a nobler and less nauseous employment to be one of the staff-officers that conduct the nocturnal weddings. His happy constitution (even when he had, with great pains, half demolished it) made him forget every thing when he was before a venison pasty, or over a flask of champagne; and I am persuaded he has known more happy moments than any prince upon earth. His natural spirits gave him rapture with his cook-maid, and cheerfulness when he was starving in a garret. There was a great similitude between his character and that of Sir Richard Steele. He had the advantage both in learning, and, in my opinion, genius; they both agreed in wanting money in spite of all their friends, and would have wanted it, if their hereditary lands had been as extensive as their imagination; yet each of them was so formed for happiness, it is pity he was not immortal."

With two passages relative to her own tastes and feelings in the last years of her life we reluctantly close our extracts.

"I no more expect to arrive at the age of the duchess of Marlborough, than to that of Methusalem; neither do I desire it. I have long thought myself useless to the world. I have seen one generation pass away; and it is gone; for I think there are very few of those left that flourished in my youth. You will perhaps call these melancholy reflections: they are not so. There is a quiet after the abandoning of pursuits, something like the rest that follows a laborious day. I tell you this for your comfort. It was formerly a terrifying view to me, that I should one day be an old woman. I now find that nature has provided pleasures for every state. Those are only unhappy who will not be contented with what she gives, but strive to break through her laws, by affecting a perpetuity of youth, which appears to me as little desirable at present as the babies do to you, that were the delight of your infancy. I am at the end of my paper, which shortens the sermon."

\* \* \* \*

"Daughter! daughter! don't call names; you are always abusing my pleasures, which is what no mortal will bear. Trash, lumber, sad stuff, are the titles you give to my favourite amusement. If I called a white staff a stick of wood, a gold key gilded brass, and the ensigns of illustrious orders, coloured strings; this may be philosophically true, but would be very ill received. We have all our play-things, happy are they that can be contented with those they can obtain: those hours are spent in the wisest manner, that can easiest shade the ills of life, and are the least productive of ill consequences. I think my time better employed in reading the adventures of imaginary people, than the duchess of Marlborough, who passed the latter years of her life in paddling with her will, and contriving schemes of plaguing some, and extracting praise from others, to no purpose; eternally disappointed, and eternally fretting. The active scenes are over at my age. I indulge, with all the art I can, my taste for reading. If I would confine it to valuable books, they are almost

as rare as valuable men. I must be content with what I can find. As I approach a second childhood, I endeavour to enter into the pleasures of it. Your youngest son is, perhaps, at this very moment riding on a piker, with great delight, not at all regretting that it is not a gold one, and much less wishing it an Arabian horse, which he could not know how to manage. I am reading an idle tale, not expecting wit or truth in it, and am very glad it is not metaphysics to puzzle my judgment, or history to mislead my opinion: he fortifies his health by exercise; I calm my cares by oblivion. The methods may appear low to busy people; but, if he improves his strength, and I forget my infirmities, we both attain very desirable ends."

On the whole it may safely be affirmed, that Lady Mary's present letters confirm the pretensions of her sex to peculiar excellence in the epistolary style; and that however highly France may estimate her Sevigné, England may claim a loftier station for her Montagu. In wit, perhaps, they were equal; and if our countrywoman is surpassed in tender sentiment and the lighter graces by her French rival, she greatly surpasses her in philosophy, in good sense, in solidity, and energetic conciseness.

The poetry of Lady Mary partakes much of the character of her prose. The Town Eclogues, all of which appear to have been hers, and many other of her earlier and lighter pieces, are well known:—as a specimen of her later and graver ones, we select two stanzas written in her Italian retreat, which afford a better summary of her life, and most other lives, than any which it is in our power to offer.

"Wisdom, slow product of laborious years,  
The only fruit that life's cold winter bears;  
Thy sacred seeds in vain in youth we lay,  
By the fierce storm of passion torn away.

"Should some remain in a rich gen'rous soil,  
They long lie hid, and must be rais'd with toil;  
Faintly they struggle with inclement skies,  
No sooner born than the poor planter dies."

**ART. XIII.** *General Biography; or Lives, Critical and Historical, of the most eminent Persons of all Ages, Countries, Conditions, and Professions, arranged according to Alphabetical Order. Composed by J. AIKIN, M.D. the Rev. THOMAS MORGAN, and Mr. WILLIAM JOHNSTON. 4to. vol. IV. (from Fab. to Gyl.)*

HAVING already noticed this interesting work (see *Ann. Rev.* for 1802, p. 617.) we shall content ourselves, on the present occasion, with announcing the appearance of the fourth volume, and giving a short summary of its contents. The volume before us compre-

hends the letters F. and G, under which a number of first-rate characters are included. Among the sovereigns, the Prussian Frederics hold the highest rank; and of these, the life of Frederic the third, or the Great, as he is usually called, is detailed considerably at length,

and in a very masterly manner. The estimate of the character of this Prince, both as a sovereign and as a man, we shall select, as an excellent specimen of the judgment and impartiality of the biographer.

“Frederic undoubtedly deserves a conspicuous place among *great princes*. As a general, though he committed faults, yet his celerity and enterprize, his quickness in seizing the precise moment of advantage, the comprehension and accuracy with which he directed complicated plans, his foresight in providing for all events and exigences, the boldness of his designs, and vigour of his execution, have, perhaps, scarcely been surpassed since the time of Cæsar. He was somewhat inclined to rashness, but his situation often justified great hazards. That he was lavish of the lives of his soldiers, was rather a defect in feeling than in judgment. They were the instruments with which he was playing a great game, and he made it finally a winning one. His political talents were very considerable, and well adapted to absolute monarchy. As a man of letters he would probably have shone even independently of his rank, or rather, perhaps the more, had he had the education and employment of a mere man of letters. His judgment was naturally solid, but in some degree perverted by his early prejudices in favour of the superficial French school. His conversation was lively and brilliant, often sarcastical. He was quick at repartee, and readily felt it. A declared unbeliever in revealed religion, his notions as to natural religion seem to have fluctuated; but his morals were uniformly guided by no other rule than his pleasure and interest. He appears to have had little sensibility, and was capable of severe and even cruel actions. Voltaire once characterised him from a marble table that stood before him—as *hard and polished*. Yet love of justice and humanity took their turns in his mind, and many examples are related of his clemency and placability.”

The crafty Ferdinand of Spain and the gallant Francis of France are interesting and well executed portraits: the popes of the name of Gregory are faithfully characterized by Mr. Morgan, and the sketch of the leading events in the busy reign of Gustavus III. of Sweden, attests the care and accuracy of Mr. Johnston.

Of the statesmen and political personages, the most eminent in the present volume are, Franklin, the Guises, and Gracchi. Thomas Firmin, a London merchant, most honourably distinguished for his unwearied and extensive benevolence, though remarkable neither for science, literature, or rank, is very pro-

perly admitted among the worthies of the human race, and is recorded in a manner suitable to his high merit.

The life of Fox, the father of the sect of Friends, or Quakers, is an extremely interesting article, and contains some original information. Bernard Gilpin, the apostle of the north, is the subject of a very pleasing memoir, skilfully abridged from the detailed account of this venerable divine, published by his descendant the vicar of Boldre. The ambitious and persecuting Bishop Gardiner affords a useful but horrible example of the diabolical spirit of religious intolerance. A few new names appear among the theologians; the principal of which are, the learned and irritable Geddes, and Dr. Gerrard, professor of divinity at Aberdeen, for the sketch of whose life the present work is indebted to the Supplement to the Encyclopædia Britannica.

Grotius stands pre-eminent among the men of literature; he is evidently a favourite with his biographer, and has received peculiar and deserved attention. Gibbon, and Dr. Farmer, the late vice-chancellor of Cambridge, here make their appearance for the first time, we believe, in a work of general biography. Several distinguished foreigners, also, hitherto only known by name to the British public, are introduced in this volume; among whom we have observed Filangeri, a learned Italian, author of a celebrated work on the science of legislation; Fulda, the great German philologist; Galeani, the patron of the splendid map of the Neapolitan dominions; and Genovesi, a distinguished professor of moral philosophy, at Naples.

The lives of Fielding, Foote, Garrick, Gay, Goldsmith, La Fontaine, and Gray, are all from the pen of Dr. Aikin, and contain a fund of excellent criticism on the character of these authors and the literary rank of their works. By way of sample we shall quote the concluding remarks on Gray.

“Many instances may be brought to prove that poets are not, more than other men, the creatures of passion, thoughtlessness, and caprice; and that of Gray is among the number. With a warm imagination, he had cool affections, and a calm sedate disposition. He was attentive to economy, yet void of the least tincture of avarice. Delicacy, with respect to pecuniary matters, was, indeed, carried by him to a degree of excess; for it made

him reject, with a sort of disdainful pride, those emoluments which he might honourably have derived from his literary exertions. The character of an author by profession was what he peculiarly shunned; yet (so difficult is consistency) it could have been only upon the strength of his public reputation as a writer, that he became a petitioner for a lucrative sinecure. His friend, Mr. Mason, attests his secret bounty, even when his circumstances were the most narrow. He was very careful of himself, and so timorous, that it is said, some of the finest views in a tour to the lakes escaped him, because he did not choose to venture to those spots where they were to be seen. This want of personal courage singularly contrasts with the manly and martial strains of his poetry. In morals he was temperate, upright, and a constant friend to virtue. His religious opinions were not known, but he always reprobated the dissemination of scepticism and infidelity. Few men of his reputation have had less vanity, and he bore with good humour and easy negligence all the critical attacks upon his compositions. As the *learning* of Gray was entirely for his own use, and produced no fruits for the public, it has no claims to particular notice. From the testimony of his friends, it seems to have comprised almost every topic of human enquiry, excepting those belonging to the exact sciences. We are almost tantalised with accounts of the valuable remarks he made upon authors and subjects in the course of his reading, which, if so deep and original as they are represented, ought in some manner to have been brought to public view. If he was, as one of his admirers has asserted, 'perhaps the most learned man in Europe,' never was learning more thrown away. It is exclusively as a *poet* that his name deserves to be transmitted to posterity. In this capacity, the small number of his compositions, compared with the high rank he has attained, must be considered as indicative of an uncommon degree of excellence in his art. And, in reality, no one appears to have possessed more of that faculty of poetical perception which distinguishes among all the objects of art and nature what are fittest for the poet's use, together with the power of displaying them in their richest colours. That many of these objects were derived to him from the works of other writers will not be denied by

a judicious admirer; and if a distinction is to be made between the poet of nature and the poet of study, he is certainly to be ranged in the latter class. It has already been remarked, that his two principal odes are expressly addressed to prepared readers; and to enter into his beauties, both of diction and versification, a course of poetical study is necessary. Even with such a preparation, the delight they afford will not be the same to all, as is manifest from Dr. Johnson's derogatory strictures; in which, however, candid readers have discovered more ill-nature than taste. In pure invention Gray cannot be said to excel, neither is he highly pathetic or sublime; but he is splendid, lofty, and energetic; generally correct, and richly harmonious.— Though lyric poetry is that in which he has chiefly exercised himself, he was capable of varying his manner to suit any species of composition. Perhaps he was best of all qualified for the moral and didactic, if we may judge from his noble *fragment* of 'An Essay on the Alliance of Education and Government.' But the number of his fragments indicates a want of power to support a long-continued flight; and it would be too indulgent to suppose that he *could* have performed all that he planned. As a writer of Latin verse he is perhaps surpassed by few in classic propriety, and certainly excels the ordinary tribe of Latin versifiers in novelty and dignity. The familiar letters of Gray are entertaining and instructive. They are free from all parade, and possess a fund of pleasantry, sometimes bordering upon quaintness."

There are several new articles of foreign naturalists, chiefly with the signature of Mr. Johnston, in which, however, although we meet with satisfactory accounts of the leading events of their lives, and accurate lists of their publications, we miss those concise but highly useful and interesting estimates of the value and object of their writings, which we meet with in the other departments. Such a summary would have been peculiarly desirable in the lives of Ferber the mineralogist, Reinhold Forster, and Gmelin; and Gleditsch the acute investigator of the cryptogamous vegetables.

ART. XIV. *An Account of the Life and Writings of Thomas Reid, D. D. F. R. S. Edinburgh; late Professor of Moral Philosophy in the University of Glasgow. By DUGALD STEWART, F. R. S. Edinburgh. Read at different Meetings of the Royal Society of Edinburgh. 8vo. pp. 222.*

THE calm and unambitious life of the philosopher recorded in these pages is but little calculated to attract public notice. In the exemplary discharge of his duties, first, as a Christian minister, and afterwards as a teacher of moral philosophy, in the universities of Aber-

deen and Glasgow, he "held the noiseless tenor of his way" for forty-four years. At this period, in 1781, being then upwards of seventy, with faculties matured, but unimpaired, he resigned the professorial dignity, and devoted the whole vigour of his mind to those

metaphysical investigations that had long engaged his attention. The result of his meditations was, a series of *Essays on the intellectual Powers of Man*; which appeared in 1785, and a treatise on the *active powers*, published in 1788. These works, although they encountered some opposition in Scotland, and were severely and somewhat illiberally attacked by Dr. Priestley, raised the character of their author to considerable eminence, as a sagacious observer of the phenomena of mind. Having thus terminated his public literary labours, Dr. Reid occupied the last eight years of his life in retracing the mathematical pursuits of his earlier years, in the investigation of the new and more philosophical principles of modern chemistry, and in composing occasionally short essays for friendly discussion in a philosophical

society of which he was a member. Thus agreeably employed, respected by the public, beloved by his friends, and retaining a considerable share both of mental and bodily activity, he reached his eighty-seventh year; when a violent disorder terminated his life, after an ineffectual struggle of about a fortnight, on the 7th of October 1796.

The principal part of the volume before us is occupied by remarks upon Dr. Reid's metaphysical works, and a defence of his system from some fundamental objections. On some points Professor Stewart has successfully vindicated his venerable tutor; but on others we are of opinion that he has completely failed. The total indifference, however, of the English public, to the subject in question, deters us from entering into the discussion.

ART. XV. *The Revolutionary Plutarch; exhibiting the most distinguished Characters, literary, military, and political, in the recent Annals of the French Republic; the greater Part from the original Information of a Gentleman resident at Paris. To which, as an Appendix, is reprinted entire, the celebrated Pamphlet of "Killing no Murder."* 8vo. Two vols.

ART. XVI. *History of the French Consulate under Napoleon Bonaparte: being an authentic Narrative of his Administration, which is so little known in Foreign Countries. Including a Sketch of his Life. The whole interspersed with curious Anecdotes, and a faithful Statement of interesting Transactions until the Renewal of Hostilities in 1803. By W. BARRE, Witness to many of the Facts related in the Narrative.* 8vo., pp. 535.

FEAR is always cruel. The Romans had once been driven to the very brink of ruin by the abilities of Hannibal, and never after thought themselves secure till their persecutions had driven the exiled warrior to self-destruction. The ambition of Louis XIV. was stopped in the midst of its career by William III.: and when the victorious arms of the confederates were on the point of inflicting on France the desolation which had attended the march of her troops through the states of Germany, and the provinces of Belgium, a plot to assassinate the redeemer of the liberties of Europe was contrived by the French ministry, and sanctioned by its monarch. The ungenerous policy of England filled Ireland with disaffection, and her alarmed ministers of torture were let loose to quell, by means which would have disgraced even an Alva, the commotions of her own raising. Bonaparte has threatened

us with invasion, and Englishmen have been found to propose an atrocious and unsparing warfare, which in modern times has been commanded only by Robespierre, and has been practised by none. In the late war and in the present the British ministry has been loudly accused of participating in, and encouraging those plans of assassination, which have been directed against the person of the chief magistrate of France. Let the ministry, if they can with truth, vindicate themselves from so black a charge by a solemn and authentic disavowal; and let the British public show the high honour and intrepid courage, for which they have long been renowned, by consigning to merited contempt and abhorrence all works, together with their authors, whose direct tendency is to degrade the generous and high-spirited patriot into the lurking assassin.

## CHAPTER X.

## P O E T R Y.

THE poetical productions of the last year have been unusually numerous, and of unusual merit. We do not mean to say that all, or even a majority of them are entitled to public notice, but the proportion of those that are so is considerably greater than might reasonably be expected. Mr. Turner, the Historian of the Anglo-Saxons, has been engaged in the study of Welch Literature, and has evinced his attachment to the ancient language of Britain, by publishing a satisfactory vindication of the genuineness and antiquity of many poems popularly attributed to Taliesin, Merdhin, and the other great bards of Wales: judging from the specimens which this gentleman has translated in the course of his work, the poems in question are certainly worthy of appearing in an English version, but are more likely to be consulted by the antiquary and historian, than resorted to by the lover of poetry. The re-publication, by the late Mr. Ritson, of the most celebrated Metrical Romances, is a very important service conferred on the literature of his country: on the knowledge and incorruptible fidelity of this editor the public may rest with liberal confidence, and will be inclined to excuse or overlook the intemperate abuse into which his regard for critical veracity has not unfrequently betrayed him. The third and last volume of Mr. Scott's Minstrelsy of the Scottish Border has made its appearance, and will add considerably to his reputation as a poet, without impeaching his taste in any other respect. Mr. Ellis has published a new and improved edition of his elegant and learned Specimens of English Poetry, from the earliest Ages, to the middle of the seventeenth Century. Dr. Darwin's Temple of Nature will not, in our opinion, add greatly to his fame, either as a poet or philosopher. Mr. Maurice, the author of the History of India, has collected his scattered poems, together with some new pieces, into a very interesting volume, the characteristic of which is splendour and harmony without much pathos. The posthumous poems of the late Mr. Moore, are an affecting proof, that genius, sense, piety, and poetic fire, are not of themselves sufficient to dissipate the deep obscurity with which modest worth is too often enveloped. We trust that the young candidate for poetic fame who has celebrated Clifton Grove with the first vernal warblings of his melodious muse, will find the patronage which he so amply deserves. A translation of some of the shorter Poems of Camoens has been published by Lord Strangford, who, with singular want of judgment, has contrived to impress us with high respect for his abilities as a poet, at the entire expence of his accuracy as a translator. The Pleader's Guide, attributed by public report to the son of the author of the New Bath Guide, contains more genuine wit and humour than we have met with for several years: And the Poems of Mrs. Grant impress us with high and equal respect for her domestic virtues and her natural talents.

ART. I. *Vindication of the Genuineness of the Ancient British Poems of Aneurin, Taliesin, Llywarch-Hen, and Merdhin: with Specimens of the Poems.* By SHARON TURNER, F. A. S. 8vo. pp. 284.

THE Myvyrian archæology of Wales has thrown much light on the early antiquities of Great Britain. It contains close translations of many poems, ascribed to bards of the sixth century, which have been preserved in manuscripts, said to be of the twelfth century; and which, with some deductions for interpolation, and some for modernization, really appear to have been written by the persons whose names they bear: Aneurin, Taliesin, Llywarch, and Merdhin. They respect Arthur, Geraint, Urien, and other heroes, hitherto only known from the mythological chronicles of the romancers.

Of Welsh population and civilization the probable history is difficult to evolve. Traces of a Cimmerian tribe may be found on the skirts of Anatolia, afterwards in Thrace, next among the Alps, in Denmark, and in Gaul, finally in Britain. But the continental Cimmerians appear to have been a savage, pastoral people, ignorant of the arts of life. The Cimmerians of Cornwall and Brittany, on the contrary, the Armorican or *sea-shore* Cimmerians, appear early to have attained a high degree of civilization; and when discovered by Julius Cæsar, were already subjected to the bardic discipline, accustomed to the use of Greek letters, and attached to various Phœnician divinities. It may be inferred, therefore, that they derived their civilization, not from their Cimmerian progenitors, but from Phœnician traders, who communicated to them the same alphabet which they had already conferred on the Greeks, and who founded civil and religious regulations analogous to their own. The insertion of these buds of refinement was of course gradual and successive; but tradition distinguished an eminent effort at colonization, a sensible intrusion of emigrants, "who had crossed the hazy sea," natives, says Taliesin, of Gafis, who, under Hu the mighty, came from the summer country, and instructed the Cimmerians in agriculture. After the arrival of Hu, the island is said to have been named Britain, from a governor of his appointing. These persons are probably the Corineus and Brutus, so celebrated by Jeffrey of Monmouth: for Gadarn-Hu, or Hu the mighty,

differs little from Corineus. These settlers are stated to have fled from the destruction of their city by a foreign power; their domestication must have preceded the arrival of Julius Cæsar by a century, to account for the progress of their arts and institutions: it seems probable, therefore, that Carthage is the Gafis of Taliesin, and that the refugees from Roman devastation came hither by sea, with what property they could remove, and founded our love for order and for commerce. This is further corroborated by the circumstance, that they are stated previously to have attempted a settlement in Aquitain.

It is peculiarly probable that the taste for pedigrees, so notoriously cultivated by the Jews and Arabs, should have been introduced by a Phœnician or Carthaginian colony; and it is remarkable, that the oldest of all the Welsh pedigrees, that which Tysilio gives of Cassibellan, precisely amounts to Hisychion: that is, Hu-ysgown, or the great Hu, whom Gwyn ab Nudd, a bard of the fifth century, appears to consider as the introducer of oxen, and who perhaps really introduced the *ychain banog*, the oxen with high prominences, or buffaloes, noticed in the triads. To his descendant Coel, the grandson of Caractacus, is ascribed the introduction of the water-mill: the captivity of his family probably occasioned him to learn in Italy both its use and method of construction.

To the intelligence contained in the triads Mr. Turner seems little attached; he abandons them to shy suspicion.

"I do not propose," he says, "this work to be a vindication of all the poems that have been generally attributed to Aneurin, Taliesin, Merdhin, or Llywarch-Hên, or promiscuously published as theirs. My object is to authenticate the genuineness of such of them as I think beyond all dispute; and they are the following:

"Of ANEURIN—The Godolin.

"Of LLYWARCH HEN—The Elegy on Geraint ab Erbin—Ditto on Urien Reged—Ditto on Cynddylan—Ditto on Cadwallon—The Poem on his Old Age—Ditto to Maenwyn—Ditto to the Cuckoo.

"Of MERDWIN—The Avallenau.

"Of TALIESIN—The Poems to Urien, and on his Battles—his Dialogue with Merd-

kin—the Poems on Elphin—and his Historical Elegies.

“In selecting the above, I do not mean to insinuate that some others, which are ascribed to these authors, may not be genuine likewise. I am satisfied that some are not genuine, and that some have been interpolated. There are several others, however, especially of Taliesin, which may be genuine. But I conceive that the question which presses is, not whether this or that poem is to be accredited, because a simpler investigation of its evidences might determine that, if a given number had been already admitted, but whether there are *any* which ought to be placed in an age so early. The prevailing scepticism denies that there are any genuine poems of the sixth century extant. It asserts, that every Welch poem, referred by Welchmen to this ancient period, is a factitious composition of the twelfth or succeeding century. My duty, therefore, if I attempt to impugn this scepticism, is to shew that there are genuine works of the sixth century now in existence. I adduce the poems above selected as such. If my arguments are successful as to these poems, then any others may be added to the accredited number, which judicious and learned criticism shall allow to be genuine, after due consideration.

“Now of the Godolin, I have mentioned, that, until very lately, a *MS.* of it was in the Hengurt library, which seemed to be of the hand-writing of the twelfth century. I am informed that it was in hand-writing and appearance very similar to the book of Taliesin, which is yet in the library, and may be seen by any one. A complete transcript of the Godolin was made by Mr. Vaughan, in the time of Charles the first, and many copies of it, of various dates, exist in Welch collections.

“The poems of Llywarch-Hên, above mentioned, are in the black book of Caermarthen, and in the red book of Hergest. They are a part of Mr. Vaughan's transcript, and of others.

“The Avallenau of Merdhin is in the black book of Caermarthen, with others that are ascribed to him. It is in sir Hugh Penant's transcript, made in the time of Henry the eighth, in the Kutta Kyvaruydh, and in other transcripts.

“Of Taliesin, the dialogue with Merdhin, the graves of the warriors, and a few others, are in the black book of Caernarthen. Most of these, which I have mentioned to be his, are with others in the *MS.* called the book of Taliesin, in the Hengurt library, which is placed in the twelfth century, or nearly so. Some are in the red book of Hergest, and all are in Mr. Vaughan's transcript, and many in y Kutta Kyvaruydk.

“What other ancient *MSS.* of any of the works of these bards, are in the Macclesfield, or other collections, I cannot state, because I am not informed. But I conceive,

that from the above statement, I am authorized to affirm, that there are *MSS.* of poems of these four bards now extant, which were written in or before the twelfth century. I will confirm this assertion by shewing, 2ndly, That these poems, or some of them, and their authors, have been mentioned or alluded to by a series of bards, whose works still exist undisputed, from before the twelfth century to a recent period.”

Mr. Turner proceeds through his defence in great detail, and with great success. Of those proofs deducible from the language of the poems, we cannot judge; the persons mentioned, and the ideas brought forward, may well have been familiar at the time in question; the talent necessary to forge poems so probable, would have secured poems superior; the inexplicability of many allusions, especially in Taliesin, throw back the compositions to a period which it must be highly interesting to illustrate and to decypher. Let us suppose that to Llywarch are ascribed poems, too remote in their chronology to have been written by one man, unless a patriarchal longevity be attributed to him; this would only render the existence of two or three Llywarchs probable. The profession of bard, in the case of Taliesin, was also hereditary. The ode to the cuckoo has a something not antique about it: so has the ode to the rose in Anacreon. Yet who disputes the genuineness of the earlier simpler songs, because a polished, finished, elaborate, exquisite one happens to be attached.

It has been objected that these Welsh bards call the English, both *Eingl*, that is Angles, *Saeson*, that is Saxons, and *Allmyn*, that is Alemanni, at a time when the Anglo-Saxons were so newly imported; that they could not yet have imposed their name on the nations at war with the Welch, and when the Alemanni were restricted to the neighbourhood of Switzerland. It is, however, by no means clear that these denominations were first introduced with Hengist and Horsa, who indeed were leaders of the Jutes. There must have been an extensive gothic population in the country, long before this pretended importation of the gothic race; and it is not unlikely that Angles and Saxons were resorted to as defenders against the Picts, because Angles and Saxons were the tribes to be defended. Nor is it unlikely that any and every army, indiscriminately recruited among the gothic na-

tions, should have been called an army of Alemanni, or *all-mien*, whether it was led against Clovis or Arthur.

The following passage throws much light on the religious tenets of the Druids:

"They mention three regions of existence, which, it is very curious to observe, they denominate *cylchau*, or circles.\*

"In the *cylch y Ceugant*, or the circle of the all-inclosing circle, there was nothing either alive or dead, but God (*Dun*), and he only, could pervade it. The circle of *Gwynnyd*, or felicity, is that which men are to pervade after they have passed through their terrestrial changes. But the circle of *Abred*, or evil, is that in which human nature passes through those varying stages of its existence which it must undergo, before it is qualified to inhabit the circle of felicity.

"All animated beings have three states of existence to pass through. The state of *Abred*, or evil in *Annwn*, or the great deep; the state of freedom, in the human form; and the state of love, which is happiness, in the *nev*, or heaven. All beings, but God, must therefore undergo three *angen*, or necessities. They must have a beginning in *Annwn*, or the great deep; a progression in *Abred*, or in the state of evil; and a completion in the circle of felicity in heaven.

"In the evil state of *Abred* there are three *angen*, or necessities. There must be *existence* in its least possible degree, which is its commencement. There must be the *matter* of every thing, from which proceeds increase, or progression of existence, which cannot be in the other states, and there must be the *forms* of all things whence discriminating individuality.

"The three necessary causes of the state of *Abred*, are to collect the matter of every nature, to collect the knowledge of every thing, and to collect power to destroy *Gwrth* (the opposing) and *Cythraul*†, and to divest ourselves of evil. Unless every state of being is thus passed through, there can be no perfection.

"The three chief infelicities attached to the state of *Abred* are, that we incur necessity, oblivion, and death; and these things are the divine instruments for subduing evil (*Drwg*) and *Cythraul*. The deaths which

follow our changes are so many escapes from their power.

"Humanity must necessarily suffer, change, and choose; and as it has the liberty of choosing, its sufferings and changes cannot be foreseen.

In passing through the changes of being attached to the state of *Abred*, it is possible for man, by misconduct, to fall retrograde into the lowest state from which he had emerged.

"There are three things which will inevitably plunge him back into the changes of *Abred*. Pride,—for this he will fall to *Annwn*, which is the lowest point at which existence begins; falsehood, which will replunge him to *Obryn*‡; and cruelty, which will consign him to *Cydril*§: from these he must proceed again in due course, through changes of being, up to humanity.

"From this exposition we see that the bardic transmigration was from *Annwn*, through the changes of *Abred* to the felicity of heaven. These changes never ended till man had fitted himself for heaven. If his conduct in any one state, instead of improving his being, had made it worse, he fell back into a worse condition, to commence again his purifying revolutions.

"Humanity was the limit of the degraded transmutations. All the changes above humanity were felicitating.

"To acquire knowledge, benevolence, and power, is the object of the human state; and these, as they require liberty and choice, cannot be attained in any state previous to humanity. Knowledge, benevolence, and power, are the arms by which *Drwg* and *Cythraul* are to be subdued: humanity is the scene of the contest.

"I will now only add, that to have traversed every state of animated existence, to remember every state and its incidents, and to be able to traverse every state that can be desired for the sake of experience and judgment, is that consummation which can only be attained in the circle of felicity. In this circle man will be still undergoing rotations of existence, but happy ones, because God only can endure the eternities of the circle of infinity without changing. Man's happy changes in the circle of felicity will exhibit perpetual acquisition of knowledge, beautiful variety, and occasional repose.||

\* "We cannot avoid recollecting here, that the great druidical temples of Stonehenge and Avebury, the smaller remains in Cornwall, that formerly in Jersey, now removed to Lord Conway's park, and others, exhibit *circles* of stones, as the essential form of their structure.

† "Cythraul is the British name for the devil; it means the destroying principle; it may have been derived from the ancient mythology of the nation: I have therefore preserved the name in the text.

‡ "Obryn literally means, "something nearly equivalent." It therefore implies a degraded transmigration adequate to the fault committed.

§ "This literally means 'a corresponding animal,' or a transmigration into some ferocious animal.

|| "The book of bardism, containing these tenets, has not yet been printed. I believe it will appear in the fourth volume of the *Welsh Archaeology*. But copious extracts from

"He may visit again the scenes of humanity for his pleasure, but cannot incur any moral depravity.

"Such is the bardic doctrine of transmigration, as it appears in the book of bardism. How far it transmits the tenets of the druids on this subject, or what modifications christianity introduced, cannot now be ascertained. By recollecting this doctrine of transmigrations, we may understand many passages of Taliesin. His Hanes Taliesin is a recital of his pretended transmigrations; and when we read in his other poems, that he has been in various shapes, as a serpent, ¶ a wild sow, a buck, or a crane, and such like, we must call to mind, that those scenes of existence in Abred, which were between Annwn and humanity, were the changes of being in the bodies of different animals. One great privilege of the being, who was far advanced in his progression to the circle of felicity, was to remember all the states through which he had passed. Taliesin seems to have been eager to establish his claims to such a successful probation. He is perpetually telling us what he has been. Oblivion was one of the courses of Abred; the recovery of memory was a proof that Drwg and Cythraul began to be overcome. Taliesin therefore as profusely boasts of his recovered reminiscence, as any modern sectary can do of his grace and election.

"There is so much of Taliesin's poetry which no one can understand, that I cannot but place him, in point of intrinsic merit, below the other bards, although, in the estimation of his countrymen, he seems to have been ranked in a superior class."

We can not but wish that this book had been accompanied with an appendix, containing a complete copy of the poems vindicated. It is natural to expect in Wales the reliques of a high degree of culture and information. In imitation of Britain, and in concert with it, Armorica, the north-west corner of Gaul, favoured, about the year 410, the revolt

of Constantine against the Roman emperor Honorius; but it did not resume on the death of the rebel its ancient allegiance. Under a constitution, in which the clergy, the nobility, and the city-corporations had all a formal influence, it continued in a state of independence until Charlemayne. The titular sovereignty of Clovis, who, by an opportune conversion to christianity, obtained the voluntary submission of the Armoricans, encroached so little on the real franchises of the burghers, that neither he nor his royal successors rivalled in power the metropolitan mayors. The conduct of the independent British was similar. First they hired the protection of the gothic stragglers; next they conferred a limited and local sovereignty; and finally they submitted wholly to the sway of the barbarian intruders: a revolution which may be considered as completed throughout this island, with the exception of a few Welsh mountains, under Offa, the correspondent of Charlemayne. During this interval of Armorican independence, and by the users of the Welch language, was laid the ground-work of all that is most peculiar in the civilization of modern Europe. A curious dissertation on this topic occurs in the Monthly Magazine (vol ix. p. 4), but the author has omitted to enquire whether heraldry, and the architecture called gothic, are not as unquestionably of Armorican or Cimmerian origin, as romance, rime, and chivalry. Let us hope the Welch antiquaries will not neglect the illustration of all these topics; and that the Mabinogi, or romances, will especially be communicated without abbreviation of any kind, and with all their instructive imperfections on their head.

ART. II. *Ancient English Romances, selected and published by JOSEPH RITSON.* 8vo. 3 vols.

THE age of Pope has been called the Augustan age of English literature, with more propriety indeed than they who bestowed upon it the appellation were aware; for as the age of Augustus was after that of Lucretius and Catullus, and Sallust and Cicero, so had the great men of England passed away before a French

school was established in the country, of Shakespere, and Spenser, and Milton. One remarkable characteristic of this school is, their total want of all due sense and feeling of their predecessors' excellence. When Spenser and Milton mention the great poets of their own country, it is delightful to observe with what love

it may be found at the end of the second volume of Mr. Edward Williams's poems, with translations. I cannot speak of this gentleman, without mentioning his talents with high respect, nor without recommending him earnestly to the attention of his wealthy countrymen. His age enforces the claims of his genius.

¶ "Wyl sarph, p. 27.—bum hwch—bum bauwch—bum garan, p. 44.

and reverence they regard them, being themselves the greatest. Because they possessed genius in the highest degree, they loved it and revered it wherever it was to be found.

ΔΕΥΤΕΡΟΝ ΑΥΤΕ ΓΕΝΟΣ, ΠΟΛΥ ΧΕΙΡΟΤΕΡΟΝ, ΜΕΤΟΠΙΣΘΕΝ  
ΑΡΓΥΡΕΟΝ ΠΟΙΗΣΑΝ ΟΛΥΜΠΙΑ ΔΩΜΑΤ' ΕΧΟΝΤΕΣ  
ΧΡΥΣΕΩ ΒΤΕ ΦΩΝ ΕΝΑΛΙΓΧΙΟΝ, ΒΤΕ ΝΟΗΜΑ.

*Hesiod.*

When the race of little men had succeeded, they were for improving every thing. Dryden, who is at the head of our second rate writers, the king of this silver age, was perpetually exemplifying the Procrustean tyranny of cutting down taller men than himself to his own measure; he could perceive that Chaucer was a poet, but his old gold seemed to him to want scouring, and he thought it was reserved for him to make it shine.—Shakespeare too had written admirable dramas; but Dryden could improve the *Tempest*, by creating a sister Sycorax for Caliban, inventing a man who had never seen woman, to match the maid who had never seen man, and seasoning the whole with his cantharides powder. So also he acknowledged the merit of Milton, but believed that the *Paradise Lost* might be improved upon the same receipt of cantharides and rime. In this same spirit, Timon of Athens was polluted by Shadwell, whose bust should be expelled from Westminster Abbey, as Marat has been from the Pantheon; and Nahum Tate, who had laid his irreverent hands upon King David, committed high treason against King Lear. With the same arrogance of imagined superiority, Pope reversified Chaucer, and translated Homer; adapting them to his own standard of poetry, with as little mercy as a modern barber would show to the grey hairs and beards of the old worthies themselves, were they living, and submitted to his improvements.

This French school was of no long continuance; a system so favourable to mediocrity still has, and long will have its underling abettors; but from the days of Pope to the present period, they who have obtained anything that can be called fame, have formed themselves upon different models. Young, extravagant as he is, so often “tottering on the edge of nonsense,” and so often on the wrong side the line, is still a powerful and original writer; he resembles one of the savage, or rather frantic trees of Salvator Rosa, knobbed, and knotted, and withered, yet manifesting strength in all its

wreathings and distortions. Something of his popularity, Thomson owes to his miserable tales of Damon and Musidora, and Palæmon and Lavinia; *stultorum numerus est infinitus*, and these stories have therefore found infinite admirers; but the better part of his Seasons, and still more his *Castle of Indolence*, have entitled him to a high and permanent rank among the poets of England. It was from Greece that Akenside derived his high and ennobling sentiments, and that passionate admiration of whatever is great and noble, which will for ever make him the favourite of all young men, from whom any thing great and noble is to be expected. Gilbert West also formed himself upon the Greeks; few poets, with so little celebrity, have produced such effect; for his reputation is not equal to his merit, but he gave the impulse and tone to Mason, and Gray, and Warton.

Meantime the works of our own ancients had been long neglected. It had been ignorantly asserted and ignorantly admitted, that Waller was the first of our poets who versified well, and Pope the first who wrote correctly. This article of taste was strengthened by Pope's ridicule of black letter learning; he hated Theobald, because he was mortified that a dull man had excelled him in performing a dull man's work; and, as he had before done in the case of Bentley, he laboured to depreciate acquirements in which he knew himself to be deficient. This ridicule was aided and aped by Mallet, a needy Scotchman, who was at all times ready to earn his dirty bread by dirty work; who cringed to Pope while he was living, and calumniated him after his death.

The growing fame of Shakespeare led gradually to a manlier taste; as the mode of criticism which Theobald had discovered was pursued, it was found that the writers who were consulted for the sake of elucidating Shakespeare, were in many instances themselves valuable. The business of annotating has at length indeed been carried to excess, so much so as to be disgraceful to the national literature. Commentators swarm upon Shakespeare, like flesh-flies over a dead lion. This accidental good however has arisen, that many authors who would else have perished irretrievably in the course of another century, or perhaps another generation, are now secured; they are sought after because they are rare, and will be preserved because they are costly.

But the publication of the *Reliques of Antient Poetry*, must be regarded as the great poetical epoch of the present reign. That Percy has been an unfaithful editor is certain; it is equally certain, that a scrupulous fidelity would have prevented the popularity of his book, and the excellent effects which it has produced. There existed no taste for such antiquities in the country at that time; and to him, as the founder or reviver of that taste, we may apply, with little wresting of its purport, the delightful praise designed for the ideal character of the poet, by Sir Philip Sidney; "for he doth not only shew the way, but giveth so sweet a prospect into the way, as will entice any man to enter into it; nay, he doth, as if your journey should be through a fair vineyard, at the first give you a cluster of grapes, that full of that taste you may long to pass further. He beginneth not with obscure definitions, which must blurre the margent with interpretations, and load the memory with doubtfulness; but he cometh to you with words set in delightful proportion, either accompanied with, or prepared for the well enchanting skill of music, and with a tale (forsooth) he cometh unto you, with a tale which holdeth children from play, and old men from the chimney corner."

Old English poetry now became a favourite branch of literature. The number of imitations which were contained in Evans's collection of ballads, evinced how deep an interest had been excited by the *Reliques*. Several of our middle age poets were now published by Davis, a useful and respectable bookseller, whose name deserves this honourable mention; and poor Headley made his selections, even in his last sickness:

"Intent to rescue some neglected rime,  
Lone blooming from the mournful waste of  
time;  
And cull each scattered sweet, that seemed to  
smile  
Like flowers upon some long forsaken pile."

*Bowles.*

A more important task was undertaken by Thomas Warton; but like Jortin, though he loved literature well enough to delight in collecting materials, he loved indolence too well to take the trouble of arranging them. He prosecuted his history as a dog takes a journey, starting aside to pursue chance game, and running himself out of breath without ad-

vancing, till he tired himself, and lay down to sleep upon the way. He is often inaccurate, sometimes hypothetical in his opinions, and sometimes capricious in his taste; yet his book contains much amusing information, and will be read with interest, and consulted with advantage.

Mr. Ellis has prefixed to his specimens of the early English poets, a history in every respect better, except in its brevity. In this he earnestly recommended the publication of some of our metrical romances, and such a work has now been executed by Mr. Ritson, of all men living the best qualified for the task, and the most trust-worthy.\*

"This collection, then, of Ancient English Metrical Romances consists of such pieces as, from a pretty general acquaintance, have been selected for the best. Every article is deriv'd from some ancient manuscript, or old printed copy, of the authenticity of which the reader has all possible satisfaction; and is printed with an accuracy, and adherence to the original, of which the publick has had very few examples. The utmost care hath been observ'd in the glossary, and every necessary or useful information (to the best of the editours judgement) is given in the notes.

"Brought to an end with much industry and more attention, in a continue'd state of ill-health, and low spirits, the editour abandons it to general censure, with cold indifference, expecting little favour, and less profit; but certain, at any rate, to be insulted by the malignant and calumnious personalities of a base and prostitute gang of lurking assassins, who stab in the dark, and whose poisoned daggers he has allready experience'd.

Mr. Ritson can feel, and confess that he feels, the malignity of others. The lot of Ishmael may be hard; but if he will lift his hand against every man, he must expect that every man's hand will be against him. The laudable and conscientious accuracy of this editor is well known; his *Antient Songs*, his edition of Laurence Minot, and his *Robin Hood*, with his other publications of a like nature have sufficiently evinced it. The unhappy infirmity of his temper is also known. The offensive virulence with which he insults those from whom he differs in opinion, and the more offensive fanaticism with which he has obtruded upon the public his hideous and hateful blasphemies. We speak thus of Mr. Ritson with more pity than indignation; lamenting that a man of such patient re-

\* It is perhaps scarcely necessary to remark that this article was received by the editor before the death of Mr. Ritson. *Edit.* 113

search, and scrupulous fidelity, should thus disgrace and injure himself; and lamenting also, that the heart of any human being should be so inveterately and hopelessly diseased.

These volumes are prefaced with a long dissertation on romance and minstrelsy, of which the first section is upon the origin of romance. Mr. Ritson begins by asserting, that the Iliad and Odyssey, the Argonauticks, the Thebaid, &c. are, in reality, as perfect metrical romances as the stories of King Arthur and Charlemayne. The siege of Troy, he says, as related by Homer, not being at all more certain, or more credible, than that of Albracca, as asserted by Boiardo. It is the humour of this writer to disbelieve those things which he ought to believe; but in this instance, happily, the error of his opinion does not injure his induction. In all ages it has been the business of the poet to

“Sing of knights and ladies gentle deeds;”

and the difference between the epic poem, and the metrical romance is more a difference of degree than of kind.

“After Statius, there is no metrical-romance-writer, or epick poet, in the Latin tongue, known to have existed before Joseph of Exeter, call'd by some Cornelius Nepos, who wrote, in six books, of The Trojan war, and, in one book, The war of Antioch; and flourished, according to Bale, about the year 1210; or Philip Gualtier, a Frenchman, author of The Alexandreid, or actions of Alexander the Great, about the same period: all three in imitation of Lucan, or Statius.”

Mr. Ritson, it seems, is unacquainted with a very curious poem of the sixth century, *de prima expeditione Attilæ regis Hunnorum in Gallias, ac de rebus gestis Waltharii Aquitanorum principis*, edited by Fischer, at Leipsic, in 1780. It is called by the editor *Carmen Epicum Seculi VI.*; but if rudeness of structure, and wildness of chivalrous adventure be of the essence of romance, this poem is certainly to be classed among romances. The author's name has perished: he was a monk of Celtic race, contemporary with Venantius Fortunatus, and Corippus Africanus. It is remarkable, that in this poem Attila is represented as a humane man, a valid testimony, when it is considered that the hero of the tale is his enemy.

“It appears, however, difficult to demonstrate that the comparatively modern romances of the French owe their immediate

origin to the epick poetry, or fabulous tales of the Greeks or Romans; but it may fairly be admitted, as by no means improbable, that these remains of ancient literature had some degree of influence, though the connection is too remote and obscure to admit of elucidation.

“After all, it seems highly probable that the origin of romance, in every age or country, is to be sought in the different systems of superstition which have, from time to time, prevail'd, whether pagan or christian. The gods of the ancient heathens, and the saints of the more modern christians, are the same sort of imaginary beings; who, alternately, give existence to romances, and receive it from them. The legends of the one, and the fables of the other, have been constantly fabricated for the same purpose, and with the same view: the promotion of fanaticism, which being mere allusion, can only be excited, or supported by romance: and, therefore, whether Homer made the gods, or the gods made Homer, is of no sort of consequence, as the same effect was produce'd by either cause. There is this distinction, indeed, between the heathen deities and the christian saints, that the fables of the former were indebted for their existence to the flowery imagination of the sublime poet, and the legends of the latter to the gloomy fanaticism of a lazy monk or stinking priest.”

We will not enter upon the useless task of correcting Mr. Ritson for his coarse and impudent language:

“Let Gryll be Grill, and have his hoggish mind!”

It is our duty to express a deep and decided disapprobation and disgust at such passages; and having expressed it, to consider his literary opinions with the attention and deference due to the high and honourable rank which he holds in this department of literature.

“Different authors have attributed the origin of romance to three sources, altogether remote from each other: 1. The Arabians; 2. the Scandinavians; 3. the Provençals. It appears, from an observation of the historian of English poetry, to have been imported into Europe by a people whose modes of thinking and habits of invention, are not natural to that country. It is generally supposed to have been borrow'd from the Arabians. It is an establish'd maxim, he proceeds, of modern criticism, that the fictions of Arabian imagination were communicated to the western world by means of the crusades. But it is evident that these fancies were introduce'd at a much earlier period: the Saracens or Arabians having enter'd Spain about the beginning of the eighth century. It is obvious to conclude, he continues, that at the same time, they disseminated those ex-

travagant inventions which were so peculiar to their romantick and creative genius. The ideal tales of these eastern invadeers, recommended by a brilliancy of description, a variety of imagery, and an exuberance of invention, were eagerly caught up and universally diffus'd. From Spain, he asserts, they soon pass'd into France and Italy. It is for this reason, he pretends, the elder Spanish romances have profess'dly more Arabian allusions than any other. There is, in fact, not one single French romance now extant, and but one, mention'd by any ancient writer, which existed before the first crusade, under Godfrey, Earl of Bologne, afterward King of Jerusalem, in 1097: neither is any thing known concerning the literature of the Moors who came over from Barbary, and settle'd in Spain in 711; nor is it at all probable, or capable of proof, that even the Spaniards, much less any of the other nations of Europe, had an opportunity of adopting any literary information, or did so, in fact, from a people, with whom they had no connection, but as enemies, whose language they never understood, and whose manners they detested; or would even have condescended, or permitted themselves to make such an adoption, from a set of infidel barbarians, who had invade'd, ravag'd, and possess'd themselves of some of the best and richest provinces of Spain; with whom they had continual wars, til they at last drove them out of the country; whom, in fact, they allways avoided, abhor'd, and despise'd. There is, doubtless, a prodigious number of Arabick poems in the library of the Escorial, which has been plunder'd from the Moors, but which no Spanish poet ever made use of, or, in short, had ever access to. It was not in the historians power to cite one single old Spanish romance that has the slightest Arabian allusion, except, indeed, that of the *Cid Ruy Dias*, where, as in those of *Charlemagne*, the Moors or Saracens are introduce'd as enemies, and in two modern books, the *Historia verdadera del rey don Rodrigo*, printed in 1592, and the *Historia de los vandos de los Zegries y Abencerrages*, printed at Seville in 1598, and, under the title of *Historia de las guerras civiles de Granada*, at Paris, in 1600; both falsely pretended to have been translated from the Arabick, and ridicule'd, on that account, by Cervantes, who makes use of the same pretence in his *Quixote*. The Spaniards are so far from having any ancient *historias de cavallerias*, which we call romances, that they have not a single ballad (which they call *romance*) upon the subject of the Moors, except, it may be, a few compose'd after or about the time of their expulsion and extant in the *Romancero general*, or other compilations of the like kind. With respect to the oriental literature for which we are indebted to the crusades, beside the *Clericalis disciplina* of Peter Alfonsus, a converted Jew, baptise'd in 1106, in which are many eastern tales, there is but one single French romance, in rime or prose,

of the thirteenth or fourteen century, which appears to have been taken from an Arabian or oriental source; it is that of Cleomedes, by King Adenes (a minstrel-monarch, or herald,) after 'The story of the enchanted horse,' in The thousand and one nights. As to the rest, this eloquent and flowery historian, whose duty it was to ascertain truth from the evidence of facts and ancient documents, and not to indulge his imagination in reverie and romance, without the least support, or even colour of veracity or probability, has not the slightest authority for this visionary system, but assumes, with confidence, that which he knew himself unable to establish by proof."

In thus correcting the error of War-ton, Mr. Ritson has run into an opposite error himself. Nothing but the heat and passion of controversy could have misled him to such an assertion as, that the Spaniards never had any connection with the Moors but as enemies, that they never understood their language, and that they detested their manners; how then does he account for the traces of Moorish manners that still exist, and for the Arabic words which abound in their language? Gastam de Fox, the first Bishop of Evora, after its recovery from the Moors, wrote a treatise upon God, the immortality of the soul, the concordance between the Sibylline oracles and the prophets, eternal happiness, purgatory and hell, in *Arabic: the language*, says Barbosa, *then most used in Spain*. The will of Nuno Alonso, Alcayde of Toledo about the same period, was written in Arabic. So much indeed was Arabic cultivated by the Spanish christians, that the ecclesiastics bitterly lament this attention to the infidels language. Alvaro of Cordovo complains, that 'ex omni Christi collegio,' scarcely one in a thousand could decently reply to a Latin salutation; when crowds, out of number, were so versed in what he calls the Chaldaic tongue, as to vie with the Moors themselves in the pompous diction, and skilful structure, and elaborate rhymes of Arabic poetry. Among the archives of the Duque del Infantado, exist some Spanish writings in Arabic characters. The Spanish language abounds with ballads upon the subject of the Moors, chiefly composed after the conquest of Granada, and before their expulsion. The satire which these ballads excited is sufficient proof of their number and popularity: one of Gongora's burlesque romances is upon this subject, though he himself was an offender.

Mr. Ritson's general argument, how

ever, is unaffected by these erroneous assertions. It is indisputably true, that their prose romances, their *historias de cavalleries*, are neither directly nor indirectly of Arabian origin, nor in any degree tinged with Arabian fiction. That intimate connection which formerly subsisted between the Spaniards and Moors, had ceased before these romances were written. With respect to the origin of the Welsh romances, Mr. Ritson has shown, that Warton was equally mistaken; but though he has overthrown his opinion, he is not possessed of sufficient data to establish his own. The titles which he has copied from Lhuyd, are indeed manifestly of French extraction; but the Mabinogion must be examined, before any well founded opinion can be formed respecting Welsh romance. For this we must look to Mr. Owen, or to the very able and learned vindicator of the Welsh bards.

With the same sound judgment, Mr. Ritson controverts and confounds Percy's hypothesis, which would trace the origin of romance to Scandinavia, and with the same intemperance proceeds himself to make assertions equally groundless. He gives the titles of certain sagas, transcribed chiefly between the years 1600 and 1700, which are evidently from the French, and infers from thence, that all the sagas are, for the most part, if not totally, translated or imitated from the French, and of very recent date. Whoever has read any of the earlier sagas, will perceive that Mr. Ritson is here venturing to decide upon a subject which he has never examined. His abuse of the Edda is equally compounded of truth and error. That no such system is to be found in Saxo Grammaticus is certain; but what does Mr. Ritson say to the evidence of Tuesday, Wednesday, Thursday, Friday and Saturday? Does he suppose that the days of the week would have been thus named, if our ancestors had never worshipped Tuisko, and Woden, and Thor, and Frea, and Surtur? Snorro, he says, is no bad name for a dreamer; but why has he omitted all notice of Sæmund, and the earlier Edda?

A more probable origin of the machinery of romance, has been assigned in the preface to the late translation of Amadis. It is there surmised to be rather of classical than of oriental origin; that enchanted armour is to be traced to the workshop of Vulcan; that dragons are of

the spawn of Python, and the Hydra, and the guardian of the Golden Fleece; that Gyges furnished the prototype of magical rings; that the nymphs, and dryads, and oreads, became fairies, and the naiads ladies of the lake. This change would be analogous to the growth of modern languages, from the Latin, and to the amalgama of pagan and christian ceremonies. The heroes of classical antiquity, not only ranked with Roland and Oliver, with Sir Lancelot and Sir Tristram, in the songs of the minstrels, but were installed, to their exclusion, in the most noble order of the nine worthies. — Jason, Hercules, Orpheus, were all adopted by the romancers; and the same deep interest was excited in the darkest ages, by the tale of Troy divine, as that divinest tale will continue to excite, while the nature of man remains unchanged. The Troy boke well exemplifies the easy process whereby gods and demigods became knights of prowess. (We want a word for the *preux* of the French, the untranslatable adjective that condenses all the virtues of chivalry.) In this book Jupiter is humanised; the addition of courtesy makes Hercules a true errant knight; and the story of his descent to hell, to deliver Theseus, is made so probable, by being translated into romance, that it may almost be admitted as an historical solution of mythological fable.

“ If the hero of a romance be occasionally borrow'd from heaven, he is, as often, sent thither in return. John of Damascus, who fabricate'd a pious romance of Barlaam and Josaphat, in the eighth century, was the cause of these creations of his fancyful bigotry, and interested superstition, being plac'd in the empyreal galaxy, and worship'd as saints. Even Rowland and Oliver, the forge'd and fabulous existences of the Pseudo-Turpin, or some other monkish or priestly impostour, have attain'd the same honour. This idea is render'd the more plausible, if not positive, by the most ancient romances of chivalry, those of Charlemagne, for instance, and his paladins, Arthur, and his knights of the round-table, Guy, Bevis, and so forth; all of whom are the strenuous and successful champions of christianity, and mortal enemys of the Saracens, whom they, voluntarily and wantonly, invade, attack, persecute, slaughter and destroy. It was not, therefor, without reason, say'd by whomsoever, that the first romances were compose'd to promote the crusades, during which period, it is certain, they were the most numerous; and to prove how radically these mischievous and sanguinary legends were impress'd upon the minds of a bigoted and idiotick people for a series of no less than five centuries, about the

year 1600, appear'd 'The famous history of the seven champions of christendome,' in which the Rowland, Oliver, Guy, Bevis, &c. the fabulous heros of old romance, are metamorphos'd into Saint George, Saint Denis, Saint James, Saint Anthony, Saint Andrew, Saint Patrick, and Saint David, the no less fabulous heros of legend and religious imposture; most of whom receive a certain degree of adoration, like the pagan deities of old, by the dedication of churches, devotional days, and the like: which celebratèd work, being a compound of superstition, and, as it were, all the lyes of christendom in one lye, is, in many parts of the country, believ'd, at this day, to be 'as true as the gospel.'

Mr. Ritson is so well aware of the value of these romances, as to have expended much labour and patience in investigating and preserving them: he calls them the songs.

"*Quæ priscis memorata Catonibus atque Cethegis;*"

but no sooner does he consider them as connected with christian feelings, than they appear to him to be "mischievous and sanguinary legends," composed to impress the minds of a "bigotted and idiotic people!"

The first metrical romance, properly and strictly so called, that is known to have existed, is, according to Mr Ritson, the famous *Chanson de Roland*. The copy given by the Marquis de Paulmy to Dr. Burney, he considers as spurious, and the stanza printed by Tressan to be his own invention. The real *Chanson de Roland*, he says, was unquestionably a metrical romance of great length, upon the battle of Roncesvalles; and Taillefer, the Norman minstrel, sung only a part before the army. We should rather have inferred from the word *cantilena*, which William of Malmsbury applies to this song, that it was actually a war song or ballad, and not of any great length. The story quoted from Hector Bois, and which, as Mr. Ritson says, there is no reason to believe, is parodied from a tale of King John the First of Portugal, which there is no reason to doubt.

This poem, be it what it may, is not known to exist. The most ancient romance in the French language, is therefore thought to be one upon the achievements of Charlemagne, respecting the destruction of the monastery of Carcasson and Narbon, and the construction of that of *de la Grace*. This was supposed to have been written at Charlemagne's command; but Mr. Ritson proves, that

it must have been subsequent to the year 1144. The *Roman de Guillaume d'Orange, surnommé au Court nes*, is nearly of the same age. Calmet supposed *Garin le Loheran* to be the oldest extant. *Alexandre* by Alexandre Bernay, and *Lambert le Cors*; and the *Brut* of Maistre Wace are of this early period.

"Before the year 1122, and even, according to the French antiquarys, in the eleventh century, had appear'd a book intitled, in the printed copys, '*Journis Turpini Historia de vita Caroli magni et Rolandi*.' This Turpin is pretended to be the arch-bishop of Rheims, whose true name, however, was Tilpin, and who dy'd before Charlemagne; though Robert Gaguin, in his licentious translation of this work, 1527, makes him, like some one else, relate his own death.—Another pretended version of this Pseudo-Turpin, which is say'd to have been made by one Mickius (or Michel) le Harnes, who live'd in the time of Philip the August, or 1206, has little or nothing in common with its false original, being, in fact, the romance of Regnaut, or Reynald, and not that of Roland, who is never once mention'd in the head-chapters, and very rarely in the book. Mister Ellis, who took it, without inspection, to be a fair translation of the false Turpin, in 1207, says, 'the real authour was perhaps a Spaniard;' but this is without authority; and in fact, the Spaniards have no romance of any such antiquity. Mister Warton calls this fabulous history 'the ground-work of all the chimerical legends which have been relate'd concerning the conquests of Charlemagne and his twelve peers:' but this, at least, requires it to have been compose'd before the year 1066, when the adventures or exploits of Charlemagne, Rowland, and Oliver, were chanted at the battle of Hastings. As a strong internal proof; however, that this romance was written long after the time of Charlemagne, he says, that the historian, speaking of the numerous chiefs and kings who came with their armys to assist his hero, among the rest mentions Earl Oell; and adds 'Of this man there is a song commonly sung among the minstrels even to this day.' In another place, he says, that 'Turpin's history was artfully forged under the name of that archbishop about the year 1110, with a design of giving countenance to the crusades from the example of so high an authority as that of Charlemagne, whose pretended visit to the holy sepulchre is described in the twentieth:' which seems highly probable."

If however there existed romance upon Charlemagne and his peers before this history was written, it is certain that the Italian, which is the noblest branch of the family, is derived from this stock.

Geoffrey of Monmouth set forth his book in 1136. We wish Mr. Ritson, or

some equally able antiquarian, would draw out the *family trees* of these two great roots. Such a pedigree would greatly elucidate the history of romance.

In the course of the fourteenth and fifteenth centuries, the metrical French romances were turned into prose. This would probably take place upon the introduction of printing: when it was no longer necessary to commit them to memory, the technical aid of rhyme was neglected. Mr. Ritson is inclined to believe the assertion of D'Herberay and Tressan, that what he calls the "far-famed and exquisite story of Amadis de Gaul," was originally written in the Picard language. This question has now been decided. There is no doubt whatever, that Vasco Lobeira was the author, though that a Picard translation, anterior to the Spanish version, may have existed, is by no means improbable.

Romance did not appear in Italy before the time of Dante and Boccaccio; it arrived still later in Spain.

The second section is concerning the Saxon and English language.

No satisfactory information can be obtained respecting the original alphabet of the Saxons. That the Britons had writings is certain; and it is perhaps to be regretted, that the bardic characters were not used in the Archaeology, and in Mr. Owen's Dictionary. Saint Patrick is said, by Nennius, to have written three hundred and sixty-five alphabets, "one for every day in the year, and upward; in order, it is presumed, to teach the Irish to read." Mr. Ritson has no mercy upon the Saxons, if we are to believe his character of our Gothic forefathers, and Mr. Pinkerton's of our Celtic; a true-born Englishman must be a miserable mongrel indeed.

"Though these treacherous strangers are not known to have brought over with them hooks or letters; or, in short, any kind of literary stock, while they continue'd pagans, they were unquestionably a brave and warlike nation, but upon their conversion to christianity, their kings became monks, the people cowards and slaves, unable to defend themselves, and a prey to every invader. The same effects had, not long before, been already produce'd upon the Romans, as they have, in modern times, upon the Mohawks, who, in consequence of a certain change, have lost all that was valuable in their national character, and are become the most despicable tribe that is left unexterminated. It will be in vain to expect any proofs of genius from

such a savage and degraded people, if, as Warton pretends, 'the tales of the Scandinavian scalds,' flourish'd among the Saxons, who succeeded to the Britons, and became possess'd of England in the sixth century, it may be justly presume'd, they had been soon lost, as neither vestige, nor notice, is preserv'd of them in any ancient writer. They had a sort of poetry, indeed, a kind of hom-bast, or insane, prose, from which it is very difficult to be distinguish'd. Alfred, it must be confess'd, a great prince, but a wretched bigot, upon the testimony of his chaplain, or confessor, who wrote his life, though he allows him to have remain'd illiterate, through the unworthy neglect, for shame! of his parents and nurse's, until twelve years of age or upward; says that the Saxon poems, being by day and night an attentive auditor, very often hearing from the relation of others, being docile, he retain'd by heart.' He had even form'd a manuel, or common-place-book, call'd, in Saxon, his *hondbec*, in which were several pieces of poetry by St. Aldhelm, who (dy'd in 709, and) successfully cultivated that study, and particularly a song he had made, which in the time of Asser was still sung by the vulgar."

It is evident, that in the days of Bede the Saxons possessed at least as much literature as any nation then existing, except the Greeks. The singular fancy of their kings for the Greek language, is not noticed by Mr. Ritson. Whatever relates to the literary history of this period, will doubtless be collected by the indefatigable historian of the Anglo-Saxons.

Edward the Confessor, who never did but one good thing, and that in consequence of seeing the devil in the treasury, began to introduce Norman customs, romance language, and Norman characters.

"The Saxon natives, a spiritless and cowardly race, who had been long accusom'd to the conquest and ascendancy of every neighbouring nation which thought proper to invade them, as the Scots, for instance, the Picts, and the Danes, the last of which had actually taken possession of the crown and kingdom of England, and held it for several reigns, were, after the Norman conquest, reduced to a state of baseness and servility. They had been deprive'd of their native landlords, who were forfeited, banish'd, and put to death; and their estates confiscated, by the rapacious Normans; they had been deprive'd of their laws, and a final attempt was now made to abolish their language. This, however, though great pains were taken to enforce it, did not entirely succeed, owing chiefly, it may be, to the stupidity of the Saxon peasants.\*"

It would have been well if Mr. Rit-

\* It would, no doubt, have been a glorious matter for a conquer'd and enslave'd people

son had explained in what the superiority of the Norman language to the Saxon jargon consisted, and what benefit would have accrued to the English from exchanging the language of their forefathers for that of their tyrants.—Till this be satisfactorily explained, we must be allowed to bless the stupidity of the Saxon peasants, and to thank God that our mother tongue is the language of Shakespere and of Milton, not of Racine and Voltaire; we must be allowed to thank God for this especial blessing, and for the numberless blessings which have arisen from it. Whatever is valuable in the laws and constitution of England, is of Saxon origin; the grievous oppressions of the feudal system, and the law of primogeniture, the main branch of that upas, were left us by the Normans. It is absurd to assert, that like the Picts, the Saxons “seem to have been cut off all at once by a single blow, without any progeny being left to represent them.” Let Mr. Ritson take up a common directory and see what proportion of the names of Englishmen are of Saxon derivation. Let him remember too the Plantagenets, and that our Edwards and Henrys were of the Saxon line.

In the reign of Henry the second

“It is most probable, Layamon, the priest, made his translation, in the style of Saxon poetry without rime, from the *Brut* of *maistre* Wace; which affords a strange and singular mixture of the Saxon and Norman idioms, both apparently much corrupted. This curious work exhibits the progress of the English language, properly so call'd, as we now have it, in its dawn or infancy, if one may use such an expression.”

The Society of Antiquaries, as to the shame of England we have no academy, should publish this valuable specimen of our earliest language. Ninety years elapsed between the completion of Layamon's work, and of Robert of Gloucester's chronicle; and in that time the language had rapidly improved. In 1362, the famous statute was passed, enjoining all law proceedings to be

pleaded in English, and enrolled in Latin. A more immediate and more lasting effect was produced by Geoffrey Chaucer, one of the great men of England; and thus was established, that language which is now spoken in America, and in New Holland, and which, whatever may be the fate of empires, will continue to be read as long as the human race shall be capable of appreciating the works of human genius.

We have now arrived at the third section, which treats of the English romances. There are not above two or three originally English. Mr. Tyrwhitt's conjecture, however, is extremely probable, that many of these, though written in French, were composed in England, and perhaps by Englishmen. While French was the court language, the poems designed for the amusement of the nobles must necessarily have been composed in French. Before, however, the origin of these rules can be ascertained, much must be done. The German metrical romances must be examined, of which a large collection was published in 1785; but above all, to explain the romantic history of Arthur, the Mabinogion must be translated. Mr. Ritson's opinion is thus well summed up.

“That the English acquire'd the art of romance-writing from the French seems clear and certain, as most of the specimens of that art, in the former language, are palpable and manifest translations of those in the other, and this, too, may serve to account for the origin of romance in Italy, Spain, Germany, and Scandinavia: but the French romances are too ancient to be indebted for their existence to more barbarous nations. It is, therefor, a vain and futile endeavour to seek for the origin of romance: in all ages and all countrys, where literature has been cultivate'd, and genius and taste have inspire'd, whether in India, Persia, Greece, Italy, or France, the earliest product of that cultivation, and that genius and taste, has been poetry and romance, with reciprocal obligations, perhap, between one country and another. The Arabians, the Persians, the Turks, and, in short, almost every nation in the globe, abound in romances of their own invention.”

to boast, that, after they had lost the succession of their native sovereigns, their laws, their possessions, their estates and property, and every thing, in short, that was really valuable, they were permitted to preserve their language, and continue a meagre, and barren jargon, which was incapable of discharging its functions; this, in fact, was the only measure of the Norman tyrants which was adapted to the benefit of their conquer'd subjects, and in this alone they were unsuccessful; neither, on the contrary, did the Saxon commonalty retain their primitive tongue: they got, indeed, a barbarous mixture of Saxon, Danish, Norman, and one knows not what, which was no more Saxon than French, and is now known by the name of English, a term formerly synonymous with Saxon.”

A good deal of ill-arranged information is heaped together in this section. Extracts from old poems that enumerate the popular romances of the times are quoted: it had been better to have given a catalogue of all whose titles could be recovered, specifying such as still exist, and where they are preserved. Here Mr. Ritson renews his attack upon the reliques of ancient poetry. He compares the original ballad of the Marriage of Sir Gawaine with Percy's improved copy, and subjoins the following remarks.

"This mode of publishing ancient poetry displays, it must be confess'd, considerable talent and genius, but savours strongly, at the same time, of unfairness and dishonesty. Here are numerous stanzas inserted which are not in the original, and others omitted which are there. The purchasers and perusers of such a collection are deceived and impose'd upon; the pleasure they receive is deriv'd from the idea of antiquity, which, in fact, is perfect illusion. If the ingenious editour had publish'd all his imperfect poems by correcting the blunders of puerility or inattention, and supplying the defects of barbarian ignorance, with proper distinction of type (as, in one instance, he actually has done), it would not only have gratify'd the austereest antiquary, but also provided refine'd entertainment "for every reader of taste and genius." He would have acted fairly and honourably, and given every sort of reader complete satisfaction. Authenticity would have been united with improvement, and all would have gone well; whereas, in the present editions, it is firmly believed, not one article has been ingenuously or faithfully printed from the beginning to the end: nor did the late eminent Thomas Tyrwhitt, so ardent a researcher into ancient poetry, and an intimate friend of the professor, ever see this curious, though tattered, fragment; nor would the late excellent George Steevens, on the bishops personal application, consent to sanction the authenticity of the printed copy with his signature."

This is fair and temperate criticism, but in the note annexed, Mr. Ritson has given vent to all the bitterness of his bilious temper.

Minstrels and minstrelsy are the subject of the fourth and last part of the dissertation.

"That the different professors of minstrelsy were, in ancient times, distinguish'd by names appropriated to their respective pursuits, cannot reasonably be disputed, though it may be difficult to prove. The *trouveur*, *trouveire*, or *rymour*, was he who compos'd *romans*, *contes*, *fabliaux*, *chan-*

*sons*, and *lais*; and those who confin'd themselves to the composition of *contes* and *fabliaux*, obtain'd the appellation of *conteurs*, *conteours*, or *fabliers*. The *menetrier*, *menestrel*, or minstrel, was he who accompany'd his song by a musical instrument, both the words and the melody being occasionally furnished by himself, and occasionally by others. The *jogelour*, *jougleor*, *jugleor*, *jogelere*, or jugler, amused the spectators with slight of hand tricks, cups and balls, &c.

Again, in *The freres tale*, v. 7049:

"A lousy *jogelour* can deceiven thee."

This appears clear from the conduct of John de Raumpayne, who, when he sets out to deceive Morris of Whittington, takes with him a male, which contains his jurglers, and out of which, most likely, he had already so blacken'd, inflatēd, and deform'd his visage, that his most intimate acquaintance did not know him. The *chanteour*, or *chanterre*, was one who sang; the *vielere* or *harpre*, he who accompany'd the *chanterre*, when he did not perform himself, and would be call'd indifferently by either name, or the general one of *minstrel*, &c. A *histrion*, or *mimus*, should, properly, have been the buffoon of a play, as he was among the Romans: but these names, in fact, appear to have been given by affected pedants, who mistook their meaning. There were, likewise, *flutours*, *timbesteres*, and *sailours*, dancers, all three mention'd by Chaucer in his translation of the *Romant of the Rose*, v. 762, &c.

"There mightist thou se these *flutours*  
*Minstrallis* and eke *jogelours*  
That well to singin did their paine—  
There was many a *timbestere*,  
And *sailours*, that i dare well swere  
Yeothe ther craft full parfitly  
The *timbris* up full subtilly  
Thei castin, and hent them full oft  
Upon a finger faire and soft."

The *farceurs*, or buffoons, were possibly, the proper *histriones* or *mimi*, who acted ridiculous and burlesque dramas of a single part, whence the term *farce* is still us'd for a short and laughable entertainment; *baladins*, or dancers; *tabourers*, or *tabareres*, who perform'd on the tabour or tabourin; and, peradventure, several other distinctions. All these, however, in process of time, appear to have been confounded under the common name of minstrels or juglers, and by Latin writers, *ministri*, *ministrelli*, *jaculatores*, *histriones*, *mimi*, *leccatores*, *scurræ*, *vaniloqui*, *citharistæ*, or *citharædæ*, *cantores*, or *cantatores*, *parasitæ*, *famelici*, *nebulones*, *epulones*, and the like. Their peculiar appellations, however, may, doubtless, have been preserved among themselves, without being much attended to by those who only consider'd them as a body of men whose profession was to please; or, at least, by their own corruption in later times,

when one did all, and the whole system sunk into insignificance and contempt."

The chief design of this section is to confute Percy's account of the minstrels. Mr. Ritson has more accurately investigated their history: he brings together all the bad parts of their character in a heavy indictment, and concludes with this parting compliment.

"Beggars they are, with one consent,  
And rogues by act of parliament"

The whole section, indeed the whole dissertation, displays patient and indefatigable research; intimates knowledge of the subject, and scrupulous fidelity. But whenever the author touches upon a subject which he does not understand, such as Cimbric or Scandinavian antiquities, or the Christian religion, he loses his temper, and immediately substitutes assertions for facts, and abuse for argument. Regarding, as we do, this unhappy disease with pity, and respecting, as we sincerely do, his industry, his knowledge, and his accuracy, we trust that Mr. Ritson will not rank us among his foes. If his sores cannot be touched without giving him pain, he will distinguish between the knife of a surgeon and the stab of an enemy.

Ywayne and Gawin is the first poem in this collection. *Le Chevalier au Lion*, the original of this romance, was written by Chrestian de Troyes, who died in 1191. The present poem seems to have been written towards the close of the fourteenth century. The French consists of 7784 verses: the English of only 4032. Unless, therefore, the story of the original has been much curtailed, the work must have been improved by a compressed translation.

Ywayne, Ewen or Owen, was the son of Urien, king, or rather, if we may be allowed the word, kingling of Reged, one of the four parts into which Cambria was then divided. The father is stiled by Llywarch Hen, in the elegy which he composed upon his death-bed, the head and most powerful pillar of Britain. The son was celebrated by Taliessin: he is named in the Triads as one of the owners "of the three steeds of depredation," "of the three blessed princes of the isle of Britain," "of the three blessed burthens of the womb of the isle of Britain," and "of the three immaculate princes of Britain." It ap-

pears by Taliessin that he slew Ida, king of Northumberland, in battle. Thus much, or, to speak more accurately, thus little is recorded of Ywayne, in authentic documents. Romance, which has given him all his celebrity, has faithfully preserved to him that irreproachable character for which he has been placed in the Triads. The fame of his cousin Gawaine is not so fair. In the poem only the better part of his qualities are represented. Gawaine is the courteous knight of the Round Table romances; but courtesy, when applied to him, must be understood in its courtly and courtier derivation, as implying deceit and wickedness. In the Mort Arthur he is represented as a traitor and a murderer.

The story of the romance is briefly this. At the court of king Arthur, Colgreivance relates, that as he was seeking adventures, he was directed to a marvellous well.

"The well es under the fairest tre,  
That ever was in this cuntrè;  
By that well hinges a bacyne,  
That es of gold gude and syne,  
With a cheyne, trewly to tell,  
That wil reche into the well.  
Thare es a chapel ner thar-by,  
That nobil es, and ful lufely,  
By the well stands a stane,  
Tak the bacyn sone onane,  
And cast on water with thi hand,  
And sone thou sal se new tithand.  
A storme sal rise, and a tempest,  
Al about by est and west;  
Thou sal here mani thonor blast,  
Al about the blawand fast;  
And there sal cum slik slete and rane,  
That unnese sal thou stand ogayne;  
Of lightnes sal thou se a lowe,  
Unnethes thou sal thi-selven knowe;  
And if thou pass with owten grevance,  
Than has thou the fairest chance  
That ever yit had any knyght  
That theder come to kyth his myght."

He followed these directions: a storm arose: a knight came up at the summons; attacked him; defeated him; took his horse, and rode away. King Arthur hearing this, swears that he will go see that sight within a fortnight. Sir Ywayne leaves the court secretly; arrives at the well, and conquers the knight, who flies from him, being mortally wounded. Ywayne pursues him to the gate of his town, and is there caught between the portcullis. A damsel, by name Lunet, has pity on him, and gives him a ring which renders him invisible, and at length persuades the

widow of the knight whom he had slain, to forgive him and marry him, that he may protect her against king Arthur's coming; for it seems, that to throw water upon that stone and raise a storm, was the method of declaring war against her country. Ywaine, now lord of the land, obeys the call, and surprises Arthur by his appearance: he feasts the king, and departs with him, by his lady's leave, promising to return at the year's end, on pain of losing her love if he broke his promise. The year passes away, and Sir Ywaine lets the day go by: his heart smites him; but a damsel comes into the court, demands from him a ring, which his lady had given him, and accuses him of breach of promise. With shame and remorse he loses his wits, and runs naked into the woods.

A damsel who stands in need of a protector sees him lying asleep. She orders an ointment to be rubbed over him, which restores his senses: he is conveyed to her castle, and successfully defends her against her enemy. For this service she would have married him, but Ywaine departs. On his way he found a dragon and a lion engaged in fight: he rescues the lion, who, in gratitude for his deliverance, follows him. He comes to the well, and there begins to bewail his folly and fortune. It happened that Lunet was confined in the chapel hard by, being, upon a false accusation of treason, to be burnt next day, unless some knight should conquer her accusers. Ywaine of course succours her. He dares not make himself known, having no hope of obtaining her forgiveness: so he continues to lead the life of an errant knight with his lion, redressing wrongs, till he is engaged in battle with Sir Gawin, neither knowing the other. They fight till the darkness obliges them to pause, and then Ywaine asks the name of his antagonist, and they embrace as the friends who loved each other best. After this event Ywaine rides to the well, and throws water upon the stone. Lunet knowing that it must be his doing, prevails upon her lady to ask assistance from the knight of the lion, saying that she knows that he will readily undertake her cause, if she will solemnly swear to do every thing in her power to reconcile him to his lady, with whom he is at variance. She takes the oath upon rich reliques, the chalice, and the mass book; and

then Lunet carries the tidings to Sir Ywaine, who, from that time forth, with Lunet, and the lady, and the lion, lived in joy and bliss. This is an excellent romance.

Mr. Ritson thinks that Ariosto was indebted to this story for the idea of Orlando's madness, or to a similar adventure in the *Mort Arthur*. The original adventure seems, from a passage which he has quoted in his *Dissertation*, from Robert of Brunne, to have been related of Dan Waryn. Orlando, perhaps, more nearly resembles Hercules, *Furioso* and *Furens*. The lion, who acts a principal part in Ywaine's battle, was perhaps remembered by Spenser in his most delightful story of Una. Morgan the wise, who made the ointment whereby Ywaine's senses were restored, is whimsically supposed to be Pelagius, the greatest of all the Morgans, not even excepting Sir Henry. More probably Morgaine le Fay was meant, and *he* may have been written for *she* in mistake.

Launfal, by Thomas Chestre, is the second in order: the French original is the work of *Marie de France*, a Norman poetess of the thirteenth century. The MSS. of the translation appears to have been written in or about the reign of Henry VI. It is in stanzas of twelve lines; the third, sixth, ninth, and twelfth, of one rhyme. The orthography has a more modern cast than that of the preceding poem, but the language is ruder. As this tale has been modernized in the well-known *fabliaux* of Messrs. Way and Ellis, we need not detail it. The parts which Mr. Ritson points out as additions by the translator, never improve, and sometimes injure, the story, which is, otherwise, excellently invented. It is remarkable that Oleron should here be selected for the kingdom of the king of the fairies.

Of Lybeaus Disconus an analysis has been given in the *Reliques*. The manuscript is the same from which Launfal was printed; the French original unknown. It is written in a twelve-lined stanza, but of more difficult structure than the last poem: the four ternal lines rhyming as in that, and also the two first couplets. There are many words in this romance which have baffled the editor's learning.

The *Geste of Kyng Horn* is believed to be the oldest romance that exists in the English language. The only copy extant appears to have been written

under Edward II. by some French or Norman scribes; by whom, says the editor, the poem itself may have been composed in the preceding reign. A fragment only of the French copy is preserved: but that fragment contains one thousand two hundred lines more than the present version; and as the names are, for the most part, entirely different, the identity of the two poems cannot be ascertained. We should not, therefore, hastily contradict Percy's opinion, that this story is of genuine English growth. That there existed a romance older than the French version is certain, because Horn himself, by a singular absurdity, is there made to refer to it,

'De suddene fui nez si ma geste ne ment.'

King Allof of Suddene is attacked and slain by the Saracens, who thrust his son, then fifteen years old, with his playmates, into a ship, and set them adrift, that they may be drowned. The vessel is stranded upon the coast of Westness, and all the children are taken into the service of King Eylmer. His daughter Rymenyld falls in love with Horn, and asks him to plight her his troth. He requires her first to obtain knighthood for him from her father. When this is done he promises to take her to wife, after he has proved himself in fight. She gives him a ring, which, while he wears and thinks of her, he can never be subdued. Horn rides away, sees a party of heathen hounds landing, and by virtue of this ring destroys them, and then returns to court. Fykenyld, one of his companions, for envy, informs King Aylmer that Horn has seduced his daughter; the king detects them together, and banishes him; who, before he departs, leaves Rymenyld to the protection of his friend Athulf, telling her that if he should not return before the end of seven years, she may take another husband. He sails to Ireland, and there, under the name of Godmod, does the king good service, and remains above six years, never sending any tidings to Rymenyld. At length he meets a page, whom she has sent in quest of him, to say, that she is by force to be married, the next Sunday being the day appointed. Horn asks help of the king of Ireland, and arrives in time. He leaves his men in ambush, changes clothes with a palmer, and in this disguise enters the court, during the marriage feast. The

passage which immediately follows we will give in the original. Its language will wear an uncouth aspect to many of our readers, but the lapidary will perceive the value of the brute diamond.

"Athulf wes o tour ful heh.  
To loke fer and eke neh,  
After Hornes conynge,  
Yef water him wolde brynge;  
The see he seh flowe,  
Ah Horn no wer rowe;  
He seyde on is songe,  
Horn thou art to longe;  
Rymenild thou me bitoke,  
That ich hire shulde loke,  
Ich have yloked evere,  
And thou ne comest nevere.  
Rymenild ros of benche  
The beer al forté shenche,  
After mete in sale,  
Bothe wyn and ale;  
An horn hue ber an honde,  
For that wes lawe of londe.  
Hue dronc of the beere,  
To knyht and skyere;  
Horn set at grounde,  
Him thohte he wes ybounde,  
He seide, Quene, so hende,  
To me hydeward thou wende,  
Thou schenc us with the vurst,  
The beggares bueth afurst.  
Hyre horn hue leyde adounc,  
Ante fulde him of the broune,  
A bolle of a galoun,  
Hue wende he were a glotoun.  
Hue seide, Tac the coppe,  
Ant drync this ber al uppe;  
Ne seh y never, y wene,  
Beggare so kene.  
Horn toc hit hise yfere,  
Ant seide, quene, so dere,  
No beer nullich ibite,  
Bote of coppe white;  
Thou wenest ich be a beggere,  
Y wis icham a fysshere,  
Wel fer come by weste,  
To seche mine beste;  
Min net lyht hier wel hende,  
Withinne a wel feyr pende;  
Ich have leye there,  
Nou is this the sevethe yere;  
Icham icome to loke,  
Yef eney fish hit toke;  
Yef env fyssh is thereinne,  
Ther of thou shalt wyne;  
For icham come to fyssh,  
Drynke nully of dyssh:  
Drynke to Horn of horne,  
Wel fer ich have yorne,  
Rymenild him gan bihelde,  
Hire herte fel to kelde;  
He kneu hue noht is fysshing,  
Ne him selve nothyng:  
Ah wonder hire gan thynke,  
Why for Horn he bed drynke.

Hue fulde the horn of wyne,  
 Ant dronk to that pelyrne.  
 Hue seide, Drync thi felle,  
 And seththen thou me telle,  
 Yef thou Horn ever seye,  
 Under wode-leye,  
 Horn drone of horn astqunde,  
 Ant threu is ryng to grounde,  
 Ant seide, Quene, thou thench  
 What y threu in the drench.  
 The quene eode to boure,  
 Mid hire maidnes soure,  
 Hue fond that hue wolde,  
 The ryng ygraved of golde,  
 That Horn of hire hedde,  
 Fol sore hyre adredde  
 That Horn ded were,  
 For his ring was there.

If this were told in the sweet verse of Spenser, nothing in romance would be more beautiful. The very play upon the name of Horn is affecting. The word is played upon in a similar manner in the other romance upon the same subject, which Mr. Ritson has printed from the Auchinleck MS.; and this seems to afford some slight presumption that the story is not originally French. Indeed, none of the names look as if they had been invented for French lips. The *theta* occurs too frequently; a good, manly, English sound; the stumbling-block, the shibboleth of our nasal-twanged neighbours. From the names, and from the mention of miming in the Auchinleck copy, we suspect the story to be of Scandinavian growth. In the French fragment the names are different; they would be changed there to render them pronounceable. But there seems no reason why an Englishman should have altered them; supposing the French to be the original: nor do we know that any such alteration has been made in the numberless tales versified from that language. There is yet another circumstance which may throw some light upon the origin of the romance. It is seldom that any inference can be drawn from the manners of the poems; for the manners of France and England were at that time little different. But in Horn Childé is a trait of manners certainly of northern growth. Rymenild, the king's daughter, serves round the horn, after the meat was done, like Rowena, "for that wer lawe of londe." Something may also be inferred from the geographical names Sudenne, Estnesse, Westnesse. Sudenne is Britain, and it is said of Allof, who reigned there "king he was by west; but if Britain bore S. or

S. W. of the maker of the story, we may ascertain in what latitude he made his observation.

It is dangerous to differ from Mr. Ritson respecting old English poetry, for of all men living he certainly is best acquainted with the subject. But in the present instance he seems to have assented to Tyrwhitt's general position, "that we have no English romance prior to the age of Chaucer, which is not a translation or imitation of some earlier French romance," and to have no other ground for the opinion which he has formed.

These remarks have led us unwittingly from the story. Horn makes his appearance with his followers, conquers his rival, and celebrates his marriage. He then tells Eylmer who he is, and how unjustly he had suspected him of seducing his daughter; and he bids him keep her till he has recovered his father's kingdom:

"Then shall Rymenild the yinge  
 Ligg by Horn the kinge.

Horn succeeds in the expedition. He exterminates the Saracens; builds up chapels and churches; and takes the crown. Meantime the traitor Fykenild seizes his wife, and secures her in a strong castle. Horn returns on the day when the forced marriage is to take place: he and some of his companions obtain admittance as harpers to the marriage feast: he slays Fykenild, and thus terminates his troubles and adventures; living thenceforth in true love and godliness.

The Kyng of Tars and the Soudan of Dammas, from the Bodleian, the writing apparently of the fourteenth century, supposed to be from the French, as the poet repeatedly refers to his original. But is it not possible that these repeated references may have been an artifice of the poet; as Ariosto quotes Turpin for tales, which Turpin never devised? The King of Tars has a fair daughter, whom the Soldanne of Damascus demands in marriage: neither she nor her parents will consent that she should be wedded to a heathen hound. The soldan comes with a mighty army, and gives the king a severe defeat, and then the princess resolves to marry him, that there may be no more waste of blood. When the soldan has carried her to Damascus, he makes her renounce her religion, which she does outwardly, having been encouraged in a dream. In

due time she is delivered of a shapeless lump of flesh. The soldan affirms, that the misfortune has befallen him because of her unbelief in Termegaunt and Mahoun; she bids him take the monster to their temples, and pray to them to induce it with shape and life, promising truly to believe in them if they will work that miracle. The soldan accordingly prays, with due perseverance, as long a time as it would have taken to ride five miles, but without effect. He then loses his patience, and knocks his idols to pieces. In his turn he promises to become a Christian, if her god will perform this miracle: a priest is found among the prisoners, and he, by the help of holy water, effects the wonder. The soldan is then baptized, *by immersion*, and such is the virtue of the font, that it washes the blackmoor white. His subjects he knows will rebel against him when they discover his conversion; by his wife's advice, therefore, he sends to her father to lead an army to his aid; and when he arrives, they resolve to hang every man who will not be christened. A great battle takes place, but the soldan is victorious; he lives a happy life, and goes to heaven at last.

The story of Emare is the same which Gower has related of Constance, and Chaucer, in his *Man of Lawes Tale*. The stanzas which describe her exposure with her child are written with more feeling than even Chaucer has displayed.

"Then was ther sorow and myche woo,  
When the lady to shype shulde go,  
They wepte and wronge her honde;  
The lady that was meke and mylde,  
In her arme she bar her chyld,  
And toke leve of the lond.  
When she wente ynto the see,  
In that robe of ryche ble,  
Men sowened on the sonde;  
Sore they wepte, and sayde, Alas!  
Certys this ys a wykked kase,  
Wo worth dedes wronge!

"The lady and the lytyll chyld,  
Fleted forth on the water wylde,  
With full harde happes;  
Her surkote that was large and wyde,  
Therwith her vysage she gan hyde,  
With the hynthier lappes.  
She was aferde of the see,  
And layde her gruf upon a tre,  
The chyld to her pappes;  
The waves that were grete and strong,  
On the bote faste they thronge,  
With mony unseimely rappes.

"And when the chyld gan to wepe,  
With sory hert she songe hit asleepe,  
And putte the pappe yn his mowth,  
And sayde, Myghth y ones gete loud,  
Of the water that ys so stronge,  
By northe or by sowthe!  
Wele owth y to warye the see,  
I have myche shame yn the,  
And ever she lay and growht;  
Then she made her prayer,  
To Jhesu and his moder dere,  
In all that she kowthe."

"Her little child lay weeping in her arm,  
And kneeling piteously to him she said,  
Peace little son! I will do thee no harm!  
With that her coverchief of her head she  
braid,  
And over his little eyen she it laid,  
And in her arm she lulleth it full fast,  
And into the heaven her eyen up she cast".

CHAUCER.

This is a sweet stanza, but contains nothing so affecting as the—with sorry heart she sung it asleep. Even the beautiful fragment of Simonides does not exceed this. Why did not Mr. Ritson, accurate as he is, insert a literal prose translation of that fragment in his notes, instead of the unfaithful and unfeeling rhymes of Dr. Burney?

Orpheus is the hero of the next poem, which is stiled a lay, being too short to be denominated a metrical romance. Sir Orpheo is here metamorphosed into a rich king, who loved harping, and excelled in it, so that

"————— There non was  
A better harper in no place."

His queen Dame Erodys is described as being

"The feyrest woman for the nonys  
That myghth be made of flessche and bonys."

The king of the fairies carries her away bodily. Orpheo for grief forsakes his kingdom, and wanders about in the woods for ten years, solacing himself with his harp. He often saw the king of the fairies come hunting with all his train, or sometimes hawking by the river side, and once drew near enough to see his wife; they knew each other, but had no power to speak. Orpheo follows the company through a hole in a rock, full three miles, till he comes to a fair country as bright as day, where there stood a noble castle. Here he knocks and asks admittance as a minstrel, and being permitted to play, displays his skill so happily, that the king promises him in reward whatever he chuses to demand. He asks for his wife,

M m

and the king of the fairies, more generous than Pluto, restores her without condition, so that they return to their kingdom and reign in peace.

Mr. Ritson supposes this to be from a French original, though no such original has been found. His argument from the fairies we think fallacious, "no notice, he says, being taken of their verdant vesture, or diminutive size, the characteristics of English fairies, it may be fairly concluded, that the poem was not invented or composed in this country; the fairies of the French and Italian romances being essentially distinct, and, in fact, generally females, endowed with singular beauty and supernatural powers." Are they not *always* females? Except Oberon we remember no male fairy, and he, like the queen bee, may be unique in the hive. The fairies in this lay exactly resemble those in the Scotch ballad of Tam Linn. The origin has been well investigated in the very interesting and excellent publication of Mr. Walter Scott.

A chronicle of England concludes the second volume; it is curious and well deserved preservation, but here it is misplaced, and in fact takes up the room of better matter.

Le Bone Florence of Rome. This excellent old romance is printed from a MSS. written about the time of Edward IV: the only copy extant. The title seems to denote a French original, but the poet himself refers rather to the *Gesta Romanorum*.

"Pope Symonde thys story wrate,  
In the cronykyls of Rome ys the date,  
Who sekyth there he may yt fynde."

The story of this poem, notwithstanding its marvels and miracles, is artfully constructed. Sir Garcy, the emperor of *Costantyne the nobull* (is this merely an epithet, or has the author been showing his skill in etymology?) sends to demand in marriage Florens, the only child of Sir Otes the Grawnt, the emperor of Rome. A rude and unseemly wooer for the fairest damsel under heaven!

"As the Romans truly tolde,  
He was a hundtird yerys olde,  
And some boke seyth mare.  
He was araved in ryche parrell.  
Of sylke and goide wythowtyn fayle,  
All whyte was hys hare.  
He seyde, Syrs, wendyth ovyr the see,  
And bydd the emperowre of Rotne sende me  
Hys doghtur swete and sware,  
And yf he any gruchyng make,

Many a crowne y schall gar drake,  
And bodes to drowpe and dare.

"Hys flesche trembylde for grete elde,  
Hys blode colde, hys body unwelde,  
Hys lypes blo for-thy;  
He had more mystyr of a gode fyre,  
Of bryght brondys brennyng schyre,  
To beyke hys boones by,  
A softe bath, a warme bedd,  
Then any maydyn for to wedd,  
And gode encheson why,  
For he was bresyd and all to-brokyn,  
Ferre travelde in harnes, and of warre wrokyn;  
He tolde them redylye;

"When ye have the maydyn brought,  
That ys so feyre and worthely wroght,  
Sche schall lygg be my syde,  
And taste my flankys with hur honde,  
That ys so feyre y understonde,  
Yn bedde be me to byde.  
Sche schall me bothe hoder and happe,  
And in hur lovely armes me lappe,  
Bothe evynn and mornye tyde;  
Byd hur sadur sende hur to me,  
Or y schall destroye hym and hys cyte,  
And thorow hys remes ryde."

Forty lords are sent upon this embassy, with a present of forty Spanish horses and forty horse-load of gold. The spokesman of the embassy, who was a proud *garson*, does not attempt to disguise the age of his master.

"He byddyth, wythowte avysement,  
That thy doghtur be to hym sent,  
For to lygg hym by;  
Hys body ys bresyd, hys bones are olde,  
That sche may kepe him fro the colde,  
Have done now hastelye.  
In comely clothyng sche schall be cledd,  
I have grete hope he wyll hur wedd,  
Sche ys a feyre lady."

He threatens too as bluntly as he woos. Of course the demand is refused, and Sir Garcy, who is not yet superannuated for war, leads a great force against Rome. Sir Mylys and Sir Emare, two sons of the king of Hungary, hear of this war, and go there to prove their fortune in the service of Sir Otes the Grawnt; a brave battle is fought, and Florens, who, like Helen and Erminia, stands on the city wall to overlook the battle, distinguishes Sir Emare for his prowess, but by an unhappy chance her father is slain, and Emare taken prisoner.

The Roman lords advise her to refuse one of the king of Hungary's sons for her husband, and as his brother is taken the offer is made to Mylys, if he will undertake to defend her.

"To syr Mylis Awdegon went,  
And askyd yf he wolde assent  
To wedde that maydyn free,

That ys whyte as lylly-flowre,  
 And be lorde and emperowre,  
 The grettyst yn Crystyante.  
 'But god forbede, and seynt Myghell,  
 That thou undurtake hyt but thou do well,  
 And trewe man thyнке to bee.'  
 To hys spechte answeryd he noght,  
 But styлле he stode and hym be thoght,  
 And seyde, Y schall avyse me.

"Avyse the, seyde that maydyn feyre,  
 For to be my fadurs heyre?  
 Lyghtly may y thyнке.  
 Be hym that suffurde woundys fyve,  
 I schall nevyр be thy wyfe,  
 To suffur dethys dynte.  
 Kyngys and dewkys have me askyd,  
 And all ther londes wolde have geve me at the  
 laste,  
 And many a ryall thyнке.  
 Forthe he yede wyth syghyng and care,  
 That he had gevyn that fowle answare,  
 For sorowe nere wolde he synke."

Meantime Emarе has been led before Sir Garcy, and being recognized is set at liberty, in remembrance of the service which the emperor had received from his father.

"Emare knelyd on hys knee,  
 'Syr, when y come into the towne  
 I and my men muste be bowne  
 To greve bothe thyn and thee!  
 Yea, God forbode that thou spare,  
 But of thy warste wyлле ever mare,  
 Garcy thus sayde he."

Florens is now offered to Emarе on the same conditions, which he bravely and joyfully accepts. The ceremony is performed, but Florens declares that she will not lie by her husband's side till he brings Sir Garcy prisoner, or leaves him dead in the field. He sallies out, and totally defeats the emperor, who takes to his ships. Emarе sends his brother Mylys with an hundred knights to guard his lady, and tell her that he is pursuing her enemy over the sea. Wicked Mylys resolves to win Florens for himself, and proposes to the hundred knights to swear that Emarе is slain, and with his last breath had enjoined him to marry the princess. Only Sir Sampson and Sir Egravayne are honest enough to resist the promises wherewith he tempts them. Sampson is presently killed, and Egravayne compelled to take an oath to serve Mylys. Florens hearing the news declares she will become a nun, but Egravayne tells the whole truth to the Pope, who absolves him from his oath of secrecy, raises the priests and the people of Rome, sets Florens at liberty from the

hundred traitors, and imprisons Mylys till his brother's return.

Emare now returns victorious, bringing Sir Garcy prisoner. When Florens hears of his landing, moved with an unhappy pity, she forgives Mylys, and sets him at liberty, that he may go and meet his brother. The villain tells him that she has been living in adultery with Egravayne, but this calumny is speedily detected. Mylys then hastens back to Rome, and tells Florens to go out and meet her husband. She goes out with the Pope and the cardinals, and the people; when they have left the city, Mylys proposes to her to ride on before the procession, and thus leads her astray. She is now in his power, and when night comes he attempts to violate her, but she prays to God and the Virgin, and immediately "his liking vanished all away." Many days he carries her on, often attempting her chastity, and as often miraculously repress, at last he hangs her up by the hair of her head and beats her, till a knight, called Terry, who is hunting hard by, hears her cries and comes up—then Mylys gallops away and escapes.

Sir Terry takes Florens to his castle, and consigns his daughter Betres to her care. A wicked knight, Machary, dwells with him; he also endeavours to force the princess, and in revenge for her resistance, cuts the throat of Betres by night, and puts the bloody knife in Florens's hand while she sleeps. The parents, therefore, believe her to be the murderess, and prepare a fire to burn her, but when they come to the act of execution Sir Terry's heart relents, and he gives her her palfrey and sends her away. Poor Florens rides on till she meets a thief on the way to the gallows; she asks the people to spare his life and give him to her for a servant, but this Clareholde, instead of acting gratefully for his preservation, proves a new enemy. He is directed by his mistress to get her a passage to Jerusalem, and he sells her to a captain, and leads her on board. This mariner, when they are out at sea, endeavours to force her; she prays again, a storm arises, the ship is wrecked, and Florens gets to shore near the nunnery of Beverfayre.

Here Florens soon becomes famous by a miraculous power which she possesses of curing all diseases by her touch, a virtue perhaps of her royal birth, though this is not specified. Emarе hears of her

cures, and having received a sore wound in his head, which had been unskilfully treated, he sets out to be healed by this nun. At the time of his arrival, Mylys, Sir Machary, Clarebalde the thief, and the captain, who have all been struck with grievous diseases, are met together in Beverrayre to be in like manner made whole.

“ At hur prayers there as sche ware,  
When sche sawe hur own lorde thare,

Sche knewe hym wele ynogh :  
So dud he hur he wolde not so saye,  
Abowte the cloystur goon are thay,

Spekyng of hys woghe.  
Then was sche warre of the four thare,  
That had kyndylde all hur care,

Nere to them sche droghe.  
They knew hur not be no kyns thyng,  
Therof thankyd sche hevyn kyng,  
And lyghtly at them loghe.

“ Mylys that hur aweye ledd,  
He was the fowlest mesell bredd,  
Of pokkys and bleyne bloo ;  
And Machary, that wolde hur have slayne,  
He stode schakyng, the sothe to sayne,  
Crokyd and crachyd thertoo.

The maryner, that wolde have layne hur by,  
Hys yen stode owte a strote for thy,

Hys lymmes were roton hym froo.  
They put Clarebalde in a whelebarowe,  
That strong thefe, be stretys narowe,  
Had no fote on to goo.”

Florens declares, that before either can be healed he must make an open confession of his sins, and in this manner the four villains avow their wickedness and clear her fame. She then heals them, and last her husband, but he burns the four wretches alive, and then takes his wife joyfully to Rome.

The Erle of Tolous. Dyaclysyon, emperor in Almayn, is at war with the Erle of Tolous, whom he has unjustly deprived of certain lands. The earl wins a great victory ; from one of his prisoners he hears much of the beauty of the Empress Beulyboon, whose name, though less heathenish, is quite as outlandish as her husband's. This excites in him a desire of seeing her, and he promises this Sir Trylabas to reward him well if he will conduct him to see her in disguise. Trylabas plays the traitor, and informs Beulyboon, proposing that they should kill the earl ; but she being a noble lady, and knowing also that in their quarrel her husband had been the aggressor, forbids this, and tells him to bring the earl where he may see her at mass. She takes care that he shall have good opportunity to view her, and, as he is in hermit's habit,

gives him a good present, and with the money a ring. Upon this the earl returns to his own country.

Two knights, whom the emperor had left to guard his wife, fall in love with her, and, like the elders with Susanna, in revenge for her virtue, secrete a man in her chamber, give the alarm, and kill him before he can be heard in his defence. She is therefore sentenced to be burnt unless some champion will maintain her cause in combat. The earl hears these tidings, and loses no time in repairing to her defence. He lodges with an abbot, who is near of kin to Beulyboon, and had confessed. Not knowing his guest, he tells him that the empress is so innocent, that the only sinful thing that she had ever committed was in once giving a ring to the Earl of Tolous. The earl then makes himself known, but expresses a wish to be assured of her innocence from her own mouth, that he may be confident and certain that he maintains a right quarrel. He is disguised as a priest, and hears her confession, then defies her accusers, and makes them confess their falsehood. This good service occasions a reconciliation between him and the emperor, who dies shortly after ; the earl is then elected to be his successor ; he marries Beulyboon, and lives with her happily three and twenty years, having fifteen children. No French original is known of this Romance. It is in the usual stanza of twelve lines.

The next is a genuine English Romance, once popular, and still well known by name—The Squir of Lowe Degre.

“ It was a squyr of lowe degre  
That loved the kings daughter of Hungre.  
The squir was curteous and hend,  
Ech man him loved and was his frend ;  
He served the kyng, her father dere,  
Fully the tyme of seven yere ;  
For he was marshall of his hall,  
And set the lords both great and smal.  
An hardy man he was, and wight,  
Both in batayle and in syght :  
But ever he was styll mornynge,  
And no man wyste for what thyng ;  
And all was for that lady,  
The kynges daughter of Hungry.  
There wyste no wyghte in Christenè  
Howe welle he loved that lady fre.  
He loved her more then seven yere,  
Yet was he of her love never the nere.  
He was not ryche of golde and fe,  
A gentyll man forsoth was he.  
To no man durst he make his mone,  
But syghed sore hym selfe alone.”

“ — Under a bente he layde hym lowe,  
Ryght even under her chambre wyndowe ;

And lened hys backe to a thorne,  
 And sayd, alas! that i was borne!  
 That i were ryche of golde and fe,  
 That i myght wedde that lady free!  
 Of golde good, or some treasure,  
 That i myght wedde that lady floure!  
 Or elles come of so gentyll kynne,  
 The ladyes love that i myght wyne!  
 Wolde god that i were a kynges sonne,  
 That ladyes love that i myght wonne!  
 Or els so bolde in eche fyght,  
 As was syr Lybius that gentell knyght,  
 Or els so bolde in chyvalry,  
 As syr Gawayne, or syr Guy!  
 Or els so doughty of my hande  
 As was the gyaunte syr Colbrande!  
 And [it] were put in jeoperde,  
 What man shoulde wyne that lady fre,  
 Than should no man have her but i,  
 The kynges doughter of Hungry."

"That lady herde his mournynge all  
 Ryght under the chambre wall."

She tells him to get himself knighted, and go serve in the wars for seven years, and then she will marry him. A wicked steward overhears this, and accuses him to the king, who behaves very well upon the occasion, but appoints the steward to watch his daughter's chamber. The squire obtains the king's leave to seek adventures; he sets out, and returns at night to take leave of his lady, but he sees the spies behind him.

"Whan that he came her chambre to,  
 Anone, he sayde, your dore undo!  
 Undo, he sayde, now, fayre lady!  
 I am beset with many a spy.  
 Lady, as whyte as whal's bone,  
 There are thyrti agaynst me one.  
 Undo thy dore! my worthy wyfe,  
 I am besette with many a knyfe."

ART. III. *Minstrelsy of the Scottish Border: consisting of Historical and Romantic Ballads, collected in the Southern Counties of Scotland; with a few of modern Date, founded on local Tradition.* Three vols. 8vo. Vol. 3. pp. 420.

WE have already given in our preceding volume (p. 635) a tolerably complete analysis of the two first volumes of this very interesting selection; and are happy to find, from the early demand for a second edition, that the success of the work has been proportioned to its merit. We had anticipated, with perfect confidence, the approbation of those who were best able to estimate the difficulties of the subject, and the merit of its execution; but the decisions of fashion are sometimes so capricious as to disappoint the prognostics of the most sagacious critics.

The pieces contained in the third vo-

lume are divided, like those of the two former, into the three classes of historical ballads, romantic ballads, and modern imitations. These we shall consider in succession.

The first of the historical might be, perhaps, more justly called a romance; because the exploits attributed to *Auld Maitland* and his sons, the heroes of the tale, are partly doubtful, partly improbable, and partly false. Yet the ballad was, upon the whole, well worth preserving, were it only for the singularity of its destiny. Though apparently alluded to by Gawin Douglas, in his *Palice of Honour*, as a popular perform-

ance, it is not till the reign of James VI. that it appears in print. The last poem, entitled the Knight of Curtesy and the Fair Lady of Faguell, is the well-known and shocking history of *Raoul Sire de Couci* and *la Dame de Faiel*, related in four-lined stanzas of eight syllables and alternate rhyme. This is the worst poem in the collection. Like the Squire of Low Degree it is printed from an unique copy in black letter.

Such are the contents of these most interesting volumes. We have noticed them at length, because there has rarely, if ever, appeared in this country a publication so valuable to the antiquary, the philologist, and the poet.

The pieces contained in the third vo-

lume are divided, like those of the two former, into the three classes of historical ballads, romantic ballads, and modern imitations. These we shall consider in succession.

ance, it is not known to exist either in print or in MS; but has been preserved, on the banks of the Ettrick, in the memory of the inhabitants, and was written down by the editor from the recitation of an old woman. Such an authority may perhaps, at first sight, appear suspicious to the poetical antiquary; yet we cannot but agree with Mr. Scott in thinking that the internal evidence of the poem is conclusive as to its authenticity; not only because the many antiquated terms which it contains are no longer intelligible in the district where it is preserved, but because the structure of the fable, the manners, the abruptness of transition, and dramatic character of the dialogue, are in the true spirit of our old romances. The style is, as might be expected, very irregular and unequal, but full of animation; which, together with its frequent appeals to the leading passions which prevailed in Scotland during the 14th and 15th centuries, will fully account for its ancient popularity. For the attention of the present age it will be principally indebted to the elegant illustrations of the editor, in whose notes on this ballad the reader will find more curious information and amusing particulars on the subject of chivalry, than could easily be gleaned from the professed histories of that singular institution.

As our limits will not permit us to comment on every poem in the volume, we shall pass over the next six articles, for the purpose of noticing *Christie's Will*, a personage who exhibited, about the middle of the 17th century, all the characteristic qualities of the ancient Moss-troopers, and whose history well deserved to be perpetuated in the minstrelsy of his country. The ballad itself indeed is not, as the editor confesses, "of genuine and unmixed antiquity, though some stanzas are current upon the border in a corrupted state;" for which reason we shall abstain from transcribing it, and lay before our readers the prose narrative given by Mr. Scott in his introduction to the ballad.

"In the reign of Charles I., when the moss-trooping practices were not entirely discontinued, the tower of Gilnockie, in the parish of Cannoby, was occupied by William Armstrong, called, for distinction's sake, *Christie's Will*, a lineal descendant of the famous John Armstrong, of Gilnockie, executed by James V. The hereditary love of plunder had descended to this person with

the family mansion; and, upon some marauding party, he was seized, and imprisoned in the tolbooth of Jedburgh. The earl of Traquair, lord high treasurer, happening to visit Jedburgh, and knowing Christie's Will, enquired the cause of his confinement. Will replied, he was imprisoned for stealing two *tethers* (halters); but, upon being more closely interrogated, acknowledged, there were two *delicate colts* at the end of them. The joke, such as it was, amused the earl, who exerted his interest, and succeeded in releasing Christie's Will from bondage. Some time afterwards, a law-suit, of importance to lord Traquair, was to be decided in the court of session; and there was every reason to believe that the judgment would turn upon the voice of the presiding judge, who has a casting vote, in case of an equal division among his brethren. The opinion of the president was unfavourable to lord Traquair; and the point was, therefore, to keep him out of the way, when the question should be tried. In this dilemma, the earl had recourse to Christie's Will; who, at once, offered his service, to kidnap the president. Upon due scrutiny, he found it was the judge's practice frequently to take the air, on horseback, on the sands of Leith, without an attendant. In one of these excursions, Christie's Will, who had long watched his opportunity, ventured to accost the president, and engage him in conversation. His address and language were so amusing, that he decoyed the president into an unfrequented and surly common, called the Frigate Whins, where, riding suddenly up to him, he pulled him from his horse, muffled him in a large cloak, which he had provided, and rode off, with the luckless judge trussed up behind him. Will crossed the country with great expedition, by paths, only known to persons of his description, and deposited his weary and terrified burden in an old castle, in Annandale, called the Tower of Graham. The judge's horse being found, it was concluded he had thrown his rider into the sea; his friends went into mourning, and a successor was appointed to his office. Meanwhile, the poor president spent a heavy time in the vault of the castle. He was imprisoned and solitary; receiving his food through an aperture in the wall, and never hearing the sound of a human voice, save when a shepherd called his dog, by the name of Batty, and when a female domestic called upon Maudge, the cat. These, he concluded, were invocations of spirits; for he held himself to be in the dungeon of a sorcerer. At length, after three months had elapsed, the law-suit was decided in favour of lord Traquair; and Will was directed to set the president at liberty. Accordingly, he entered the vault, at dead of night, seized the president, muffled him once more in the cloak, without speaking a single word, and, using the same mode of transportation, conveyed him to Leith sands, and set down the astonished judge on the very

spot where he had taken him up. The joy of his friends, and the less agreeable surprise of his successor, may be easily conceived, when he appeared in court, to reclaim his office and honours. All embraced his own persuasion, that he had been spirited away by witchcraft; nor could he himself be convinced of the contrary, until, many years afterwards, happening to travel in Annandale, his ears were saluted, once more, with the sounds of Maudge and Batty—the only notes which had solaced his long confinement. This led to a discovery of the whole story; but, in these disorderly times, it was only laughed at, as a fair *ruso de guerre*.

“Wild and strange as this tradition may seem, there is little doubt of its foundation in fact. The judge, upon whose person this extraordinary stratagem was practised, was sir Alexander Gibson, lord Durie, collector of the reports, well known in the Scottish law, under the title of *Durie's Decisions*. He was advanced to the station of an ordinary lord of session, 10th July, 1621, and died, at his own house of Durie, July 1646.”

\* \* \* \*

“Tradition ascribes to Christie's Will another memorable feat, which seems worthy of being recorded. It is well known, that, during the troubles of Charles I., the earl of Traquair continued unalterably fixed in his attachment to his unfortunate master; in whose service he hazarded his person, and impoverished his estate. It was of consequence, it is said, to the king's service, that a certain packet, containing papers of importance, should be transmitted to him from Scotland. But the task was a difficult one, as the parliamentary leaders used their utmost endeavours to prevent any communication betwixt the king and his Scottish friends. Traquair, in this strait, again had recourse to the services of Christie's Will; who undertook the commission, conveyed the papers safely to his majesty, and received an answer, to be delivered to lord Traquair. But, in the meantime, his embassy had taken air, and Cromwell had dispatched orders to intercept him at Carlisle. Christie's Will, unconscious of his danger, halted in the town to refresh his horse, and then pursued his journey. But, as soon as he began to pass the long, high, and narrow bridge, which crosses the Eden at Carlisle, either end of the pass was occupied by a party of parliamentary soldiers, who were lying in wait for him. The borderer disdained to resign his enterprise, even in these desperate circumstances; and at once forming his resolution, spurred his horse over the parapet. The river was in high flood. Will sunk—the soldiers shouted—he emerged again, and, guiding his horse to a steep bank, called the Stanners, or Stanhouse, endeavoured to land, but ineffectually, owing to his heavy horseman's cloak, now drenched in water. Will cut the loop, and the horse, feeling himself disembarassed, made a desperate exertion, and succeeded in

gaining the bank. Our hero set off at full speed, pursued by the troopers, who had for a time stood motionless, in astonishment at his temerity. Will, however, was well mounted; and, having got the start, he kept it, menacing, with his pistols, any pursuer, who seemed likely to gain on him—an artifice, which succeeded, although the arms were wet and useless. He was chased to the river Eske, which he swam without hesitation; and, finding himself on Scottish ground, and in the neighbourhood of friends, he turned on the northern bank, and, in the true spirit of a border rider, invited his followers to come through, and drink with him. After this taunt, he proceeded on his journey, and faithfully accomplished his mission. Such were the exploits of the very last border freebooter of any note.”

The next article, *the duel of Wharton and Stewart*, is printed from tradition, and affords a fresh proof of the correctness with which favourite pieces of poetry are preserved in the memory of village hearers. Its principal merit however is, that it has served as an excuse for many curious and entertaining notices respecting the rise and progress of duelling.

The remainder of this class consists of pieces which are strictly historical; and which, though neither venerable from their antiquity, nor important as specimens of language, nor possessed of much poetical merit, have either supplied or suggested to the editor such a variety of local descriptions, so many lively delineations of character, and so much interesting anecdote concerning that eventful period of our history which intervened between the accession of Charles I., and the restoration of his son, that we can confidently recommend this portion of the present volume as calculated to inspire a more general interest than any part of the whole work. There is, in all great revolutions of government, a point of time which is highly favourable to the moral painter; an interval between the first storm of popular frenzy and the last dead calm of military despotism; when every passion is excited, and every character exhibited without restraint or disguise. This interval was rather longer in Scotland than in England; the causes of the revolution, the actors in it, their views and their means were different; so that Mr. Scott's sketches, which are strictly appropriate to the country and the times, will have the merit of novelty to the greater part of his English readers. As an introduction to *Lisly's March* he

takes a retrospective view of the causes which led to the civil war; compares the violent but able tyranny of Henry VIII. in England, with the artful though timid policy of James I., and with the precipitate bigotry of Charles I. in Scotland; and rapidly traces the progress of the contest of prejudice between king and people, from the first solemn league and covenant to the renewal of hostilities after the treaty of Rippon. The next ballad, "on the battle of Philiphaugh," gives him occasion to continue his recital through the brilliant campaign of Montrose, whose career of victory was arrested by the surprise and rout of his army at this place, the site of which is correctly and elegantly described. A sort of rude elegy on the *Gallant Grahams* is prefaced by an account of the subsequent defeats of the royalists, and of the death of Montrose; and lastly, the battle of Loudon-hill, and the battle of Bothwell-bridge, the first describing a successful effort, and the latter the total discomfiture of the *Cameronians*, serve as a vehicle for the history of the persecution by which Charles II. after his restoration, again excited the flames of fanaticism.

The second class, consisting of romantic ballads, contains only ten pieces, of which, though all deserve to be rescued from oblivion, no more than two appear to us to possess much merit, viz. *Young Benjie* and the *two Corbies*; and of the latter of these we cannot help doubting the antiquity. The editor tells us that he received it from a friend, "as written down, from tradition, by a lady." "It is a singular circumstance, (continues he) that it should coincide, so very nearly, with the ancient dirge called *the three ravens*, published by Mr. Ritson; and that at the same time there should exist such a difference as to make the one appear rather a counterpart than copy of the other." Now it appears to us that, so far as the two pieces resemble each other at all, the coincidence is so strong as to warrant our belief that the one is a copy, or perhaps a recollection of the other. The last stanza of Mr. Scott's copy, which is much more sublime than Mr. Ritson's, has so little to do with *hawks*, or *lemans*, or *hounds*, or *ravens*, that it may have been supplied from any other romantic ballad; and the preceding stanza, in which a hungry raven descants on the *white neck-bone*, the *bonny blue eyes*, and the *golden locks* of a

murdered knight, is very far removed from the simplicity of Mr. Ritson's dirge, which is unquestionably ancient. The third stanza is, indeed, a counterpart to the fifth and sixth couplet of what we suppose to be the original; but it strikes us only as an injudicious alteration.

The poetical strength of the present volume lies in its modern pieces, in imitation of the ancient ballad; on these, therefore, we shall bring forward a few remarks. For the poet of a polished age to imitate the rude minstrel of a barbarous one, is a task equally degrading and difficult—their faults he will not, their beauties he cannot, counterfeit. It is, perhaps, only by starting forth in the nakedness of the savage, that his unfettered strength and wild agility can be emulated; but shall the civilized man so transgress his accustomed decorums? What, then, can or ought a modern ballad, founded on an old tradition, to be? Vainly did we search for a solution of this question in "the Mermaid" of Mr. Leyden, which is disgraced by tawdry affectation purely modern; and in the following line, "The moon-beams *crisp* the curling surge," by nonsense, as far as we know, purely original. The flowery nothingness of Miss Seward's "Rich auld Willie's Farewell," satisfied us as little, notwithstanding its liberal sprinkling of Scottish words. Mr. Lewis's *sir Agilthorn* we found possessed of much poetical and sentimental beauty, but deficient in *costume*, in something that might give "a local habitation," and a date, to the personages of the tale. The story has likewise the important failing of being much more trite in fiction than in real life. "Ellandonan Castle," a tale founded on authentic history, and told with nature and spirit, threw some light on the object of our search; but it was in "Cadyow Castle," the work, as we suppose, of our poetical editor himself, that we found the complete answer to our enquiries. The subject of this ballad, (the murder of the Regent Murray, by Hamilton of Bothwellhaugh) a striking and well known fact, of a date sufficiently modern to be heard with interest, affords an excellent ground-work for the decorations of the bard. The language is nervous and spirited—it is pure English, and equally free from obsolete vulgarism and modern nicety. The sentiments preserve the same judicious medium between the coarseness of past ages and refinements

of the present. The manners show the science of the antiquary, and the lively touch of the poet. And this, according to our judgment, is the very definition of a good modern ballad. But our readers shall taste for themselves.

" 'Tis night—the shade of keep and spire  
Obscurely dance on Evan's stream,  
And on the wave the warder's fire  
Is chequering the moon-light beam.

" Fades slow their light ; the east is grey ;  
The weary warder leaves his tower ;  
Steeds snort ; uncoupled stag-hounds bay,  
And merry hunters quit the bower.

" The draw-bridge falls—they hurry out—  
Clatters each plank and swinging chain,  
As, dashing o'er, the jovial route  
Urge the shy steed, and slack the rein.

" First of his troop, the chief rode on ;  
His shouting merry-men throng behind ;  
The steed of princely Hamilton  
Was fleetest than the mountain wind.

" From the thick copse the roe-bucks bound,  
The startling red-deer scuds the plain,  
For the hoarse bugle's warrior sound  
Has roused their mountain haunts again.

" Through the huge oaks of Evandale,  
Whose limbs a thousand years have worn,  
What sullen roar comes down the gale,  
And drowns the hunter's pealing horn ?

" Mightiest of all the beasts of chace,  
That roam in woody Caledon,  
Crashing the forest in his race,  
The Mountain Bull comes thundering on.

" Fierce, on the hunters' quiver'd band,  
He rolls his eyes of swarthy glow,  
Spurns, with black hoof and horn, the sand,  
And tosses high his mane of snow.

" Aim'd well, the chieftain's lance has flown ;  
Struggling, in blood the savage lies ;  
His roar is sunk in hollow groan—  
Sound, merry huntsmen! sound the *pryse*\*!"

Could the chieftain himself have recounted his hunting feats with more animation? But the approach of Hamilton after the deed is done, is yet more highly wrought—we, like our hero, are irresistibly hurried on by the impetuous current of the verse,

" But who, o'er bush, o'er stream and rock,  
Rides headlong, with resistless speed,  
Whose bloody poniard's frantic stroke  
Drives to the leap his jaded steed ;

" Whose cheek is pale, whose eye-balls glare,  
As one, some visioned sight that saw,  
Whose hands are bloody, loose his hair?—  
—'Tis he! 'tis he! 'tis Bothwellhaugh.

" From gory selle,† and reeling steed,  
Sprung the fierce horseman with a bound,  
And, recking from the recent deed,  
He dashed his carbine on the ground."

The transition from the past to the present at the conclusion of the tale, when,

" For the loud bugle, pealing high,  
The blackbird whistles down the vale,  
And sunk in ivied ruins lie  
The banner'd towers of Evandale,"

is natural and pleasing, and affords a most happy conclusion.

Dr. Jamieson's "Water Kelpie," a singular poem, the chief design of which was, "to give a specimen of Scottish writing more nearly approaching to the classical compositions of our ancient bards, than that which has been followed for seventy or eighty years past," deserves to be brought into comparison with Burns's *Halloween*, which, if it does not equal in humour, it probably does in faithful delineation of vulgar superstitions, while it excels that poem in decorum, and in accurate imitation of ancient language. A copious glossary is annexed, of the necessity for which, as well as of the genuine descriptive merit of the piece, our readers shall judge.

" Quhan lads and lasses wauk the clais,  
Narby yon whinny hicht,  
The sound of me their daffin lays ;  
Thai dare na mudge for fricht.  
Now in the midst of them I scream,  
Quhan toozlin' on the haugh ;  
Than quhihher by thaim down the stream,  
Loud nickerin in a laugh.

" Sicklike's my fun, of wark quhan run ;  
But I do meikle mair :  
In pool or ford can nane be smur'd  
Gin Kelpie be nae there.  
Fow lang, I wat, I ken the spat,  
Quhair ane sall meet his deid :  
Nor wit nor pow'r put aff the hour,  
For his wanweird decreed."

The volume closes with the "War Song" of the Edinburgh light dragoon volunteers, which we might have been tempted to blame as misplaced ; but the merit of the piece, and the spirit of the day, disarm our criticism. What indeed can Mr. Scott do better, after exhausting the patrimonial poetry of his ancestors, than seriously set about making new, which he has talents to render so greatly superior to the old?

\* *Pryse*—The note blown at the death of the game.

† *Selle*—Saddle. A word used by Spenser, and other ancient authors.

We cannot take leave of this very entertaining and masterly performance, without expressing our regret at not finding, in this volume, the history of Border-poetry, which, if we mistake not, the editor had in his former volumes given us reason to expect. We trust

that he has not forgotten his promise, but has reserved the performance for one of the works which we see announced as nearly ready for publication; viz. *The lay of the last Minstrel*, and an edition of *Sir Tristram*, as written in the thirteenth century by Thomas of Erceeldoune.

ART. IV. *Specimens of the early English Poets; to which is prefixed, an Historical Sketch of the Rise and Progress of English Poetry and Language.* By G. ELLIS, Esq. 2d edit. corrected. 3 vols. 8vo.

WE take advantage of the re-appearance of this work, to express our sense of its excellence.

The Historical Sketch, as it is modestly called, which comes down to the reign of Henry VIII. contains more of pertinent matter than is to be found in the volumes of Warton; nothing irrelevant is introduced, and no labour of research has been spared to obtain whatever information appertained to the subject.

After some preliminary observations on the language of our ancestors, Mr. Ellis gives, as a specimen of Anglo-Saxon poetry, the ode on Athelstan's victory, with a literal translation, and likewise a metrical version, in the style and language of the 14th century. The last was written by the present ambassador at Madrid, then an Eton school-boy, and is certainly the most wonderful instance of critical imitation, in one so young, that has ever fallen within our knowledge.

The origin of rhyme is next considered: on this subject some light has been thrown by Mr. Turner's essay in the *Archæologia*. An abstract of M. de la Rue's very curious dissertations is then given, and his decisive opinion adduced to prove the important fact, that *it was from England and Normandy that the French received the first Works which deserve to be cited in their Language*. The section is concluded thus;

"But it is not sufficient that the mines of literature contained in our public libraries should be distinctly pointed out, unless some steps are taken to render them generally useful. All the information that can be obtained from the professed historians of the middle ages has been collected by the successive labour of our antiquaries, whose activity, acuteness, and perseverance, do them the highest honour: and their ingenuity has often been successful in detecting, and extorting by comparative criticism, many particulars respecting the state of society, and the progress of arts and manners, the direct communication of which would have been con-

sidered by the monkish annalists as degrading to the dignity of their narrative. But these details, which are neglected by the historian, form the principal materials of the poet. His business is minute and particular description; he must seize on every thing that passes before his eyes; and the dress, the customs, the occupations, the amusements, as well as the arts and learning of the day, are necessary, either to the embellishment or the illustration of his subject. An edition of the works of the Norman poets, or at least of a copious and well selected series of extracts from them, would be a most valuable present to the public; and, indeed, it is only in this shape that they can be very generally useful: because the difficulty of the old manuscript characters is a permanent tax on the ingenuity of each successive student: it is in every case a delay to the gratification of his curiosity; and the talent of decyphering obsolete characters is not necessarily attached to the power of profiting by the information which is concealed under them. Besides, a scarce and valuable manuscript cannot possibly be put into general circulation; and many learned men are necessarily debarred, either by distance, or by infirmity, or by the pressure and variety of their occupations, from spending much time in those public repositories of learning, to which the access has indeed been rendered easy, but could not be made convenient, by the liberality of their founders."

A specimen is given of Layamon's version of Wace, probably the last effort of the Saxon language. The progress of our tongue is then traced, from its earliest origin, with a brevity suited to the size of the work, and with such erudition and judgment, as must excite a wish in every reader that Mr. Ellis's volumes had been upon a larger scale.

The following remarks are made upon the language of Chaucer, a subject which should have been investigated by his late biographer.

"The researches of Mr. Tyrwhitt have proved what Dryden denied, viz. that Chaucer's versification, wherever his genuine text is preserved, was uniformly correct; although the harmony of his lines has in many instances

been obliterated by the changes that have taken place in the mode of accenting our language. But Chaucer's reputation as an improver of our versification principally rests on the invention (or at least on the first adoption) of the ten-syllable or heroic verse, of that verse which has been employed by every poet of eminence from Spenser to Dr. Johnson, and in which its original inventor has left many specimens, both in the Knight's Tale and in the Flower and the Leaf, which Dryden despaired of improving.

"With respect to Chaucer's language, it is impossible not to feel some disappointment at the cautious and doubtful opinion delivered by the author of our national dictionary, and delivered in the introduction to that truly noble monument of his genius. That Chaucer 'might probably make some innovations,' and that 'his diction was in general like that of his contemporaries,' we should have conjectured without Dr. Johnson's assistance; because a writer of genius and learning will be likely to make some innovations in a barbarous language, but, in so doing, will not choose to become quite unintelligible. From a critic so intimately acquainted with the mechanism of language we should have expected to learn, whether Chaucer had in any degree added to the precision of our English idiom by improvements of its syntax, or to its harmony by the introduction of more sonorous words; or whether he was solely indebted for the beauty and perspicuity of his style to that happy selection of appropriate expressions which distinguishes every writer of original thinking and real genius.

"All Chaucer's immediate successors, those who studied him as their model, Hoccleve, Lydgate, King James I. &c. speak with rapture of the elegance and splendour of his diction. He is 'the flower of eloquence;' 'superlative in eloquence;' his words are 'the gold dew-drops of speech.' Such exaggerated praises certainly imply an enthusiastic though, perhaps, absurd admiration; and, as these poets would probably attempt to imitate what they considered as eminently beautiful, it seems likely that an examination of their style must enable us to discover what they considered as the improvements introduced by Chaucer.

"Now the characteristics of our poetry during the fifteenth and sixteenth centuries are an exuberance of ornament, and an affectation of Latinity, neither of which peculiarities are to be found in Robert of Gloucester, Robert de Brunne, Minot, Langland, or indeed in any of the poets anterior to Chaucer. This, therefore, may be supposed to be what Chaucer himself and his successors meant by what they called an ornate style, of which the following stanza, extracted from the Court of Love, is a curious specimen:

"Honour to thee, *celestial* and clear,  
Goddess of love, and to thy *exsultide*,

That giv'st us light so far down from thy sphere,  
Piercing our heartes with thy *pulchritude*!  
Comparison none of *similitude*  
May to thy grace be made in no degree,  
That hast us set with love in unity.  
[St. 88. fol. 380. ed. 1602.]

"It is not meant that this is an example of Chaucer's usual style; indeed no poet is, in general, more free from pedantry: but the attentive reader will find that in the use of words of Latin derivation, most of which are common to the French and Italian languages, he very generally prefers the inflections of the latter, either as thinking them more sonorous, or because they are nearer to the original; and that in his descriptive poetry he is very fond of multiplying his epithets, and of copying all the other peculiarities of the Italian poetry (from which his favourite metre is unquestionably derived), with the view of 'refining our numbers, and improving our language, by words borrowed from the more polished languages of the Continent.'

It is well said of the Canterbury Tales that they contain more information respecting the manners and customs of the fourteenth century, than could be gleaned from the whole mass of contemporary writers, English or foreign.

The section upon the private life of our ancestors contains more than is to be found in any single writer upon the subject. It is not possible to make any abstract of this part, in which every sentence is of essential import.

Stephen Hawes, whom Warton praised in some unaccountable humour, and who in consequence has since been praised abundantly at second-hand, is treated by the present writer with just severity. The specimens which he has extracted are thoroughly worthless; and we, who have read the poem, know that they fairly represent the baldness and affectation of this miserable writer. We will insert here a curious specimen of metre from this poem, which has not been selected by Mr. Ellis.

"*Cace* doubtfull, may yet a whyle abyde;  
*Grace* may in space a remedy provyde.  
Countenance causeth the promotion,  
Nought awayleth service without attendance,  
Repentance is after all *abuson*,  
Thought afore wolde have had *perseverance*,  
Wroughte how should be by dede the *mischance*,  
Abyde nothing till thou do the dede,  
Provyde in minde how thou mayst have mede.  
Promocion groweth after good governaunce,  
Attendance doth attayne good favour.

*Abusyon* is causer of all varyaunce,  
*Perseveyraunce* causeth great honour,  
*Mischaunce* alway is' roote of dolour.  
*Dede* done cannot be called agayne,  
*Mede* well rewarded both with joye and payne."

Of all our old poets, Stephen Hawes is the very worst.

This poet brings us to the close of Henry VII.'s reign.

"The accession of Henry VIII. could not fail to promote the progress of elegant literature in England. His title to the crown was so undoubted that it left him no apprehension of a rival, and fully secured his subjects against the recurrence of those sanguinary civil wars which had so long desolated the country. He was young, handsome, accomplished, wealthy, and prodigal; and the nobility, effectually humbled by the policy of his father, crowded round his person, with no higher ambition than that of gaining his favour and sharing his profusion, which was exhibited in frequent tournaments, in masques, or entertainments consisting of music, dancing, gaming, banquetings, and the display of dresses at once grotesque and magnificent. All the pleasures and all the gallantry of the age were assembled at his court. The press, which had already produced complete and sumptuous editions of our best early poets, furnished an abundant supply of metrical romances, Christmas carols, and other popular compositions. Henry himself is known to have been a proficient in music, and was perhaps an occasional writer of poetry;\* and though his skill in the art be rather problematical, his taste for it is fully evinced by the almost universal practice of his courtiers. Accordingly, this reign forms a marked epocha in our poetical history.

"Chaucer, as we have seen, had formed his taste upon the model of the Italian, no less than of the French poets; but the masculine beauties of Boccaccio in the *Teseide* and *Filostrato* had excited his admiration much more than the gentler graces of Petrarch, who now became the universal favourite. It may, perhaps be matter of surprize, that the style of this poet was not sooner adopted as a model by our writers of love-songs, because the manners of chivalry had, in the very infancy of our literature, blended the tender passion with a very competent share of ceremonious enthusiasm. It is probable, however, that the Italian language

alone possessed, at that time, sufficient pliability to form a compound of metaphor and metaphysics in the contracted shape of a sonnet.

"This difficult novelty seems to have been first attempted by the court poets of the reign of Henry VIII. It must be confessed, that a string of forced conceits, in which the imagination of the reader is quite bewildered,—of harsh and discordant rhymes,—and of phrases tortured into the most unnatural inversions,—is, not unfrequently, the only result of their perverse ingenuity. But even these abortive struggles were not quite useless. In their repeated endeavours to exhibit with distinctness the most minute and fanciful shades of sentiment, they were sometimes led to those new and happy combinations of words, to those picturesque compound epithets, and glowing metaphors, of which succeeding writers, particularly Shakspeare and Spenser, so ably availed themselves. The necessity of comprising their subject within definite and very contracted limits taught them conciseness and accuracy; and the difficult construction of their stanza forced them to atone for the frequent imperfection of their rhymes, by strict attention to the general harmony of their metre. Although, from their contempt of what they thought the rustic and sordid poverty of our early language, they often adopted a cumbrous and gaudy magnificence of diction; they accumulated the ore which has been refined by their successors, and provided the materials of future selection."

At this era the regular series of specimens commences. We must content ourselves with exhibiting a few from the many delightful poems here brought together: to comment upon them would be to enter into a critical history of English poetry.

Richard Edwards, who died in 1566, is the author of the following ballad.

*"Anantum iræ amoris redintegratio est.*

[In the *Paradise of Dainty Devices*.]

"In going to my naked bed, as one that  
 would have slept,  
 I heard a wife sing to her child, that long  
 before had wept.  
 She sighed sore, and sang full sweet, to bring  
 the babe to rest,  
 That would not cease, but cried still, in suck-  
 ing at her breast.  
 She was full weary of her watch, and grieved  
 with her child,

\* \* The following lines are, in the *Nugæ Antiquæ*, ascribed to this monarch:

The eagle's force subdues each bird that flies.

What metal can resist the flaming fire?

Doth not the sun dazzle the clearest eyes;

And melt the ice, and make the frost retire?

The hardest stones are pierced through with tools?

The wisest are, with princes, made but fools.

She rocked it, and rated it, until on her it  
smil'd;

Then did she say, 'Now have I found the  
proverb true to prove,

'The falling out of faithful friends renewing  
is of love.'

"Then took I paper, pen, and ink, this pro-  
verb for to write,

In register for to remain of such a worthy  
wight.

As she proceeded thus in song unto her little  
brat,

Much matter utter'd she of weight in place  
whereas she sat;

And proved plain, there was no beast, nor  
creature bearing life

Could well be known to live in love without  
discord and strife:

Then kissed she her little babe, and sware by  
God above,

'The falling out of faithful friends renewing  
is of love.'

\* \* \* \* \*

"I marvel much, pardie,' quoth she, 'for  
to behold the rout,

To see man, woman, boy, and beast, to toss  
the world about;

Some kneel, some crouch, some beck, some  
check, and some can smoothly smile,

And some embrace others in arms, and there  
think many a wile.

Some stand aloof at cap and knee, some hum-  
ble and some stout,

Yet are they never friends indeed untill they  
once fall out.'

Thus ended she her song, and said, before  
she did remove,

'The falling out of faithful friends renewing  
is of love.'

We quote Lord Herbert of Chirbury's  
epitaph on himself, in respect to the ta-  
lents of that extraordinary man.

"The monument which thou beholdest here  
Presents EDWARD LORD HERBERT to thy  
sight;

A man who was so free from either hope or fear  
To have or lose this ordinary light,

That, when to elements his body turned were,  
He knew, that as those elements would

fight,

So his immortal soul should find above,

With his Creator, peace, joy, truth, and  
love."

This was an extraordinary family.  
His brother George, the poet, is treated  
too contemptuously by Mr. Ellis. No-  
thing can be viler than his conceits; but  
nothing can be more exquisite than the  
language in which those very conceits  
are expressed. Perhaps, of all our poets,  
he best deserves to be called the Well of  
English undefiled. A neat edition of  
his temple was printed in 1796, at  
Bristol, in honour of its piety, not its  
merit.

"On his Muse, by George Withers,  
(Written in prison.)

"And though for her sake I'm crost,  
Though my best hopes I have lost,  
And knew she would make my trouble  
Ten times more than ten times double,  
I should love and keep her too,  
Spite of all the world could do.  
For though banish'd from my flocks,  
And confin'd within these rocks,  
Here I waste away the light,  
And consume the sullen night,  
She doth for my comfort stay  
And keeps many cares away.  
Though I miss the flowery fields,  
With those sweets the spring-tide yields,  
Though I may not see those groves  
Where the shepherds chant their loves,  
And the lasses more excel  
Than the sweet-voiced Philomel;  
Though of all those pleasures past  
Nothing now remains at last  
But remembrance, poor relief,  
That more makes than mends my grief;  
She's my mind's companion still,  
Maugre Envy's evil will.  
Whence she should be driven too,  
Were't in mortals power to do.  
She doth tell me where to borrow  
Comfort in the midst of sorrow,  
Makes the desolate place  
To her presence be a grace,  
And the blackest discontents  
To be pleasing ornaments.  
In my former days of bliss  
Her divine skill taught me this,  
That from every thing I saw  
I could some invention draw,  
And raise pleasure to her height  
Through the meanest object's sight.  
By the murmur of a spring,  
Or the least bough's rusteling;  
By a daisy whose leaves spread,  
Shut when Titan goes to bed;  
Or a shady bush or tree  
She could more infuse in me,  
Than all nature's beauties can  
In some other wiser man.  
By her help I also now  
Make this churlish place allow  
Some things that may sweeten gladness  
In the very gall of sadness.  
The dull loneliness, the black shade  
That these hanging vaults have made,  
The strange music of the waves,  
Beating on these hollow caves;  
This black den, which rocks emboss,  
Overgrown with eldest moss;  
The rude portals that give light  
More to terror than delight;  
This my chamber of neglect,  
Wall'd about with disrespect;  
From all these and this dull air,  
A fit object for despair,  
She hath taught me by her might  
To draw comfort and delight.  
Therefore, thou best earthly bliss,  
I will cherish thee for this,—

POESY !—thou sweet'st content  
 That e'er heaven to mortals lent.  
 Tho' they as a trifle leave thee  
 Whose dull thoughts can not conceive thee;  
 Tho' thou be to them a scorn  
 That to nought but earth are born;  
 Let my life no longer be  
 Than I am in love with thee.  
 Though our wise ones call thee madness,  
 Let me never taste of gladness  
 If I love not thy maddest fits  
 More than all their greatest wits.  
 And tho' some too seeming holy  
 Do account thy raptures folly,  
 Thou dost teach me to condemn  
 What makes knaves and fools of them."

In the remarks upon our language which form the conclusion of this work, Mr. Ellis advances an opinion that it rather supplanted the Saxon, than succeeded to it as it were by legitimate inheritance.

"The general disaffection and spirit of revolt, excited among the English by the evident partiality of the Conqueror to the partners of his victory, compelled him to adopt a system of defence for his newly acquired dominions, which had a necessary tendency to produce the changes that afterwards took place in the language of his subjects.

"It has been observed by all our historians, that the Saxons, though a brave and warlike people, had made little progress in the art of fortification, and that to this circumstance the Danes were indebted for the almost constant success of their piratical incursions. The Normans, on the contrary, surpassed all the nations of Europe in this branch of tactics; and William, availing himself of this superiority, erected numerous citadels, which, being filled with Norman garrisons, secured and over-awed all the towns in the kingdom, and afforded him the means of assembling his army with safety and expedition.

"It is evident that each of these garrisons bore a much higher proportion to the number of inhabitants in the neighbouring cities, at whose expence they were from the first supported, than that of the whole body of Normans to the aggregate population of the kingdom. It was necessary, therefore, that some mercantile jargon should be adopted as a medium of communication between the foreigners and the natives; and although such a jargon, being only employed for occasional purposes by each, could not immediately displace and become a substitute for the established language of either: though the Normans were, during a very considerable length of time, completely separated from their English neighbours by the strongest opposition of passions and prejudices: though even their commercial intercourse was very

limited: it may be doubted whether these circumstances had not the effect, of ultimately rendering more complete that alteration of language, which they certainly contributed, in the first instance, to retard.

"In fact, the most striking peculiarity in the establishment of our vulgar English is, that it appears to have very suddenly superseded the pure and legitimate Saxon, from which its elements were principally derived, instead of becoming its successor, as generally has been supposed, by a slow and imperceptible process. The Saxon, certainly never ceased to be cultivated during more than a century after the Conquest, because the conclusion of the Saxon Chronicle, which relates the death of Stephen, cannot have been written before the following reign; and the translation of Wace by Layamon is not likely to have been composed much before the year 1180. From this period, I believe, the language began to decline, but it did not cease till much later; for we have a Saxon charter dated in the 43d year of Henry III. that is to say, in 1258. It has been often printed, particularly by Lord Lyttelton and Dr. Henry, both of whom have thought it necessary to add an English translation. On the other hand, we possess some English specimens, which, in the opinion of all our antiquaries, cannot be referred to a later period than 1250: it follows therefore that, during several years after the establishment of our present mixed language, the Saxon continued to be the only form of speech known to a large portion of the inhabitants of this country.

"Now, if we consider that the Saxon, however it might have degenerated from its former elegance, still retained the advantage of a regular and established grammar, while the construction of the Anglo-Norman, or English, was extremely fluctuating and barbarous; it will, probably, be thought that the latter could only have acquired the superiority over its parent language by means of the predominant wealth and influence of that part of the community by whom it was exclusively cultivated."

This work has been materially improved since its first appearance. We still miss a few authors of merit or celebrity: Hobbes, Chamberlayne, Chalkhill, Cleaveland, Stanihurst, Abraham Fraunce. A second series of specimens selected from our early metrical romances, to complete the sketch of our poetical antiquities, is nearly ready for the press. The lovers of English literature will rejoice at this intelligence: unlike most antiquarians, Mr. Ellis possesses not only the knowledge and the patience necessary to collect materials, but also the judgment to select, and the taste to arrange them.

ART. V. *The Poetical Works of the late Thomas Warton, B. D. Fellow of Trinity College, Oxford, and Poet-Laureat. Fifth Edition, corrected and enlarged. To which are now added, Inscriptionum Romanarum Delectus, and an Inaugural Speech, &c.; together with Memoirs of his Life and Writings, and Notes critical and explanatory.* By RICHARD MANT, M. A. Fellow of Oriel College, Oxford. 8vo. 2 vols. pp. about 700.

THE memory of the Wartons is deservedly dear to all lovers of English literature. Mr. Mant has performed an acceptable service to the public in thus editing the poems of the younger Warton; we should rejoice to see the same due tribute paid to the elder brother also.

The memoirs of Thomas Warton contain, of course, little incident to create or gratify curiosity; he led an easy, indolent, collegiate life, amusing himself with literary pursuits. Mr. Mant has published his first composition, a letter written when he was nine years old. Dr. Joseph Warton always preserved it as a literary curiosity, and as such we copy it.

"Dear sister,

"I thank you for your letter; and, in return, I send you the first production of my little muse, which I wish was now old enough to make a song for you to set to music; but at present I send you these four verses.

*"On Leander's swimming over the Hellespont to Hero: translated by me from the Latin of Martial.*

"When bold Leander sought his distant fair,  
(Nor could the sea a braver burthen bear,) Thus to the swelling waves he spoke his woe,  
Drown me on my return,--but spare me as I go.

"I agree with you in thinking that friendship, like truth, should be without form or ornament; and that both appear best in their dishabille. Let friendship, therefore, and truth, music and poetry, go hand in hand.

"The above verses I know are a trifle—but you will make good-natured allowances for my little young muse; it will be my utmost ambition to make some verses, that you can set to your harpsichord;—and to shew you upon all occasions how sincerely I am your affectionate brother,

*From the School,* "THOMAS WARTON."  
Nov. 7, 1737.

The following circumstances appear to us to prove what has generally been surmised.

"On the anonymous publication of the 'Heroic Epistle to Sir William Chambers,' about the year 1776, it is known that various opinions were entertained as to who was the author. Mr. Warton being present in a large company, where it was the subject of

conversation, ascribed it to Mason. The declaration was at first made inadvertently. 'Well,' said he, 'if I had been Mason, I would not have written it.' When his words were taken up, he was surprised at his having so committed himself; but having once delivered, proceeded to substantiate his opinion. It was founded on the internal evidence of the poem; versification, style, &c. 'But, Mr. Warton, style is so uncertain a criterion: how can you pretend to say that the poem was written by Mason from its style?' 'Just,' he answered, 'as a hatter would tell you who made that hat.'

"The opinion, thus delivered and supported, by some means came to the knowledge of Mason; who, having occasion to write to Warton about the time, took notice of it in the following letter:

"But while I have the pleasure of writing to you, I feel myself half inclined to add a short expostulation on another subject. I have been told that you have pronounced me very frequently in company to be the author of the Heroic Epistle to Sir William Chambers, and I am told too that the premier himself suspects that I am so upon your authority. Surely, sir, mere internal evidence (and you can possibly have no other) can never be sufficient to ground such a determination upon, when you consider how many persons in this rhyming age of ours are possessed of that knack of Pope's versification, which constitutes one part of the merit of that poem; and as to the wit, humour, or satire which it contains, no part of my writings could ever lead you, by their analogy, to form so peremptory a judgment. I acquit you, however, in this procedure of every, even the slightest, degree of ill-nature; and believe that what you have said was only to shew your critical acumen. I only mention it, that you may be more cautious of speaking of other persons in like manner, who may throw such anonymous bandlings of their brain into the wide world. To some of these it might prove an essential injury; for though they might deserve the frown of power, (as the author in question certainly does,) yet I am persuaded that your good nature would be hurt if that frown was increased or fixed by your *ipse dixit*.

"To say more on this trivial subject, would betray a solicitude on my part, very foreign from my present feelings or inclination. My easy and independent circumstances make such a suspicion sit mighty easy upon me; and the minister, nay the whole ministry, are free to think what they

please of a man, who neither aims to solicit, nor wishes to accept, any favour from them.

"Believe me to be, with the truest esteem, sir, your much obliged and very faithful servant,

"W. MASON.

"P. S. I should be sorry if you thought this latter part of my letter required any answer."

A copy of the Probationary Odes was sent to Warton with this letter:

"Rev. Sir,

"I hold ingratitude to be one of the basest crimes that can stain the human character. I have deemed it therefore my indispensable duty to transmit the inclosed to you, as a testimony of my grateful recollection for the peculiar service you have rendered me, in setting the first example of a *joke*, by the continuance of which I have already profited so much, and hope to do still more so by the succession of future editions, with which the accompanying effusions will be indispensably honoured in future. Had it not been for the inimitable effort of luxuriant humour which proceeded from you on the occasion I allude to, the world would have been deprived of the most astonishing exhibition of genuine *joke*, that ever graced the annals of literature, and I should have been still more unhappy to have lost the opportunity of a competent independency. I entreat you, therefore, good sir, to accept my warmest gratitude, and believe me to be ever yours,

"The Editor of the Probationary Odes."

On this letter Mr. Mant has simply remarked, that *his readers* may perhaps understand it: he should have stigmatized it as it deserves. Every writer lays himself open to public satire: as poet-laureat, Warton was almost officially exposed; he himself, with his characteristic good humour, joined honestly in the laugh. But this letter was a private insult, for which, as no provocation had been given, so no palliation can be admitted.

Some odd peculiarities of Warton are noticed by his biographer.

"It will be no serious imputation on the character of such a man to say, that he had his singularities and imperfections. Biographical justice requires that such things should be noticed; and a smile may perhaps be excited at the information, that the historian of English Poetry was fond of drinking his ale and smoking his pipe with persons of mean rank and education; that he partook of a weakness which has been attributed to the author of the Rambler, and believed in preternatural apparitions; that, in his fondness for pleasantry and humour, he

delighted in popular spectacles, especially when enlivened by the music of a drum; and that such was his propensity to be present at public exhibitions, as to have induced him at a time, when he was desirous of not being discovered, to attend an execution in the dress of a carter."

Of his love of the drum we remember an anecdote current at Oxford. He was a member of the Jelly Bag Society, so called because the fellows of that foundation wore jelly bags on their heads. From the absurdity of this costume the place of meeting was kept secret. It was known that Warton was a member, and a drum was beat through the streets as the best means of discovering him. The bait took, he could not resist the sound, but throwing up the window, thrust out head and jelly bag to see what was passing.

"It has been remarked, that during his residence at Winchester he was fond of associating with his brother's scholars: indeed he entered so heartily into their sports and employments, as to have been occasionally involved in rather ludicrous incidents. Being engaged with them in some *culinary* occupation, and alarmed by the sudden approach of Dr. Warton, he has been known to conceal himself in some dark corner, and has been drawn out from his hiding place, to the no small astonishment and amusement of the doctor, who had taken him for some great boy. He would assist the boys in making their exercises, generally contriving to accommodate his composition to the capacity of him whom he was assisting. 'How many faults?' was a question, the answer to which regulated him; and a boy was perhaps as likely to be flogged for the verses of Mr. Warton as for his own.

"I remember that an anecdote used to be told relating to this part of Mr. Warton's conduct, which is somewhat characteristic of both the brothers. Warton had given a boy an exercise; and the doctor thinking it too good for the boy himself, and suspecting the truth, ordered him into his study after school, and sent for Mr. Warton. The exercise was read and approved: 'And don't you think it worth half-a-crown, Mr. Warton?' said his brother: Mr. Warton assented. 'Well then, you shall give the boy one.' Our author accordingly paid the half-crown for his own verses, and the doctor enjoyed the joke."

Rat-hunting was a sport in which he delighted to join with the boys; when one of these expeditions was to be undertaken, he supplied themes and verses for the truants who required them. It will not be wondered at that the name

of Tom Warton should be beloved by all the Wykehamists who remember him.

The editor compares the studies and performances of Warton and Gray, as being contemporaries, between whom there existed more than a general resemblance of talents, pursuits, taste, and acquirements. "Partiality to my author," he says, "shall not lead me to dispute, that as a poet the palm of superiority must be adjudged to Gray.

"But in making this concession, some reservation may not unfairly be claimed. It should be remembered that the poems of Gray were uniformly composed on subjects chosen by himself; but that the subjects of some of the best of Warton's were imposed by the duty, and encumbered with the weight, of an official station. Nor is this all.—for it may further be added, that in every point the superiority of Gray is far from manifest; that if Gray has more abstract poetry, Warton has more picturesque imagery; if Gray has more fire, Warton yields not to him in grandeur; if Gray more frequently strikes the imagination, Warton is not less successful in delighting it; and that if, in the examination of individual pieces, Gray is allowed to be more perfect, Warton, in the general estimate, has certainly more variety. Not a poem of Gray's can be mentioned, but one of the same kind may be produced from Warton: but several of the poems of Warton are such kinds as Gray has never attempted."

One fault is common to both poets, that of too often substituting sound for sense, swelling out sentences that are as beautiful as bubbles in the sunshine, and as empty, if examined. Mr. Mant might fairly have allowed Warton the praise of more originality; for Gray, with all his merit, is a maker of centos, a putter-together of mosaic pictures; the designs are indeed his own, but he has picked out the materials piece by piece.

The editor is mistaken in asserting that Warton, as a commentator on English poetry, "possesses the singular merit of having been the first to illustrate his authors by an examination of the works with which they had been principally conversant." That merit is Theobald's, and it provoked the envy of Pope, who being an indifferent scholar, and a worse commentator, abused Bentley for his learning, and Theobald for his annotations.

Mr. Mant's criticism on the poetry of his author, contains no error so important as to need correction, and no ob-

servations of such novelty or utility as to deserve to be extracted. Why does he call our heroic verse the English pentameter? The five-foot Iambic, or the ten-syllable line should be its name: to call it a pentameter because it contains five feet, is mere pedantry.

The poems now first published are two translations from Horace, in the metre of Collins's Ode to Evening, and the two following poems.

*"Solitude, at an Inn,*

*"(Written May 15, 1769.)*

Oft upon the twilight plain,  
Circled with thy shadowy train,  
While the dove at distance coo'd,  
Have I met thee, Solitude!  
Then was loneliness to me  
Rest and true society.  
But, ah! how alter'd is thy mien  
In this sad deserted scene!  
Here all thy classic pleasures cease,  
Musing mild, and thoughtful peace:  
Here thou com'st in sullen mood,  
Not with thy fantastic brood  
Of magic shapes and visions airy,  
Beckon'd from the land of fairy:  
'Mid the melancholy void  
Not a pensive charm enjoy'd!  
No poetic being here  
Strikes with airy sounds mine ear;  
No converse here to fancy cold  
With many a fleeting form I hold,  
Here all inelegant and rude  
Thy presence is, sweet Solitude."

*"On Mr. Head,*

Oh spare his youth, O stay thy threat'ning  
hand,  
Nor break too soon young wedlock's early  
band!  
But if his gentle and ingenuous mind,  
The generous temper, and the taste refin'd,  
A soul unconscious of corruption's stain,  
If learning, wit, and genius plead in vain,  
O let the mourning bride, to stop thy spear,  
Oppose the meek resistance of a tear!  
And when to sooth thy force his virtues fail,  
Let weeping faith and widow'd love prevail!"

The first of these poems is evidently an uncorrected effusion, but it is pleasing because the feeling which it describes will be recognized by every one. The epitaph is perfectly Irish: an address upon a tombstone to Death, requesting him to spare the person who is there interred. We have never seen a more flagrant instance of that vile common-place artifice, which converts a figure of passion into the trick of composition. Mr. Edgeworth may insert the Epitaph in his Essay upon Bulls.

From the inaugural lecture we copy

N n

the very able estimate of the faults and merits of Tacitus.

“Tandem vero Tacitus, Sallustii impunitas sententiolas, et argutas clausulas, adsectans, quem prius apud eum corruptum invenit stylum, corruptiorem adhuc effecit: multaque insuper nova dictionis aucupia, et obscuram quandam elegantiam, et urbanitates, nescio quas, e declamatorum scholis, quæ tunc Romæ magnopere florebant, cupidissime arripuit. Quo quidem furo (ut id obiter dicam) nihil perniciosum magis styli historici sanitati accidisse poterat, nihil quod ab ejus nativa indole magis, abhorret. Ut cunque vero Tacitus parum sibi temperaverit ab hisce argutiis et importuna concinnitate, mirifico tamen acumine ea, quæ casum magni et ambitiosissimi imperii comitari solent, delatorum insidias, magnatum conspirationes, civium proscriptiones, suspectam principibus privatorum potentiam, et superbissimæ dominationis occulta concilia, persequitur, investigat, eruit: nec minima etiam præteriens, ut exinde res maximi momenti extricet, et futura occupans et præmonstrans. Quod cum sauciæ acitatis est, et perspicaciæ summæ, admirandum magis in hujus ingenii scriptore judico, quod tantopere polleat in descriptionibus, ad metum et terrorem comparatis; in quibus confingendis egregie seligit imagines, et captat circumstantias non nisi maximo poetæ vel pictori perspicendas; hoc

tamen parce et obscure, ut sentiamus eum plura apud se sublimiter concepta habere, quæ non vult proferre, et indicia tantum utens, et levissima lineamenta adhibens, et lectori multa consulte relinquens, ita tamen ut ostendat vel quæ studiosè celavit.”

It only remains to notice the editor's annotations. They are generally trifling and worthless;—for instance. “V. 84, I meditate my lightsome lay.” ‘To meditate my rural minstrelsy,’ *Comus*, v. 547; ‘meditate the muse,’ *Lycid.* v. 66; ‘Musam meditari,’ *Virg. Ecl.* i. 2.” Again, and in the same page, V. 295, “Which sloping hills around inclose.”

‘meanwhile’ murmur’ing waters fall  
Down the *slope hills.* *Par. Lost*, iv. 260.”

The greater part of these notes are no better. To make such annotations requires no better talent than memory. Boys who *cap verses* are employed quite as much to their own and to the public improvement. This is the folly of the times, and it has prevailed too long: two centuries ago it was the fashion in Italy, and Spain, and France; England has taken up the absurdity when other countries were weary and ashamed of it.

#### ART. VI. *Poems*, by PETER BAYLEY, jun. Esq. 8vo. pp. 208.

STOP thief! Mr. Peter Bayley, jun. is a literary sharper, who has obtained credit upon false pretences, and made his way into good company by wearing stolen clothes. Without farther preamble we shall proceed to convict this gentleman of plagiarisms as artful, as dishonourable and as dishonest, as have ever stamped any pretender with infamy.

The poem entitled an Evening in the Vale of Festiniog, is made up from the Lyrical Ballads of Mr. Wordsworth.

“It is a blessed scene, and I rejoice  
That I have felt inwove into my being  
A love of the green fields, and azure sky,  
Mountains, and all the multitudinous throng  
Of waves that sound along the rocky shore.  
And therefore (for this never-dying passion,  
This craving appetite, has led me on,  
As though possess’d with moody thoughts,  
and fed  
With wayward fancies)—therefore have I  
roam’d  
Through devious wilds, through pathless  
glens, and climb’d  
The tall cliff’s topmost crag, and therefore  
bar’d  
To the sharp mountain-blast my glowing  
breast.

Nor nursing other feelings have I sought  
The savage grandeur of yon wilds sublime,  
The foaming cat’ract, or the softer voice  
Of bubbling hill-streams—To this place I  
come  
Led by the self-same impulse.

This hoar stone,  
Studded with moss, with green and fringed  
moss,  
With crimson fret-work, and bright cups of  
gold;  
And all emboss’d with curled knots, and tufts  
Of lichens—this hoar stone shall be my seat.”

These lines are botched up from the following passages of the Wye and the Thorn.

“And so I dare to hope,  
Though changed no doubt from what I was,  
when first  
I came among these hills; when like a roe  
I bounded o’er the mountains, by the sides  
Of the deep rivers and the lonely streams,  
Wherever Nature led: more like a man  
Flying from something that he dreads, than  
one  
Who sought the thing he loved. For nature  
then,  
(The coarser pleasures of my boyish days  
And their glad animal movements all gone by)  
To me was all in all.—I cannot paint  
What then I was. The sounding cataract

Haunted me like a passion : the tall rock  
The mountain and the deep and gloomy wood,  
Their colours and their forms, were then to me  
An appetite, a feeling and a love."

Lyrical Ballads, vol. i. 195.

" And let the misty mountain winds be free  
To blow against thee."

Ibid. 198.

" Therefore am I still  
A lover of the meadows and the woods  
And mountains, and of all which we behold  
From this green earth."

Ibid. 196.

" Like rock or stone it is o'ergrown  
With lichens to the very top.

\* \* \*

All lovely colours there you see  
All colours that were ever seen,  
And mossy network too is there,

\* \*

And cups the darlings of the eye,  
So deep is their vermilion die."

Lyrical Ballads, i. 37.

The next instance is more obvious  
and more offensive, as it is a base and  
unfeeling parody upon what we shall  
not scruple to call one of the finest pas-  
sages that ever was or can be written.

" Who so unblest'd as to lock up his heart  
Against the soothing power and sweet illapse  
Of Nature's voice!—For sure there dwells a  
voice,

A moving spirit, and a speaking tongue,  
In the loud waters, and the nimble air,  
And the still moonbeam, and the living light  
Of suns, resplendent in their mid career."

Peter Bayley, p. 45.

" And I have felt  
A presence that disturbs me with the joy  
Of elevated thoughts ; a sense sublime  
Of something far more deeply interfused,  
Whose dwelling is the light of setting suns,  
And the round ocean, and the living air,  
And the blue sky, and in the mind of man ;  
A motion and a spirit, that impels  
All thinking things, all objects of all thought,  
And rolls through all things."

Lyrical Ballads, i. 196.

Mr. Peter Bayley, aware that so re-  
markable a passage as this would be  
recognised, has affected in one part to  
imitate Petrarch, and for " the living  
light of suns" has quoted *un vivo sole*.  
A knave is never so knavish as when he  
affects honesty. Unfortunately for this  
gentleman, we also understand Italian,  
and we know that the phrase " un vivo  
sole" is one of the metaphors common  
to all rhymers, one of the slang com-  
pliments of the Italian poets to their  
mistresses. The passage which he has re-

ferred to is most likely the following, in  
the 70th Sonnet of Petrarchi, speaking  
of Laura :

" le parole

Sonava altre che pur voce humana  
Uno spirto celeste, un vivo sole  
Fu quel, ch' e vidi, &c."

that is a living sun, (or as the commen-  
tator has it in the notes below, a living  
sun of beauty) says Petrarch, " was she  
whom I saw, and if she be so no longer,"  
that is on account of her age, as the  
Sonnet goes on, " the slackening of the  
bow does not cure the wound." It  
occurs again in the 31st Canzonet, and  
with the same application. After hav-  
ing spoken of a fountain which boils in  
the night and becomes cold as the sun  
rises, he goes on, saying, that it is even  
so with him, who is a fountain of tears,  
for

" Quando 'l bel lume adorno,  
Ch' e 'l mio sol. s' allontana, e triste, e sole  
Son le mie luci, e notte oscura e loro ;  
Ardo allhor ; ma se l' oro  
E i rai veggio apparir del vivo sole,  
Tutto dentro, e di fuor cento cangiar me,  
E ghiaccio farne, cosi freddo torno."

Petrarch's " living Sun" is then the  
eyes of Laura, and Mr. Peter Bayley  
has endeavoured to conceal his theft by  
falshood.

If this had been a single instance, it  
might have been excused as a pardonable,  
though not prudent effect of admiration,  
but of that hereafter. Mr. Peter Bayley  
is not contented with single imitations ;  
he parodies and he paraphrases ; he in-  
serts half a line in one place and the  
other half in another ; he patches in  
single phrases, such as " sweet skirmish-  
ing" applied to the sound of a brook,  
stolen from the Nightingale, " with  
skirmish and capricious passagings." The  
whole art of literary thieving might be  
illustrated from this single poem.

" Yet when the coil,  
The stir and bustle of the world shall press  
Heavily on my heart, and when my soul  
Is sick to death of the incessant hum  
And ceremonious buzz of social life

\* \* \* \* \*

a resting place  
For my long harass'd thoughts, and thou  
shalt slake  
Thy soul's hot fever ; thou shalt soothe away  
The fretful peevishness that on the mind  
Hangs most unpleasantly.

\* \* \*

Then will thy heart confess  
The presence of a sober joy —

— — — then thy mind  
Disburthen'd of its fever and thick gloom  
And all surrendered up to the strong charm  
Of Nature."

Bayley, 53, 54. 49.

Compare these passages with Mr.  
Wordsworth's "Wye."

"When the fretful stir  
Unprofitable, and the fever of the world  
Have hung upon the beatings of my heart,  
How oft in spirit have I turn'd to thee!

\* \* \*

nor the sneers of selfish men,  
Nor greetings where no kindness is, nor all  
The dreary intercourse of daily life  
Shall e'er prevail against us.

\* \* \*

to the influences  
Of shapes and sounds and shifting elements  
Surrendering thy whole spirit."

Lyrical Ballads.

An old Art of Poetry contains the following Short Method of making verses. "He who desires to know how to make verses without their costing him much trouble or study, should take one or two or more lines from some good poet, which are elegant and sonorous, and he should repeat those over to himself, and then try to make others to the same sound and pattern, and if the sense be wanting at first, or should not be quite so good, he must not mind that; by doing this, and getting a master to teach him to make synalephas and contractions, and by knowing how to rhyme, by the help of our dictionary, he will make himself a poet." Upon this rule Mr. Peter Bayley has proceeded. His "ceremonious buzz of social life," is made to the pattern of "The dreary intercourse of daily life," and the whole volume is made up of these hyper-plagiarisms, where the theft is not more daring. We should suspect Mr. Peter Bayley to be an Etonian by this trick; it is the way they make their centos and win their prizes, and in consequence the school never produces a poet. Gray is the great master of this craft and mystery; he possessed the passion of a poet, and therefore always affects young and impassioned readers, but possessing neither a creative fancy nor a populated mind, the parts of his poems are all composed upon this receipt.

We proceed with our proofs.

"Not alone

To him who sickens at the dizzy joys  
And's ormy raptures that the world affords."

Bayley, 50.

"That time is past,  
And all its aching joys are now no more,  
And all its dizzy raptures."  
Lyrical Ballads, i. 195.

\* \* \*

"And one I know,  
One gentle maid, whose mild and peaceful  
soul

Is sway'd and temper'd by the very hand  
Of softness and complacency; her heart  
True and obedient to the touch divine  
Of Nature, and alive to every thrill  
That flows from her pure influence, would  
own

Her magic in this vale—Oh gentle maid!"  
Bayley, 52.

"A most gentle maid  
Who dwelleth in her hospitable home  
Hard by the castle, and at latest eve,  
(Even like a lady vow'd and dedicate  
To something more than Nature in the grove)  
Guides thro' the pathways; she knows all  
their notes;  
That gentle maid."

Lyrical Ballads, i. 94.

\* \* \*

"Thou hast learned to look  
On these things with no idle ken; thy mind  
Has long regarded a free intercourse  
With Nature's voice as the unfailing stay  
And guardian of thy feelings, as the rock  
The shield and anchor of thy purest joys,  
And therefore thou art happy—and thy mind  
Is stored with sweet and pleasant images,  
And made the habitation of those charms  
Which thou hast seen and felt; and after  
days

Shall see thee feeding on the blissful thoughts  
Which thou hast treasured in thy memory."

Bayley, 53.

"For I have learn'd  
To look on nature— 196.  
— well pleas'd to recognize  
In nature, and the language of the sense,  
The anchor of my purest thoughts, the nurse,  
The guide, the guardian of my heart, and soul  
Of all my moral being.— 197.

— and in after years

When these wild ecstasies shall be matur'd  
Into a sober pleasure, when thy mind  
Shall be a mansion for all lovely forms,  
Thy memory be as a dwelling-place  
For all sweet sounds and harmonies, &c."

Lyrical Ballads, 199.

The "sober pleasure" has been pilfered by Mr. Bayley elsewhere: p. 54.

\* \* \*

"And now farewell! thou smiling vale, thou  
source  
Of calm and pleasant thought, for this one  
night  
Farewell, thou smiling vale! refresh'd in heart  
And glad in spirit; with oft loitering step  
And still reverted gaze, I quit these scenes

Purposing if to-morrow's sun shall shine  
Upon these eyes, once more to visit thee."

Bayley, 53.

"Farewel, O warbler! till to-morrow's eve,  
And you my friends farewell."

Lyrical Ballads, 95.

We now come to the *Forest Fay*, the metre of which poem is copied from the *Forsaken Indian* of Mr. Wordsworth. The plagiarisms here, which are innumerable, are mostly in masquerade; but Mr. Bayley's wardrobe not being very large, a passing look is sufficient to detect them. To string together parallel passages is the fashionable criticism of the day, and considered as mere criticism it is idle and worthless work. In the present instance it becomes an act of justice to expose an impostor.

"Then point I out the squirrel's hoard,  
Then point I out what trees afford  
Safe nourishment and wholesome food  
Among the treasures of the wood.  
I guide to where sweet berries grow,  
Where earth-nuts in the turf abound."

Bayley, 62.

Filched in spirit, and partly in words  
from the Mad Mother.

"I know the poisons of the shade;  
I know the earth-nuts fit for food."  
Lyrical Ballads, i. 142.

\* \* \* \*

"Then ditties fill the air around,  
Then choral strains together rise;  
Now one soft, flowing single sound."  
Bayley, 62.

"Sometimes all little birds that are  
How they seem'd to fill the sea and air  
With their sweet jargoning.  
And now 'twas like all instruments,  
Now like a lonely flute,  
And now it is an angel's song  
That makes the heavens be mute."  
Lyrical Ballads, i. 170.

\* \* \* \*

"a goblin rout  
Swim to and fro, and in and out,  
They coil about in wreaths like snakes  
And swarm thick-clustering in the light,  
Then dash the fire about in flakes,  
And skirmish with well-mimick'd fight;  
And oft the fire-flood shifts its hue,  
Green, purple, yellow, red or blue."  
Bayley, 63.

"To and fro they were hurried about,  
And to and fro and in and out. —  
Beyond the shadow of the ship  
I watch'd the water-snakes,  
They moved in tracks of shining white,  
And when they rear'd, the elfish light

Fell off in hoary flakes.  
Within the shadow of the ship  
I watch'd their rich attire;  
Blue, glossy green, and velvet black,  
They coil'd and swam, and every track  
Was a flash of golden fire."  
Lyrical Ballads, i. 164.

"About, about, in reel and rout  
The death fires danced at night,  
The water like a witch's oils,  
Burnt green, and blue and white."  
Ibid. 154.

\* \* \* \*

"Oh, sov'reign Nature! thou whose sacred  
sway  
Softens the rugged heart; by thee beguil'd  
The soul new-moulds its essence; soft and  
mild  
Is the sweet influence that soothes away  
Each jarring discord: thou with thy sweet  
play  
Of forms and tints, waters and thickets wild,  
So strongly workest on thy wayward child,  
That, conquer'd, all his soul receives thy ray."  
Bayley, Sonnet, i. 79.

—"till his very soul  
Unmoulds its essence, hopelessly deform'd  
By sights of ever more deformity. —  
—With other ministrations thou, O Nature!  
Healest thy wandering and distemper'd child:  
Thou pourest on him thy soft influences,  
Thy sunny hues, fair forms, and breathing  
sweets,  
Thy melodies of woods, and winds and  
waters,  
Till he relent and can no more endure  
To be a jarring and a dissonant thing  
Amid this general dance and minstrelsy."  
Lyrical Ballads, vol. ii.

\* \* \*

The Sonnets are chiefly stolen from Mr. Bowles, sometimes the theft is verbal, more frequently the thoughts and plan are pilfered. True to his golden rule of writing by pattern, Mr. Peter Bayley has extended it from one or two lines to whole poems. He has even invented a new mode of plagiarism, that of translating from his contemporaries, unless indeed it be imitated from the common school exercise of turning an Ode of Horace into a different metre—thus the following Sonnet is reversified from Mr. Bowles.

"To a Flowering Shrub—in Winter.  
"How art thou chang'd, once-blooming tree!  
when last  
Amid these paths I gave my feet to stray,  
Cherish'd by gales and show'rs, and sum-  
mer's ray,  
Fair didst thou flourish.—But thy hour is  
past;  
And, scatter'd by the fury of the blast,  
N n 3

Thy blushing flow'rs, the gift of rosy May,  
Thy buds, and verdant leaves are whirl'd  
away,

And all thy honours to the earth are cast—  
Ah! yet a little; and the breath of spring  
Shall crown thee with fresh flow'rs; again  
shall bring

Fragrance to thy young buds, and new-born  
bloom,

Again shall fan thee with propitious wing.  
But oh! what spring shall dawn upon the  
gloom

That dwells around the cold and silent tomb!"

Bayley.

"How shall I meet thee, summer, wont to  
fill

My heart with gladness, when thy pleasant tide  
First came, and on each coomb's romantick  
side

Was heard the distant cuckoo's hollow bill?  
Fresh flowers shall fringe the wild-brink of  
the stream,

As with the songs of joyance and of hope  
The hedge-rows shall ring loud, and on the  
slope

The poplars sparkle in the transient beam;  
The shrubs and laurels which I lov'd to tend,  
Thinking their May-tide fragrance might  
delight,

With many a peaceful charm, thee, my best  
friend,

Shall put forth their green shoot, and cheer  
the sight!

But I shall mark their hues with sickning eyes,  
And weep for her who in the cold grave lies."

Bowles, i. 32.

In another Sonnet Mr. Bayley has  
fitted in the same conclusion.

"That now has left me here to weep and mourn  
Her that lies buried in the silent tomb."

Bayley, 85.

The Sonnet "*at Harlech Castle*," thus  
affectedly entitled, in imitation of Mr.  
Bowles, is stolen in the same manner  
from Mr. Lloyd, more impudently, as  
the original thoughts are more marked.

"HARLECH! with many a pause and cautious  
tread

I climb'd thy hills; while, wafted from the  
main

With low wail, as of one long rack'd by pain,  
Through thy lone tow'rs the breezes sigh;  
its head

The long lank grass that o'er thy tops is  
spread

Waves wildly; thy hoar ruins shew how vain  
Conquest's proud pageant, vict'ry's lofty  
strain,

And the priz'd wreath that shades the hero's  
head.—

Thy walls are mould'ring; for the clanging  
steel,

And din of arms, the murmur'ing mountain-  
bee,

Humming amid the wild flow'rs that conceal

Thy turret tops, shall give her minstrelsy;  
And Mercy smiles, e'en in thy courts, to see  
The waving harvest all its stores reveal."

"To Craig Miller Castle.

"This hoary labyrinth, the wreck of Time,  
Solicitous with tinid step I tread,  
Scale the stern battlement, or venturous climb  
Where the rent watch-tower bows its grassy  
head.

These dark damp caverns breathe mysterious  
dread,

Haply still foul with tinct of ancient crime;  
Methinks some spirit of the ennobled dead,  
High-bosom'd maid, or warrior form sublime  
Haunts them; the flapping of the heavy bird  
Imagined warnings fearfully impart,  
And that dull breeze below that feebly stirr'd,  
Seem'd the deep breathing of an o'ercharg'd  
heart!

Proud Tower, thy halls now stable the lean  
herd,

And musing Mercysmiles that such thou art."

Coleridge's Poems, 2d edition.

Mr. Bowles has been plundered as  
unmercifully as Mr. Wordsworth, by  
this dealer in shreds and patches.

"Oh! breathe once more that air; Oh! yet  
bid sound

Once more that well-remember'd much lov'd  
lay,

First heard by me, when in life's golden May  
My happy hours danc'd on in laughing round,  
There where, through verdant banks with  
poplar crown'd,

Smooth Weaver, steals along his silent way,  
Winding in many a maze with sinuous play;

Near whose cool wave, as on the flow'ry  
ground

Supine I lay, those sounds first charm'd my  
ear."

From Mr. Bowles's Sonnet at Ostend  
upon the Bells.

"Bidding me many a tender thought recal  
Of summer days, and those delightful years,  
When by my native streams, in life's fair  
prime,

The mournful magic of their mingling chimes  
First wak'd my wondering childhood into  
tears."

Vol. i. 15.

In another Sonnet, part of this same  
passage is botched in.

"to me it speaks of days  
Of long past peace, of those delightful years  
That never shall return." Bayley, 94.

And here Mr. Peter Bayley squints at  
the Sonnet on re-visiting Oxford, by the  
same author.

But it were endless to enumerate all  
the petty larcenies of this literary Bar-  
rington. Any person conversant with  
Mr. Bowles's Sonnets who shall peruse

these, will perceive that they are in all their parts either servilely copied, or stolen, or more dishonestly translated.

We shall notice only one poem more, in which Mr. Peter Bayley has completely reversed the dream of the alchemist, and succeeded in transmuting gold into lead.

"And that sweet warbling, in her face  
Call'd up a new and lively grace :  
That warbling moulded every look,  
And feelings born of sound bid rise  
Soft radiance in her kindling eyes ;  
And all her frame with sweet emotion shook.

Then in each feature I could see  
The workings of that sympathy,  
The silent joy that o'er her stole."

Bayley, 101.

"Nor shall she fail to see  
Even in the motions of the storm,  
Grace that shall mould the maiden's form  
By silent sympathy.  
The stars of midnight shall be dear  
To her, and she shall lean her ear  
In many a secret place,  
Where rivulets dance their wayward round,  
And beauty born of murmuring sound,  
Shall pass into her face."

Lyrical Ballads, vol. ii. 137.

\* \* \* \*

"And oh, the look ! when from that tree  
At length she turn'd her eyes on me !  
That look may never pass away ;  
Even now it works upon my mind,  
And in its magic I shall find  
Subject and food for many a future day."

Bayley, 102.

"The look with which they look'd on me  
Had never pass'd away."

Lyrical Ballads, i. 163.

— "with pleasing hopes

That in this moment there is life and food  
For future years."

ibid. i. 194.

This is by no means an uninteresting specimen of Mr. Bayley's general practice of plagiarism ; having the Lyrical Ballads by heart, he fits in the scraps as they are wanted, with the same facility that a school-boy caps verses.

"Why is my hand upon my heart ?"  
Bayley, 100.

and again, in the last stanza of the same poem

"Therefore my hand is on my heart.

I look, the sky is empty space,

I know not what I trace,

But when I cease to look, my hand is on my heart."

Lyrical Ballads, ii. 77.

Mr. Bayley, in this "Ivy Seat," has kept his eye throughout upon the last quoted poem. His Gentle Maid, in this piece of patch-work, is a *second* translation from the Nightingale—with this difference, that the Nightingale is changed into a Blackbird. Yet Mr. Peter Bayley himself thinks, that to pass off compilations for original compositions, is roguery. "Mr. Kelly does *compile* with a vengeance," says honest Mr. Peter Bayley. "*When a man publishes in his own name mere musical centos, it is time to hint to him, that borrowing here a little, and there a little, procured Arne the appellation of 'pilfering Tommy Arne.' But enough of musical rogues.*" p. 138.

Pilfering Peter Bayley perhaps supposes, that he has made the thoughts of others his own by his manner of remodelling them. There is a passage in one of Donne's Satires which will fit this gentleman.

"But he is worst who, beggarly doth chaw  
Others wits fruits, and in his ravenous maw  
Rankly digested, doth those things out-spue  
As his own things ; and they're his own 'tis true :

For if one eat my meat, tho' it be known  
The meat was mine, ——— \* \* \*

Old Donne is somewhat coarse in his expression ; but Mr. Bayley may turn to the thirtieth line of his second satire, to see how such gentlemen as himself appropriate their neighbours meat.

But enough of *versifying rogues*. It is sufficient to add, that Mr. Peter Bayley has pillaged Akenside as he has Mr. Bowles and Mr. Wordsworth ; that he may be tracked to Cowper and to Charlotte Smith ; in short, that his whole volume is one mass of patchwork. *Enough of versifying rogues!* We have a heavier charge than that of simple roguery to bring against this dishonest man.

That Mr. Bayley should never praise, never refer to the authors whom he has plundered, was to be expected ; to have so named them would have been giving a hint to his detection. This is the common trick of plagiarists ; but Mr. Bayley is no common plagiarist, and he has advanced one step farther in meanness. After having made up his own poems by scraps from Mr. Wordsworth's, he has had the baseness to attempt to ridicule Mr. Wordsworth, and has sneered at him by name ; in the hope, that those of his readers who have never read the Lyrical

Ballads, may be prevented from reading them by the contempt which he has thus expressed. The miserable vanity which tempted this gentleman to build his own fame upon another's merits, to piller the reputation of a contemporary, to plume his own magpye tail with the feathers of the bird of paradise, this wretched craving for notoriety would have deserved no heavier punishment than the contempt and scorn which necessarily would follow detection; but this other offence

is of a deeper die. Like a loathsome reptile, it is not enough for him to feed and fatten, but he must endeavour to sting and to stain with his pollutions. The moral turpitude of this action excites our wonder and indignation. We know not the name which is hidden under this *alias* of Peter Bayley; and happy it is for him, that he can be thus concealed; but be he whom he may, this we shall say of him—

*Hic niger est, hunc tu Romane cave!*

ART. VII. *Clifton Grove, 'a Ske'ch in Verse, with other Poems.* By HENRY KIRKE WHITE, of Nottingham. 12mo. pp. 111.

OF all the volumes which come before us, there are none which we take up so hopelessly as these little fools-cap octavos of wire-wove paper, hot pressed. We sit down heartlessly and reluctantly to examine the works of a new candidate for poetical fame, taught by the doctrine of chances and by sad experience to expect something which we cannot honestly praise, and yet should be unwilling to condemn. In the present age every pretender to poetry can versify well, and many a volume, which now sinks quietly into oblivion, would have acquired no trifling celebrity in the days of Dryden and Pope, or even at the commencement of the present reign. But it requires something more now to qualify a writer for a place among the British poets, than was admitted by our forefathers as a qualification. Reputation may be acquired by striking defects as well as striking beauties, but dullness and mediocrity have now no chance or possibility of success.

It is, therefore, with no common pleasure that we announce these extraordinary productions of early genius. It will require some faith in the reader to believe, that the following Ode was written by a boy of thirteen.

*"To an early Primrose.*

"Mild offspring of a dark and sullen sire!  
Whose modest form, so delicately fine,  
Was nurs'd in whirling storms  
And cradled in the winds.

"Thee, when young spring first question'd  
winter's sway,  
And dar'd the sturdy blust'rer to the fight,  
Thee on this bank he threw  
To mark his victory.

"In this low vale, the promise of the year,  
Serene, thou openest to the nipping gale  
Unnotic'd, and alone  
Thy tender elegance.

"So virtue blooms, brought forth amid the storms

Of chill adversity, in some low walk  
Of life, she rears her head  
Obscure and unobserv'd.

"While every bleaching breeze that on her blows,

Chastens her spotless purity of breast,  
And hardens her to bear  
Serene the ills of life."

The author of these poems is now only seventeen. He shall plead in his own cause.

"The unpremeditated effusions of a boy from his thirteenth year, employed, not in the acquisition of literary information, but in the more active business of life, must not be expected to exhibit any considerable portion of the correctness of a Virgil, or the more vigorous compression of a Horace. Men are not, I believe, frequently known to bestow much labour on their amusements; and these poems were most of them written merely to beguile a leisure hour, or to fill up the languid intervals of studies of a severer nature.

"*ΠΑΣ ΤΟ ΟΙΚΕΙΟΣ ΕΡΓΟΝ ΑΓΑΠΑΕΙ*—Every one loves his own work, says the Stagyrte; but it was no overweening affection of this kind which induced this publication. Had the author relied on his own judgment only, these poems would not, in all probability, ever have seen the light.

"Perhaps it may be asked of him, what are his motives for this publication. He answers—simply these: The facilitation through its means of those studies which from his earliest infancy have been the principal objects of his ambition; and the increase of the capacity to pursue those inclinations which may one day place him in a honorable station in the scale of society."

However desirous we should be, for the sake of their future fame, to dissuade all young poets from premature publication, it is evident that no such prudential notions could apply to the present instance. The author has expressed a

hope that the profits of this volume may enable him to enjoy the advantages of a collegiate education, with a view, we presume, to ordination. In this hope, we fear and believe he will be disappointed; but disgraceful as the want of patronage has ever been in England, we will indulge the hope that some powerful patron will be found on the present occasion—some person of rank and opulence who will seize the easy opportunity of securing and deserving the thanks of posterity by doing good.

That this young poet is deserving of every encouragement which the public can bestow, the following extracts will sufficiently evince.

“Now, when the rustic wears the social smile,  
Releas'd from day and its attendant toil,  
And draws his household round their evening  
fire,

And tells the oft-told tales that never tire :  
Or, where the town's blue turrets dimly rise,  
And manufacture taints the ambient skies,  
The pale mechanic leaves the lab'ring loom,  
The air-pent hold, the pestilential room,  
And rushes out, impatient to begin  
The stated course of customary sin :  
Now, now, my solitary way I bend  
Where solemn groves in awful state impend,  
And cliffs, that boldly rise above the plain,  
Bespeak, blest Clifton! thy sublime domain.  
Here, lonely wand'ring o'er the sylvan bow'r,  
I come, to pass the meditative hour ;  
To bid a while the strife of passion cease,  
And woo the calm of solitude and peace.  
And oh! thou sacred pow'r, who rear'st on  
high

Thy leafy throne where waving poplars sigh !  
Genius of woodland shades ! whose mild  
controul

Steals with resistless witch'ry to the soul,  
Come with thy wonted ardour, and inspire  
My glowing bosom with thy hallow'd fire.  
And thou too fancy ! from thy starry sphere,  
Where to the hymning orbs thou tend'st  
thine ear,

Do thou descend, and bless my ravish'd sight,  
Veil'd in soft visions of serene delight.  
At thy command the gale that passes by  
Bears in its whispers mystic harmony.  
Thou wav'st thy wand, and lo ! what forms  
appear !

On the dark cloud what giant shapes career !  
The ghosts of Ossian skim the misty vale,  
And hosts of sylphs on the moon-beam sail.

\* \* \* \* \*

Dear native grove ! where'er my devious track,  
To thee will mem'ry lead the wand'rer back.  
Whether in Arno's polish'd vales I stray,  
Or, where “Oswego's swamps” obstruct the  
day ;

Or wander lone, where wildering, and wide,  
The tumbling torrent leaves St. Gothard's side ;

Or, by old Tago's classic margin muse,  
Or stand entranc'd with Pyrenean views ;  
Still, still to thee, where'er my footsteps roam,  
My heart shall point, and lead the wand'rer  
home.

When splendor offers, and when fame incites,  
I'll pause, and think of all thy dear delights.  
Reject the boon, and weary'd with the change,  
Renounce the wish which first induc'd to  
range ;

Turn to these scenes, these well-known scenes  
once more,

Trace once again Old Trent's romantic shore,  
And tir'd with worlds, and all their busy ways,  
Here waste the little remnant of my days.  
But if the fates should this last wish deny,  
And doom me to some foreign shore to die ;  
Oh ! should it please the world's supernal

King,  
That weltering waves my funeral dirge shall  
sing ;

Or, that my corse should on some desert  
strand,

Lie stretch'd beneath the Simoom's blasting  
hand ;

Still, tho' unwept I find a stranger tomb,  
My sprite shall wander thro' this fav'rite  
gloom,

Ride on the wind that sweeps the leafless  
grove,

Sigh on the wood-blast of the dark alcove,  
Sit a lorn spectre, on yon well-known grave,  
And mix its moanings with the desert  
wave.”

There is nothing which we should so solicitously seek to avoid as the danger of exciting disappointment by undue praise. That the present volume has its faults, who would not expect? The story of the ballad is ill conceived, and we should censure the Hudibrastic letter if it were not for the anecdotes of the author which it contains. The tale of Bateman is given with less effect in his polished couplets than in the old ditties to which he refers, and by which we also were impressed in childhood. It would be invidious to point out these defects, without observing, that such defects must exist in the productions of a young man, and that no fault in such a case could be so ominous, as the absence of all faults. There is no sap or vigour in the tree that pushes out no shoots of wild luxuriance. One specimen more.

“To the herb *Rosemary*.

“Sweet scented flow'r ! who'rt wont to bloom  
On January's front severe,  
And o'er the wint'ry desert drear  
To waft thy waste perfume !  
Come, thou shalt form my nosegay now,  
And I will bind thee round my brow,

And as I twine the mournful wreath,  
I'll weave a melancholy song,  
And sweet the strain shall be, and long,  
The melody of death.

"Come fun'ral flow'r! who lov'st to dwell  
With the pale corse in lonely tomb,  
And throw across the desert gloom  
A sweet decaying smell.  
Come press my lips, and lie with me  
Beneath the lowly Alder tree,  
And we will sleep a pleasant sleep,  
And not a care shall dare intrude  
To break the marble solitude,  
So peaceful, and so deep.

"And hark! the wind-god as he flies  
Moans hollow in the forest trees,  
And sailing on the gusty breeze  
Mysterious music dies.

Sweet flow'r that requiem wild is mine,  
It warns me to the lonely shrine,  
The cold turf altar of the dead;  
My grave shall be in yon lone spot,  
Where as I lie by all forgot,  
A dying fragrance thou wilt o'er my ashes  
shed."

This is a most interesting poem. We know no production of so young a poet that can be compared to it, and when we say this, we remember Cowley and Pope and Chatterton.

The frequent allusions to ill health throughout this volume, give us a melancholy presentiment which we sincerely hope may be groundless.

ART. VIII. *Select Poems; by the Author of Indian Antiquities.* 8vo. pp. 120.

HAPPY is the poet whose learning, or whose genius, enables him in an age when smoothness of numbers and correctness of versification, even when combined with justness of sentiment and elegance of expression, can confer little distinction on one of the thousand votaries of the muses, to strike out a new path, and seize the envied prize of novelty and originality. This happiness is Mr. Maurice's in a considerable degree. The *Crisis*, a poem, addressed to Mr. Pitt, on the threatened French invasion in 1798, escapes the stigma of triteness even on the hacknied subjects of English freedom and heroism, and French ambition and atrocity, by the vigour of its diction, the vividness of its painting, and the glow of its colouring. The complimentary address to Mr. Pitt with which it opens, is most happily wound up in a noble simile.

"For others let the fragrant incense burn,  
Wafted from adulation's flaming urn;  
Unaw'd by menaces, unwarped by praise,  
Proud sterling virtue seeks no borrow'd bays;  
While Genius, tow'ring on its throne of light,  
Shines, in its own transcendent lustre, bright;  
The flame it feels through kindred bosoms  
spreads,

And wide the intellectual radiance sheds,  
As yon bright orb that lights the distant pole,  
And warms the glitt'ring spheres that round  
it roll,

Exhaustless, flames with undiminish'd beam,  
Nor misses from its fount th' immortal stream."

The apostrophe to the Egyptians, and exhortation to them to avenge the unprovoked attack of the French, is a passage of great animation and picturesque beauty. But the poem to the memory of Sir William Jones, as the most charac-

teristic of the volume, is the one which demands our most particular attention. The bard transports himself to the tomb of "departed Genius," on the distant shores of India, and after smiting "the choral shell," in a solemn and appropriate symphony, "the Genius of the East" appears to him in a flood of glory.

"Not that dire spectre, who, in later days,  
In Asia's courts rears high her pageant  
shrine,  
Who spurns the martial plume, and loves to  
blaze

In waste of diamonds from Golconda's mine.

Oh! not that bloated monster, stain'd with  
blood,

Who on pale harams vents her murd'rous  
rage;

To screaming infants tends th' impoison'd food,  
And to the bow-string dooms enfeebled  
age:

But she, of elder birth, whose righteous sway  
Asia's undaunted sons exulting own'd,  
When liberty diffus'd her halcyon day,  
And virtue rul'd the helm, with Cyrus  
thron'd."

This majestic female, after pouring forth a tribute of well-deserved applause to the memory of the deceased, proceeds to trace the progress of science from its first dawn on the mountains of Taurus, throughout the east, and at length to the western empire of Rome; branding, as she proceeds, all the mighty desolators of the earth who, in their turns, quenched in blood the sacred fire of learning, and involved the world in darkness; and extolling their milder descendants under whose influence peaceful arts again flourished, and the intellectual flame was re-kindled.

The whole skill of the poet has evidently been exerted to give discriminating strokes to the successive ravagers, from the first Mahometan conqueror of India, to the subverters of the Mogul empire, who thus pass in review; and as far as sameness on similar subjects can be avoided, he has avoided it: the difficulty of his task, it should be remembered, is greatly increased by the slight acquaintance of the general reader with the subjects of his song, which renders it necessary to narrate events in plain terms, and mention characters by name, which might otherwise have been glanced at by an allusion, or recalled to memory by a hint. Of his success, we can only give the evidence of two specimens.

"Frantic with bigot rage, with blood defil'd,  
A gorgeous crescent gleaming on his crest,  
What furious demon, from Arabia's wild,  
Hurls desolation through the ravag'd East?"

"A sabredrench'd with infant gore he waves,  
His eyes in opium's wildest frenzy roll;  
And, while of sacred rites the maniac raves,  
Lust and revenge pollute his guilty soul.

"O'er Persia wide his myriad host he pours,  
Burning for spoil, for human blood athirst;  
Resistless, India, on thy fertile shores,  
Tossing their flaming brands, his legions burst.

"On Bactria's hills are quench'd the sacred fires,  
The Mithriac priests are on their altars slain;  
The proud Sassanian dynasty expires,  
And Asia bends to ORHMAN's baleful reign.

"Through all her bounds the outeries of despair,  
The shrieks of violated beauty, rise;  
While, blasted by his crescent's dreadful glare,  
The bloom of science and of genius dies."

\* \* \*

"Hark! on Carmania's hills the trumpets sound,  
And the fierce Afghan tribes to arms invite;  
The thund'ring war-steed spurns the trembling ground,  
And neighs impatient for the promis'd fight.

"To conquest by resistless NADIR led,  
From Candahar they rush impetuous down:  
High on the tyrant's burnish'd crest display'd  
Gleam the rich spoils of Persia's plunder'd crown.

"Gainst vet'ran warriors, nerv'd with triple steel,  
Thy millions, Hindostan, in vain advance;  
No more thy rajahs burn with patriot zeal,  
No more, enervate, wield the ponderous lance.

"Invincible the iron phalanx moves,  
Dreadful as wasting storms or raging fire:  
Delhi, again, a victor's vengeance proves,  
Again her butcher'd sons in heaps expire.

"Tho' all Golconda flames before their eyes,  
Not all Golconda can appease their rage:  
Unmov'd they hear the screaming infants' cries,  
Unaw'd, the curses of expiring age."

The striking beauty of the two last lines we need scarcely point out. A recurrence to the lamented subject of the elegy, and a procession of the inferior geni of India concludes the piece.—  
"Westminster Abbey," is a less happy effort of our author. The remarks on the vanity of every thing human, which make a large part of it, though clothed in poetical language, are trite in the extreme, and too much dwelt upon; for after all, "These little things are great to little man." In characterizing the distinguished persons, whose monuments he contemplates, he is not very accurate or intelligible. We are quite at a loss to know which of our Edwards is intended to be celebrated in the following passage:

"O'er *sainted Edward's* shrine, Devotion,  
mourn;  
Once deck'd with treasures brought from  
ev'ry clime,  
And crowns from brows of vanquish'd monarchs torn."

The last line seems to apply to Edward III.; but by what action of his blood-stained conquering reign he has acquired a title to the meek honours of saintship, we confess ourselves totally ignorant.

The very offensive, though common fault, of placing persons of small renown on a level with characters of the highest fame, is prominent in this stanza:

"Where hath not glory wafted Vernon's  
name?  
Where Wager, Warren, are your deeds  
unsung?  
Where Churchill, Townshend, eldest sons of  
fame,  
And Wolfe, the theme of ev'ry Briton's  
tongue?"

If the reader pauses a moment at the name of one of the pretended "eldest sons of fame," to ask, "Who was he?" the whole effect of such a passage is lost.

The "Hymn to Mithra" serves to display the author's oriental learning, and powers of lofty versification; it pos-

sesses much grandeur of imagery, and poetic description, but from the recondite nature of the subject, it is little fitted to interest any reader, and from the deficiency of notes, will probably be unintelligible to many. We must beg to suggest, with submission to Mr. M's deep knowledge on the subject, an incongruity in enumerating the planets by their *Greecian* names of Jupiter, Mars, &c. whilst the sun and moon are designated by their *Persian* appellations of Mithra and Astarte. We cannot but enter our protest against the presumption of our author, in admitting one of his school-boy exercises, though sanctioned by the

applause of Dr. Johnson, among "*Select Poems*," published at a mature age. The other pieces of this volume, which are trifles, and not very pleasing ones, we shall pass over in silence.

On the whole we may observe, that the poetic talents of Mr. M. are more adapted to delight the fancy, than to touch the heart; on which account he will do well to employ himself on the splendid and novel topics afforded by Asiatic literature, rather than on domestic subjects of deeper interest, which require pathos, simplicity, nature—the heart as well as the head of a poet.

ART. IX. *Poems*, by S. T. COLERIDGE. Third Edition. 12mo. pp. 202.

THE character of Mr. Coleridge, as a poet, is so well known, and his merit so fully acknowledged, that nothing more can be expected of us on announcing the third edition of his poems, than a few remarks suggested by comparison with the last. The diminished bulk of the volume, caused by the omission of the works of Messrs. Lloyd and Lamb, instantly excited our warmest approbation, particularly as we were inclined to consider it as an evidence of the ripened taste and improved discernment of our author. In his own productions we remarked a few highly judicious alterations, with some others which we could not equally approve—on the whole we must suggest, that he has still to learn "the art to blot." He omits scarce any thing, and so far from sinking, his juvenile productions appear to rise in his esteem; several of these, which in the last edition were thrown into a supplement, with a kind of confession of their inferiority, now boldly thrust themselves into the body of the volume, without apology and without abbreviation.

The pieces now first offered to the public are few and short, but such as afford examples of the best and worst manner of this striking and peculiar writer. Novel and picturesque personification, sometimes almost expanding into allegory, forms perhaps the most prominent and most beautiful feature of the highly figurative style of Mr. Coleridge, but never did he display this characteristic with more exquisite grace than in the following lines:

"Ah, fair delights! that o'er my soul  
On Mem'ry's wing, like shadows, fly!

*Ah, flowers! which Joy from Eden stole  
While Innocence stood smiling by!"*

Absence, a Farewell Ode.

The political sentiment of the following sonnet is now obsolete, but the animated simile by which it is ushered in, is worthy of a longer date.

"As when far off the warbled strains are heard  
That soar on Morning's wing the vales among,  
Within his cage th' imprison'd matin bird  
Swell the full chorus with a generous song:  
He bathes no pinion in the dewy light,  
No father's joy, no lover's bliss he shares,  
Yet still the rising radiance cheers his sight—  
His fellows' freedom soothes the captive's cares!  
Thou, Fayette! who didst wake with start-  
ling voice

Life's better sun from that long wintry night,  
Thus in thy country's triumphs shalt rejoice  
And mock with raptures high the dungeon's  
might:

For lo! the morning struggles into day,  
And slavery's spectres shriek and vanish from  
the ray!"

Some other political sonnets, which are far from possessing equal poetical merit, and are disgraced by much coarse vehemence of thought and expression, surely ought not now to have been brought forward for the first time.

In the complaint of Ninethoma, and another metrical imitation of Ossian, we cannot discern the slightest trace of Mr. Coleridge's hand, though we clearly recognise that of a correct and cultivated poet; these proofs of versatility of talent are pleasing, and show that it is perfectly at the option of this favoured genius, to dance along the fairy paths of elegance, or soar into the loftiest regions of sublimity.

ART. X. *The Defence of Order; a Poem.* By JOSIAH WALKER, A. M. 8vo. pp. 176.

MR. Walker is unhappy in the choice of his subject: more knowledge and more power of thought than he possesses are requisite to render didactic poetry tolerable. Where he digresses into narrative he is far more successful. The following passage is well executed for its style of composition.

“ Alas! how fair the dawn to thousands rose,  
Who ne’er again their eyes in sleep should close!  
Ere midnight’s watch, with foul explosion driven,  
In mangled atoms, round the burning heaven!

“ In fancied safety, lies the Gallic host,  
Moored on the margin of the shelvy coast;  
But see, amazed, the British line appear,  
Shoot round their flank, and dare their faithless rear;  
With dreadful flexure, to a crescent bend;  
Down half their length its clasping horns extend;  
Till closer, closer yet, the fierce embrace,  
With fiery pressure, melts them from the place.

“ Thus, eastern monarchs, round the savage lair,  
Where couching pards, and lamp-eyed tigers glare,  
Light up a circle of nocturnal fire,  
And nigher yet the curve contracts, and nigher;  
Till, struck with dread, the hollow-growling game  
See closed apace the moving wall of flame;  
Escape in vain, with anguished eye, explore,  
And shake the forest with a dying roar.

“ But who shall paint the last convulsive throes,  
As ships with ships, in grappling fury, close;  
Briton and Frank, in mad disorder, joined,  
Bolt meeting bolt, and mast with mast entwined!  
The glassy deep reflects the fiery air,  
And distant Pharos reddens in the glare;  
Afric looks on, with blank astonished eyes,  
As, here withdrawn, her fortune Europe tries;  
—Till, bursting vast, a dread volcanic crash,  
And, coating night’s black vault, a sulphurous flash,

Like Time’s last groan, each pulseless heart  
appal,  
And stilly darkness drops her veil o’er all.  
At that dread signal, Gallia’s naval knell,  
Loose from her grasp unravished India felt;  
And those, sent forth to spoil the jewelled queen,  
A hope forlorn on Egypt’s plains were seen.

“ And now, the arena’s awful gate unbarred,  
A passage broken through the slaughtered guard,  
Nelson retires, to seek severer toil,  
And shake the Baltic, as he shook the Nile;  
While Scotia’s chief the flower of Albion leads,  
To crown the conflict with their noblest deeds.  
How sternly calm, portentously serene,  
Their glorious entrance on the vacant scene!  
In steady lines, the glittering boats convey  
A freight of heroes through the watery way,  
To Nile’s broad mouth their sweepy course  
they bend,

Whose jaws, beset with fangs of fire, distend.  
On Nature’s wall, the beetling cliff of sand,  
A living parapet, the warriors stand;  
And, bellowing ceaseless from the embattled steep,

The surfy strand their red artillery sweep.  
Yet, full in front, their course the rowers urge,  
To shouts and songs responsive, beat the surge;

And, should a bolt, which skilful glances guide,  
Crush some ill-fated consort by their side,  
Not fear, but rage, the thickening stroke impels,

And louder still, the doubling chorus swells.  
The crooked keels at once indent the sand;  
With ringing arms, the soldier leaps to land;  
And, on the beach, which arrowy thunders  
tear,

And sheeted lightnings scorch with livid glare,  
Selects his place, as in parading shew,  
When British beauty shone—his only foe.  
Fast as the warriors drop, their comrades still  
Leap to the spot, the gory gaps to fill;  
Arrayed in speed, they move with growing  
pace,

Till quickening, kindling, glows the rapid race;  
And up the cliff, with more than mortal  
might,

They pant, they press, and seize the hostile  
height;

—Hostile no more, for every foe is fled,  
In rout and tumult, o’er the valley spread.”

ART. XI. *The Inquiry.* Part I. 12mo. pp. 44.

THIS well-meant poem is decent but dull. It requires no common talents to render metaphysical argument tolerable in verse; with what success this author has attempted it a brief extract will suffice to show,

“ Strange world of good, replete with ev’ry  
evil,  
Pain, death, want, woe, damnation, and the  
devil;  
So spoke Voltaire—and with too just a hand  
His sportive tale of human mis’ry plann’d,

Which brings all earthly woe before our eyes,  
And, strange! to make us laugh, not make  
us wise:

This world's great purpose, thou delusive  
droll,

Was not to turn our brains, but try our soul.  
For evils physical must be confess'd  
Of moral good the fountain and the test.  
And grant the world were all thy colours  
make it,

Even as they represent it, let us take it—  
Thy pen profane its unmeant aid hath given  
To scripture, immortality, and heaven.  
For who the birth of evil can declare,  
Save inspiration? what, save heav'n, repair?"

There is neither reason nor poetry in  
these lines. Half this pamphlet is filled  
with notes, which discover as little judg-  
ment as the text.

ART. XII. *Epigrams: in Two Books.* By W. BARNES RHODES. 12mo. pp. 84.

A VERY indifferent collection. The  
following are examples of the best:

"The glow which Cloe's cheeks possess  
Is something more than Nature's dress;  
Yet such her happy knack,  
Although she paints, there's none can boast

Of knowing which she uses most,  
Carminc or coniac."

"Of every hope and wish possest,  
You'd think that Ned was truly blest:  
No: Ned, of wealth and friends bereft,  
Has nought but hopes and wishes left."

ART. XIII. *Norbury Park, a Poem; with several others: written on various Occasions.* By JAMES WOODHOUSE. 12mo. pp. 132.

THE author of this little volume pre-  
sumes to recall the public attention to  
his name; only by his modest motto—  
*Sutor ultra crepidam.*

James Woodhouse is the Woodstock  
shoemaker, who many years ago excited  
the attention of the public, the successor  
in notoriety to Stephen Duck, but with  
far superior talents, and the predecessor  
of Mrs. Yearsley and the Bloomfields.  
He is now advanced in age, and when  
we express a hope that this volume may  
obtain a successful sale, we add with  
truth and with pleasure that its merits  
deserve success.

The following passage will evince that  
this poet has looked at nature with no  
inattentive eye.

"Lovelier far than vernal flow'rs,  
Thy mushrooms shooting after show'rs;  
That fear no more the fatal scythe,  
But proudly spread their bonnets blythe,  
With coverings form'd of silk and snow,  
And lin'd with brightening pink below.  
Like banners, bless'd, they speak of peace,  
And tell me trouble soon shall cease;  
Still auguring glad, with aspect bland,  
Love's rapturing vintage just at hand;  
But more the later fungus race,  
Begot by Phebus' warm embrace,  
In summer months, or procreant earth,  
By damp September brought to birth;  
That, just like Jove, produce their seed,  
From teeming brain, for future breed;  
Their forms and hues some solace yield,  
In wood, or wild, or humid field;  
Whose tapering stems, robust, or light,  
Like columns catch the searching sight,  
To claim remark where e'er I roam;  
Supporting each a shapely dome;

Like fair umbrellas, furl'd or spread,  
Display their many-colour'd head;  
Grey, purple, yellow, white, or brown,  
Shap'd like War's shield, or Prelate's crown—  
Like Freedom's cap, or Friar's cowl,  
Or China's bright inverted bowl—  
And while their broadening disks unfold  
Gay silvery gills, or nets of gold,  
Beneath their shady, curtain'd cove,  
Perform all offices of love.

In beauty, chief, the eye to chain,  
'Mong whispering pines, on arid plain;  
A glittering group, assembled, stands,  
Like Elfs or Fays embattled bands—  
Where every arm appears to wield,  
With pigny strength, a giant shield;  
And deeply dyed in sanguine gore,  
With brazen bosses studded o'er;  
While magic Fancy's ear confounds  
The whistling winds with hostile sounds."

Thus also these lines addressed to  
Shenstone upon his Rural Elegance.

"What! cannot He who form'd the fount  
of light,  
And shining orbs that ornament the night!  
Who hangs his silken curtains round the sky,  
And trims their skirts with fringe of every dye!  
In sheets of radiance spreads the solar beams,  
With soften'd lustre, o'er the tranquil streams;  
Or, o'er the glittering surface, softly flings  
The whispering winds with gently waving  
wings,

While every kindled curl's resplendent rays  
Quick dart and drown in bright successive  
blaze!—

Who dipp'd in countless greens the lawns  
and bow'rs,

And touch'd, with every tint the faultless  
flow'rs!—

With beauty clothes each beast that roams  
the plain,

And bird's rich plumc with ever-varied stain!

Each fair-scal'd fish in watery regions known,  
And insect's robe that mocks the colour'd  
stone!

Doth he not form the peasant's visual sphere,  
To catch each charm that crown, the che-  
quer'd year?

Construct his ear to seize each passing sound,  
From wind, or wave, or wing, or whistle,  
round?

From breathing breeze, or tempest's awful  
roar,

Soft lisp'ing rills, or ocean's thundering shore?  
Unnumber'd notes that fill the echoing field,  
Or mingled minstrelsy the woodlands yield?  
The melting strains, and melodies of song,  
That float, impassion'd, from the human  
tongue—

Or, fondly feels each sound, that sweetly slips,  
Thro' ear to heart, from favourite lovers' lips.  
Can trace the nicer harmony, that springs  
From puny gnats' shrill-sounding treble wings;  
Light fly's sharp counter; bees' strong tenor  
tone;

Huge hornet's bass, and beetle's drowsy drone,  
Grasshopper's open shake, quick twittering  
all the day,

Or cricket's broken chirp, that chimes the  
night away."

The poem entitled *Norbury Park* abounds with passages of similar merit. We should in particular notice the description of the *Yew Trees*.

ART. XIV. *The Voyage Home from the Cape of Good Hope; with other Poems relating to the Cape, and Notes.* By H. W. TYTLER, M. D. 4to. pp. 75.

"OUR captain, to whose care was giv'n  
Three hundred souls, on ocean driv'n,  
Prov'd faithless and unjust;  
And, after him, let none rely  
On promise, or on Fame's loud cry,  
Or in appearance trust.

"Indignant muses! sing the fate  
Of him, so poor unfortunate,  
And impious suicide;  
Who, from the poop, at noon of day,  
When all were turn'd a diff'rent way,  
Plung'd headlong in the tide.

"Nor voice he rais'd, nor arms he spread;  
The billows rose above his head,  
And sunk him in the main.  
Yet ladders to his aid were thrown;  
And gen'rous hearts, by ropes, went down,  
But all, alas! prov'd vain."

The poetry of this pamphlet, as will be seen by the foregoing specimen, is below criticism and below contempt. From the manner in which it is printed, twelve lines in a quarto page, and the price charged for it, we suppose the author designs it as a decent method of levying contributions upon his friends.

ART. XV. *Poems on Various Subjects.* By Mrs. GRANT, of Laggan. 8vo. pp. 447.

THESE poems are submitted to the public under circumstances which excite interest and bespeak indulgence.

They are the productions of native genius, brought forth amid rocks and wilds, and at intervals snatched from the laborious duties of domestic life. But we shall allow the lady to introduce her own offspring with the simple grace by which she is distinguished.

"Go, artless records of a life obscure,  
Memorials dear of loves and friendships past,  
Of blameless minds, from strife and envy pure;  
Go, scattered by affliction's bitter blast,  
And tell the proud, the busy, and the gay,  
How rural peace consumes the quiet day.

Ye dear companions, in life's thorny way,  
Who see your modest virtues here display'd,  
Forgive, for well you know the unstudied  
lay

Was only meant to soothe the lonely shade.  
But, when the rude thorn wounds the song-  
ster's breast,

The lengthen'd strains of woe betray her se-  
cret nest." *Introductory verses.*

The longest and most finished piece

in the volume, entitled "*The Highlanders, or Sketches of Highland Scenery and Manners, with some Reflections on Emigration,*" contains much novel and picturesque description, with many fine strains of pathos and moral reflection; the versification is modelled on that of Goldsmith, and in the passages relative to emigration, there is some similarity, which perhaps could scarcely be avoided, to the sentiments of the *Deserted Village*. In the family worship of the peasant, and the reception of Farquhar at Glen Doe, there is a slight imitation of the "*Cottar's Saturday Night*;" but, in general, Mrs. Grant is very far from deserving the appellation of a plagiarist. The far greater part of her scenery is snatched from the sublime and savage landscapes before her eyes; whilst by much the larger portion of her sentiment is drawn from the pure and copious spring within her bosom. The removal to the mountain *shealings*, or "*summer flitting*" affords an apt example.

"When dappled grey first streaks the eastern sky,  
With quick dispatch the cottage-matrons vie,  
Who first shall load the steed that leads the way;

And wheels and vessels in due order lay.  
Then in collected numbers, duly rang'd,  
With lighten'd hearts, to care and fear estrang'd,

The train proceed;—and first the motley herd,  
For greater strength, or agile force prefer'd,  
Lead on;—the milky mother following near,  
Their sportive young behold with matron fear:  
Then come the bleating kind with plaintive cry,

And children overjoy'd, they know not why;  
And mothers, smiling on the guiltless race,  
Or clasping infants in their fond embrace.

"High on the mountain's side, or in the wood,

Where nature reigns in savage solitude;  
Or deep embosom'd in some narrow glen,  
Where coy retirement shuns the haunts of men,

The shelter'd bothys rise to shield the train,  
Who joy to view their summer haunts again;  
For here again the sylvan age returns,  
Nor man the curse of ceaseless labour mourns:  
Fair Freedom walks abroad, unties her zone,  
And joys to see the landscape all her own.

"Thrown careless on the slope—see vacant *Ruse*

Bask in the sun, or court the cooling breeze;  
And musing *Fancy*, by some brook reclin'd,  
In language clothe the murmurs of the wind;  
Or frame to vocal reeds the native lay,  
Or form of mountain-flowers the chaplet gay.  
See *Sport*, with *Exercise* and *Health* combin'd,  
In happy union, fleetier than the wind,  
Thro' pathless wastes the sprightly game pursue,

"Oft out of reach, but never out of view:  
While eager *Hope* impetuous grasps the prize,  
And *Ardour* lightens in the hunter's eyes.  
At length, exulting o'er the trembling spoil,  
They see the dun deer fall to crown their toil.

"And when calm evening bathes the flow'rs in dew,

And bids the thrush his mellow note renew,  
With answering music maidens pour the lay,  
And drain the listening kine at close of day:  
Delighted echoes spread the cheerful strains,  
And rapt attention holds the silent swains:  
But holds not long—for every thicket round  
Young voices mix'd in cheerful chorus sound.  
Each lone recess the wand'ring tribes explore,  
And now return exulting with their store  
Of berries, that in rich luxuriance spread,  
O'er the dark heath their crimson lustre shed;  
Or trailing o'er the rocky fragment's side,  
The glossy foliage spreads its verdant pride;  
While raspberries richly flavour'd, climb on high,

And bask in all the radiance of the sky;  
Or *brambles*, on the brook's wild margin spread,

With jenny lustre deck their pebbly bed:

Where with coy wing the *plumiger* retires,  
And high beyond the rolling mist aspires,  
In safest solitude and purest air,  
To rear her young with fond maternal care:  
And *mountain hares*, white as the drifted snow,  
Ascend, while fear and danger pant below;  
Or, where the *eagle* darts his vigorous flight  
From cliffs sublime, to trace the realms of light."

The escape of the Chevalier; the heroism of Flora Macdonald; the cruelty of the English troops, after the battle of Culloden; the universal dejection and depopulating emigrations of the highlanders, consequent on the Disarming Act, are subjects which, in a poem like the present, could not be passed over in silence; and in the hands of Mrs. Grant, they are far from being destitute of interest. Whatever may be thought of our author as a philosopher or politician; whatever fault may be found with her want of method, and occasional prolixity, few, we imagine, will peruse the *Highlanders*, without admiration of the patriotic spirit which inspires it, and the gleams of genuine poetry by which it is enlivened.

The smaller pieces are principally in the familiar style, and were intended only for the amusement of the particular friends of the writer; thus it has happened that they have somewhat too much of locality to be thoroughly relished by the public at large; yet they are easy, and by no means destitute of humour and fancy. The best of them have considerable tenderness and pathos.

"A Familiar Epistle to a Friend," notwithstanding some negligence and incorrectness, is a remarkably pleasing poem, and inspires us with the utmost respect and affection for the author; it proves (what indeed it is highly illiberal, however common, to deny) the possibility of a female poet's turning aside from her darling pursuit at the summons of duty, and stooping to fulfil the humble offices of the nurse and the housewife—the wife and the mother—and again returning to these pursuits, after the busiest years of life are past, for the entertainment of her friends and the benefit of her family.

There are two poems translated from the Gaelic. They possess considerable beauty, but partake of the prolixity and obscurity so disgusting in the poems of Ossian: the prose dissertation prefixed is sensible and elegant. Mrs. Grant ap-

pears to give the truest and most candid account of the celebrated version of Macpherson that has yet been published.

We have already said, that the poems of Mrs. Grant are entitled to indulgence; but we should be deficient in our duty to the public, and indeed to the author, did we neglect to point out some faults which call for correction. We do not stop to particularize the bad rhymes, but they are numerous. That poorest of all expletives *so* frequently occurs, as—"so deep, so sweet," &c. "The clan's proud standard waves *amain*."

"When probity and wisdom *both* combine  
With *all* the poignant humour of a Burns,"

and several similar lines are flat and redundant in the extreme. Industry, support, sonorous, ærial, &c. should never make their appearance on this side the Tweed; nor such prosody as

"Dear Beatrice with pleasure I read your  
kind letter,"  
"More difficult to clear than his reverence's  
text."

Several sentences are inaccurately constructed, and most of the pieces might be compressed with advantage. Mrs. Grant evidently possesses those great requisites for poetic excellence, a lively fancy and a feeling heart, and we shall be rejoiced to announce a second edition of her poems with *omissions* and corrections.

ART. XVI. *Armine and Elvira: a legendary Tale. The Ninth Edition. With other Poems.* By EDMUND CARTWRIGHT, M. A. 12mo. pp. 132.

THE elegant tale of Armine and Elvira, first given to the world in 1771, has acquired for its author a degree of poetical fame, which naturally led us to expect great pleasure from the perusal of the volume before us. Time, we flattered ourselves, must have ripened, from blossoms so fragrant and beautiful, a mellow and delicious fruit.

In this pleasing anticipation we have been somewhat deceived. The tender plant of poesy, it is probable, has received but little culture from Mr. Cartwright during the last thirty years: thus the vernal bloom of fancy has been suffered to fade in neglect, and has only been succeeded by an autumnal blow equally transient and less lovely.

Our author must not, however, be confounded with the herd of common versifiers; though deficient in strength and boldness—never brilliant, and rarely original—he is always moral, generally elegant, often ingenious, and sometimes pathetic. There is a striking resem-

blance between the style and genius of Mr. Cartwright and of his friend Dr. Langhorne; but the former is less chargeable than the latter with obscurity and affectation.

"Youth and Age," an ode from the Swedish, may certainly "be considered as a literary curiosity" as well as an agreeable and elegant piece; though, but for the advertisement, we should never have conjectured it to be of foreign birth.

None of the new pieces are of great length, nor does their author claim for them any higher title than that of "*Trifles*." The following is a *trifle*, but surely a very tender and pleasing one.

"Not once the sun has deign'd to shine  
My Susan, thro' this day so dear,  
'Tis yet, save that which made thee mine  
'To me the brightest of the year.

"This day first saw those eyes so blue,  
Their fascinating beams display—  
Blest day! to come with rapture new,  
Yet never steal a charm away!"

ART. XVII. *Nugæ Poeticæ.* By F. SAYERS, M. D. 8vo. pp. 37.

OF a thin pamphlet, with a title so unpretending, a short account will suffice. Its longest and most finished piece, entitled, "Theseus and Ariadne, from an epithalamium by Catullus," is an elegantly versified poem, more concise, yet more ornamented than the original, of which it is rather an abstract than a version. In some passages we could wish that more of the *costume* of the Latin bard had been preserved, and that it had been

less completely transformed into a modern English production. Translation, it should be recollected, may be instructive, whilst imitation can only be entertaining. For instance—a literal version of the lines,

"*Non humilis curvis purgatur vinea rastris.  
Non glebam prono convellit vomere taurus.  
Non falx attenuat frondatorum arboris um-  
bram,*"

would have given the English reader

some new ideas, some insight into the peculiarities of foreign and ancient husbandry; whereas the expressions,

"The fields deserted give to sweetest peace  
The tired steer; the rattling harrows cease:  
The plowshare rusts unheeded, and the oak  
No longer trembles to the woodman's stroke,"

present him only with domestic images long familiar to his imagination. Again, there is a picturesque distinctness in

"*Candida permulcens liquidis vestigia lym-  
phis,  
Purpureave tuam consternens veste cubile,*"

which recalls the simplicity of patriarchal manners, but which is totally lost in

—"every office had been dear  
That served thy wants to ease, thy life to  
cheer."

It is singular that the modern should have fallen short of the delicacy of the ancient poet in making Ariadne "breathe her fervent prayer," for the safety of Theseus, forgetful of the "*tacito labello*," of his master.

"*Talia qui reddit pro dulci præmia vita,*" is affectedly rendered

"That thus repays  
The gift of life, the boon of gilded days."

And in several instances the copy falls short of the energy of the original.

ART. XVIII. *A short Account of John Marriot, including Extracts from some of his Letters, to which are added some of his Poetical Productions.* 12mo. pp. 194.

A Short account indeed; out of a hundred and ninety-four pages it employs nine! however there is enough of it.

Mr. Marriot was one of the people called Quakers, and this little volume of posthumous poems appears to be edited by a member of that respectable society. Mr. Marriot was of a mild and amiable disposition, received a religious education, and profited by it, as appears from

ART. XIX. *Poems; consisting of Elegies, Sonnets, Songs, &c. and Phantoms; or, the Irishman in England; a Farce in two Acts.* By T. JONES. 12mo. pp. 136.

MR. JONES has been tried in the Court of Criticism, and found guilty of violating the laws of poetry, by writing and publishing nonsense verses: the judg-

"Jack the Giant Killer," possesses considerable merit as a good natured parody on Homer, and a sly satire on his modern imitators.

Of the smaller pieces it may be remarked that their diction, though frequently elegant, is considerably infected with those quaint and unauthorized novelties, by which too many writers of the present day endeavour to elevate trite and prosaic ideas into a semblance of high poetry. The following elegiac stanzas, improperly styled a *Sonnet*, will be a sufficient specimen.

"To a Snow-drop.

"Fair flower! but yesterday thy milk-white  
vest

A pearly dew-drop on earth's bosom lay;  
At noon thy green stem rear'd its silken crest,  
To meet the radiance of the transient ray.

"The night came on—amid the storm-cloud's  
lower

The hail fell thick—the biting frost-winds rose,  
To-day I mark thy silvery front no more—  
Deep art thou buried in the drifted snows.

"Like innocence by chilling woe oppress'd,  
But for a while thou'rt bent by winter's tread,  
Again with Heaven's all-cheering sun-shine  
blest,  
Thou'lt rear to brighter hours thy spotless  
head."

his resignation under the severe affliction of a disappointment in his affections. Many of these poetical pieces were written when he was very young; they were not intended for the public eye, and had Mr. Marriot been alive, many of them, probably, would not have been exposed to it. They have the general merit of mediocrity.

ment of the law is—but as this is the prisoner's first offence, the Court, in its mercy, remits the sentence.

ART. XX. *Il Fiore della Poesia Italiana, &c. The Flowers of the Italian Poetry of the 18th Century, preceded by some historical Notices of the Poets. The whole selected and compiled by G. B. CASSANO, Professor of Languages and of Italian Literature.*

THESE little volumes contain a judicious selection of beautiful poems: higher praise cannot be bestowed upon a compilation of such trifling extent; yet short

as it is, it will be useful to the lovers of Italian literature in this country, where foreign books are not easily to be procured, even at a price three and four-fold of their original cost.

The prefatory notices are brief but useful. The editor must surely be mistaken, when he asserts that Pope was accustomed to say there were only two per-

sons in the world who understood Greek, Calvini, in Florence, and he himself in London. Pope was too feeble a Grecian for this vaunt. The Rector of L. does not extend his supremacy beyond the limits of England, not even after dinner, when he confines the knowledge of Greek to one man.

ART. XXI. *Scenes of Infancy; descriptive of Tiviotdale.* By JOHN LEYDEN. 12mo. pp. 184.

WE have seen many poems of the present day which greatly resemble this, and yet we scarcely know how to characterize it. The verse is smooth, the diction elegant, the matter varied, a picturesque country is described, many fanciful superstitions are touched on, many historical facts narrated, which are interesting even in plain prose; yet altogether the performance is not impressive. Except a slight degree of affectation, we are unable to point out any positive fault in the style; but in the plan of the piece there is a great and obvious one—it wants regularity, compactness, and union of parts into a whole. Perhaps we should be full as correct in saying the piece has no plan.

Still, if this were all, detached parts, however, might please, or indeed the whole, when considered as a miscellany, like Cowper's *Task*, which surely arrests attention full as forcibly as any regular epic in our language. But, if we must

say it, one trifling circumstance still remains to be objected—Mr. Leyden is *not a poet*, and when this is the case, a man is as little likely to succeed in a scene as in a drama—in an epigram as in a satire—in a couplet as in a volume.

Though it may rather militate against our assertion, we quote Mr. Leyden's best passage, in which the genuine feelings of his heart seem to have been his inspirers. Speaking of himself is apt to render the plainest man eloquent. Mr. L. it is to be observed, is about to embark for the East Indies.

“Not yet, with fond but self-accusing pain,  
Mine eyes, reverted, wander o'er the main;  
But, sad, as he that dies in early spring,  
When flowers begin to blow, and larks to sing,  
When nature's joy a moment warms his heart,  
And makes it doubly hard with life to part.  
I hear the whispers of the dancing gale,  
And, fearful, listen for the flapping sail,  
Seek, in these natal shades, a short relief,  
And steal a pleasure from maturing grief.”

ART. XXII. *Poems on several Occasions.* By CHARLES CRAWFORD, Esq. 2 vols. 12mo. pp. 350.

IN these volumes there is a great deal of sound morality and orthodox religion, and about as much poetry as in a copy of the Bellman's verses. But these sweeping censures are unpardonable: gentle reader, then, judge for yourself.

“Pale sickness spread o'er Delia's face of late,  
Threaten'd her brilliant charms t' obliterate;  
Dimm'd was the lustre of that beauteous eye,  
Which apathy might warm to extacy.  
They fear'd, who knew the highly valued maid,  
That medicine would try in vain its aid.”

The maid recovered, however: physicians sore, long time she bore, but at last got well.

Among other pious breathings, we have a poetical paraphrase, as it is called by a violent misnomer, of our Saviour's sermon on the mount: *exempli gratia*:

“Ye know full well, by those of ancient time,  
Adultery was held a heinous crime;  
But I to you laws dictate more severe,  
And say—unto a woman *whosoe'er*  
The wishful eye a love of lust shall dart,  
Is a complete adulterer in heart.”

Reader, hast thou enough? If not, repair to Mr. Becket, of Pall Mall, and buy the book.

ART. XXIII. *Petrarca: a Collection of Sonnets from various Authors; with an Introductory Dissertation on the Origin and Structure of the Sonnet.* By GEORGE HENDERSON. 12mo. pp. 192.

THERE is no artifice employed by the book manufacturers of this age of commercial speculation, which calls more loudly for critical reprehension than the immoderate use of compilation and selection. By this nefarious practice the original author is defrauded of the hard-earned recompence of genius—the public is tricked into repeated purchases of the same thing under different titles—and the literary profession is degraded into a system of scarcely-legal robbery.

The gleaner of the present collection introduces it by the following admirably-constructed sentence: “It certainly may not be deemed the least presumptuous undertaking in any one who shall attempt to point out to public regard the beauties of others.” In his case, however, his humility considers it as singularly fortunate, that the possibility of his mistaking in judgment “has been almost prevented by the earlier decision of one who in like matters seldom errs,—the public.” That is, the volumes from which he pilfers are in every body’s hands. Could any ill-natured critic have demonstrated more clearly the inutility of his book? Mr. Southey it

seems was hard-hearted enough not to comply with the collector’s desire of “enriching” his “book” (or himself) with a few of his admired sonnets. Probably that gentleman conceived that the consent of the public ought to be obtained as well as his own: an idea which seems to have escaped several others who are mentioned as consenting to the reprinting of their productions. The “dissertation” is penned in a style beneath criticism, but extremely pompous and evidently laboured. As to the sonnets themselves, a few of them are good, good at least for sonnets, which at best are but stiff difficult trifles, and surely more remote from the simplicity which they often affect than any other class of poems in our language. But the majority of them are little better than ravings of “moon-struck melancholy,” aped by hysterical affectation, or drivelling incoherencies, lisped by sentiment in her dotage, than which nothing can be conceived more hostile to genuine poetry, manly sense, and that sensibility which strengthens while it elevates the soul—which checks selfishness, adorns virtue, gives a zest to domestic privacy, and increases the sum of human happiness.

ART. XXIV. *Calista, a Picture of modern Life; a Poem, in three Parts.* By LUKE BOOKER, LL. D. 4to. pp. 28.

PREMISING that divine poeta is to be literally rendered poetic divine, we address Dr. Booker in the words of Virgil—

“*Tale tuum nobis carmen, divine Poeta,  
“Qualc sopor.”*

ART. XXV. *The Suicide, with other Poems, by the Rev. C. W. ETHELSTON, M. A.* 8vo. pp. 150.

WE cannot praise this book. It is unnecessary to notice faults, where there

are no merits. The sin of omission is deadly.

ART. XXVI. *Scenes of Youth, or rural Recollections; with other Poems.* By WILLIAM HOLLOWAY. 8vo. pp. 160.

THE publication of a second volume indicates that Mr. Holloway has found purchasers for the first. His verses are very respectable. We extract this little poem, not as the best, but as the shortest.

“*Expostulation to a Bird started in a favourite Walk.*

“Sweet native of this brake entangled dell,  
Where, the last spring, I mark’d amid the  
boughs

Thy pensile cradle wave, and heard the trill  
Of thy soft mother’s kind attentive spouse,  
Who took his stand upon the hedge-row  
green,  
To watch the school-boy’s wild and wan-  
d’ring steps:  
O startle not! no stranger to this scene,  
With cruel heart, or hand felonious creeps.  
Here, where the moss climbs up the steepy  
bank,  
On whose soft bosom basking violets lie,  
And modest primroses, or cowslips lank,

Diffuse their sweets, unseen by vulgar eye,  
 Oft let me hear thee—while, like thee, I seek  
 This lone retirement of our earliest days ;  
 And let us join our rural notes, to speak  
 The God of universal nature's praise ;  
 For 'tis his guardian hand us both sustains,  
 His common bounty we in common share :  
 For us he cloth'd the woods and deck'd the  
 plains,  
 Adorn'd the meads, and scented all the air.  
 He gave *thy* dulcet throat the pow'rs of song,  
 He breath'd the tuneful rapture through  
*my* breast,  
 He cast our lot those rustic shades among,

ART. XXVII. *The Pleader's Guide, a didactic Poem, in two Parts, &c. By the late J. J. S. Esq. Special Pleader and Barrister at Law. (A new edition.) 12mo. pp. 212.*

THOUGH the wit of this singular production is almost exclusively technical, a very superficial acquaintance with the profession will enable the reader to enjoy its pleasantries.

"The poem is divided into two parts, and the whole subdivided into eighteen lectures, being the substance of a course of instruction in the practice of the courts, and the art of special pleading, originally intended by the author for the use of his kinsman, Mr. Job Surrebutter, to whom it is particularly addressed. The author, in the outset of his plan, professes to demonstrate to his pupil the decided superiority of the common law over the civil, with respect to some *peculiar* advantages, heretofore, perhaps, not fully considered ; and from thence proceeds to instruct him in the history of a suit at common law, commencing with the original writ, and conducting him regularly through the whole of the subsequent process, in all its splendid varieties and modifications ; and finishing the first course of his lectures with the parties' final appearance in court, upon the return of the process to outlawry.

"The subsequent lectures, which compose the second part, resume the subject at the point where it rested, preserving the epic and didactic character of the work, through the remaining stages of the pleadings and the trial."

\* \* \* \* \*

"Of legal fictions, quirks, and glosses,  
 Attorney's gains, and client's losses,  
 Of suits created, lost, and won,  
 How to undo, and be undone,  
 Whether by common law, or civil,  
 A man goes sooner to the devil,  
 Things which few mortals can disclose  
 In verse, or comprehend in prose,  
 I sing—Do thou, bright Phœbus, deign  
 To shine for once in Chancery-lane ;  
 And, Clio, if your pipe you'll lend  
 To Mercury the lawyer's friend,  
 That usher of the golden rod,  
 Of gain and eloquence the god,  
 Shall lead my step, with guidance sure,  
 Safe through the palpable obscure,

Where meek simplicity has fix'd her rest.  
 Why then should I against thy life conspire,  
 Or seek thy thralldom, while I range secure ?  
 O, mild associate of the heaven-taught quire !  
 Dismiss thy fears—my presence yet endure.  
 'But thou art MAN !' methinks such strains  
 I hear,  
 'Well then may we suspect the plausible  
 lay,  
 Nor trust that those *our* feeble race should  
 spare,  
 Whose faithless arts too oft their *own* be-  
 tray ?"

And take my parchments, for his labour,  
 To cover your harmonious labour."

After this exordium the poet or lecturer calls upon all members of the law to listen to him and laugh. This appeal rather unpleasantly disturbs that tone of irony which runs through the work, and which should not in any instance have been laid aside. He then addresses his kinsman, for whose benefit these instructions are chiefly designed.

"But, chiefly thou, dear Job, my friend,  
 My kinsman, to my verse attend ;  
 By education form'd to shine  
 Conspicuous in the pleading line,  
 For you, from five years old to twenty,  
 Were cram'd with Latin words in plenty ;  
 Were bound apprentice to the muses,  
 And forc'd with hard words, blows, and  
 bruises,  
 To labour on poetic ground,  
 Dactyls and Spondees to confound,  
 And when become in fiction wise,  
 In Pagan histories and lies,  
 Were sent to dive at Granta's cells,  
 For truth in dialectic wells,  
 There duly bound for four years more  
 To ply the philosophic oar,  
 Points metaphysical to moot,  
 Chop logic, wrangle, and dispute ;  
 And now, by far the most ambitious  
 Of all the sons of Bergersdicius,  
 Present the law with all the knowledge  
 You gather'd both at school and college,  
 Still bent on adding to your store  
 The graces of a pleader's lore ;  
 And, better to improve your taste,  
 Are by your parents' fondness plac'd  
 Among the blest, the chosen few,  
 (Blest, if their happiness they knew,)  
 Who for three hundred guineas paid  
 To some great master of the trade,  
 Have, at his rooms, by *special* favour,  
 His leave to use their best endeavour  
 By drawing pleas, from nine till four,  
 To earn him twice three hundred more,  
 And, after dinner, may repair,  
 To *foresaid* rooms, and then and there  
 O o 3

Have *'foresaid* leave, from five to ten;  
To draw th' *aforesaid* pleas again."

The second and third lectures treat of the king and his prerogative, and of the great superiority of the common to the civil law. Having past through this preliminary matter, the poet makes this humorous invocation.

"And first bright Cynthius I'll *supæen*  
From hallow'd fount of Hippocrene,  
And *summons* from th' Aonian grove,  
The daughters of Olympian Jove;  
But if those sweet harmonious maids  
Disdain to quit their vocal shades,  
Nor Cynthius will his fount forsake,  
To gloomy Dis my pray'r I'll make, }  
And seek the Acherontic Lake  
Down to the hall of Erebus I'll go,  
And *move* some Dæmon in the courts below."

We have now the history of a suit at common law, till it arrives at the party's appearance, upon the *Capias Utlagatum*. Mr. Surrebutter then digresses to relate the memoirs of his own professional career: how, by the patronage of Buzzard, Hawk and Crow, Tom Thornback, Shark and Co. attornies all, and by courting the friendship of attornies, such as Joe Ferret, he has risen to his present enviable practice. The first part is then concluded by an address to the two great characters of the legal mythology of England.

"Then let us pray for writ of \*Pone,  
John Doe and Richard Roe his crony,  
Good men, and true, who never fail,  
The needy and distress'd to bail,  
Direct unseen the dire dispute,  
And pledge their names in ev'ry suit—  
Sure 'tis not all a vain delusion,  
Romance, and fable Rosierusian,  
That spirits do exist *without*,  
Haunt us, and watch our *whercabout*;  
Witness ye visionary pair,  
Ye floating forms that, light as air,  
Dwell in some special pleader's brain;  
Am I deceiv'd? or are ye twain  
The restless and perturbed sprites,  
The manes of departed knights,  
First of the post? whose fraud and lies,  
False pleas, false oaths, and *Alibis*,  
Raised ye in life above your peers,  
And launch'd ye towards the starry spheres,  
Then to those mansions 'unanneal'd,'

Where unrepented sins are seal'd:  
Say, wherefore, in your days of flesh  
Cut off, while yet your sins were fresh,  
Ye visit thus the realms of day,  
Shaking with fear our frames of clay;  
Still doom'd in penal ink to linger,  
And hover round a pleader's finger,  
Or on a writ impal'd, and wedg'd,  
For plaintiff's prosecution pledg'd,  
Aid and abet the purpos'd ill,  
And works of enmity fulfil,  
Still doom'd to hitch in declaration,  
And drive your ancient occupation?  
While thus to you I raise my voice,  
Methinks I see the ghosts rejoice  
Of lawyers erst in fiction bold,  
Levinz and Lutwyche, pleaders old;  
With writs and entries round him spread,  
See plodding Saunders rears his head.  
Lo! Ventris wakes! before mine eyes  
Brown, Lilly, and Bohun arise!  
Each in his parchment shroud appears,  
Some with their quills behind their ears,  
Flourish their velvet caps on high;  
Some wave their grizzel wigs, and cry  
Hail happy pair! the glory and the boast,  
The strength and bulwark of the legal host,  
Like Saul and Jonathan, in friendship tried,  
Pleasant ye lived, and undivided died!  
While pillories shall yawn, where erst ye  
stood,  
And brav'd the torrent of o'erwhelming mud,  
While gaming peers, and †dames of noble race,  
Shall strive to merit that exalted place;  
While righteous scriv'ners, who when Sun-  
day shines,  
Pore o'er their bills, and turn their noughts  
to nines,  
(Their unpaid bills, which long have learn'd  
to grow  
Faster than poplars on the banks of Po,)  
Freely shall lend their charitable aid,  
To young professors of the gambling trade;  
While writs shall last, and usury shall thrive,  
Your name, your honour, and your praise,  
shall live:  
Jailers shall smile, and with bumbailiffs raise  
Their iron voices to record your praise,  
Whom law united, nor the grave can sever,  
'All hail John Doe, and Richard Roe for  
ever!'"

The second part opens in an excellent strain of poetry.

"Then once more, O ye pleaders, and once  
more  
I come your pleas and pleadings to explore,  
Ye plodding clerks, with fingers never weary,  
And thro' the confines of your cloisters dreary,

\* "Pone.—The Pone is the writ of attachment before mentioned, it is so called from the words of the writ, *Pone per vadium, salvos plegios*, "Put by gage and safe pledges. A. B." John Doe and Richard Roe.

† "Dames.—The author in this passage seems to have contemplated the probability of certain characters of both sexes in the fashionable world, exhibiting their persons in the pillory for keeping public gaming tables. It is written in the true spirit of prophecy, and from a late declaration of a learned and noble judge, (no less distinguished for his impartial and independent spirit, than for his great zeal and earnestness for justice) the editor very sincerely hopes Mr. S.'s prophecy will be shortly fulfilled."

Following the process 'bove the Aonian steep,  
I have presum'd with inky thumbs to sweep  
The \*golden lyre; nor yet the more have  
†ceas'd

To greet †St. Michael the archangel's feast,  
Nor still sometimes upon §St. Martin's morn  
||Thro' Inner and thro' Middle Temple borne  
(While yet detained in that obscure resort)  
Cease I to roam thro' ¶Elm or Garden Court,  
Fig-tree, or Fountain Side, or learned shade  
Of King's-Bench Walks, by pleadings vocal  
made—

Thrice hallow'd shades! where slip-shod  
benchers muse,  
Attorneys haunt, and special pleaders cruise!"

The case of John-a-Gull and John-a-Gudgeon is then narrated through all its proceedings till the trial, when the counsel agree

" To draw  
A special case, and save the point in law,  
That so the battle, neither lost nor won,  
Continued, ended, and again begun,  
Might still survive, and other suits succeed,  
For future heroes of the gown to lead,  
And future bards in loftier verse to PLEAD."

And thus ends this very original and very humorous poem.

ART. XXVIII. *Glasgow: a Poem*, by JOHN MAYNE. 12mo. pp. 51.

AN outline of these verses was published in the Glasgow Magazine for December, 1783. Dr. Geddes praised it in his Epistle to the Society of Antiquaries of Scotland in 1792, and now in 1803, the author has revised, extended, and republished it.

The poem contains sixty of what may be called Scotch stanzas: of their merit a brief specimen may suffice.

"Hail Industry! thou richest gem  
That shines in virtue's diadem!  
While Indolence, wi' tatter'd hem,  
Around her knee,  
Sits, chitt'ring, like the wither'd stem  
O' some boss tree!

"To thee we owe the flocks o' sheep,  
That glad Benlomond's cloud-capt steep;  
The pregnant mines that yield yon heap  
O' massy coals;  
And a' the tenants o' the deep,  
Caught here in shoals!

\* "Golden Lyre.—Sir John Fortescue observes, 'that the university of the laws, (for so he calls the Inns of Court and Chancery) did not only study the laws to serve the courts of justice, but did further learn to dance and to sing, and to play on instruments on the Ferial days.' *Dugd. Orig. Juridic.* c. 55. *Fortescue de Laud. Leg. Ang.* c. 49. Mr. S. seems to have acted up to the spirit of the original institution. See the Memoirs of his professional career, part I. lect. 7."

† " ——— yet not the more  
Cease I to wander where the muses haunt,  
Clear spring or shady grove, &c. Milton."

‡ "St. Michael the archangel.—The law terms respectively derive their names from the festivals of the church, immediately preceding their commencement. Michaelmas Term originally commenced in eight days after the feast of St. Michael inclusive, *Octabus St. Michaelis*; but by the joint operation of two acts of parliament, and the alteration of style, it has in effect been procrastinated, so as not to commence before the 6th of November."

§ "Saint Martin.—*Crastino St. Martini*, 'the morrow of St. Martin,' the 12th day of November; formerly the fourth, now the second return day of Michaelmas term."

|| "Thro' inner and thro' middle darkness borne. Milton."

¶ "Elm, or Garden Court.—'The Inns of Court were placed out of the city and noise thereof, in the suburbs of London. *Scorsin parumper in civitatis suburbio.*' Fortescue. The several courts in the Temple, have been erected at different periods, upon the scite of the gardens and pleasure-grounds, belonging to the *Hostel* or *domus mansionalis* of the Temple, granted originally upon lease to Sir Julius Cæsar and others."

Enough notes are added to eke out the little volume to fifty pages: they are designed to illustrate the local allusions.

The re-appearance, after twenty years, of such a single solitary trifle as this, is somewhat curious; and when we observe

that its resurrection was made at Gloucester, it reminds us of the poor American fly, who was sent across the Atlantic in a bottle of Madeira, and revived by the sun-beams just to flutter and die in another country.

ART. XXIX. *Syr Reginalde; or, the Black Tower: a Romance of the Twelfth Century. With Tales, and other Poems.* By E. W. BRAYLEY and W. HERBERT. 12mo, pp. 170.

IN this worthless volume there is one extraordinary extract from Jackson's State of the Defunct, which, for its oddity, deserves to be re-extracted.

"An acquaintance of mine, an Oxford scholar, hath, to my certain knowledge and belief, cured many disorders, and laid the ghosts of many disturbed people, when no other person could do them. In a village where I lived, I do know that there was a great house, a mansion-house, haunted by a spirit that turned itself into a thousand shapes and forms, but generally came in the shape of a boiled scrag of mutton, and had baffled and defied the learned men of both universities; but this being told to my friend, who was a descendant and relation of the learned Friar Bacon, he undertook to lay it, and that even without his books; and it was done in this manner: he ordered some water to be put into a clean skillet, that was new, and had never been on the fire. When

the water boiled, he himself pulled off his hat and shoes, and then took seven turnips, which he pared with a small pen-knife that had been rubbed and whetted on a loadstone, and put them into the water. When they were boiled, he ordered some butter to be melted in a new glazed earthen pipkin, and then mashed the turnips in it. Just as this was finished, I myself saw the ghost, in the form of a boiled scrag of mutton, peep in at the window, which I gave him notice of, and he stuck his fork into him, and soused both him and the turnips into a pewter dish, and eat both up. And the house was ever after quiet and still. Now this I should not have believed, or thought true, but I stood by and saw the whole ceremony performed!!!"

This story has been indifferently versified. Having extracted the prose narrative, we have cut the jewel out of the head of the toad.

ART. XXX. *Rhapsodies* by W. H. IRELAND, *Author of the Shaksperian MSS. &c.* 8vo. pp. 200.

"AS on thy title page, poor little book!  
Full oft I cast a sad and pensive look;  
I shake my head, and pity thee;  
For I, alas! no brazen front possess,  
Nor do I ev'ry potent art profess,  
To send thee forth from censure free."

We must own that this title page leads us to a very different conclusion, and convinces us that the writer does possess a brazen front. "*Rhapsodies* by W. H. Ireland, *author of the Shaksperian MSS.*" We should willingly have suffered Mr. W. H. Ireland to pass by, even though he had not had the decency to hide himself under some *alias*, but when he chuses to remind us of a fraud, that evinced as total a want of all feeling of excellence, all reverence for genius, as it did of all common honesty, we cannot but observe that the face which forms the frontispiece to the volume would have appeared with more propriety in the pillory.

These rhapsodies are like all Mr. Ireland's former verses, a mixture of

old phraseology and modern barbarisms. A short specimen will suffice.

"Ah, willow, willow! droop with me,  
Still bend thy verdant head,  
For I have lost my own true love,  
Ah! wherefore is she fled?"

Sad willow tree,  
She's gone from me,  
So, willow, I will weep with thee.

"The silver stream which bathes thy root,  
Is emblem of my heart,  
It gently murmurs as it glides;  
I moan love's cruel smart.

So willow weep,  
When cold I sleep,  
And shade me in the grave full deep.

"For round thee still the breeze shall moan;  
Thou still wilt droop thine head,  
And, weeping, shade the friendly turf  
That shrouds me when I'm dead.

So, willow tree,  
I'll sit by thee,  
Thou soother of my misery."

The ballads are the best pieces, if best be an allowable epithet to pieces of which none are good.

ART. XXXI. *Society; a Poem, in Two Parts, with other Poems. By JAMES KENNEY. 8vo. pp. 172.*

FROM this volume we will quote what appear to us the best specimens of the author's performances, serious and comic.

“ Pass to the weary and deserted couch  
Of grey infirmity; the wreck of health,  
And strength, in nature's stealing progress  
borne

To piteous helplessness; ungrateful youth  
Its cheerful smiles denying him, his mind  
Dwells undiverted on the view of death  
Approaching with deliberate pace, as loth  
To seize a prey so fair, so long resisting.  
Bear with his childishness, and let him taste  
A social hour; thine ear awhile allow  
To his garrulity, his favourite tales  
Of earlier times, when he was young and gay.  
'Twill make him happy, stir his sluggish  
blood

To brisker circulation, and perhaps  
Defer the hour when it must flow no more.  
This is the only pleasure age can know;  
Nor surely less the pleasure to bestow it.  
Of late my worldly callings drew me oft  
Where such a man dozed out his eve of life.  
A man of bustle he had been, and chose  
Life's busiest cares: his active spirits yet  
Scarce ninety pilfering years had plundered  
out;

And thus his heavy fate more heavy seem'd.  
His energies decaying, he resigned  
His interests to the kindred next his heart,  
And sought repose. Sole on his interests bent,  
His kindred soon forgot their source. Neglect  
Repaid their benefactor, or when nigh,  
Contempt was smirking in each face, and sneers  
For errors of his fast-decaying sense  
And wasted memory. The old man felt  
His mortifying lot, and drooped apace.  
Yet when the zephyr breath'd, and the bright  
sun

Shone gaily forth, he hobbled to his door  
And eieery gazed upon the world: and oft  
Hestopt (for such acquaintance had he made)  
A passer by, to ask how fared his health  
And what the news. In ruder times he sat  
Unjoyous in an old arm-chair. When I ap-  
pear'd,

He rose ('twas all he could) and shook my  
hand.

He gladden'd at my sight, for well he knew  
I scorned him not, but had a willing ear  
For his discourse. He told me his complaints;  
Even that was comfort—told me how his  
friends

No more delighted in his sight; and thence,

ART. XXXII. *Poems from the Portuguese of Luis de Camoens; with Remarks on his Writings, Notes, &c. By Lord Viscount STRANGFORD. 8vo. pp. 160.*

THIS little volume exhibits a very singular instance of literary imposition. We use the word in no dishonour-

A natural step, reverted to his days  
Of youth and happiness: then tidings ask'd  
Of how the world went now. Unsparing I  
Freely the wished intelligence supplied,  
'Till smiles would play upon his wrinkled  
cheeks,

And all his cares, and all his woes seem'd  
nought.

And when the hour of separation came,  
He griev'd it was so soon; in warmest phrase  
Talk'd of what thanks he was in debt to me,  
That I had done him so much charity;  
Then with his palsied hand again shook mine,  
And bad me soon return.”

The following lines are part of a poem occasioned by a satire upon short people.

“ Complexions unseemly, or limb that of-  
fends;

Bandy legs and high shoulders, carbuncles,  
and wens,

Shall soon feel the force of my song.  
Your scare-crows and dowdies I'll cursedly  
maul,

All under-sized people, or people too tall,  
And people as broad as they are long.

“ All ye that have locks to disfigure the pate,  
Like carrots in hue, and as stubbornly straight,  
Such locks ye shall certainly rue.

And henceforth shall none with impunity  
wear

A nose of the bottle kind, nose that's too spare,  
Or nose you might make into two.

“ On an uncomely leg, or a mere stump of  
wood

Assuming the place where a leg has once  
stood,

Depend on't my wit sha'n't be stinting.  
No face with more mouth than should come  
to its share,

Or short of an eye any longer I'll bear,  
And let me catch any man squinting!

“ Next ailments of every description I'll scout:  
Colds, agues, and fevers, the gripes and the  
gout,

Shall get a satirical trimming.  
And dotage shall feel too the gall of my pen;  
For no good excuse can be for old men,  
And surely still less for old women.”

There is some merit in these passages, but Mr. Kenney is often feeble and often incorrect.

ble sense, and wish that one less equivocal could have been found to express our meaning. The trick which Lord Strang-

ford has practised is perfectly the reverse of that of which we have convicted Mr. Peter Bayley, junior. Instead of pilfering the reputation of another, Lord Strangford has been increasing it: he has imputed his own merits to Camoens.

"The late ingenious translator of the *Lusiad* has portrayed the character, and narrated the misfortunes of our poet, in a manner more honourable to his feelings as a man, than to his accuracy in point of biographical detail. It is with diffidence that the present writer essays to correct his errors; but as the real circumstances of the life of Camoens are mostly to be found in his own minor compositions, with which Mr. Mickle was unacquainted, he trusts that certain information will atone for his presumption."

It does not, however, appear that any inaccuracies have been detected in Mickle's account. Enough has been added to elucidate, in some degree, the character of the poet, and still more that of his present biographer.

"The family of Camoens was illustrious, and originally Spanish. They were long settled at Cadmon, a castle in Galicia, from which they probably derived their patronymic appellation. However, there are some who maintain that their name alluded to a certain wonderful bird,† whose mischievous sagacity discovered and punished the smallest deviation from conjugal fidelity. A lady of the house of Cadmon, whose conduct had been rather indiscreet, demanded to be tried by this extraordinary judge. Her innocence was proved, and in gratitude to the being who had restored him to matrimonial felicity, the contented husband adopted his name."

Of Vasco Pires de Camoens, Alcayde of Alamquer, the ancestor of the poet, some anecdotes might have been found in history, little to his honour. He is accused of having accepted a commission to assassinate the master of Ovis, afterwards Joam I. at Atouguia, and it is certain, that after he had capitulated with that prince upon honourable terms, he engaged in a conspiracy against his life; in resentment, because certain favours had been refused to his solicitations.

Lord Strangford having stated that

"\* The *Camao*. Our poet himself gives a somewhat different account of the matter. (*Quintil. a huma dama*, v. 190.) Formerly, every well regulated family in Spain retained one of these terrible attendants. The infidelity of its mistress was the only circumstance which could deprive it of life. Should her guilt have been extended to any degree beyond a wish, the faithful bird immediately betrayed it, by expiring at the feet of its injured lord. It soon was difficult to find a *Camao* that had lived in the same family during three generations; and at length the species became entirely extinct!

"This odious distrust of female honour is ever characteristic of a barbarous age. The *Camao* of Spain, and the *Mumbo* of Africa, are expedients indicative of equal refinement."

the poet was born at Lisbon, observes that the place of his nativity is ascertained by his frequent application of the epithet *paternal* to the Tagus. There is no reason to doubt the fact, because it is certain that his parents were Lisboners; but no such inference can be deduced from his calling the Tagus *paternal*. The epithet would have been equally applicable had he been born at Santarem, Salvaterra, Abrantes, or any village upon the course of the river.

"During the period which he passed at the university, he was an utter stranger to that passion, with which he afterwards became so intimately acquainted. It is even recorded, that while the manly graces of his person inspired many of the better sex with admiration, he treated his fair captives with disdain, or at most, as the mere objects of temporary transport.

"But the scene was soon to be changed, and on his arrival at Lisbon, he was destined to feel the full vengeance of that god whose power he had contemned. Love is very nearly allied to devotion, and it was in the exercise of the latter that Camoens was introduced to the knowledge of the former. In the church of 'Christ's Wounds,' at Lisbon, on the 11th of April, 1542, he first beheld Dona Caterina de Ataide, the object of his purest and earliest attachment. The churches of Spain and Portugal, says Scarron, are the very cradles of intrigue; and it was not long before Camoens enjoyed an opportunity of declaring his affection, with all the romantic ardour of eighteen, and of a poet.

"But, in those days, love was a state of no trifling probation, and ladies then unconsciously expected a period of almost chivalrous servitude, which, happily for gentlemen, is no longer required. The punctilious severity of his mistress formed the subject of our poet's most tender complaints; for, though her heart had secretly decided in his favour, still Portuguese delicacy suppressed all avowal of her passion. After many months of adoration, when he humbly besought a ringlet of her hair, she was so far softened by his entreaties, as to make a compromise with prudery, and bestow one of the silken fillets which encircled her head! These anecdotes must not be despised, for they mark the temper of the times.

"The peculiar situation of Dona Caterina

(that of one of the queen's ladies) imposed an uniform restraint on her lover, which soon became intolerable. Like another Ovid, he violated the sanctity of the royal precincts, and was in consequence banished from the court. With the precise nature of his offence we are unacquainted, but it too probably arose from a breach of discretion, the first and noblest amongst the laws of gallantry. Whatsoever it might have been, it furnished a happy pretext to the lady's relations, for terminating an intercourse which worldly considerations rendered, on her part, of the highest imprudence. But Love prepared consolation for his votary, where least he expected it. On the morning of his departure, his mistress relented from her wonted severity, and confessed the secret of her long-concealed affection. The sighs of grief were soon lost in those of mutual delight, and the hour of parting was, perhaps, the sweetest of our poet's existence. Thus comforted, he removed to Santarem (the scene of his banishment) but speedily returned to Lisbon, again tasted of transport, was a second time detected, and a second time driven into exile. To such a spirit as Camoens, the inactivity of this situation must have proved insupportable; the voice of Love whispered a secret reproach, and inspired him with the glorious resolution of conquering the obstacles which fortune had placed between him and felicity. He accordingly sought and obtained permission to accompany King John III. in an expedition then concerted against the moors in Africa. Here, whilst bravely fighting under the command of a near relation, he was deprived of his right eye, by some splinters from the deck of the vessel in which he was stationed. Many of his most pathetic compositions were written during this campaign, and the toils of a martial life were sweetened by the recollection of her for whom they were endured.

"His heroic conduct in many engagements, at length purchased his recall to court. He hastened home, fraught with the most tender anticipations, and found—what must have been his feelings?—that his mistress was no more!

"There can scarcely be conceived a more interesting theme for the visions of romance, than the death of this young and amiable being. The circumstances of her fate are peculiarly favourable to the exercise of conjecture. She loved, she was beloved, yet unfortunate in her attachment, she was torn from the world at the early age of twenty; and we cannot but adorn her grave with some of the wildest flowers which fancy produces."

To this event the poet often alludes. One sonnet upon the subject is thus paraphrased in the present volume.

"When from my heart the hand of Fortune  
tore

Those smiling hopes that cheer'd mine  
earlier day,

Would that she too had kindly borne away  
The sweetly sad remembrances of yore!

I should not then, as now, in tears deplore

My buried bliss, and comfort's fast decay;

—For Love (on whom my vain dependance  
lay)

Still ling'ring on delights that live no more,

Kills all my peace—whene'er the tyrant sees.

My spirit taste a little hour of ease!

Fell star of fate! thou never canst employ

A torment teeming with severer smart,

\*Than that which Memory pours upon the  
heart,

While clinging round the sepulchre of joy!"

The character of Lord Strangford's translations, when any originals actually exist, we shall elucidate hereafter. In this place we will insert another sonnet, omitted by the noble writer, in which nothing has been added to the ideas, though something has certainly been lost in the expression, as must inevitably be the case where the beauty of the original consists in the sweet and simple expression of a sweet and simple feeling.

Meek spirit, who so early didst depart,  
Thou art at rest in heaven! I linger here  
And feed the lonely anguish of my heart,  
Thinking of all that made existence dear.  
All lost! if in the happy world above,  
Remembrance of this mortal life endure,  
Thou wilt not there forget the perfect love  
Which still thou seest in me, O spirit pure!  
And if the irremediable grief,  
The woe which never hopes on earth relief,  
May merit aught of thee, prefer thy prayer  
To God, who took thee early to his rest,  
That it may please him soon amid the blest  
To summon me, dear maid! to meet thee  
there.

To most imaginations Camoens will never appear so interesting as when he is bewailing his first love. It is in these moments that he is most truly a poet. Shall we be excused for inserting another specimen of his natural manner?

Delightful fields, and thickets gay and green,  
Ye woods that shadow o'er the mountain's  
scene,

Ye rocks grotesque, ye fountains cold and  
clear,

Who, as ye murmur down the sparkling steep  
Your concord with the waving woodlands  
keep,

And send sweet music to the traveller's ear.  
O lovely scenes! unsatisfied my sight

Dwells on your beauties now, your ancient  
shade,

Clear fountains, gleaming through the open-  
ing glade,

Rocks, thickets, fields, and all your green  
delight.

Me, other than I was, ye now behold,  
I gaze around, and tears suffuse my eyes;  
Ye tell me, lovely scenes, of days of old,  
And thoughts of former happiness arise.

But it is the humour of Lord Strangford to represent Camoens as very amorous, and very successful in his amours.

"There are some who assert that Camoens quitted Lisbon in consequence of a discovered intrigue with the beautiful wife of a Portuguese gentleman. Perhaps this story may not be wholly unfounded. It is improbable that he remained long constant to the memory of a departed mistress, when living beauty was ready to supply her place. His was not a heart that could safely defy temptation, although the barbarous ingenuity of some commentators would make us believe, that all his amours were purely platonic, and that he was ignorant of the passion in every other respect. Happily for himself, the case was different, and his works record that he more than once indulged in the little wanderings of amatory frolic."

"Gallantry was the leading trait in the disposition of Camoens. His amours were various and successful. Woman was to him as a ministering angel, and for the little joy which he tasted in life, he was indebted to her. The magic of female charms forms his favourite theme, and while he paints the allurements of the sex with the glowing pencil of an enthusiast, he seems transported into that heaven which he describes. Nor did this passion ever desert him; even in his last days, he feelingly regretted the raptures of youth, and lingered with delight on the remembrances of love. A cavalier named Ruy de Camiera, having called upon our author to finish a poetical version of the seven penitential psalms, raising his head from his miserable pallet, and pointing to his faithful slave, he exclaimed, 'Alas, when I was a poet, I was young, and happy, and blest with the love of ladies, but now, I am a forlorn deserted wretch:—See—there stands my poor Antonio, vainly supplicating four-pence to purchase a little coals—I have them not to give him!' The cavalier, as Sousa quaintly relates, closed his heart and his purse, and quitted the room. Such were the grandees of Portugal!"

Having, therefore, assigned the character of Camoens, Lord Strangford writes poems in the *pure* manner of Little Moore, and prints them as translations from the Portuguese.

"Thou hast an eye of tender blue,  
And thou hast locks of Daphne's hue,  
And cheeks that shame the morning's break,  
And lips that might for redness make  
Roses seem pale beside them;  
But whether soft or sweet as they,  
Lady! alas, I cannot say,  
For I have never tried them.

"Yet, thus created for delight,  
Lady! thou art not lovely quite,  
For dost thou not this maxim know,  
That Prudery is Beauty's foe,  
A stain that mars a jewel!  
And e'en that woman's angel face,  
Loses a portion of its grace,  
If woman's heart be cruel!

"Love is a sweet and blooming boy,  
Yet glowing with the blush of joy,  
And (still in youth's delicious prime)  
Tho' ag'd as patriarchal time,  
The withering god despises:  
Lady! would'st thou for ever be  
As fair, and young, and fresh as he—  
Do all that Love advises!"

Some of the comment of Faria, says his Lordship, has been introduced into the translation of this poem, and certain very necessary liberties taken with the original. The original poem to which he refers—

Naõ sei quem assella  
Vossa formosura,  
Que quem he tao dura  
Naõ pode ser bella, &c.

lies open before us, and the necessary liberty which has been taken is to write a new one, differing totally in every part and point. We have not the edition of Faria y Sousa to look for his comment, nor, poet as old Manuel was, are we disposed to believe that the present ingenious writer has been more indebted to the note than to the text.

The original referred to for the following Madrigal consists of only three lines, being the *mote* or text which Camoens was to amplify.

"The simple youth who trusts the fair,  
Or on their plighted truth relies,  
Might learn how vain such follies were,  
By looking in his lady's eyes,  
And catch a hint, if timely wise,  
From those dumb children, cradled there!  
'Poor fool! thy wayward feats forbear,'  
(Those mute advisers seem to say)  
'And hence with sighs, and tears, and care,  
'For thou but fling'st thy heart away,  
'To make a toy—for babies' play."

He who trusts in eyes, says the original, may see in their babies that babies have no faith.

Quem se confia em huns olhos,  
Nas meninas delles ve,  
Que meninas naõ tem fe.

Lord Strangford might have succeeded in his stratagem, if he had not affixed the line of Portuguese to each of his poems; we should then in vain have

sought for the originals, though no doubt whatever would have existed in our own minds. In fact, he who is any ways conversant with Portuguese literature, could not for a moment believe that any poems of this character, we may almost add, of this merit, exist in the language. We will not say that Camoens has never written so well, for what beauties he has are of a higher class, of a purer and better feeling: but he has never written so fancifully, and where any hint of these Canzonets and Madrigals does exist in his verses, it has always been most materially improved. We will adduce one instance more. What follows is the literal and naked translation of the 34th sonnet.

When the clouded sun is showing to the world a calm and doubtful light, I go along a delightful meadow thinking of my fair enemy. Here I see her concerting her tresses, there with her face so fair upon her hand, here cheerfully talking, there thoughtful, now standing still, now walking; here she is seated, there she sees me, raising up those eyes, so careless! here somewhat moved, there secure; here she is sorrowful, there she laughs, and in fine in these weary thoughts this vain life perpetually passes away.

When such a poem as this is referred to as the original of the coming canzonet, will not the reader wonder why Lord Strangford, like a true adept, should wish to conceal his power of transmuting base metals into gold?

"When day has smil'd a soft farewell,  
And night-drops bathe each shutting bell,  
And shadows sail along the green,  
And birds are still, and winds serene,  
I wander silently.

"And while my lone step prints the dew,  
Dear are the dreams that bless my view,  
To Memory's eye the maid appears,  
For whom have sprung my sweetest tears,  
So oft, so tenderly:

"I see her, as with graceful care  
She binds her braids of sunny hair;  
I feel her harp's melodious thrill  
Strike to my heart—and thence be still  
Re-echo'd faithfully:

"I meet her mild and quiet eye,  
Drink the warm spirit of her sigh,  
See young Love beating in her breast,  
And wish to mine it's pulses prest,  
God knows how fervently!

"Such are my hours of dear delight,  
And morn but makes me long for night,  
And think how swift the minutes flew,  
When last amongst the dropping dew,  
I wander'd silently."

As it is an allowable stratagem in war to hoist false colours, we have no objection to see good verses of Irish manufacture smuggled in under the Portuguese flag, but when his Lordship censures the very conduct which he has himself adopted, without acknowledging what he has done, he carries the deception too far.

"The translator begs to observe, that for the most part, he has closely copied his author, but that where circumstances demanded, he has not hesitated to be

"True to his sense—but truer to his fame."

"Literal versions are justly deemed absurd; yet, on the other hand, too great an extension of the Horatian precept, '*Nec verbum verbo*,' has been the bane of many. It has proved to the world of translation, what the phrase 'liberality of sentiment' has been to that of morals—the worst of errors have originated from both."

Twenty sonnets have been selected from three hundred and one of the original; for each of these a prototype exists, but the resemblance is never striking, partly because Lord Strangford cannot submit to the trammels of translation, partly because he has adopted the Italian structure of the sonnet, in opposition as it appears to his own better judgment.

"Amongst other reasons why the legitimate Italian sonnet be not suitable to the genius of the English language, the following is not the least forcible. In those languages which are more immediately formed on the Latin, there is a frequent similarity of termination, which greatly facilitates the use of rhyme. Accordingly, the Italian, Spanish, and Portuguese languages (which originate from that source) have adopted the licence of polysyllabic rhyme, and with it the sonnet. The former was a liberty which they could scarcely have avoided, but which has never been sanctioned by the '*Musæ severiores*' of England. To us, therefore, the mechanical arrangement of a sonnet becomes a matter of peculiar difficulty."

The point is fairly stated here, but Lord Strangford has neglected to draw the legitimate inference. This has been well done by Mr. Coleridge. "A sameness," he says, "in the final sound of its words is the great and grievous defect of the Italian language. That rule, therefore, which the Italians have established, of exactly *four* different sounds in the sonnet, seems to have arisen from their wish to have *as many*; not from any dread of finding *more*. But surely it is ridiculous to make the *defect* of a foreign

language a reason for our not availing ourselves of one of the marked excellencies of our own. 'The sonnet,' says Preston, 'will ever be cultivated by those who write on tender pathetic subjects. It is peculiarly adapted to the state of a man violently agitated by a real passion, and wanting composure and vigour of mind to methodize his thought. It is fitter to express a momentary burst of passion, &c.' Now, if there be one species of composition more difficult and artificial than another, it is an English sonnet on the Italian model. Adapted to the agitations of a real passion! Express momentary bursts of feeling in it! I should sooner expect to write pathetic axes, or pour forth extempore eggs and altars! But the best confutation of such idle rules is to be found in the sonnets of those who have observed them, in their inverted sentences, their quaint phrases, and incongruous mixture of obsolete and Spenserian words: and when at length the thing is tooled and hammered into fit shape, it is in general racked and tortured prose, rather than any thing resembling poetry." In proof of the justice of this opinion, the reader may be referred to Miss Seward's 'legitimate' sonnet to Mr. Carey, and Mr. Capel Loft's to the young poet of Nottingham, Mr. White, whose productions we have noticed with so much pleasure; and on the other hand, to Bowles and to Charlotte Smith, which last excellent writer must be regarded as the reviver of the sonnet in England.

Lord Strangford has therefore been constrained, by the unnatural metre which he has adopted, to deviate from the sense of the original. That it is possible to render the Italian sonnet, or the Italian ottava rima, into a corresponding metre, without adding to, or detracting from the original, and even without altering or omitting an epithet, and this too in verses which, in the natural flow and life of language vie with those which they represent, we have been convinced, by inspecting such efforts of consummate skill, which the translator of Filangieri has executed. But without this demonstration we should have conceived it impossible, and to effect it requires a combination of talents, which can so rarely occur, that, perhaps, they ought not to be sacrificed to the task of translation. The present translator, however, has deviated from

his original, by choice, as well as by necessity. It is evident that he has thought Camoens too low, and has therefore raised him upon stilts. Let the following improvement be compared with a plain and unadorned version of the Portuguese.

"Lives there a wretch, who would profanely dare

On Love bestow a tyrant's barbarous name,  
And foe to every soft delight, proclaim  
His service, slavery; its wages, care?

For ever may he prove it so, nor e'er

Feel the dear transports of that generous flame;

For him nor maiden smile, nor melting dame  
The silent couch of midnight bliss prepare!

For much he wrongs the gentlest, best of pow'rs,

Whose very pangs can charm, and torments please,

Whom long I've known, and in whose angriest hours

Such rapture found, as would I not forego;

No—not forego, for all the dead, cold ease

Which dull indifference could e'er bestow!"

Is there who says that love is like the wind

Fickle, ungrateful, full of fraud and lies?

That wretched man hath sure deserved to find  
From Love all vengeance and all cruelties!

Gentle, benignant, merciful is Love;

Believe not him who says love is not so!

Let the vile slanderer live by men below

Despised, and hated by the gods above.

If ever Love work'd misery, in me

May man the sum of all his evils see,

Me whom he seems delighted to oppress;

The utmost rigour of his power I prove,

Yet would not change the miseries of love

For all the world beside calls happiness.

Camoens is never so amorous as his translator. There may be as much fire, but there is less flame; as much passion, but more modesty. The Portuguese is often flat, sometimes puerile, but rarely turgid; and where his subject is happy, never writer has poured forth a sweeter flow of natural and recognizable feelings. The two following sonnets, plainly versified, will exemplify his best manner, for his sonnets are beyond comparison his best productions.

Waters of Tejo, gentle stream, that flow  
Thro' these fair meads, refreshing as ye go  
Herbage and flowers, and flocks, and with delight

Soothing the nymphs and shepherds on your shore,

I know not, gentle river, when my sight

Shall linger on your pleasant waters more.

And now I turn me from you, sad at heart,

Hopeless that fate my future lot will bless;

That evil fate which bids me now depart,

Converts remembered joy to wretchedness.

The thought of you dear waters oft will rise;  
And memory oft will see you in her dreams,  
When I on other airs shall breathe my sighs,  
And drop far off my tears in other streams.

\* \* \*

When I behold you lady! when my eyes  
Dwell on the deep enjoyment of your sight,  
I give my spirit to that one delight,  
And earth appears to me a Paradise.  
And when I hear you speak, and see you  
smile,  
Full, satisfied, absorbed, my centered mind  
Deems all the world's vain hopes and joys  
the while

As empty as the unsubstantial wind:  
Lady I feel your charms, yet dare not raise  
To that high theme, the unequal song of praise.  
A power for that to language was not given,  
Nor marvel I, when I those beauties view,  
Lady, that he whose power created you,  
Could form the stars, and yonder glorious  
heaven.

We may perhaps have trespassed upon the strict purport of a review in intruding these translations; but it was our wish to exemplify the real characteristic of a poet whose merits are, of all others, the most unduly and disproportionately rated. The English *Lusiad* was certainly the most unfaithful translation in the world, till the present volume appeared. Mr. D'Israeli may chronicle it as one of the curiosities of literature, that two Englishmen, of considerable genius, should have employed themselves at different times in interpolating a Portuguese poet. Passages of ten, twenty, thirty lines are continually inserted by Mickle, and the loose texture of the original is compressed, and thereby strengthened to make room for these improvements: in one place he has introduced above three hundred lines, to the material advantage of the story. The fact is, that Mickle translated the *Lusiad* as a speculation, thinking that the subject would excite a national interest, and procure him patronage. When he came to examine the poem, he found it uninteresting, tedious, feeble, and, in fact, worthless to any but a Portuguese, for we shall see that its merits in point of language, which are very frail, are not to be appreciated by a foreigner. That such was his own conviction is evident, by the liberties which he has taken, and we entertain no doubt whatever, that this opinion he expressed to his confidential friends, as may possibly appear by his letters, if any such be in existence. Still the subject was popular, and the poem had ob-

tained some celebrity; *omne ignotum pro magnifico*. Mickle profited by this; he was a man of very considerable genius, and his particular excellence lay in description, of which the *Lusiad* was barren and bald. He therefore added, altered, and embellished without scruple, and without scruple praised his own interpolations with the freedom of a translator. The English *Lusiad* is, therefore, a *refaccimiento* in another language rather than a translation. It is still heavy, from the inherent and unconquerable stupidity of the story; and offensive, by its monstrous and gross machinery: but Mickle has mingled so much ardent spirit with the meagre beverage, that it will keep; and the industry with which he has prefaced and elucidated it, cannot be too much praised.

It is not so easy to understand why Lord Strangford should chuse to sail under convoy of Camoens. Poor Mickle was of a calculating nation; and he knew also, that if original merit was powerful enough to attract attention, it infallibly excited envy also: the humbler claim was, therefore, to him the more profitable. But the rank of the present writer would have secured him some notice and some approbation. *Absit invidia dicto*, his talents entitle him to both.

We now return to the preface, which strictly regards Camoens.

“ Our author, like many others, has suffered much from the cruel kindness of editors and commentators. After the first publication of his “*Rimas*,” there appeared a number of spurious compositions, which, for some time, were attributed to him. Amongst these was a poem to which notice is due, not on account of its own merit, but from regard to the reputation of Camoens. It is called ‘The Creation and Composition of Man,’ and is a strange medley of anatomy, metaphysics, and school divinity. In subject, and occasionally in execution, it strikingly resembles the purple *Island of Phineas Fletcher*; and, like it, is a curious example of tortured ingenuity. One instance shall suffice. Man is typified under the symbol of a tower. The mouth is the gateway, and the teeth are described as two and thirty millers, clothed in white, and placed as guards on either side of the porch. His metaphor is more satirically just, when he represents the tongue as a female, old and experienced, whose office was to regulate and assist the efforts of the thirty-two grinders aforesaid, all young men of indispensable utility and extraordinary powers!

' *Duros e rijos, trinta e dous molciros*  
' *De grande força, e útil exerciço !*'

He must possess no little credulity, who would attribute such a work to the author of the *Lusiad* !"

This poem was attributed to Camoens by the printer, as Britain's *Ida* was in like manner, and with equal absurdity, ascribed to Spenser. But though the *Creaçam e Composiçam do Homem* was printed upon this erroneous supposition, the error was discovered before it was published, and acknowledged in the volume which contained it, so that, in fact, the poem has never past as the production of Camoens. The oddity of the allegory alone would be no proof that it was not his work. The two-and-thirty millers may be paralleled by as many porters in one of the most wonderful and delightful poems that ever has been, or ever will be, produced by human genius.

" And round about the porch on every syde  
Twice sixteen warders sat, all armed bright  
In glistering steel and strongly fortifyde ;  
Tall yeomen seemed they, and of great might,  
And were enraunged ready still for fight."

*Fairy Queene, b. ii. c. 9.*

These grinders, indeed, are in keeping ; nor would they be disapproved by any new Aristotle who should lay down the rules for allegoric composition, as deduced from good old John Bunyan, the Homer of his class. There are, indeed, two miserable absurdities in this poem :—the castle is built upon two moving pedestals—and is moreover brought to-bed of another castle !

" There is also another poem which bears his name, but is certainly the production of a different hand. The martyrdom of St. Ursula and the eleven thousand virgins forms its subject. But it is not probable that the persevering chastity of these unhappy ladies could ever have found favour in the sight of our amorous bard. It is still less likely that he would have celebrated it in his song."

This is a new and whimsical mode of criticism. Lord Strangford discovers that Camoens was of a very amorous disposition ; and, therefore, as chastity was not his favourite virtue, he could not have written this poem in honour of our eleven thousand virgins ! This reminds us of Mr. Godwin, who draws a character of John of Gaunt, in contradiction to all the contemporary historians, and then makes his engraver

" very happily" improve the portrait of John of Gaunt, to make it suit his new historical character ! The fact is, that though this poem is one of the many which was stolen by Diogo Bernardes (a poet whom Lord Strangford strangely undervalues), it has been incontrovertibly proved to be the work of Camoens.

" The genius of Camoens was almost universal. Like the great father of English poetry, there is scarcely any species of writing, from the epigram to the epic, which he has not attempted, and, like him, he has succeeded in all. It is not the province of the translator to offer any remarks on the *Lusiad*. That task has already been ably performed. Of his minor productions, the general characteristic is ease ; not the studied carelessness of modern refinement, but the graceful and charming simplicity of a Grecian muse. When he wrote, the Italian model was in fashion ; and as Camoens was intimately acquainted with that language, he too frequently sacrificed his better judgment to the vitiated opinion of the public. Hence the extravagant hyperboles and laborious allusions, which he has sometimes, though rarely, employed. But his own taste was formed on purer principles. He had studied and admired the poems of Provence. He had wandered through those vast catacombs of buried genius, and treasure rewarded his search. Even the humble knowledge of Provençal literature, which the present writer possesses, has enabled him to discover many passages which the Portuguese poet has rendered his own. But we must be careful not to defraud Camoens of the merit of originality. To that character he has, perhaps, a juster claim than any of the moderns, Dante alone excepted. The same remark which Landino applies to that poet, may be referred to him. He was the first who wrote with elegance in his native tongue. The language of Rome, and even of Greece, had been refined by antecedent authors, before the appearance of Virgil or of Homer, but Camoens was at once the polisher, and in some degree the creator of his own. How deplorable must have been its state, when it naturalized two thousand new words, on the bare authority of a single man ! Monsieur Ménage was wont to pique himself on having introduced into French the term "*vénuste* ;" yet all his influence could never make it current, nor indeed did it long survive its illustrious fabricator."

Lord Strangford quotes French authority for the last assertion—bad authority in any point of literature, and particularly of Portuguese literature—as witness Voltaire's criticism upon the *Lusiad* ! an instance of shameless impudence so characteristic of the individual and the nation, that it never should

be forgotten. Two thousand words would make a large proportion of the poet's vocabulary. That Camoens did much in improving the language is certain. To nouns, which before were used only in the plural, he gave a singular: he changed the termination of proper names for the sake of euphony: he lengthened some words; abbreviated others; revived some which had become obsolete; and made many from the Latin. Sometimes, says Antonio das Neves, he abused this liberty, and coined words almost macaronic. But, in general, his innovations were so analogous to the nature of the language, that occasioning no difficulty, and exciting no surprize, they were quietly naturalized.

Camoens is, therefore, regarded as the writer who gave the last improvement to his native language. How far he actually improved it, it is not possible that a foreigner can judge; but this is his great and main merit. His poetical character can neither be estimated by the present volume, nor by the English *Lusiad*: the merits of the one must be assigned to Mickle, and the other to Lord Strangford. Whether this species of deception is to be justified we will not say; but, as far as regards our individual gratification, being acquainted with the Portuguese poet, we were well pleased to discover originals where we only expected translations.

ART. XXXIII. *Original Poems on Miscellaneous Subjects. By the late Rev. JOHN EDMONDS, Jun. A. M. late Fellow of Catherine Hall, Cambridge, Rector of Skinand, in the Diocese of Lincoln, and Vicar of Alrewas, in the County of Stafford. Written during his Minority (from 14 to 18 Years of Age). 8vo. pp. 28.*

THESE effusions of early genius are modestly introduced by the following advertisement:

"Parental affection, perhaps, has regarded the following juvenile productions, of a much-loved son, with too great a degree of partiality. From those who bear the honoured name of parent, she has nothing to fear in thus giving to the world a collection of verses, which the writer never finished for the public eye; and she hopes to disarm the criticism of such readers as do not come within that class, by referring them to the early period of the writer's life when they were composed.

Sept. 5, 1803. "M. EDMONDS."

Are we to infer, that after he had passed his eighteenth year, Mr. Edmonds turned his back on the muses? That they were not coy to his infant wooings, the following lines, written on the death of a school-fellow, John Griffiths, will sufficiently prove. This elegy is written both in Latin and English; we give the latter:

"O, gloomy Death, why has thine iron dart  
This virtuous youth from his companions  
torn;  
Hung his sad home with black, each kindred  
heart  
With anguish wrung, and bade a mother  
mourn?"

ART. XXXIV. *Narrative Poems. By J. D'ISRAELI. 4vo. pp. 55.*

MR. D'Israeli is well known to the public, as a pleasing and successful  
ANN. REV. VOL. II.

"O say, thou demon, does not with'ring age  
Fill the infernal seats with wonted prey?  
Why has thine hand, with undistinguish'd  
rage,

Before it blossom'd, torn the bud away?

"Yet vain thy trophies! impotent thy power  
To quell its vigour—from the earth shall rise,  
With renovated bloom, th' ethereal flower,  
And with its grateful fragrance fill the skies.

"Oh, blest inhabitant of highest heaven!  
(For highest heav'n the just shall ever gain)  
Regard the verse, by pious friendship given,  
Whose measures of thy mournful fate complain.

"Regard a mother's grief, her sighs attend;  
Mark her wan cheeks, what bitter drops be-  
dew;

And eyes that wept so late the husband's end,  
How soon for thee, the son, these streams  
renew!

"Accept this tribute to thy much-lov'd  
shade,

My breast no weak dissembled sorrows swell:  
If these can please thee, lo! these rites are  
paid—

Farewell, my friend, for evermore farewell!"

Two or three of the pieces have a good deal of humour, and there is altogether an indication of so much poetic talent, that we regret that Mr. Edmonds did not leave some specimens of his powers in maturer years.

writer. His *Curiosities of Literature* have been the amusement of every  
P p

lounge: his Domestic Anecdotes of the French Nation excited a higher interest, and, while they amused the idler, afforded ample matter of reflection to the philosopher; his Vaurien has produced a swarm of worthless imitations: but it would be as absurd to blame Mr. D'Israeli for the trash of Miss Hamilton and Mr. G. Walker, &c. as to accuse the Nile, because of the reptiles that breed in its slime. His romances displayed fancy and feeling.

Three stories are contained in the present elegant volume. The Carder and the Carrier, which is the first, is so absurd in story, that no talents could make it interesting. The girl sportively rubs her lover's teeth with what she mistakes for a leaf of sage, but it proves to be a poisonous plant, and instantly kills him. She is arrested as a murderer, and led by a crowd, with the judge, to the place where the body lies: there she tells her tale, and then

“ Bowing her head, the plant of poisonous  
breath

She sucked, and blest the vegetable death.  
Quick thro' her veins the flying poisons dart,  
And one cold tremor chills her beating  
heart.

She kneels, and winds her arms round Pas-  
quil's breast,

There, as 'twere life to touch, she creeps to  
rest;

On him once more her opening eyes she raised,  
The light died on them as she fondly gazed;  
With quick short breath, catching at life, she  
tried

To kiss his lips, and as she kissed, she died.

“ O did the Muse but know the learned name  
To blast that fair-deceiving plant to Fame!  
O never may it drink the golden light  
With laughing tints—the garden's hypocrite!  
Ye colder botanists the plant describe,  
Gaze on the spectre-form, and class the tribe!  
But ye sweet-souled, whose pensive bosoms  
glow

With the soft images of amorous woe,  
From ye the Muse one tender tear would  
claim;

One shudder, at the plant without a name!”

We know not whether this tale be original, or versified from some foreign author.

The second is the well-known story of Cominge. The third a tale addressed to a Sybarite. Anasillis places a statue of himself made by Praxiteles in the character of Love, in Aglaia's bower, that she may learn love from adoration. The scheme succeeds—

“ All day entranced she sits; her “ sweet-  
liest” care

To look and sigh—and evening met her there.  
And oft she talked, she vowed, complained,  
carest,

Sighed on its face, and leant upon its breast.

“ Meanwhile protraction charms th' ena-  
moured boy;

To raise enjoyment lingers to enjoy.  
Patient in pleasure forged th' enduring chain;  
Who wins too easy wins to lose again.  
He takes the statue from the maiden's bower,  
To try if absence breaks its magic power;  
Since female vows in absence will decay;  
Slaves in an hour are constant for a day.

“ But not Aglaia thus—her heart sincere  
By love created claimed th' eternal year.  
She comes—'tis gone!—what dear enchant-  
ment stole

In the soft moanings of her love-worn soul.  
From her cold fingers fell each dewy flower;  
She shuddered, in the solitary bower.  
Her fond regrets, her beauty veiled in tears  
Now touched Anasillis—the youth appears  
With morn's first beam; like love the youth  
is drest;

Stretched in the bower he seems by sleep op-  
prest.

She comes—she starts! she gazes, trembles  
near—

“Tis Love! (she hardly breathes) the god is  
here!

Stept from his pedestal, a breathing form!  
Marble so loved relents, and like myself is  
warm.

Ah, not in vain th' ideal form I loved,  
Not vain the silent tears, a picture moved!—  
Stilly she trod, and all unbreathing gazed,  
Then tremulously kissed the hand she raised.  
The virgin kiss imparts the finest flame,  
The sweet sensation trembling thro' her frame;  
Nor quits the hand, but half delirious takes  
To press it to her heart—and Love awakes!

“ She kneels—can anger in that softness  
dwell?

Once having seen thee, must I bid farewell?  
Is love a crime? then half the guilt be thine,  
Blame thy seducing powers, thine eyes divine!  
Think ere thou shakest me from thy gentle  
arm,

How small the triumph o'er a virgin form!  
Anasillis in fond entrancement hears,  
Bends o'er the nymph, and kissed away her  
fears.

Then thus—an innocent deceit forgive;  
Smile on thy picture and the form shall live.

“ She then, ‘ unskilled, how features are  
abroad,’

First of thy race, to me thou art a god!  
How oft when idle fancy idle roved  
For uncreated shapes—'twas thee I loved!  
And if I may not mate with thee, I die;  
Oh, be not twice a statue to my sigh!

“ With meek surrender, and a timorous glance,  
The boy, each soft retiring grace enchants;

While to his bosom all the virgin stole;  
Kissed with adoring lips, and gazed his soul.  
Then triumphed Love, with nature for his  
dower,  
And Time with silvery feathers winged the  
hour.

"To thee young Sybarite! the tale we give,  
If once thou sighest for graces that will live,  
To one dear nymph thy spotless youth resign,  
And love's eternity shall all be thine!

ART. XXXV. *Beneficence; or, Verses addressed to the Patrons of the Society for bettering the Condition of the Poor.* By F. A. WARREN, B. D. 4to. pp. 35.

"THE author has been desirous of giving to his verses a simple domestic manner; if they please, it will be by natural description, and unrestrained sentiment; he would wish his muse to resemble a rural beauty, who knows not, or if she know, only scorns artificial and meretricious decorations. About the success of his publications, no writer, it is presumed, is altogether indifferent. Great as is the authority for the assertion, the vaunt, under any circumstances, that 'success and miscarriage will be alike empty sounds,' savours more of the pride of stoicism, than the reality of truth; but he, whose expectations are low, cannot be very

To modest beauty, fate decrees the power,  
To raise with fond delay the amorous hour.  
Who knows a soft Aglaia's heart to move,  
To her shall be—the tender power of love!"

The language of these poems is highly laboured, and occasionally obscure. It abounds too with modern barbarisms; but these will pass current, for the King's English has long been debased.

much disappointed; and if the author of the following poem may, on some accounts, be arraigned and condemned in the court of criticism, he still feels confident that, in the opinion of liberal or just judges, he can scarcely deserve to be tortured on its wheel, or exposed on its gibbet."

The subject and temper of this poem would have saved it from a rigorous sentence, even if its size required long examination, or its faults severity. The stanzas upon the death of the Duke of Bedford are the best.

ART. XXXVI. *Scottish descriptive Poems; with some Illustrations of Scottish literary Antiquities.* Edited by Mr. LEYDEN. 12mo. pp. 255.

WE cannot flatter our readers with the hope of much entertainment from the volume before us.

The first and longest poem it contains is entitled Clyde; it is the production of a Scottish schoolmaster named Wilson, and was published at Glasgow in the year 1764. In 1767, its author, of whom Mr. Leyden has given a life, was chosen to superintend the grammar-school of Greenock, on condition that he should abandon "the profane and unprofitable art of poem making." It is probable, that Mr. Wilson himself regretted this prohibition more than his readers; for his Clyde offers no indication of talents above mediocrity. The locality of its subject would preclude a much finer poem from becoming popular; and perhaps the following passage, descriptive of the falls of the Clyde, is the only one capable by its animation of arresting the attention of any reader:

"Where ancient Corehouse hangs above the stream,  
And far beneath the tumbling surges gleam,  
Engulphed in crags, the fretting river raves,  
Chaffed into foam, resound his tortured waves;  
With giddy heads we view the dreadful deep,  
And cattle snort and tremble at the steep,  
Where down at once the foaming waters pour,  
And tottering rocks repel the deafening roar:

Viewed from below, it seems from heaven  
they fell!

Seen from above, they seem to sink to hell!  
But when the deluge pours from every hill,  
And Clyde's wide bed ten thousand torrents  
fill,

His rage the murmuring mountain streams  
augment:

Redoubled rage, in rocks so closely pent:  
Then shattered woods, with ragged roots up-  
torn,

And herds and harvests down the wave are  
borne;

Huge stones heaved upward through the  
boiling deep,

And rocks enormous thundering down the  
steep,

In swift descent, fixed rocks, encountering,  
roar,

Crash as from slings discharged, and shake  
the shore."

"Albania" is another poem of moderate quality, which might have been suffered to fall into oblivion, with little injury to the public. The most curious and interesting piece in the present collection, is pedantically intitled "Day Estival," and was written by Alexander Hume in the latter end of the sixteenth century. His style is a singular mixture of Latin, French, Scotch and English, and is characteristic of the individual much more than of the age. Hume ap-

pears, however, to have possessed an excellent ear for verse, a turn for observation, and a taste for the beauties of nature; and had he not been a pedant in his youth, and fanatic in his riper age, might, we think, have become a poet. Our readers shall judge.

"The time so tranquil is, and still,  
That no where shall ye find,  
Save on a high and barren hill,  
An air of passing wind.

"All trees and simples, great and small,  
That balmy leaf do bear;

ART. XXXVII. *Poetical Register, and Repository for Fugitive Poetry, for 1802.* 8vo. pp. 450.

IT is with pleasure that we see this elegant collection increasing in value: the present volume is much richer than the last in "Original Poetry," and the "Fugitive Poetry" likewise appears to us better selected; indeed there is scarcely any absolute trash in the whole work, which, when the size of the book is considered--an octavo of 450 pages--must appear extraordinary, and highly creditable to the bards of the present day, as well as to the editor of the "Poetical Register."

We must allow, however, that we do not see the utility or the honesty of *borrowing* so largely, and without acknowledgment, from periodical works of great sale, and present popularity, which are not usually thrown aside by the purchasers, like old news-papers, but regularly bound up into handsome volumes.

We must further confess, that we ourselves should prefer, and we believe the sentiment extends to all who have drunk deep of the spring of the Muses--to sip slightly of the Castalian dews, in the exalted form of *distilled waters*, instead of quaffing full goblets of the common *draft liquor* of the fountain.

To speak without a metaphor, we should have been better pleased to find such pieces as the following thrown together in the form of a pamphlet of twenty pages, than scattered at certain distances through a volume of some hundred.

"*The Emigrant's Grave, founded on a true Story, by W. Spencer, Esq.*

"WHY mourn ye, why strew ye these flow'rets around,

To yon new-sodded grave, as your slow steps advance?

In yon new-sodded grave (ever dear be the ground!)

Lies the stranger we lov'd, the poor exile from France.

Nor they were painted on a wall,  
No more they move or stir.

"Calm is the deep and purp'ous sea,  
Yea smother nor the sand;  
The wallis, that weltering wont to be,  
Are stable like the land.

"So silent is the cessile air,  
That every cry and call,  
The hills and dales, the forest fair,  
Again repeats them all."

Mr. Leyden's notes are prolix and desultory; we could have excused his Gaelic extracts, and their translations likewise.

And is this the poor exile at rest from his woe,

No longer the sport of misfortune and chance?

Mourn on, village mourners, my tears too shall flow

For the stranger ye lov'd, the poor exile of France.

Oh! kind was his nature, tho' bitter his fate,

And gay was his converse, tho' broken his heart;

No comfort, no hope, his own heart could elate,

Tho' comfort and hope he to all could impart.

Ever joyless himself, in the joys of the plain

Still foremost was he, mirth and pleasure to raise,

And sad was his soul; yet how blithe was his strain,

When he sung the glad song of more fortunate days!

One pleasure he knew; in his straw-covered shed

For the snow-beaten beggar his faggot to trim:

One tear of delight he could drop on the bread

Which he shar'd with the poor, tho' still poorer than him.

And when round his death-bed profusely we cast

Ev'ry gift, ev'ry solace our hamlet could bring,  
He blest us with sighs, which we thought were his last;

But he still had a pray'r for his country and king.

Poor exile, adieu! undisturb'd be thy sleep!

From the feast, from the wake, from the village green dance,

How oft shall we wander by moonlight to weep

O'er the stranger we lov'd, the poor exile of France.

To the church going bride shall thy  
 mem'ry impart  
 One pang as her eyes to thy cold relics glance,  
 One flow'r from her garland, one tear from  
 her heart,  
 Shall drop on the grave of the exile of France."

Most of the pieces of distinguished merit  
 which adorn this collection, are signed  
 with the names of writers already known  
 to the public--we observed, however,  
 both in the last volume and the present,  
 some poems with the signature Alcæus,  
 which are excelled by none of the others  
 in spirit, originality, and true poetic fire.  
 As an encouragement to bashful merit,  
 we swell our article by copying the fol-  
 lowing

*Ode to the Volunteers of Britain, on the Pros-  
 pect of Invasion.*

"O for the death of those,  
 Who for their country die,  
 Sink on her bosom to repose,  
 And triumph where they lie!  
 How beautiful in death  
 The warrior's corse appears,  
 Embalm'd by fond affection's breath,  
 And bathed in woman's tears!  
 The loveliest spot of earth  
 Be sacred to the brave;  
 The womb of her that gave them birth,  
 Their country's womb, the grave.  
 — But the wild waves shall sweep  
 Britannia's foes away,  
 And the blue monsters of the deep  
 Be surfeited with prey!—  
 No!—they have 'scap'd the waves,  
 'Scap'd the sea-monsters' maws;  
 They come!—but O shall Gallic slaves  
 Give English freemen laws?  
 By Alfred's spirit, no!  
 —Ring, ring the loud alarms!  
 Ye drums awake, ye clarions blow,  
 Ye heralds shout "to arms."  
 To arms our heroes fly;  
 And leading on their lines,  
 The British banner in the sky,  
 The star of conquest shines.  
 The lowering battle forms  
 Its terrible array:  
 Like clashing clouds in mountain storms,  
 That thunder on their way;  
 The rushing armies meet;  
 And while they pour their breath,  
 The strong earth shudders at their feet,  
 The day grows dim with death.  
 — Ghosts of the mighty dead!  
 Your children's hearts inspire,  
 And while they on your ashes tread,  
 Rekindle all your fire.

The dead to life return;  
 Our fathers' spirits rise!  
 — My brethren! in your breasts they  
 burn,  
 They sparkle in your eyes.

Now launch upon the foe  
 The lightening of your rage;  
 Strike, strike th' assailing giants low,  
 The Titans of the age.

They yield,—they break,—they fly;  
 The victory is won:  
 Pursue!—they faint,—they fall,—they  
 die;  
 O stay!—the work is done.

Spirit of Vengeance rest:  
 Sweet Mercy cries "forbear!"  
 She clasps the vanquish'd to her  
 breast;  
 Thou wilt not pierce them there!

—Thus vanish Britain's foes  
 From her consuming eye!  
 But rich be the reward of those  
 Who conquer—those who die!

O'ershadowing laurels deck  
 The living hero's brows;  
 But lovelier wreaths entwine his neck,  
 — His children and his spouse!

Exulting o'er his lot,  
 The dangers he has braved:  
 He clasps the dear ones, hails the cot,  
 Which his own valour saved.

—Daughters of Albion! weep;  
 On this triumphant plain,  
 Your fathers, husbands, brethren sleep,  
 For you and freedom slain.

O gently close the eye,  
 That lov'd to look on you;  
 O seal the lip, whose earliest sigh,  
 Whose latest breath was true:

With knots of sweetest flowers  
 Their winding sheets perfume;  
 And wash their wounds with true-love  
 showers,  
 And dress them for the tomb:

For beautiful in death,  
 The warrior's corse appears,  
 Embalm'd by fond affection's breath  
 And bathed in woman's tears.

Give me the death of those,  
 Who for their country die;  
 And O be mine like their repose,  
 When cold and low they lie!

Their loveliest native earth  
 Enshrines the fallen brave:  
 The womb of her that gave them  
 birth,  
 That womb shall be their grave."

ALCÆUS.

Sheffield, Aug. 29, 1803.

ART. XXXVIII. *The Picture; Verses written in London, May 28, 1803, suggested by a magnificent Landscape of Rubens, in Possession of Sir George Beaumont. By the Rev. W. LISLE BOWLES, 4to. pp. 20.*

——— "For lo! where, all alarm'd  
The small birds, from the late-responding perch,  
Fly various, hush'd their early song, and mark,  
Beneath the darkness of the bramble-bank  
That over-hangs the half-seen brook; where  
nod  
The flow'ring rushes, dew-besprent; with  
breast,  
Ruddy, and emerald wing, the king-fisher  
Steals through the dripping sedge away: what  
shape  
Of terror, scares the woodland habitants,  
Marring the music of the dawn? Look round,  
See, where he creeps, beneath the willowy  
stump.  
Cow'ring, and low, step silent after step,  
The booted fowler, keen his look, and fixt  
Upon the adverse bank, while, with firm hand,  
He grasps the deadly tube: his dog, with ears  
Hung back, and still and steady eye of fire  
Points to the prey; the boor, intent, moves on  
Silent and creeping close, beneath the leaves,  
And fears, lest ev'n the rustling reeds betray  
His foot-fall: nearer yet, and yet more near  
He stalks: ah! who shall save the heedless  
groupe,  
The speckled partridges, that in the sun,  
On yonder hillock green, across the stream,  
Bask unalarm'd, beneath the hawthorn bush,  
Whose aged boughs the crawling blackberry  
intwines!"

These are the best lines in this poem, and in part these lines are excellent; but what namby-pamby Vauxhall song-monger ever invented any viler trash than this "simple song:"

ART. XXXIX. *Fugitive Verse and Prose, &c. By J. P. ROBERDEAU. 8vo. pp. 170.*

MIRTH and mourning; magpye feathers—a mixture of all heterogeneous materials. We select a serious and a comic specimen.

*To the expiring Century, Jan. 1, 1801.*

"Octennia hence!—The desolating groan  
Of wars' ensanguin'd field; the purpled pest:  
Pale famine's querulous cry, with triple moan  
Thy parting steps attend.—Avaunt unblest!  
What tho' philosophy has mark'd thy road,  
And bright-ey'd science rear'd her radiant head,  
And polish'd arts their splendors have bestow'd;  
Meteors of bliss!—how little ye bestead!  
"Oh may thy new-born sister's rising rays,  
Compose this chaos of conflicting woes!—  
May plenty, health, and peace command our  
praise  
To the pure fount whence good and mercy  
flows!  
May reason visit earth, with truth conjoin'd;  
Philanthropy refine, and justice guide man-  
kind!"

"Leave the loud, tumultuous throng,  
And listen, listen, listen  
To the milk-maid's simple song."

SONG.

"Forget me not, tho' forced to go  
Wide o'er the roaring sea;  
When the night-winds blow,  
And the moon is high  
In the paly sky,  
My love I will think of thee."

"He look'd in my eyes, for I could not speak:  
A tear he wip'd from his dark brown cheek,  
O then, my own true sailor said,"

"Though the roaring sea,  
Part my love and me,  
Yet if luck betide,  
My bonny, bonny bride,  
She shall be the young milk-maid."

"O green are the rushes that flow'r in the  
burn,  
And I grieve for my love, who may never  
return."

We know no poet of any merit whose poems are so limited as those of Mr. Bowles—he plays as sweetly as it is possible to play upon a fiddle with one string.

A note to this poem informs us of a design to illustrate the picturesque character of Theocritus by paintings by Sir George Beaumont. Respecting as we do the admirable talents of Sir George, we should be sorry to see them employed on such a subject. Sicilian scenery can only be studied in Sicily.

*The Stage Coach Company.—A Shakespearian parody.*

——— "Moley is a stage,  
Where men and women all are passengers.  
They have their middle and their corner seats;  
Which no one on the road presumes to change,  
Altho' close-wedg'd with seven! And first the  
lap-child,  
Mewling and pewking o'er your shoes and  
boots;  
And next the down-cast school-boy, with his  
boxes,  
And pockets shilling fill'd—and large plumb  
cake,  
Which somewhat sweetens school! And next  
the Ensign,  
Cramming hot-rolls, and eyeing, at each cup,  
Molly who serves the breakfast.—Next a  
slumberer;  
Full of sour wine, with ill-look'd, unshav'd  
beard;  
Rolling his noddle, sudden in naps and wak-  
ings,

Seeking the banish'd, chaste sobriety,  
 Ev'n in the jolting coach ! And then the *Vicar*,  
 In sloping belly, with fat tythe-pig lin'd ;  
 With grizzled wig, and silken scarf-form'd  
 vest,  
 Strew'd with rappee : his elbows lifted high,  
 'Tis so he digs your ribs !—The sixth niche  
 shews  
 A meagre, mortified, warm-wrapp'd *old maid* ;  
 With morning cap snug drawn, and muff up-  
 held,

Her curving nose and chin, seeking approach,  
 The sole good *points* she shows, and her shrill  
 voice

Pour'd forth against the boldness of the age,  
 Full oft' repeats the theme ! Last plac'd of all,  
 Which ends this ' worshipful society,'  
 Sits a young nymph, in ev'ry thing reverse,  
 Sans sleeves, sans coats, sans cap, sans every  
 thing !"

Mr. Roberdeau is evidently a man of  
 considerable talents.

ART. XL. *Works of Richard Owen Cambridge, Esq. with an Account of his Life and Character.* By his Son, GEORGE OWEN CAMBRIDGE, M. A. Prebendary of Ely, 4to. pp. 580.

WE have perused, with singular pleasure, the uneventful but extraordinary life of Mr. Cambridge ; extraordinary because we recollect no individual, ancient or modern, whose life was so uniformly happy. Too opulent to need a profession, too wise to chuse one, he passed his days in the enjoyment of a literary leisure, and of a literary fame equal to his deserts and wishes ; till the age of eighty-three, he lived without disease or infirmity, and then declining without pain for two years, he enjoyed, at length, the last blessing which can be bestowed upon man, that *ευδαιμονία*, for which it has been well observed by Beddoes, the moderns have unhappily no name, that peaceful and placid death which may truly be called falling asleep.

ΙΕΡΟΥ ΟΥΤΥΝΟΥ

Κοιμάται! ὁπότε μὴ λείπει τις ἀρχὴς.

and thus he departed, a man of fourscore and five, leaving his wife and all his children living, having never suffered sickness, sorrow, or any of the calamities which flesh is heir to.

Of the versatile talents of this gentleman, some interesting and uncommon facts are recorded in these memoirs.

" Lord Anson, having admired the structure and success of these boats, as used by the inhabitants of the Ladrone islands, a particular description of which is given in his voyage, was preparing to make trial of one in England, when my father ventured to suggest his doubts

whether a boat, whose safety depended upon the most exact equilibrium, would succeed in this uncertain climate, however well it might answer on the smooth sea, and under the steady breezes of the Pacific Ocean ; proposing, at the same time, to construct a boat upon a plan somewhat similar, that might obviate those objections. The experiment, in both cases, was creditable to his knowledge of the subject. The flying prow was twice tried between Portsmouth and the Isle of Wight, and each time (as I have been informed) it was overset ; after which it was hung up in the boat-house of the royal yard at Deptford, where it has ever since remained, and may now be seen ; but the double boat answered every purpose required, being so swift that no other boat could overtake it, and so safe that it was scarcely possible for it to be overset."\*

\* For the ordinary diversions of the field, to which country gentlemen usually devote so much of their time and talents, my father had no relish ; but instead of the gun, he took up the exercise of shooting with the bow and arrow, in which he acquired such a degree of dexterity, as with a little further practice might have enabled him to enter the lists with William Tell, or the man recorded in the Scribleriad, who deprived Philip of the sight of one of his eyes with an arrow, which was addressed ' To Philip's right eye.' The head of a duck, swimming in the river, was a favourite mark, which he seldom missed ; he likewise shot many small birds perching on trees, and some of the larger sort he has brought down when upon the wing ; until happening to see one of his arrows, that had accidentally dropped into a post, he was struck with the hazard he ran of injuring

\* The double boat consisted of two distinct boats, fifty feet in length, and only eighteen inches wide, placed parallel to each other at the distance of twelve feet, and secured together by transverse beams, over which a slight platform or deck was placed. Thus constructed, it was enabled to spread a much larger portion of canvas than any other boat that presented so small a resistance to the element in which it moved. It is remarkable that Captain Cook should, many years afterwards, find the ingenious inhabitants of the Sandwich Islands making use of boats upon a similar plan, and which experience had shewn them was preferable to the flying prow, or any other form that could be devised by a people unacquainted with the use of iron.

some fellow-creature, and from that time relinquished this amusement. But as shooting fish was not liable to any risk, he continued that diversion, with arrows made for the purpose by the Indians of America; and was almost as expert in the use of them. Whatever pursuit he engaged in, he followed with uncommon ardour, and seldom desisted until he had reached the extent of the subject: this fondness for the bow, therefore, induced him to collect specimens of all the bows and arrows that could be met with in different parts of the world, and to make himself acquainted with the precise methods of using them. He likewise procured whatever books he could find upon the subject of archery, particularly those which related to the laws and practice of the old English bowmen, as well as what remained respecting the use of those weapons among the ancients."

The *Scribleriad* is the most important of Mr. Cambridge's works. From this, well known as the poem is, we will select two passages for their singular and original excellence.

"This Momus heard and from Olympus height,

To distant Lybia wing'd his rapid flight.  
Sudden he joins the rash Scriblerus' side,  
While good Albertus' form the god belied.  
Instant, behold! the guardian pow'r commands

A spark to issue from the blazing brands;  
Which fell, directed, on the sage's head,  
And sudden flames around his temples spread.  
The subtle god the destin'd moment watch'd:  
Swift from his head the hairy texture snatch'd,  
And, unperceiv'd, amidst the crowd's amaze,  
A soaring rocket in the cawl conveys.  
The latent fraud portentous, cuts the air,  
And bears, thro' distant skies, the blazing hair."

\* \* \* \*

"Firm and compact in three fair columns wove,

O'er the smooth plain, the bold Acrosticks move;

High o'er the rest the tow'ring leaders rise  
With limbs gigantic and superior size.  
They lead the van, unmov'd in the career,  
And Bout-rimées bring up the lagging rear.  
Not thus the looser Chronograms prepare,  
Careless their troops, undisciplin'd to war;  
With ranks irregular, confus'd, they stand,  
The chieftains mingling with the vulgar band.  
But with still more disorder'd march, advance  
(Nor march it seem'd, but wild fantastic dance.)

The uncouth Anagram's distorted train,  
Shifting, in double mazes, o'er the plain.  
From different nations next the Centos crowd,  
With borrow'd, patcht, and motley ensigns proud.

Not for the fame of warlike deeds they toil,  
But their sole end the plunder and the spoil.

Next, an uncertain and ambiguous train  
Now forward march; then counter-march again.

The van now first in order, duly leads;  
And now the rear the changeful squadron heads.

Thus onwards Amphibæna springs to meet  
Her foe; nor turns her in the quick retreat.  
To join these squadrons, o'er the champaign came

A num'rous race of no ignoble name;  
The mighty Granibo leads th' intrepid van:  
The next a forward loud industrious clan.  
Riddle and Rebus, Riddle's dearest son;  
And false Conundrum, and insidious Pun;  
Fustian, who scarcely deigns to tread the ground;

And Rondeau, wheeling in repeated round.  
Here the Rhopalics in a wedge are drawn,  
There the proud Macaronians scour the lawn.  
Here fugitive and vagrant o'er the green,  
The wanton Epigrammatist is seen.  
There Quibble and Antithesis appear,  
With Doggrel-rhymes and Echos in the rear.  
On their fair standards, by the wind display'd,  
Eggs, altars, wings, pipes, axes were pour-tray'd."

Without entering into any minute criticism upon this poem, which certainly deserves the reputation it has obtained, we may observe that there is a radical fault in its design. The objects of Scriblerus's pursuit are represented as actually attainable. The petrified city exists when he sets out in search of it; there is, therefore, no absurdity in his travelling to explore it; the competitors of the games actually fly, and row under water, and there appears no reason in the poem why the transmutation of metals, which is the final action, should not be equally performed.

The prose part of the volume consists of the papers which he contributed to the *World*; concerning these a good *bon mot* is recorded. A note from Moore, requesting an essay, was put into Mr. Cambridge's hands on a Sunday morning as he was going to church; his wife observing him rather inattentive during the sermon, whispered, "what are you thinking of," he replied, "of the next *World*, my dear."

We will add one anecdote more in the hope that it may operate as an example.

"Of his attention to collect original papers, and the desire to make them useful to the public, a handsome testimony is given by Mr. Horace Walpole, who, actuated by the same liberal motives, printed at Strawberry-hill, in the year 1758, *An Account of Russia as it was in the year 1710*, by Charles Lord Whit-

worth.' In the preface to this little book, Mr. Walpole, after stating that the manuscript was communicated to him by Mr. Cambridge, who had purchased it among a very curious set of books, collected by Monsieur Zolman, secretary to the late Stephen Poyntz, Esq. adds, 'This little library relates solely to Russian history and affairs, and contains in many languages, every thing that

perhaps has been written on that country. Mr. Cambridge's known benevolence, and his disposition to encourage every useful undertaking, has made him willing to throw open this magazine of curiosity to whoever is inclined to compile a history, or elucidate the transactions of an empire almost unknown even to its contemporaries."

ART. XLI. *The Pleasures of Nature; or, the Charms of Rural Life; with other Poems.* By DAVID CAREY. 12mo. pp. 164.

THE principal of these poems is that from which the volume takes its title, "The Pleasures of Nature." It is written in the stanza of Beattie's Minstrel, and is principally characterized by the unpardonable crime of dullness. We suspect that Mr. Carey is more likely to

excel in the burlesque than the serious. The Parody on Gray's Elegy is well done, and the "Illegitimate Ode to the Shop of an eminent Bookseller," is no bad travestie of a part of the same poet's Ode to Eton College.

ART. XLII. *The Triumphs of Poesy; a Poem.* By J. C. HUBBARD, M. A. *Author of Jacobinism, &c.* 4to. pp. 20.

THIS little poem has merit which entitles it to a longer date than the ephemeral productions of this prolific age. Its verse is correct, flowing, and unusually harmonious. The stanza is happy; it gratifies the ear of the reader with sufficient variety, without imposing too heavy shackles on the genius of the writer. Its style is lively, perspicuous, and dignified. Originality of subject, indeed, it cannot boast. The great luminaries of poetry, Homer, Virgil, Milton, &c. would probably have been equally well known with their characteristic excellencies, to every reader, if Mr. Hubbard had never existed. Still it always gives us some pleasure to hear an old friend and favourite respectfully mentioned, particularly by a man who gives us at the same time a favourable opinion of his own talents and judgment. His character of Horace pleased us much: the fourth line is peculiarly applicable—the "cautious skill" of Horace in following Pindar must be apparent to every observant reader.

"Correct and gay, as Horace sweetly sings,  
And hangs in rapture o'er the Grecian lyre.  
With bolder rage he sweeps the Sapphic strings,  
Or wakes with cautious skill the Theban fire;  
Or bids the echoes of the Sabine grove  
Resound the pleasing pangs, the wanton wiles  
of love.

"Modell'd with happiest, unobtrusive art,  
Obliquely keen and elegantly warm,  
His easy numbers steal upon the heart,  
Instructing, flatter, and reproving, charm:  
Unlike the torrent of a later age;  
When satire hurl'd, in vain, the thunders of  
her rage."

In a passage relative to Thomson, Mr. H. has shown the possibility of reading, admiring, quoting, and at the same time totally misunderstanding an author. He speaks of—

—— "The fleecy veil of falling snow  
That hides the blushes of the boreal morn,"  
without once suspecting that the "boreal morn," or Aurora Borealis, is a quite different thing from a winter morning. Our *Master of Arts* is not more fortunate where he speaks of "the rich tissue of his Doric lay." A Doric lay, certainly means a rustic lay (if classical cant has any meaning); but what can be less so than the learned strain of Thomson? The author certainly confounds the ideas of rustic and rural.

The poem concludes with a line slightly altered from Collins. Does Mr. Hubbard think originality equally to be dispensed with in modern English as in modern Latin verse? Let him break his college fetters, let him dare to indulge conceptions of his own, and he will find his powers of versification fully adequate, without plagiarism, to express them with brilliancy and effect.

ART. XLIII. *Poems,* by NATHANIEL BLOOMFIELD. 12mo. pp. 128.

MR. Capel Lofft is the editor of this little volume; in deference to his im-

primatur, a bookseller of Bury has printed it at his own risk for the benefit of the

author; and his *probatum est* is affixed to each of the poems.

"Whoever," says Mr. Loft, "has read the preface to the *Farmer's Boy*, will hardly fail of recollecting the name of Nathaniel Bloomfield, the author of the poems here offered to the public.

"It will be remembered, that he there appears, with his brother, George Bloomfield, standing in the place of the father, whom they had early lost, to their younger brother Robert.

"It is natural to suppose, that this brotherly interference, and its consequences, greatly and advantageously influenced the dispositions, pursuits, and habits of thought and conduct, of all three of the brothers. And it is the more exemplary, when it is considered how young the two eldest were at that time.

"It is an encouraging instance, how much may be effected for each other by the poor and uneducated, if they have prudence, activity, and kind affections; and how unexpectedly, and to an extent far beyond apparent probability, success is given by Providence to virtuous and benevolent efforts.

"Beyond question, the brothers of this family are all extraordinary men; and perhaps every one of them is more so than he would have been without the fraternal concord which has animated them all, and multiplied the powers of all by union and sympathy."

Nathaniel was apprenticed to a taylor, and at present works at that trade in London. He was not without his fears, "lest it should be thought that, although the muse can visit a Shepherd's Boy, there may be some employments which exclude her influence.—That a Taylor should be a Poet, he doubted, might appear too startling an assertion; and he had said accordingly to his brother George, in a letter, when this publication was first going to press, 'I want you to exclude the word taylor. Let there be no such word in the book. But perhaps I am too late. I know there is in the public mind as great contempt for him who bears the appellation of taylor, as Sterne has made old Shandy have for Simkin, Nicky, or Tristram. How many Cæsars and Pompeys, says he, by mere inspiration of the names, have been rendered worthy of them? And how many are there who might have done exceedingly well in the world, had not their characters and spirits been totally depress'd and Nicodemiz'd; and I will add (says Mr. N. Bloomfield) taylor'd into nothing? In the *Rehearsal*, the author, to make the most ridiculous part of it still more ridiculous, tells us, that it was written to a taylor, and by a taylor's wife. And even the discerning Spectator has given into this common-place raillery in the *Monkey's Letter* to her Mistress. He has made the soul which inhabited Pug's body, in recounting the humiliating state it had formerly been in, say, that he had been a taylor, a shirtup, and

a tom-tit. It is from these causes, as well as from the habits and appearance contracted by a recluse and sedentary life, that, in the enlivened, as well as the ignorant, the ideas of taylor and insignificance are inseparably linked together."

Tillotson's Sermons and a few religious tracts were his first studies; after he had removed to London he purchased the *Night Thoughts*, and by means of stall-hunting collected a few other poets. It was his evening's amusement, when single, to read Entick's Dictionary, and to write down every word of which he wished to remember the spelling or the meaning. For the last fifteen years he has read but little, his family having claimed his utmost exertions; his business allowing little leisure, and what leisure he had being generally employed in walking with his children. Though very poor he has been very happy.

The Essay on War is designed to shew, says the author,

"That war is an inevitable ill,  
An ill thro' nature's various realms diffus'd,  
An ill subservient to the general good."

The paradox is supported by sundry trite arguments which we will not waste time in confuting. As a specimen of the poetry we select the personification of Gunpowder.

"Gunpowder! let the soldier's pean rise,  
Where'er thy name or thundering voice is heard:

Let him who, fated to the needful trade,  
Deals out the adventitious shafts of death,  
Rejoice in thee; and hail with loudest shouts  
The auspicious era, when deep searching art  
Froin out the hidden things in nature's store  
Call'd thy tremendous powers: and tutor'd  
man

To chain the unruly element of fire  
At his controul, to wait his potent touch;  
To urge his missile bolts of sudden death,  
And thunder terribly his vengeful wrath.  
Thy mighty engines and gigantic towers  
With frowning aspect awe the trembling  
world.

Or weak, or powerful, what escapes thy force?  
When thy dire thunder and thy sudden blaze  
Hath taught the birds to tremble—little know,  
Ah! little know those gentle sons of air  
How fully their destruction is aveng'd:  
That man himself, thy terror's boasted lord,  
Within the blacken'd hollow of thy tube,  
Affrighted sees the darksome shades of death;  
Nor only moutning groves, but human tears,  
The weeping widow's tears, the orphan's cries,  
Sadly deplore that e'er thy powers were known:  
Hosts whirl'd in air, and cities sunk in flames,  
Attest the horrid triumphs of thy might.  
Yet let thy advent be the soldier's song—  
No longer doom'd to grapple with the foe

With teeth and nails—when close in view,  
and in  
Each other's grasp, to grin, and hack, and  
stab;

Then tug his horrid weapon from one breast  
To hide it in another; with clear hands  
He now, expertly poisoning thy bright tube,  
At distance kills, unknowing and unknown,  
Sees not the wound he gives, nor hears the  
shriek

Of him whose breast he pierces—gunpowder!  
(O! let humanity rejoice) how much  
The soldier's fearful work is humanis'd,  
Since thy momentous birth, stupendous  
power!"

Of this essay, Mr. Capel Lofft says, that it displays a greater mastery in the mechanism, and greater power of numbers, than he should have almost thought possible in the first attempt in blank verse, even to a person of the best education. I regard it, he adds, as a poem of extraordinary vigour and originality in thought, plan, conduct, language and versification; I think it has much indeed of the philosophic character, poetic spirit, force of colouring, energy and pathos, which distinguish Lucretius. I am either ignorant wherein genius consists, or it is manifest in the idea, the style and numbers, the design and conduct of this poem.

Having read our extract, the reader will see that there needs no waggoner's team to draw the inference. Mr. Capel Lofft is ignorant wherein genius consists, or this poem has all the charms of thought and diction; but this poem has no other merit than what it derives from the situation of its author. It is remarkable, that a poor man, labouring at an unhealthy and ignominious business, should be able to write verses at all. The *reductio ad absurdum* is mathematical demonstration. The poem being bad, Mr. Capell Lofft is ignorant, Q. E. D. lamentably ignorant, and presumptuously obtrusive of his ignorance.

The other poems have more merit. We quote the following stanzas to praise them, and are happy that it is in our power to praise them. They are the advice of an old man to a poor lover:

"Though envious age affects to deem thee  
boy,  
Lose not one day, one hour, of proffer'd  
bliss;

In youth grasp every unoffending joy,  
And wing'd with rapture snatch the bridal  
kiss.

"Let not this chief of blessings be deferr'd,  
Till you your humble fortune can improve;

None's poor but he, by sordid fears deterr'd,  
Who dares not claim the matchless wealth  
of love.

"Virtue can make most rich thy little store;  
Virtue can make most bright thy lowly  
state;

Murmur not then that virtuous thou art poor,  
While prosperous vice can make men rich  
and great.

"The bad man may, his every sense to please,  
Each soft indulging luxury employ:  
The plenitude of elegance and ease  
He may possess, but never can enjoy.

"No, though his goods, and flocks, and  
herds abound,  
His wide demesne to fair profusion grown;  
Though proud his lofty mansion looks around,  
On hills, and fields, and forests, all his own:

"Tho' this may tempt thee, murmuring to  
complain,  
With conscience clear, and life void of of-  
fence,

'Verily, then, I've cleans'd my heart in vain;  
In vain have wash'd my hands in innocence.'

"Yet could'st thou closely mark the envied  
man,  
See how desires ungovern'd mar his peace;  
Or had'st thou pow'r his inward mind to scan,  
How soon in pity would thy envy cease.

"Repine not then, that low thy lot is cast,  
Health gives to life or high or low its zest;  
'Tis appetite that seasons our repast,  
And weariness still finds the softest rest.

"For all thy blessings thankfulness to wake,  
Think of less cultur'd lands, less peaceful  
times:—

Our coarsest fare, when sparingly we take,  
'Tis luxury, compar'd with other climes.

Think of the poor Greenlander's dismal caves,  
Where thro' their long, long night they  
buried lie:

Or the more wretched lands where hapless  
slaves  
Hopelessly toil beneath the fervid sky.

"In Britain, blest with peace and competence,  
Rich fortune's favours could impart no more:  
Heaven's blessings equal happiness dispense,  
Believe my word, for I am old and poor.

"Many who drudge in labour's roughest  
ways,

By whom life's simplest, lowliest walks  
are trod,  
Happily live, to honour'd length of days,  
Blessing kind nature, and kind nature's  
God."

Mr. Capell Lofft supposes he has found  
a nest of poets. However much he is  
mistaken, the Bloomfields are certainly  
extraordinary men; and it gives us a

moral and consoling pleasure to see, that in circumstances so unfavourable, such men can exist. Their patron, good as his motives are, it is our duty to correct;

his impertinent and intemperate exaggerations of praise, must injure those whom he designs to serve.

ART. XLIV. *Poems, lyrical and miscellaneous. By the late Rev. HENRY MOORE, of Liskeard.* 4to. pp. 153.

IT is with mingled pain and pleasure, that we prepare to give our testimony to the talents and merit of an author, who was destined, by a singular and melancholy fate, to break forth upon the public ear, in all the pomp and harmony of song, just as the silent lapse of time had hurried him, in the evening of age, but the dawn of reputation, beyond "that bourne whence never traveller returns."

Dr. Aikin, as editor, has prefixed the "few biographical memoirs" that could be obtained, or expected, of a man "whose lot it was, with genius, learning, and morals, to pass a life of almost total obscurity."

Mr. Moore, we are informed, was the son of a dissenting minister at Plymouth, where he was born in 1732. He was destined for his father's profession; and after the usual course of school and academical education,

"In 1755 or 1756, was elected minister to a dissenting congregation at Dulverton in Somersetshire. In 1757, he removed to a similar situation at Modbury in Devonshire; where he continued till his final removal to Liskeard in Cornwall, which took place about the year 1787. In these long periods of life he appears to have been almost totally lost from the notice of the world; recollected, perhaps, by some of his fellow-students as a youth of promise; known by a few brother ministers as a man of learning and critical talents; but probably scarcely recognized by two or three individuals for the splendid and cultivated genius, capable of shining in the highest ranks of literature, had fortune produced him upon a theatre suited to his powers. How he appeared in the latter portion of his narrow course, to an intimate friend who was able properly to estimate him, will best be shown in that friend's own words. 'He was probably led to adopt his retired and obscure mode of life, partly from the weakness of his constitution, the original infirmity of which was distressingly increased by his studious and sedentary habits; partly from the singular modesty and diffidence of his disposition. Notwithstanding, however, he thus voluntarily withdrew from general society, when in company with any one with whom he felt himself at ease, his conversation was most agreeable and entertaining, enlivened with sprightly sallies and seasonable anecdotes. Although there was so little in

his situation that seemed calculated to produce contentment and thankfulness, and although he had long suffered under painful and complicated bodily complaints, yet he was perfectly free from any disposition to repine. I never heard him utter a querulous expression. The composure and resignation of his mind seemed always undisturbed.—His manners were singularly mild and gentle. He appeared utterly unconscious of possessing any extraordinary powers: indeed, his behaviour indicated a greater degree of humility and distrust than I almost ever witnessed.' I shall add, that both the trials he underwent, and the sources of his consolation, are strongly marked in his poems; in perusing which, we cannot but feel, that though he suffered much, he was *not*ly supported.

"During the last summer," continues Dr. Aikin, "Mr. Moore put into the hands of the friend above referred to, a volume of MS. poems, which, with singular modesty, he requested him to shew to some person sufficiently conversant with productions of the kind, to judge of their fitness for the public eye. I was applied to on the occasion; and I trust the readers of these pieces will be convinced, that I could not hesitate in giving a decided opinion in their favour. In reality, I scarcely ever experienced a greater and more agreeable surprise, than on the discovery of so rich a mine of poetry, where I had not the least intimation of its existence. That the author should have passed seventy years of life almost totally unknown, was a circumstance that excited the interest of all to whom the poems were communicated; and we were impatient that, however late, he should enjoy those rewards of merit which had so long been withheld. In the mean time he was attacked with a severe stroke of the palsy, which, while it left his intellects free, incapacitated him for every exertion. There was now no time to be lost. My offer of taking upon myself the whole care of the editorship was thankfully accepted; and a subscription was set on foot, which met with the warm support of many, who were desirous that all possible comfort should be supplied to cheer the helpless decline of such a man. But the progress of debility anticipated these well intended efforts: he sunk tranquilly under his disease, on November 2, 1802, having, however, lived to enjoy some satisfaction from the knowledge, that there were persons whom he had never seen, who could regard him with cordial esteem and friendship. As he lived in celibacy, and had no dependent relatives, no other object remained

for a subscription, than that of bringing forward his posthumous work in an advantageous manner, secure both from loss and neglect."

To analyse a volume of lyrical and miscellaneous poems, would be difficult, to characterize them will be easier to us, and more satisfactory to our readers. The moral and religious odes exhibit the conceptions of a saint, and the execution of a poet; the most fervent, rational, and amiable piety, varied and enlivened by faithful and animated sketches of nature, by apt and classical allusions to the history and poetry of antiquity, and, above all, by the "breathing thoughts and burning words" which impress on the scrolls of eloquence and poetry the stamp, the inimitable stamp, of genius. The lighter and miscellaneous pieces, are captivating by their harmony, elegance, and originality of sentiment.—The subject matter of Mr. Moore's poems is such as the book of nature and of God, the treasures of learning, the feelings of a warm heart, and the reveries of an active fancy, offer to the retired and contemplative man. His versification, evidently modelled on that of Dryden, is sonorous, rich, flowing, and majestic.—In forming the measures of his odes, which are mostly of the pindaric or irregular kind, he displays the most exquisite taste and knowledge of harmony; his rhymes partake of the inaccuracy common to the last generation of versifiers; his sentences are sometimes intricate, from their length and parenthetical construction, a fault probably occasioned by the want of some friend to whom he might have read his compositions aloud; and he has sometimes been guilty, like most of those, whose minds receive little other nourishment than such as is supplied by their own reading and meditations, of imitating and repeating himself. Occasional imitations of other poets might also be pointed out, if the venerable author were now capable of profiting by our strictures.

The "Ode to Spring," with which the volume commences, has the merit of novelty on a trite subject, which is chiefly procured by the moral reflections drawn from the prospect of universal reanimation and beauty, and the lively glance "through nature up to nature's God." One ode, as a specimen of those on moral topics, which have all a strong resemblance to each other in diction, and the general tone of sentiment, we present en-

tire to our readers, who will do justice to the new and brilliant simile with which it opens, and the noble vein of sentiment and picturesque description by which it is pervaded.

*"The Vanity of Fame."*

"As vapours from the marsh's miry bed  
Ascend, and gath'ring on the mountain's head,  
Spread their long train in splendid pomp on  
high;

Now o'er the vales in awful grandeur lour;  
Now flashing, thund'ring down the trembling  
sky,

Rive the tough oak, or dash th' aspiring tow'r;  
Then melting down in rain,

Drop to their base, original again;  
Thus earth-born heroes, the proud sons of  
praise,

A while on fortune's airy summit blaze;

The world's fair peace confound,  
And deal dismay, and death, and ruin round,  
Then back to earth these idols of an hour,  
Sink on a sudden, and are known no more.

"Where is each boasted favourite of fame,  
Whose wide expanded name  
Fill'd the loud echoes of the world around,  
While shore to shore return'd the lengthen'd  
sound?

The warriors where, who, in triumphal pride,  
With weeping freedom to the chariot tied,  
To glory's capitolian temple rode?  
In undistinguish'd dust together trod,  
Victors and vanquish'd mingle in the grave;  
Worms prey upon the mould'ring god,  
Nor know a Cæsar from his slave;  
In empty air their mighty deeds exhale,  
A school-boy's wonder, or an ev'ning tale.

"In vain with various arts they strive  
To keep their little names alive,  
Bid to the skies th' ambitious tow'r ascend;  
The cirque its vast majestic length extend;  
Bid arcs of triumph swell their graceful round;  
Or mausoleums load th' encumber'd ground;  
Or sculpture speak in animated stone  
Of vanquish'd monarchs tumbled from the  
throne:

The rolling tide of years  
Rushing with strong and steady current, bears  
The pompous piles, with all their fame away,  
To black oblivion's sea;  
Deep in whose dread abyss the glory lies  
Of empires, ages, never more to rise!

"Where's now imperial Rome,  
Who erst to subject kings denounc'd their  
doom,  
And shook the scepter o'er a trembling world?  
From her proud height by force barbarian  
hurl'd.

Now, on some broken capital reclin'd,  
The sage of classic mind  
Her awful relics views with pitying eye,  
And o'er departed grandeur heaves a sigh;  
Or fancies, wand'ring in his moon-light walk,  
The prostrate fanes, and mould'ring domes  
among,

He sees the mighty ghosts of heroes stalk  
In melancholy majesty along,  
Or pensive hover o'er the ruins round,  
Their pallid brows with faded laurels bound ;  
While Cato's shade seems scornful to survey  
A race of slaves, and sternly strides away.

" Where old Euphrates winds his storied  
flood,

The curious traveller explores in vain  
The barren shores, and solitary plain,  
Where erst majestic Babel's turrets stood ;  
All vanish'd from the view her proud abodes,  
Her walls, and brazen gates, and palaces of  
gods !

A nameless heap o'erspreads the dreary space,  
Of mingled piles an undistinguish'd mass ;  
There the wild tenants of the desert dwell ;  
The serpent's hiss is heard, the dragon's yell ;  
And doleful howlings o'er the waste affright,  
And drive afar the wand'ers of the night.

" Yet 'tis divinity's implanted fire,  
Which bids the soul to glorious heights aspire ;  
Enlarge her wishes, and extend her sight  
Beyond this little life's contracted round,

And wing her eagle flight  
To grandeur, fame, and bliss without a bound.  
Ambition's ardent hopes, and golden dreams,  
Her tow'ring madness, and her wild extremes,  
Unfold this sacred truth to reason's eye,  
That ' man was made for immortality.'

" Yes, friend ! let noble deeds, and noble aims  
To distant ages consecrate our names,  
That when these tenements of crumbling clay  
Are dropt to dust away,

Some worthy monument may still declare  
To future times ' we were !'

Not such as mad ambition's vot'ries raise  
Upon the driving sand of vulgar praise ;

But with its firm foundation laid  
On virtue's adamant rock,  
That to the skies shall lift its tow'ring head  
Superior to the surge's shock.

Plann'd like a Memphian pyramid sublime,  
Rising majestic on its ample base,  
By just degrees, and with a daring grace,  
Erect, unmov'd amid the storms of time !

" Of time ! no, that's a period too confin'd  
To fill th' unbounded mind,  
Which o'er the barrier leaps of added years,  
Of ages, æras, and revolving spheres,

And leaves the flight of numbers still behind.

When the loud clarion's dreadful roll  
Shall rend the globe from pole to pole ;  
When worlds and systems sink in fire,  
And nature, time, and death expire ;  
In the bright records of the sky  
Shall virtue see her honours shine ;  
Shall see them blazing round the sacred shrine  
Of blest eternity."

" The fall of Zion" is one of the sublimest prophetic denunciations we have met with ; never surely was a picture of consummate horror so strongly drawn, and so artfully shaded, as the following :

" 'Tis come—the mighty day ! how awful  
low'rs

Its murky morn ! the works of death begin !  
Without, the flame—without, the sword de-  
vours,

And famine wastes within.

Ah ! what a groan was there,  
As bursting from the bosom of despair !  
See o'er her famish'd babe the mother hang !  
Maternal fondness adding edge to woe,  
Keen as her childbed's agonizing throes.  
But, oh ! my chill'd blood shudders at the  
sight—

Resistless hunger gives a fiercer pang.  
Mother, forbear !—sun, hide thy trembling  
light !

Blot out the deed accurst, eternal night !"

The veil is indeed cast by the hand of a master ! There is a happy boldness in the following metaphor of the " Ode on Divine Love :

" What tho' to Heaven's empyrial vault aspire  
Your gilded domes, with rival splendors  
crown'd !

Soon, soon destruction, with her tongue of fire,  
Shall lick them from the ground."

The much lamented loss of a young lady, to whom he was fondly attached, and soon after of a bosom friend, awoke the lyre of our poet to strains of the deepest pathos. His " Invocation to Melancholy" must touch a responsive chord in every human breast, which has once vibrated to the stroke of tender grief. The first verse contains a very judicious deviation from the rules of prosody, which *this writer* never lightly violates :

" Dost thou thro' the glimmering glade,  
Beneath the moon's pale ray,  
With many a slow step stray ?"

An exquisite imitation of a celebrated passage of Virgil, occurs in this stanza :

" All the long night he tells his plaintive tale  
Along the list'ning vale,  
To ev'ry vagrant rill,  
To ev'ry bending hill,

And bids the hollow gales in pity bear  
His swelling sighs to her.

Thee beautiful, thee cold, thee scornful maid !  
Thee mourns his musical, his melting lay,  
Thee at the closing shade,  
And thee at dawning day."

" *Te dulcis conjux, te solo in litore secum,  
Te veniente die, te decedente canebat.*"

Gladly would we indulge ourselves in still more copious extracts from so rich a store. But we have done enough ; the lovers of genuine poetry, and pure elevated virtue, will eagerly welcome this production, as offering in its *moral odes*

what has long been a *desideratum* in the language. France still boasts the far inferior and almost antiquated works of J. B. Rousseau, in a similar walk; and it

is not probable, that the British public will value less highly this, the first offering, and dying legacy of humble worth and bashful genius.

ART. XLV. *Poems, by Mrs. G. SEWELL, Relict of the late Rev. George Sewell, Rector of Byfleet, Surrey.* 12mo. pp. 283.

THIS elegant little volume, which appears to be patronised by a numerous and very splendid list of subscribers, consists of short miscellaneous pieces, exhibiting just sentiments in easy verse. High

poetic fancy, glowing diction, rich and varied harmony are of such rare occurrence, that their absence ought no more to excite disappointment, than the not finding pearls in every oyster.

ART. XLVI. *The Press; a Poem, published as a Specimen of Typography.* By JOHN M'CREEDEY, *Liverpool.* Thin quarto.

THE singular humility of this title-page cannot fail to excite the curiosity of our readers, who will ask with astonishment, what kind of poet he can be, who submits his numbers to the public eye, merely for the purpose of affording an opportunity of display, to the mechanical skill of the printer. Their surprise will be diminished on learning that, in this instance, the poet and printer are one and the same person, and that the author of "The Press," is the very man who, in his humbler capacity, has been instrumental in diffusing through the nation the rich intellectual stores of a Currie, a Roscoe, a Smythe, and a Shepherd. It is not wonderful that Mr. M'Creedy, animated by the encouragement of such patrons, should feel anxious to acquire for the Liverpool press, a reputation for beauty and correctness of workmanship hitherto confined to those of the metropolis.

In the laudable pursuit of excellence in his art, our poetical printer engaged in a course of laborious and expensive experiments, by means of which he has at length succeeded in preparing an ink which, without fatiguing the eye by a too glaring black, gratifies it by a mellow richness of tint never before attained. His presswork is likewise remarkable for its smoothness and evenness of colouring, though the common, not the French, press, has been employed. The type, which is the same used by Bulmer, in Boydell's splendid Shakspeare, is an extremely good one, formed on the Bas-

kerville model, though inferior to the delicate fineness of Figgins's best letter. This *pattern work* is likewise adorned by emblematical wooden cuts of superior excellence.

A clear and satisfactory statement of the controversy respecting the origin of printing is subjoined to the poem; as likewise, a somewhat violent declamation against the paper-taxes, and the act by the which a printer is obliged to subscribe his name at the beginning and end of every work. The intentions of the legislature, in framing this regulation, might perhaps afford cause for reprehension; but certainly the obligation of marking their works has enabled this class of artizans, to make known to the world in general, their names and respective merits, with which only authors and booksellers were previously acquainted. Mr. M'Creedy is not a man to be ashamed of working under the public eye, as his present production sufficiently evinces, nor ought he, therefore, to be the first to exclaim against the revival of a practice, universal among the early and eminent printers, and alone capable of again elevating that into a liberal art, which, for some time past, has sunk into a mere mechanical trade.

The sentiments of our author are free and manly; his verse is smooth and correct, and certainly reflects honour on one whose opportunities for the cultivation of literature must have been snatched, with haste and difficulty, from more important and lucrative avocations.

ART. XLVII. *The Powers of Imagination; a Poem, in three Parts. Written at the Age of Sixteen.* By Miss CHARLOTTE SEYMOUR. 4to. pp. 130.

THIS poem possesses three irresistible claims to be indulgently reviewed, namely, the youth and sex of the author,

and the lovely portrait which is prefixed; at the same time we are bound not to violate our implied engagement with the

public. We shall therefore confine ourselves to the expression of regret, that the friends of this young lady should possess so little common sense as to encourage a publication which, we are

sure, the author herself, when her taste and judgment shall be a little more matured, will wish that it had been confined within the circle of her family and intimate acquaintance.

ART. XLVIII. *The Temple of Nature ; or, the Origin of Society : a Poem, with philosophical Notes.* By ERASMUS DARWIN, M. D. F. R. S. 4to. pp. 300.

DR. Darwin, like Lucretius, has endeavoured to blend in his poetical works the grave features of philosophy with the mutable graces and smiling charms of imagination. In a considerable degree he has succeeded ; and his "Economy of Vegetation," and "Loves of the Plants," will attract notice for the splendid digressions and similes which they contain, long after the philosophical reveries upon which they are based shall be forgotten.

The distinguishing characteristic of Dr. Darwin's poetry is picturesque description, conveyed in remarkably harmonious language, but weakened in its effect by the very slight interest which the general plan is calculated to excite in comparison with that of particular passages. The author himself indeed has compared his "Loves of the Plants" to a series of paintings connected together by a festoon of ribbands, a description which may also be applied with perfect justice to the "Economy of Vegetation," and the work at present before us.

The "Temple of Nature" consists of four cantos, the first of which treats of the origin or production of life ; the second of the transmission or re-production of life ; the third relates to the progress of the mind ; and the fourth investigates the necessary connexion between good and evil. The philosophical system here displayed and illustrated in the notes, scarcely differs, in any respect, from what has been already published in the former works of the same author, and is therefore, for the most part, a mere repetition of dubious or misapplied facts. The verse abounds with stanzas, and even whole passages, closely imitated from the "Botanic Garden," and is strikingly deficient in those brilliant similes and personifications which constitute the most valuable portion of Dr. D.'s poetry.

As in the Newtonian system the motions of inanimate matter are explained by the laws of attraction and repulsion, so Dr. Darwin considers the phenomena of vitality to be ultimately attributable

to contraction or the shortening of a fibre on the application of a stimulus, and its gradual re-extension when the stimulus is removed. There is this slight difference, however, between the two theories, that Newton did not proceed a step without rigorous demonstration, whereas Dr. Darwin does not bring a single argument, or even analogy, in support of his hypothesis. Having formed a contractile fibre by the successive application of minute particles of matter to each other, he supposes its extremities to unite and thus produce a ring ; a multitude of rings united form a tube, which, by the process of assimilation, forms a living animal. Or to use the author's own words,

"In earth, sea, air, around, below, above,  
Life's subtle woof in Nature's loom is wove ;  
Points glued to points a living line extends,  
Touch'd by some goad approach the bending  
ends ;

Rings join to rings, and irritated tubes  
Clasp with young lips the nutrient globes or  
cubes ;

And, urg'd by appetencies new, select,  
Imbibe, retain, digest, secrete, eject."

From living tubes, which have thus acquired "appetencies new," he supposes the microscopic animalcules and vegetables to be produced without the intervention of either solitary or sexual generation. At length in some of the larger of these living tubes two kinds of organic particles begin to be formed, the one endowed with "nice appetencies," and the other most conveniently with "apt propensities:" in consequence of which, whenever they arrive within the sphere of each other's attraction, they unite, and strange to say, produce a living being similar to that of which they composed a part ; and thus commences the process of solitary generation. In this manner are formed the leaf-buds in vegetables, and thus

"—— The male polypus parental swims,  
And branching infants bristle all his limbs.  
So the lone tenia, as he grows, prolongs  
His flattened form with young adherent  
throings ;

Unknown to sex the pregnant oyster swells,  
And coral insects build their radiate shells."

During the numberless ages that intervened between the advancement of vital fibres to animals, the different circumstances to which individuals were exposed by exciting different wants and sensations, would produce corresponding changes in their organization, and in some of the most complicated *sexual reproduction* would commence. At first the two sexes would be united in the same individual, as we find to be the case in snails; but this soon proving inconvenient, the hermaphrodites, by the help of wishing and imagination, or (in the language of another school of modern philosophy equally rational with Dr. Darwin's) by exerting their energies, would be able to separate the sexes into distinct individuals, and by successive improvements convert a snail into a man and woman.

"In these lone births no tender mothers  
blend

Their genial powers to nourish or defend;  
No nutrient streams from Beauty's orbs improve,

These orphan babes of solitary love;  
Birth after birth the line unchanging runs,  
And parents live transmitted in their sons;  
Each passing year beholds the unvarying  
kinds,

The same their manners, and the same their  
minds.

Till as ere long successive buds decay,  
And insect shoals successive pass away;  
*Increasing wants the pregnant parents vex  
With the fond wish to form a softer sex:*  
Whose milky rills with pure ambrosial food  
Might charm or nourish their expected brood.  
*The potent wish in the productive hour  
Calls to its aid Imagination's power;*  
O'er embryo throngs with mystic charm  
presides,

And sex from sex the nascent world divides."

The evolution of this supremely absurd system is the main object of the two first cantos; the ingenious author, however, finds occasional opportunities of informing us how the more complicated animals originated from the simpler ones. Animal life begun while the earth was yet covered with water; but when the continents were raised by central volcanoes, multitudes of microscopic animalcules would find themselves in the air or on the moist earth, and being thus obliged to adopt new habits and modes of life, would, by degrees, convert their aquatic organs into aerial ones; their

fins would become legs and wings, and their gills be changed into lungs, &c.

"As in dry air the sea-born stranger roves,  
Each muscle quickens, and each sense improves;  
Cold gills aquatic form respiring lungs,  
And sounds aerial flow from slimy tongues."

It grieves us to throw any suspicion on the originality of this luminous theory; but truth obliges us to say that the Abate Fortis has at least as strong a claim to it as Dr. Darwin: this philosopher being of opinion, not merely that microscopic animalcules and some of the simpler animals have learnt to accommodate themselves to a terrestrial instead of an aquatic existence, but that the human race has originated from mermen and mermaids; he is inclined to believe that the celebrated Neapolitan diver, surnamed *the fish*, was, like Achilles, Aristæus, and other heroes of antiquity, very nearly allied to the oceanic nymphs; and that the Greenlanders have but very lately emerged, as is evident from their strong attachment to whale oil and seal-flesh. In a note to the "Botanic Garden," Dr. Darwin throws out a hint that insects may have originated from the male and female blossoms of *vallisneria*, and other diœcious plants; the same idea is repeated in the present work, whence we may conclude that the author considered it as by no means improbable. He repeats also with seeming satisfaction the old Egyptian and Rabbinical notion, that man was formerly hermaphrodite, and sagely remarks, in confirmation, the existence of the rudiments of nipples in the male. That the human race was formerly quadruped, and arose from a family of monkeys on the banks of the Mediterranean, who had accidentally learnt to use the adductor pollicis, he is well disposed to believe, on the authority of those profound and accurate observers, Buffon and Helvetius!

The "philosophical notes," which, from the title page, seem to have been of at least equal value, in the estimation of the author, with the poetical text, besides serving to illustrate the proper subject of the poem, are occupied with various geological and chemical discussions. These exhibit as noble a contempt of facts and philosophical precision as any part of the work; but to enter into a formal refutation of them is neither consistent with our plan, nor with the limits to

which we are restrained. A short example will be sufficient.

"It is probable that much oxygen enters the composition of glass, as those materials which promote vitrification contain so much of it, as minium and manganese; and that glass is hence a solid acid in the temperature of our atmosphere, as water is a fluid one." All future chemists will, we doubt not, hold themselves indebted to Dr. Darwin for informing them that an acid may be composed of siliceous earth, metallic oxyds and alkali, and that water and sulphuric acid are similar substances, though they have not a single characteristic property in common.

We have already observed, that the poetry of this volume is by no means so deeply impressed with the characters of genius as the "Botanic Garden;" there are no passages to be compared with the splendid simile of the balloon, or the sublime description of the army of Cambyzes, in the African deserts, perishing by hunger and overwhelmed by sand. We are disgusted by perpetual repetitions, and no author ever so strikingly exemplified that odious fault of imitating himself: the structure of the verse too is remarkably monotonous, and destitute, in several instances, of that rich harmony which so eminently distinguishes the former productions of Dr. Darwin.

As pleasing exceptions, however, to these faults we shall quote two passages: the first of which is taken from the triumphal progress of Cupid and Psyche, in the second canto, and is exquisitely

harmonious; the second describes the cavern of Oblivion.

"Pleased as they pass along the breezy shore,  
In twinkling shoals the scaly realms adore,  
Move on quick fin with undulating train,  
Or lift their slimy foreheads from the main.  
High o'er their heads on pinions broad display'd,

The feather'd nations shed a floating shade;  
Pair after pair enamour'd shoot along,  
And trill in air the gay impassion'd song.  
With busy hum in playful swarms around  
Emerging insects leave the peopled ground,  
Rise in dark clouds, and, borne in airy rings,  
Sport 'round the car, and wave their golden wings.

Admiring Fauns pursue on dancing hoof,  
And bashful Dryads peep from shades aloof;  
Emerging Nereids rise from coral cells,  
Enamour'd Tritons sound their twisted shells;  
From sparkling founts enchanted Naiads move,

And swell the triumph of despotic Love."

\* \* \* \*

"Deep-whelm'd beneath, in vast sepulchral caves,

Oblivion dwells, amid unlabell'd graves;  
The storied tomb, the laurell'd bust o'erturns,  
And shakes their ashes from the mould'ring urns.

No vernal zephyr breathes, no sun-beams cheer,

Nor song, nor simper, ever enters here;  
O'er the green floor, and round the dew-damp wall

The slimy snail and bloated lizard crawl;  
While on white heaps of intermingled bones  
The Muse of Melancholy sits and moans;  
Showers her cold tears o'er Beauty's early wreck,

Spreads her pale arms, and bends her marble neck."

## CHAPTER XI.

## P L A Y S.

THE loss of popularity which Drury-lane theatre experienced last year from the secession of Mrs. Siddons and her brother, was most amply retrieved by the invention of a thing in which a dog and a wooden doll were the most interesting characters. After such a proof of the public taste, we cease to be astonished at the miserable trash contained in the following articles.

ART. I. *Hear Both Sides; a Comedy, in five Acts; as it is performed at the Theatre Royal, Drury Lane.* By THOMAS HOLCROFT. 8vo. pp. 90.

THIS comedy acts extremely well: there is a good deal of bustle and plot in it, and the dialogue is supported with a considerable degree of spirit. Sir Ralph Aspen, a valetudinary, both in body and mind, is a well-drawn character, and has something of originality in it. There is an inconsistency in suffering Fairfax, who is represented as having so much real

disinterestedness and generosity about him, to behave with such unfeeling contumely, and inhumanity to the starving Milford. His restitution of Old Travis's fortune, too, should have anticipated the personal reproaches of Headlong, Transit, &c. It should not have been possible to have attributed his conduct to a double motive.

ART. II. *Delays and Blunders; a Comedy, in five Acts; as performed at the Theatre Royal Covent Garden.* By FREDERICK REYNOLDS. 8vo. pp. 74.

THE critics of box, gallery, and pit, have passed judgment on this play; we

submit in silence: if they have blundered upon applause, we shall delay censure.

ART. III. *The Voice of Nature; a Play, in three Acts; as performed at the Theatre Royal Haymarket.* By JAMES BOADEN.

IN the third chapter of the first book of Kings is that celebrated judgment of Solomon between the two harlots, which made his wisdom renowned throughout all Israel. A French dramatist, M. Caigniez, selected this as the subject of a play, and Mr. Boaden's "Voice of Nature" is avowedly imitated from the *Jugement du Salomon*. The story is simple and affecting, and Mr. Boaden has certainly confided its effect upon the audi-

ence entirely to its own intrinsic simplicity and pathos. It has succeeded upon the stage without show or bustle, without the aid of elevated sentiment or spirited dialogue. The voice of nature has prevailed; it must indeed find its way to every maternal bosom, and we consider it as honourable to the feelings of an audience, that it should be gratified with such a plain unvarnished tale as this.

ART. IV. *A Tale of Terror; a Dramatic Romance, in three Acts; as first acted at the Theatre Royal Covent Garden.* By HENRY SIDDONS.

WE are sorry to see the name of Siddons annexed to any thing so foolish.

ART. V. *The Maid of Bristol; a Play in three Acts; as performed at the Theatre Royal in the Haymarket.* By JAMES BOADEN. *With an Address to the Patriotism of the British People, as an Epilogue, written by George Colman the Younger.* 8vo. pp. 48.

MR. Boaden is an old stager; he knows very well what will draw a clap from the

gallery, and is not at a loss to throw out something every now and then to please

the pit, and eke the boxes. Every other sentence in this play is in honour of the humanity, the generosity, the nobleness, the tenderness, the patriotism, the — every thing else that is godlike of the British tar. In times like these, as Mr. Colman says in his epilogue—

“In times like these, the sailor of our play  
Much more than common sailors has to say.”

Truth will out, and here it is blunder-

ed out. But Mr. Boaden is no party-man : he is too prudent to trust the fate of his play to the sailors alone ; and very wisely, now that two-thirds of the audience are soldiers, or soldiers' wives and daughters, very wisely he divides his compliments with an even hand between the red coats and the blue trowsers.

The sea-slang of Ben Block glides very glibly off his tongue, and his is the most entertaining character of the piece.

ART. VI. *Hearts of Oak ; a Comedy, in five Acts ; as performed at the Theatre Royal Drury Lane.* By JOHN TILL ALLINGHAM. 8vo. pp. 71.

MR. Allingham seems to have had Kotzebue's *Stranger* in view when he wrote this play. Dorland suspects Eliza, his wife, of infidelity ; is absent from her seventeen years ; returns to England in disguise, is introduced to her, finds her innocent, implores pardon for his injurious suspicions, and the play closes with the prospect of their living very happily afterwards. The singular character of the stranger, however, is not transferred to Dorland, but to Dorland's friend, Ardent, where it is preposterous and unaccountable. When Dorland leaves the

country he gives charge of his daughter to Ardent ; Ardent receives very large remittances for the education of his adopted child, and, in order to stifle any jealousy which might arise in the bosom of his own daughter, at the superior affluence of his friend's, he sends the former out of the way. Can any thing exceed the absurdity of supposing that a man would turn his own child out of doors, and neglect her, that he might take somebody's else ! Mr. Allingham must study the human heart a little more before he can excel as a dramatist.

ART. VII. *Mrs. Wiggins ; a Comic Piece, in two Acts ; as performed at the Theatre Royal Haymarket.* By JOHN TILL ALLINGHAM. pp. 49.

THE audience had sense enough to express their disgust at such insufferable nonsense.

ART. VIII. *Raising the Wind ; a Farce, in two Acts ; as performed at the Theatre Royal Covent Garden.* By JAMES KENNEY. 8vo. pp. 37.

THERE is a good deal of dry humour in this after-piece ; the principal character, Diddler, is very well supported, and with the assistance of Mr. Lewis's acting, we hope Mr. Kenney has found it answer his purpose of raising the wind.

ART. IX. *The Caravan : or, the Driver and his Dog. A grand serio-comic Romance, in two Acts.* Written by FREDERICK REYNOLDS. The Music by William Reeve. 8vo. pp. 46.

IT is curious enough that the principal personage in this “grand serio-comic romance” should be omitted in the dramatic personæ ! Carlo—the dog Carlo, who has brought so many good houses.

## CHAPTER XII.

## ROMANCES AND NOVELS.

IT is a singular circumstance, that the once popular, but, of late years, almost forgotten romance of *Amadis de Gaul*, should have been brought to public notice by two writers in the course of the last year: To Mr. Southey we are indebted for a compressed prose translation of the whole; and to Mr. Rose for a metrical version of the first part of this celebrated work. Of the novels which have appeared since the publication of our last volume, we have selected *Delphine*, translated from the French of Madame de Stael, and *The Depraved Husband*, originating also from a French female writer; because, from their popularity, we suspect that they have already done some mischief, and, if not timely opposed, may be productive of more. *Miss Riversdale's Letters*, the *St. Clair* of Mrs. Helme, and *Thaddeus of Warsaw*, by Miss Porter, are added to our list, as the best among the many incentives to idleness, which the last year's stock of the circulating libraries can exhibit.

ART. I. *Amadis de Gaul: a Poem, in three Books; freely translated from the first Part of the French Version of Nicholas de Herberay, Sieur des Essar, with Notes.* By WILLIAM STEWARD ROSE, Esq. 12mo.

THIS venerable romance has been chiefly known to the public through the medium of Mons. de Tressan's French abridgment. Although we admit that gentleman's lively talents, as well as the extent of his researches into ancient lore, we have never been quite satisfied with his romances, and particularly with his *Amadis*. It is difficult, perhaps impossible, for any Frenchman so absolutely to forget his country, his age, and above all, his own dear person, as to execute a good and sustained picture of former manners. Above all, the solemn and dignified stile of chivalry, exalted too by the formality of the Spanish character, sits awkwardly upon the Parisian man of fashion. It is a masquerade disguise which he finds it impossible to maintain with uniformity; and he therefore ever and anon lifts the mask, slides into a *bon-mot*, a compliment, or a trite sentiment about *la douce humanité*: all which is utterly inconsistent with the grave and masculine manners of the knights and dames of

old, and with the corresponding tone of their historians. Impressed with these feelings, it is with great pleasure that we behold an emulation among the English literati to restore to his pristine honours *Amadis de Gaul*, the model of romance and flower of knights errant. The public have been at the same time favoured with a poetical version of the first book by Mr. Rose, and with a prose translation of the whole four books by Mr. Southey, of which in our next article.

*Amadis de Gaul* differs from most romances of chivalry in the unity and simplicity of the plot, and affords at the same time a greater display of the author's inventive powers. The numerous romances of the Round Table, as well as those of Charlemagne and his Paladins, concern a set of actors, to each of whom earlier tales, or perhaps remote tradition, had already affixed a local habitation and a discriminate character. The story, therefore, frequently referred to older romances on the same subject,

upon which it was founded, or with which it was connected, and was of course in itself imperfect and desultory. But in *Amadis de Gaul* the whole history, the dramatis personæ, nay often the very scene of action, is the pure invention of the author from the stores of his own imagination. Hence his work in this particular has more the plan of a regular epic than the *Orlando Furioso* itself. Mr. Rose seems to have been struck with these advantages, and impelled by them to the task of translating into English verse the first book of this admired work, which, as it concludes with the consummation of the loves of *Amadis* and *Oriana*, is easily separated from the other three, which terminate with their marriage. The translator has chosen the common heroic stanza, of which he has displayed a pleasing command: perhaps we might, from early association, have preferred that of *Spenser* and *Fairfax*, dedicated, as it were of old, to record feats of chivalry, but Mr. Rose may shelter himself under the authority of the late Mr. Way, and the more venerable example of *Dryden*. We proceed to analyze the fable, intermingling some specimens of the poetry.

*Garinter*, an ancient monarch of *Brittany*, had two daughters; the eldest was married to the king of *Scotland*, the second, named *Eliseni*, was termed the *Lost Recluse*, on account of her devotion to religion. *Garinter* in hunting sees a valiant knight beset by two felon barons, both of whom fall under his single arm. He accosts the victor and invites him to his court; upon the road the stranger again signalizes his prowess, by slaying a lion. The knight proves to be *Perion*, king of *Gaul*; and during his residence at the court of *Brittany*, he captivates the affections of the *Lost Recluse*. At a stolen midnight interview their faiths are solemnly pledged, and *Amadis* owes his birth to the meeting. *Perion* returns to *Gaul*, upon hearing tidings of his father's death, under the solemn promise of claiming the hand of *Eliseni* as soon as his kingdom should be settled: but he is prevented from executing his purpose, by a "tide of strange adventures." Meanwhile the *Lost Recluse* is in the utmost danger from a rigorous law, which sentenced to death every maiden who violated the laws of chastity. By the prudent intervention of her confidante, she is delivered of a male child, the famous *Amadis*, who is placed

by the attendant in a small cradle, containing his father's sword and other tokens of recognition, and thus launched into the ocean. The cradle and its contents are rescued by *Gandales*, a knight of *Scotland*, when returning in a galley to his native country. The infant *Amadis*, named the Child of the Sea, is educated with *Gandalin*, the son of his foster-father. Meanwhile *Perion* finds time to wed publicly the *Lost Recluse*. A damsel appears suddenly before him, and in mysterious language announces the chivalrous prowess of his sons. The fair *Eliseni* bears another son, named *Galaor*, but he also is lost to his parents, being carried off by a giant. Meantime the mysterious damsel appears to *Gandales*, declares herself to be a fay or fairy, named *Urganda the Unknown*, and foretells the renown of the Child of the Sea. That noble youth being accidentally noticed by his aunt, the queen of *Scotland*, she requests he may be sent to court. Here *Amadis* first sees the lovely *Oriana*, daughter of *Lisvard*, king of *England*, who becomes the unrivalled lady of his affections. He receives the honour of knighthood from the hand of his own father, *Perion*, who comes to *Scotland* to request aid against the invasion of *Abyes*, king of *Ireland*. *Amadis* sets out to join the Scottish army raised for this purpose. On his way he receives a lance from *Urganda*, with which he frees his father, *Perion*, imprisoned by a false old knight, and abolishes the evil customs of *Galpan*, a lawless baron, who, not content with oppressing knights and dishonouring damsels, was wont to impose upon them certain hard and intolerable conditions. By these achievements the renown of *Amadis* is highly exalted, when attended by *Gandalin*, his foster-brother, now acting as his squire, he joins the Scottish succours, and reaches *Brittany*. In a desperate battle the Irish prove successful, notwithstanding the prodigies of valour achieved by *Amadis* and his father. But the issue of the war being pledged on a single combat betwixt the young hero and the Irish king, the latter is slain by *Amadis*, and the invading army retreat with his dead body. His victory is followed by a discovery of our hero's birth, in consequence of the tokens with which he was exposed being recognized by his mother. Shortly after this happy event, *Amadis* departs for *England*, under pretence of seeing the court of king

Lisvard, but in reality again to enjoy the society of the lovely Oriana. In passing a forest he again meets Urganda, to whom he renders an essential service, and by whose direction he bestows the order of knighthood upon a youth, who proves to be Galaor, his own brother. Proceeding on his adventures, he is be-nighted near a castle during a heavy storm.

“Gay glittering forms athwart the case-  
ment glance,

And loud resounded minstrelsy and dance;  
Long at the gates he shouted, in the sound  
Of mingled dance and song his cries were  
drown'd:

At length a voice, ‘I wot some craven knight,  
Some losel vile that fears the face of light;  
Hence from my gates! hence while unscathed  
ye may,

And bless thy dole that sent thee not by day.’

‘Caitiff accursed,’ made Amadis reply,

‘Bereft of grace, devoid of courtesy,  
Swift let my blazing torches lend their light,  
And take my fierce defy to mortal fight.’

‘Bethinks me, sir,’ the taunting churl re-  
plied,

‘More ire than wit thy random speech doth  
guide;

With screech owls and ill-omen'd birds of  
night

I wage not, I, unprofitable fight.

But so it please thee ill-advised remain,

Here bide the piercing cold and pelting rain,

And eftsoons as Aurora's dawning light

Shall serve to guide my conquering arm aright,

Long wish'd for tho' it come, I'veen the day

Shall ill the night's bad harbourage repay.

Now hold thine host excused if he retire

To lead the festive dance, to joy the lyre,

And with fair dames the spicy goblets quaff.’

He said, and ended with a churlish laugh.”

Amadis, repulsed from this inhospitable castle, finds shelter in the pavilion of a damsel, where he learns that the churlish castellan, Durdan by name, was on a certain day to maintain by combat in the lists, the right of his paramour to certain fiefs and lands possessed by another lady. It will readily be guessed that Amadis appears as the adverse champion, and discomfits the discourteous Durdan. He is welcomed by Lisvard, but more tenderly in a private interview with Oriana.

“Say, lordings gay! say damsels bright in  
bower!

Who reap love's sweets, and own his magic  
power,

What blissful thoughts these faithful lovers  
share?

What ceaseless transports joy the tender pair?

For all too faint the poet's art, I wis,

To paint in seemly guise their rapturous bliss.”

After some stay at King Lisvard's court, Amadis resumes his profession of knight-errantry, and encounters Arcalaus, redoubted as a knight, but yet more terrible as an enchanter, in his own castle. Our hero, successful in the combat, is nevertheless imprisoned in an enchanted chamber in the castle; and Arcalaus, clothed in his arms, repairs to the court of Lisvard, and announces his having slain the heir of Gaul. The consternation of the court, and the despair of Oriana is soon removed by the appearance of Amadis himself, liberated from the dungeon by the superior spells of Urganda. Meanwhile an old man with two knights, to whom he was apparently captive, enters the court of Lisvard, and commits to that monarch's care a splendid crown and mantle, desiring that they should be restored on the next plenar court-day, or that the king should in lieu grant him a boon. The old man and his attendants accordingly appear at the *cour pleniére*, and the king, unable to produce the treasures (which had been stolen from his custody by enchantment), is compelled by his knightly faith to grant the boon demanded, which is no other than the surrender of Oriana to the strangers. The obligation of the “boon granted” (*don octroyé*) permitted no evasion, and the princess was delivered up to the disguised Arcalaus, by whose art this stratagem had been executed. Amadis was not in court when this extraordinary scene took place; but, apprized by his faithful squire, he waylays the ravishers, and dealing among them death and discomfiture, rescues from their hands the beloved Oriana. A bank by a fountain engages the lovers to rest on their return to London. Here the lovely princess becomes conveniently and obstinately drowsy, though Amadis attempts to awake her by the most endearing caresses.

“Or slept the damsel still, or paused the  
knight,

I wot not, I: wo worth the daring wight  
Who steals on hymen's joys, and boldly wrays  
Fond love's mysterious rites to vulgar gaze!  
But sooth to say, if still soft slumber weigh'd  
The drooping eyelids of the royal maid,  
A dream of more than mortal joy, I wis,  
Lapt the sweet damsel's every sense in bliss.”

With the mutual happiness of the lovers concludes this elegant version of the first book of Amadis. Mr. Rose's

style, which is simple without meanness, and from a judicious intermixture of ancient words, has an antique and interesting cast, is well suited to the nature of the subject. Among these phrases we observe the verb *gar*, (*to cause to do*,) which we believe is exclusively a Scottish expression, and therefore should not have been used. An occasional monotony occurs in the poem, which we conceive to arise from Mr. Rose having chosen to abridge certain parts of the narration, which he could not avoid alluding to for the sake of distinctness, and which his plan did not suffer him to dilate into description. All mere narrative conveyed in verse has a cold and creeping effect. In those passages where

Mr. Rose has given more rein to his imagination, the descriptions are natural and spirited, and the adventures well selected. We think, however, more use might have been made of the volatile Galaor, whose fickleness in amours forms, in the original romance, such an admirable contrast to the fidelity of his brother. Notes are added to this pleasing poem, in which Mr. Rose displays considerable acquaintance with the manners of the middle ages and the laws of chivalry. Two elegant imitations of Ovid, entitled, "*Elisena Perioni*," and "*Guendolena Locrino*," are prefixed to the poem. They are the contribution of the honourable William Herbert, the friend of the author.

ART. II. *Amadis de Gaul: by Vasco Lobeyra. From the Spanish Version of Garcior-donez de Montalvo. By ROBERT SOUTHEY. 4 vols. 12mo.*

THIS article is so intimately connected with the last, that referring to our account of the first book of *Amadis*, as versified by Rose, we proceed with the story of the following three books from the prose translation of Mr. Southey.

While the enchanter Arcalaus was practising his ineffectual stratagem upon the peace and honour of Oriana, he had organized against Lisvard a grand revolt headed by a false traitor, named Barsinan. *Amadis* was mean time engaged in delivering the princess, and in reaping the reward of his victory; but his brother Galaor suppressing by his valour this formidable insurrection, the court of Lisvard was restored to safety and splendour by the united exertions of the brothers of Gaul. *Amadis*, to increase his renown, seeks to accomplish the adventure of the Firm Island, an enchanted domain, containing certain perrons (pillars), by which the fidelity of lovers might be ascertained. The probationers were able to advance only in proportion to the warmth and constancy of their affection, and the ground of trial was terminated by a most splendid apartment, which was only accessible to the most valiant knight and the fairest lady in the universe. *Amadis* penetrated into this beautiful chamber, and was acknowledged as their lord by the inhabitants of the Firm Island. While he was triumphing in his conquest, he received an unexpected and heart-rending letter from Oriana, who, by a concurrence of circumstances, had been led to believe him false to her love.

Her letter branded him with disloyalty, and forbade him ever to appear before her. The superscription, like that of Don Quixote's letter from the Sierra Morena, bore these words: "I am the damsel wounded through the heart with a sword, and you are he who wounded me." *Amadis*, on receiving this letter, abandons his conquest in despair, and betakes himself to a solitary island, or rather insulated cliff, called the *poor rock*, where he does penance with a hermit until he is reduced to death's door. Oriana, however, being at length undeceived, discovers with difficulty his retreat, and commands him to live for her sake. The obedient knight recovers at his lady's command, and repairs again to the court of Lisvard, where he performs miracles of valour in defence of the English monarch, which are duly rewarded in secret by his grateful daughter. Meantime certain envious courtiers excite a jealousy of *Amadis* and his friends in the mind of Lisvard, who, forgetting his own character and their services, treats them at first with coldness, and at length with absolute injustice and contempt. Fired at this usage, *Amadis* himself, the knights of his kindred, and many others, whom he had subdued by arms or attached to him by courtesy, renounce formally the service of Lisvard, and retire to the Firm Island. *Amadis* himself, incapable of making war upon the father of Oriana, wanders through the world under various disguises, quitting his arms and cognizance as soon as his great deeds had

made them distinguished, and assuming others which were till then unknown. He even comes to the assistance of Lisvard when sorely distressed by his enemies, and with his father and brethren aids him in procuring a decisive victory. But Lisvard, hardening his heart against conviction, refuses to receive Amadis to favour, and he leaves Britain in despair, narrowly escaping the snares of Arcalaus, by whom he was again imprisoned. Meanwhile Oriana is secretly delivered of a son, named Esplandian. The infant is carried off by a lion, but is finally reared by a holy hermit, called Nasciano. Amongst the subsequent adventures of Amadis, that of the Endriago is distinguished for its wildness. This monster was born of a giantess, by incestuous commerce with her own father. The idols whom its parents glutted with human sacrifices conferred on their unnatural offspring the strength and courage of a lion, the wings and talons of a griffin, and the free-will of a human being. Its first exercise of its privileges was to suck some five or six nurses to death, shortly after it slew its parents, and finally it laid waste the island where it was born, which from that time was called the Devil's Island, the body of this monster being tenanted by a foul demon. Amadis, on hearing this history, landed on the isle, and, attended by his squire Gandalin, went in quest of the monster.

"The Endriago came bounding over the rocks; but fiercer and more terrible than ever; and the reason was, that the devils seeing how this knight put more trust in his mistress Oriana than in God, had power thereby to enter it and make it more terrible, thinking that if that knight perished there would be none other so bold as to attack this monster. The Endriago came on, breathing smoke and flames of fire in its fury, and gnashing its teeth, and foaming and rustling its scales, and clapping its wings, that it was horrible to see it; and when the knight saw it and heard its dreadful voice, he thought all that had been told him was nothing to what the truth was, and the monster bounded towards them more eagerly, because it was long since it had seen a living man. But the horses took fright at seeing it, and ran away in spite of all the knight and Gandalin could do: so the knight dismounted and said, 'Brother, keep you aloof that we may not both perish, and see what success God will give me against this dreadful devil; and pray to him to help me, that I may restore this island to his service, or if I am to die here to have mercy upon my

soul: for the rest, do as I have said before.' But Gandalin could not answer for exceeding agony, for assuredly he thought his master's death was certain, unless it pleased God miraculously to deliver him. The green-sword knight then took his lance, and covered himself with his shield, and went against the Endriago as a man already dead, but without fear. The devil seeing him come, snorted out fire and smoke so black and thick that they could scarcely see one another; and he of the green-sword went on through the smoke, and drove at the monster with his lance, and by great good fortune pierced it in the eye; it caught the lance with its talons and bit it into pieces, and the iron and a fragment of the stave remained driven in through its tongue and the skin of the throat, for it had sprung on upon it, thinking to seize the knight, but he defended himself with good heart seeing his exceeding peril, and the shock of this wound repelled the monster; and the blood ran fast, and with the shrieks it gave ran down its throat and almost choked it, so that it could neither close its mouth nor bite with it. The knight then drew his green sword and struck at it, but the blow fell upon its scales and felt as though it had fallen upon a rock, and it made no impression; the Endriago thought then to grasp him, but only caught his shield, which it plucked so fiercely that he fell upon his hands, but he recovered, while with its talons the monster rent the shield to pieces. He then, seeing that his shield was gone, and that his good sword availed him nothing, knew that he had no hope unless he could strike the other eye. Now the Endriago was faint and weak with its wound, and our Lord having wrath that the wicked one had so long had the dominion over those who, sinners as they were, believed his holy catholic faith, was pleased to give the knight strength and especial grace to perform what else, by course of nature, could not have been done. He aimed his sword at the other eye, but God guided it to one of the nostrils, for they were large and spreading, and so hard he thrust that it reached the brain, the Endriago itself forcing it on, for seeing him so near it grappled with him and plucked him towards itself, and with its dreadful talons rent away the arms from his back, and crushed the flesh and bones to the very entrails: but being then suffocated with its own blood, and the sword being in its brain, and above all the sentence of God being passed upon it, its grasp released and it fell like one dead, and the knight plucked out his sword, and thrust it down his throat till he killed the monster. But before its soul departed, the devil flew from its mouth, and went through the air with a great thunderclap."

After this horrible adventure, in which we acknowledge the bold imagination of the old romancer, Amadis continues to

signalize himself by various deeds of prowess. Meanwhile Lisvard, blinded by ambition, betrothes his daughter Oriana to El Patin, emperor of Rome, thinking by that means to secure the succession of his crown to his younger daughter, whom he especially favoured. As this was contrary to the feudal establishment, his best counsellors and vassals remonstrate against it, but in vain. Oriana is embarked on her journey to Rome, when the Roman fleet is attacked by that of the Firm Island, totally defeated, and the princess carried to the island in triumph. Lisvard levies an army to avenge this insult, and two desperate battles are fought betwixt him and the knights of the Firm Island. At length, however, by the intervention of the hermit Nasciano and that of the young Esplandian, the loves of Amadis and Oriana become known, and a reconciliation being accomplished betwixt him and Lisvard, both armies turn their swords against Arcalaus, who had hovered in the mountains to assail them when exhausted by mutual wounds. The romance concludes with the final defeat of the false enchanter, and the triumphant entry of Oriana into the forbidden chamber, by which the enchantments of the Firm Island were terminated; but above all with the marriage of Amadis and Oriana, the boldest knight and the most beautiful damsel in the universe.

From this meagre sketch the reader may perceive at least the unity of the story of Amadis, in which all the adventures combine as directly to the same grand end as in the wrath of Achilles, or the wanderings of Ulysses, sung by the earliest romance writer, as well as the most sublime poet of antiquity. But the liveliness of the subordinate adventures of Don Galaor, together with the pointed discrimination of the inferior characters, can be only learned from the work itself. We venture to say that those who seek mere amusement will not be disappointed of their aim; and that those whose object is information, may learn more of the manners of chivalry, as well as of the structure of the ancient romance, by an attentive perusal of Amadis, than by a thousand modern essays. We greatly approve of the stile in which Mr. Southey's translation is executed. Disclaiming every idea of modernizing what is chiefly valuable for being ancient, he has adopted a strain

of language perfectly intelligible to modern readers, but from the arrangement of the sentence and the occasional use of phrases, which, though not obsolete, are at least antiquated, he has united clearness with an appropriate and venerable cast of antiquity. Mr. Southey's original intention seems to have been to correct and republish the old English translation of Anthony Munday, but he judiciously exchanged his plan for a new version of the Spanish original, with the use of a copy of which he was accommodated from the valuable collection of Mr. Heber. The work is shortened, but not abridged. All unnecessary recapitulation and circuitry of expression is avoided or condensed, and thus without omission of a fact or sentiment, the translation is one half shorter than that of Munday.

Some preliminary remarks are given by way of preface, in which Mr. Southey ardently maintains that Amadis de Gaul was first written in the Portuguese language. The authors of that nation (with a single exception) claim it as the original composition of Vasco Lobeira, a valiant knight of Lisbon, who flourished during the reign of King Joam, and died at Elvas in 1403. The Portuguese edition of Lobeira is not now known to exist, the earliest version being executed by Garciondonez de Montalvo, a Spaniard, who professes to have compiled it from ancient histories. We do not think that Mr. Southey has clearly made out Lobeira's title to be the original author, at least in the strictest sense of the word. Nicolas de Herberay, Sieur des Essars, who in 1574 executed a French translation of Amadis from the Spanish of Montalvo, says, that he had seen a remnant of an old MS. on the same story, written in the Picard language, from which he thought that the Spanish authors had made their translation. Mons. de Tressan, after describing the collection of French romances lodged in the library of the Vatican by Christina of Sweden, affirms positively that he remembers there to have seen Amadis de Gaul written in very ancient French, being what Herberay described as the Picard language, the dialect of Picardy corresponding precisely to the romance language during the latter part of the reign of Philip Augustus, and through those of Louis VIII. and of St. Louis. See the epistolary dedication of Herberay, prefixed to his translation,

p. 5. Corps d'Extraits des Romans, tom. iii. p. 4. Fontenelle Theatre, tom. iii. We do not think that the direct testimony of these two witnesses. (Frenchmen although they be) to the existence of a work which they themselves saw, can be weighed down by the negative affirmation of the Portuguese writers. But enough of praise will remain to Lobeira, if we suppose it was he who first modelled the romance into its present shape; and in this view his inventive powers will deserve as much praise, as if he had not assumed for the ground-work the rude lays of some ancient French minstrel. Had Milton executed his projected epic upon the story of Brutus, the tale of Geoffrey of Monmouth would have little injured his claim to originality.

Mr. Southey in his preface touches upon the endless continuations, so inartificially tacked to the original Amadis

by a herd of Spanish imitators. In these ill-adapted supplements, which swelled to an immense size, the dignity of the original Amadis was inflated into the most insupportable bombast, the wildness of his magic into puerile *diablerie*, nay the morals were depraved, although Herberay tells us, "*toutefois ils ne sont a rejeter; car il se trouve maintes bonnes exemples, qui peuvent servir pour la salvation de noz ames.*"

Our limits would be exceeded by further commentary on this interesting article. In our opinion, the public is much indebted to Mr. Southey for restoring to general inspection what may be justly termed a classical romance of the first order, while the *raciness* of the original is so admirably preserved, that but for the introduction, the modern orthography, and the modern type, we could have believed it written under the auspices of the house of Tudor.

### ART. III. *Sappho; after a Greek Romance.* 12mo. pp. 310.

WIELAND, in the preface to his *Peregrine Proteus*, assures us, that he enjoys the possession of a talent in common with the renowned spirit of Swedenborg, by virtue of which his soul transports itself at times into the company of departed persons, and according as it is inclined, can either hearken unseen to their conversations with each other, or if it chooses, can join in conversation with them. Wieland has often exercised this faculty with the greatest advantage; for whenever his soul, after any of its visits to the departed shades below, or the Olympic gods above, returns into its earthly body, we are made very accurately acquainted with the conversation that passes among philosophers and moralists, and even among the immortals themselves.

The author of the present volume has thus endeavoured to transport his readers into Greece, and introduce them to the company of the Lesbian muse. We meet her at dinner, we meet her at supper; we listen to her conversations with Eutychius and Nomophilus, and among other important subjects, hear discussed with becoming gravity and seriousness, the grave and serious questions "whence arises that attention with which we behold fountains?" and "why, during the severity of winter, is it so pleasing to assemble round the family hearth?" These are deliberated upon at length, and thus

is the knotty question solved: "I believe, answered Nomophilus, that it is from the varying motion of those objects; and if such be the case, he continues, with much facetiousness, "let us go in quest of fresh amusement from motion and variety—having remained here long enough!"

The story of Sappho is doubtless well fitted to be the ground-work of a romance; but in such hands as those of Wieland, it would have been made the vehicle also of much critical and philosophic learning: here it is a mere story. The author has scraped together what history has recorded of this unfortunate female, for the sake of effect has added a few circumstances from the stores of his own fancy, and altogether produced a decent novel for the shelves of a circulating library.

If history has not left it quite certain whether Phaon was insensible to the ardour of Sappho's passion, or unfaithful to his vows, the testimony in favour of the latter opinion certainly preponderates.

"*Cantabam: meminî (meminerunt omnia amantes)*

*Oscula cantanti, tu mihi rapta dabas,  
Hæc quoque laudabas; omnique a parte placebam*

*Sed tunc precipue, cum fit amoris opus."*

Ovid agrees with those who assert that she lost her parents when very

young ; and if not a wife, that she was at least a mother :

*" See mihi natales ierant, cum lecta parentis  
Ante diem lachrymas ossa bibere meas."*

*" Et tanquam desint, quæ me sine fine fatigent  
Accumulat curas filia parva meas."*

HEROID XV.

Our author, on the contrary, makes Sappho a virgin ; leaves her father and mother alive, and disconsolate at her flight into Sicily ; and although Phaon is related to have received his death from the hand of an enraged husband, who surprized him in bed with his wife, he is here represented as most conscientiously insensible to the caresses of Sappho, his faith being pledged to a rival virgin !

Some authors have supposed that the beautiful ode which is preserved in Longinus, was addressed to one of her female favourites ; but the writer of this volume asserts, " that none of these scandalous histories have record or repute in Mitylene : " he has, therefore, translated this

ode, and made Sappho address it to Phaon.

*" As blest as a goddess is she,  
Who, sitting beside thee awhile,  
Can hear thy sweet converse, and see  
Thy face that enchants with its smile."*

*" Yet this of its ease robb'd my heart ;  
For, when lovely Phaon was nigh,  
My tongue not a word could impart,  
Its accents half-utter'd would die."*

*" Flames subtly pervade ev'ry vein ;  
Mine eyes with thick mists swimming  
round,*

*All dark on a sudden remain ;  
Mine ears in deep murmurs resound :*

*" Cold dews o'er my body prevail ;  
I tremble quite through me and sigh ;  
My cheeks like sick roses grow pale ;  
And, breathless, I fancy I die."*

That any body should satisfy himself with this sing-song ditty, after the glowing version of Ambrose Phillips, or the more close but less spirited translation of the same fragment by Mason, is perfectly astonishing ! The translation of the Hymn to Venus is in a better style, but will not bear a comparison with that of Ambrose Phillips.

ART. IV. *Thaddeus of Warsaw.* By MISS PORTER. 12mo. 4 vols, about 220 pages each.

THE high spirit of patriotism which animates the bosom of Thaddeus, could not have been more opportunely displayed than at this moment, when the alarm is revived of a meditated invasion from the most implacable and unmerciful of foes. Historical truth is in these pages made the handmaid of fiction : Miss Porter, desirous of portraying a character, which prosperity cannot intoxicate nor adversity depress, has chosen magnanimity as the subject of her story. Nowhere have the reverses of fortune given more ample scope for the display of this virtue than in Poland, whose unassisted sons struggled valiantly for her independence, and were afterwards doomed to grace the victorious car of their barbarian conquerors. Miss Porter has introduced some of the leading characters and events in the last hapless efforts of that ill-fated country : he who can read the exploits of a Kosciusko and a Sobieski, without feeling his bosom warmed with the generous emotions of patriotism, would hear the beat to arms in defence of his own shores with a cold and insensible heart.

We cannot for one instant doubt but

that *our* resistance will be more successful, and that France will lead her ineffectual hordes to disgrace, discomfiture, and death ; but in order to give additional vigour and effect to that resistance, let the massacres at Ismael and Prague be present to our recollection. The blood-stained hero of those scenes, indeed, is gone to answer for his guilt ; but there is a living likeness left behind him, who would revive those scenes in all their horror : should his foot reach England,

*" The thirsty entrants of this soil,  
Would daub her lips with her own children's  
blood."*

Far is it from us to insult the misfortunes of a fallen man, but we cannot think the unhappy Stanislaus deserves all the encomium which Miss Porter bestows on his character : his intentions were benevolent, and he wished to save the lives of his subjects. But through age, probably, and infirmity, his mind had lost its vigour at that momentous crisis, when more than its pristine vigor was demanded. When at a council of deputies he laid before them the dispatches of the empress, and determined

to surrender at discretion, she should have put himself at the head of his army, he should have recalled to memory the unconquerable valour of La Valette, and he would have found that the nobles of Poland could emulate in intrepidity and persevering courage, the brave knights of Malta: *perhaps* Suwarrow and Bri-

nicky might have retired abashed, like Mustapha, and Hassem, bearing back to Catherine, as these did to Solymán, the ghost of a departed army!

In Vol. II. p. 191, Miss Porter has unaccountably attributed Ambrose Phillips's translation of Sappho's celebrated ode, to Mr. Addison.

ART. V. *Very Strange but very True! or the History of an old Man's young Wife. A Novel.* By FRANCIS LATHOM. 12mo. 4 vols. about 240 pages each.

MR. LATHOM is a gentleman who very frequently amuses himself in writing novels and plays. We have read some of his productions, and they have generally evinced a fertility of invention, rather than any refinement of taste, or cultivation of the understanding. His forte is low humor. In the present instance he has descended to mere vulgarity: the characters here introduced are to the last degree unnatural, the story and the incidents equally improbable.

We regret that Mr. Lathom should waste his time and talents in this manner: instead of writing a foolish novel once a month, if he studied character with attention, and gave himself time to mature his plans, rather than trust to his invention as he proceeds, we are inclined to believe that he might produce something which would do him credit. That he should not perceive how much he lowers himself in the public eye by writing such stuff as this, is *very strange but very true*.

ART. VI. *The Depraved Husband and the philosophic Wife.* By MADAME GENLIS. 12mo. 2 vols. pp. 325.

MADAME GENLIS has endeavoured to shew the absurdity and viciousness of what is called *modern philosophy*, by exhibiting characters in which its principles operate in full force. We have several

novels on this thread-bare subject in our own language, far more ably executed than the *Depraved Husband* and the *Philosophic Wife*, which is as dry and uninteresting a *lecture* as we ever read.

ART. VII. *Estelle: a Pastoral Romance.* By M. de Florian, Member of the French Academy, and of those of Madrid and Florence. Embellished with seven Plates. Translated by Mr. MAXEY.

TO translate, though a humble, is not always an easy task. "Grace," as Florian justly observes in the introduction of this very work, "is not translatable;" and grace is almost the sole merit of *Estelle*—grace too of a kind so purely French, that the author himself could not have transfused it into another language.—The plot of this romance is equally Gallic with the style, and most peculiarly uncongenial to English feelings.

The childish fondness of *Estelle* and *Nemorin* has ripened, on their attaining the age of sixteen, into a passion which of course is pronounced invincible. The father of *Estelle* then induces *Nemorin* to banish himself from his fair shepherdess and his native village, by acquainting him that he had promised an old friend on his death-bed to marry her to his son. The shepherdess *virtuously* consents, without a moment's hesitation, to obey her father, by resigning her hand

to one man, while she cherishes in her heart the fondest passion for another. Circumstances, however, occur to delay this horrible marriage; and the supposed death of the father, and the absence of the intended husband, leave *Estelle* at liberty to contract herself to her first love. In vain! the old man comes to life again, the young one returns, the *submissive* damsel receives this *qui pro quo* without a murmur, and the wedding is concluded. We must not, however, partake the despair of our disappointed hero; to husbands in the situation of *Meril*, it is, indeed, "dangerous to take a cold, to sleep, to drink," how much more to go into battle! *Meril* is killed: the heroine in a very curious soliloquy on his grave, informs the hero and the reader that he had been her husband only in name, and that her heart is unchanged. She insists, however, on mourning her full year, with an attention to punctilio truly admirable

in so fond, and so simple a shepherdess : after this, hands are joined, and all parties made happy.

We have detailed the story of this romance thus fully, for the purpose of exposing the false and dangerous principles of conduct adopted even by those French writers who seem to pique themselves on decency and morality ; for, by how many besides Florian, is the “ legal prostitution” of a marriage, against which the heart revolts, cried up as the most heroic of sacrifices, at the same time that the first love is represented as unconquerable, and the obstinate perseverance in it, after the most sacred vows have been exchanged with another object, this adultery of the heart, is made the test of exalted sentiment, and a soul superior to the common kind ! Thus, by an absurd and cruel contradiction, the most amiable characters are rendered at the same time the slaves both of duty and passion, on the success of which attempt, “ to serve two masters,” the manners of modern France afford an ample comment. Wiser was the attempt of Madame de

Genlis utterly to expel the tender passion from the female bosom at least, in a state of society which afforded scarce a hope of its innocent gratification ! Wiser still, and much more consonant with the best feelings of our natures, is the system of the English law, which, by restricting the authority of parents within moderate bounds, and enabling young persons to follow, in a considerable degree, the dictates of their own hearts, spares the anguish of concealed and hopeless love, while it checks the frenzy of illicit passion.

Long may the indulgence of our laws guard the strictness of our manners ; and while we spurn our neighbours’ fetters, on one hand, let us not adopt, on the other, that unbridled licentiousness which slavery has produced, and slavery alone can palliate.

We are not displeased to conclude this article, by pronouncing, that the execution of the translation is little calculated to recommend the design of the original. The prose is very bald *French English*, and the verse is contemptible.

ART. VIII. *St. Clair of the Isles ; or, the Outlaws of Barra, a Scottish Tradition.* By ELIZABETH HELME. 4 vols. 12mo.

AMID the masses of dulness and vulgarity intruded on the public under the title of novels and romances, it is not a little refreshing to us to meet with any thing that relieves our weariness, and interests our feelings. The demand for works of this class is much too large to be entirely supplied by first-rate artificers ; when, therefore, a piece comes to hand, free from stain and mildew, and turned out in a conscientious and workman-like manner, we are eager to recommend it to our customers, even though it should be found deficient in perfect symmetry of pattern, exquisite brilliancy of colouring, and laborious accuracy of finishing.

The tradition on which the romance before us is founded, possesses both interest and novelty : the characters are sketched with considerable strength, and blended and contrasted not unhappily. The scene is laid in North-Britain, during the 15th century ; but the manners

and language are those of an age and nation much more refined than Scotland under the two first Jameses. This is a kind of anachronism, however, which it would be idle to represent in a heinous light, when the genuine language of the country could not be understood by an Englishman, nor the unvarnished manners of the times tolerated by a modern.

The style of Mrs. Helme is deficient in grace, in polish, and sometimes in grammar ; but it is clear and unaffected, and displays the fluency of a practised writer, though not the accuracy of a scholar. The heroine may be thought somewhat too forward, and more eager than beseems a modest damsel to share the fortunes of “ a banished man condemned in woods to roam.”

But on the whole, we may promise the readers of these volumes a considerable share of entertainment, enjoyed free of expense to morality, propriety, or common sense.

ART. IX. *Letters of Miss Riversdale, a Novel, in three Volumes, 12mo. about 370 pages each.*

THIS novel is not to be confounded with the vulgar trash of the day : the author is one of those who have seen the *mores hominum multorum Turbes*, and who

has not suffered the advantages of an extensive intercourse with mankind to pass unheeded away. In a sort of prefatory advertisement some anxiety as to the success of this 'artless tale' is expressed, from the prevailing taste of the day for the marvellous dramatic; contrary to the usual mode of dressing fiction in the semblance of truth, we are told, that in the present instance pains have been taken to dress truth in the garb of fiction; "still it is fiction so devoid of adventure, so little deviating from the natural result of the genuine workings of a susceptible mind, that its chief claim to interest must rest upon the corresponding emotion it will excite in every unsophisticated honest heart." The mere story, indeed, is so extremely simple, that we should convey a very inadequate and injurious idea of this novel by a dry and meagre relation of it: Miss Riversdale, who addresses these letters to her absent brother, is at a very early age impressed with a deep sense of gratitude to Colonel Malcolm, for the parental guardianship which he assumes over her conduct. Young, beautiful, amiable, and accomplished, protected only by a mother, who for the advantage of conferring on her daughter an unexpensive education, had left her native country and retired to Geneva, Miss Riversdale is exposed to the flattery of fops, and the artfulness of knaves. Malcolm warns her of the danger, but his friendship is not perfectly disinterested: the charms of his protégée make an impression on his heart, and notwithstanding the very great disparity of years between them, he is induced, from the frequent and sincere expressions of esteem and gratitude which had flowed from her lips, to hope that he may have inspired her with a more tender passion. She admits his addresses; but the colonel, with an honest and an honourable heart, is haughty, coarse, and intemperate: his love degenerates into jealousy, and the workings of this turbulent and detested passion are strikingly portrayed in the character of Malcolm. His suspicions are excited to the very highest pitch by the assiduities of Prince Polinski, a most accomplished character, into whose company Louisa Riversdale is frequently thrown, and to whose talents, virtue, and grace of body and of mind she is far from being indifferent.

To the unreasonableness of his jea-

lousy in its commencement, Colonel Malcolm might fairly have attributed the too just grounds for it which now existed: it had so frequently hurried him into violence, and even brutality of behaviour towards Miss R. that all her friends were alarmed at the certain misery which awaited her. The attachment of Miss R. indeed had been so sensibly weakened, that she had unguardedly expressed a conviction that the fulfilment of her engagement with the Colonel would make her wretched; nevertheless, she says, "I must abide by it; from the dictates of honour there is no appeal." Under such an impression, happiness in the marriage state is not to be looked for; and Lady Riversdale, without the knowledge of her daughter, addresses a letter to Colonel Malcolm, who is at Venice, stating the situation of Louisa's feelings, and throwing her upon his honour for releasing her from an engagement which she is determined to fulfil, although it blasts every hope of happiness. The colonel, before he replies to Lady R. writes to Louisa, incredulous that her affections were so estranged: "no pen but your own shall make me believe it. I await my fate at your hands."

Lady Mary Melville is a character who effectually forwards the action of the piece here: in earlier life she had been fascinated with the accomplishments of Colonel Malcolm, who was not equally sensible of her charms. The brother of Lady Mary, a Scotch gentleman of fortune, who affectionately sympathized with his sister's sufferings, had deviated from the ordinary delicacies which prohibit the unsolicited avowal of a female passion, and had gone so far as to make overtures to the colonel in behalf of one who had

"let concealment

Like a worm i' the bud, feed on her damask cheek."

The colonel, however, was too much a man of honour to bestow his hand where he could not give his heart: a sincere friendship had nevertheless been cultivated between them, and some recent acts of disinterestedness on the part of the lady, had given it additional force and ardor. Our readers will not fail to recognise in this story some of the features of *Clementina*, in Sir Charles Grandison.

At the time that Lady Riversdale addressed her letter to the colonel, Louisa was confined to her bed at Paris, in so dangerous a state of illness, that it was not even thought prudent to indulge her with the perusal of any letters which were sent to her; of course she was unable to answer any. Colonel Malcolm considered her silence as a confirmation of the mortifying intelligence he had received from Lady Riversdale, to which, therefore, he now returned an answer, releasing Louisa from an engagement which appeared to her so pregnant with wretchedness. At the same time he addresses a letter to Lady Mary Melville, complaining of the treatment he had received, and expressing his regret that he had not been more sensible of the honour done him by her partiality, at a time when it offered a prospect of the steady and unalloyed satisfaction for which a rational man ought alone to look in a matrimonial connection. He states that rejected, cast off, as he now is, it would be an insult to court her acceptance of his hand, intimating, however, at the same time, that the slightest encouragement would bring him to her feet. Lady Mary immediately writes to Miss Riversdale for an explanation of the mystery: the favourable impression which Colonel Malcolm had made on her heart is indelible; but she has too high a sense of honour to accept of his hand, without previously informing herself from Louisa's pen, of the circumstances of the case. The same illness, however, which incapacitates Louisa from answering the colonel, incapacitates her from answering Lady Mary, who draws a similar inference from her silence; and is prompted to return a flattering answer to the long-lost object of her affections, telling him that if his proposal is not solely dictated by anger against Miss Riversdale, but really arises from a wish to pass his life with a woman, whose every thought will be subservient to his pleasure, she is ready to convince him that her affection is of that generous sort which only seeks the happiness of its object, and that he may command her hand whenever he pleases to call for it.

It must be acknowledged that the god of silence is not called in here to accomplish a difficulty unworthy of his interference. The author, indeed, must have been a good deal puzzled to get Louisa out of the scrape, and tie the

hands of the colonel before he had recourse to so singular a correspondence as that which produced the present happy extrication. We consider this as one of the clumsiest manœuvres in the novel; it has a number of excellencies, but is not without faults, some of which we shall notice as we proceed.

After a very lingering illness, Louisa at length recovers, and goes into company; this gives the author an opportunity of shewing his intimacy with Parisian manners and characters, which indeed are sketched with a very skilful hand: he is master of colloquial French, and seems to be versed in the idiomatic niceties of the language. The conversations with which the novel abounds are extremely characteristic: as the subject of the following, which takes place at the English ambassador's hotel, is generally interesting, we shall give it as a specimen:

"At dinner the conversation was uncommonly brilliant, chiefly supported between the Marchioness and Mr. Stanville; she speaking French, he English. Wit sparkled on both sides, but I thought a great deal of what Madame de Stanville said borrowed its prettiness from the language in which it was spoken; while Mr. Stanville lent a grace to his expressions, of which I was not aware the English language was susceptible. His selection of words is very striking; for, without the smallest degree of pedantry, he says the very commonest things in the very best possible manner, and seems indeed, as you say, to have a turn of thought peculiarly his own.

"The tone of his voice appeared to me also singularly pleasing. I should think his persuasion would be irresistible—what influence must his oratory derive from this in the house of commons! Did you ever hear him speak, Henry?

"The conversation at one time took a political turn, and Madame de Sainval having expressed a curiosity, in regard to the different merits of some of the most admired speakers; Sir George said, that Lord N——'s fort seemed to lie in the clearness of his financial statements, and the simplicity of his arguments, never weakening their force by superfluous declamation.

"Add to this his extraordinary self-possession, and peculiar felicity in warding off the scurrilous invective with which he is frequently attacked," said Mr. Stanville, "I can often fancy I see his guardian angel perched upon his shoulder, and whispering in his ear the best possible reply upon every occasion. Then, his pleasantry so conciliating; his ridicule enlivening, without irritating the house—the very objects of it join-

ing irresistibly in the laugh; his wit is phosphoric, brilliant, without being caustic."

"Comment!" interrupted Madame de Sainval, "*on se permet dans votre grave parlement de faire de l'esprit? j'aurois crue que ce seroit un crime de l'esc-raison.*"

"You would perhaps on the contrary, think it usurped a portion far too considerable of the debate," replied Mr. Stanville, "if you were to hear the splendid, figurative, animated imagery of B——, soaring away from his subject, till it is scarce possible for the mind's eye to follow him; quoting from Lucretius, Hudibras, Cicero, Rabelais, or an old ballad, with equal readiness."

"But all this occasionally so interlarded with puerile pathos, and vulgar scurrility," said Sir George.

"That arises from want of taste, not of powers," Mr. Stanville replied.

"Digressions without end," continued Sir George, "the apparent conclusion of his speech starting into the exordium of another, like Ovid's *Metamorphoses*; in short, I am come to consider his rising to speak, merely as a signal to adjourn to the beef-steak room; and so, I'll be sworn, did the better half of the members, when they nicknamed him the dinner-bell."

"I believe it may be fair to say of him," rejoined Mr. Stanville, "that for good, bad and indifferent he has not his equal. There is a mixture of delight and disgust in hearing him, which seems to endue the ear at once with the centripetal and centrifugal motions; at the same time, his mind is perfectly electric, for upon the slightest friction, it pours forth a stream of intellectual light."

"Which so completely dazzles his devotees," interrupted Sir George, "that they are ready to subscribe even to his judgment."

"The ambassador thought, that, as a finished orator, Mr. P—— soared above competition."

"Mr. Stanville admitted his talents to be refined, versatile, and polished. His flowery, harmonious periods, his nice selection of apparently unstudied phrases, his inexhaustible copiousness are very striking; and that perspicuity of diction, which seems to express his ideas with such clearness."

"Seems to express?" interrupted the ambassador.

"Certainly only *seems*, for upon a moment's reflection, you will commonly find it impossible to attach any precise meaning to it."

"But this I take to be a peculiar art, for which I give him great credit," contended the ambassador; "for you will allow, that when it suits his purpose to be fully understood, he can state the most complicated business with the clearest accuracy."

"So that your lordship values his powers of language," replied Mr. Stanville, archly, "in proportion as they serve to disguise his meaning?"

"This occasioned a general smile. Mon-  
ANN. REV. VOL. II.

sieur de Sainval, who from having served in America, understands English, and speaks it with tolerable fluency, observed, that he had always conceived British orators above every sort of trick themselves, while they so constantly affixed that epithet as the stigma of French politics.

"We have an old adage which may account for it," said Sir George, "mocking is catching."

"Mr. Stanville good-humouredly seeming to wish to do away his friend's bluntness, said, "there are certain *rusés de guerre* admitted in all governments; and I do not mean to detract from abilities so conspicuous as Mr. ——'s in particular; I have always admired the never failing felicity, with which he improves to his own advantage, the slightest opening given by his antagonist."

"But observe," said Sir George, "whether it be ever possible to carry away, or quote any thing from his speeches."

"No, they certainly are characterised," Mr. Stanville replied, "by a languid; glittering verbosity, which fills the ear without satisfying the mind. How strikingly contrasted with the energetic, commanding, impassioned eloquence of his rival! which at once convinces the understanding, and seizes upon the heart."

"Ay, there indeed," exclaimed Sir George, "are candour and acuteness, joined to sound judgment, depth of thought, and force of logic, unequalled."

"His elocution level to every capacity," rejoined Mr. Stanville; "never seeking for a word to embellish his period, but enlisting and disciplining the commonest in a moment, to charge in the ranks, and bear down all opposition. He proves the irresistible power of luminous common sense, leaving all the little arts of debate at a distance, and stands forth alone the *Orator of Reason*."

"There I recognize the true English character," said Madame de Sainval, "and I judged your whole parliament to be so composed."

"You did us too much honour, indeed," replied Sir George, shaking his head. "One such man in a century would be sufficient to support the dignity of the human race! You'll allow him to be phosphoric and electric too, Stanville?"

"He," exclaimed Mr. Stanville, with an enthusiasm that well became him!—"His oratory is the effulgence of the meridian sun, darting the ray of unsophisticated reason around, and shedding intellectual day."

"Upon my soul, you are inspired, Stanville!" cried Sir George, looking delighted with the brilliancy of his friend's observations.

"*Et inspiré encore par la raison, dénuée des grâces!*" added Madame de Sainval, smiling, "*cette grande triste raison—si froide—si âpre—si peu inspirante—quel miracle!*"

"Perhaps, upon better acquaintance with  
R r

her, you might think more favourably," said Monsieur de Sainval, with a degree of archness which I did not think he had possessed. Her eye struck fire as she glanced at him; and the 'retort' not 'courteous,' I believe, was rising to her lips; but Mr. Stanville averted it by observing, that Madame de Sainval would not easily find the opportunity of improving an acquaintance, which her appearance was so likely to put to flight.

"Mr. Stanville's wit, like Midas's touch, has the property of converting all to gold. It would not readily have occurred to any one else, to turn the mere repetition of a reproach into a compliment," replied the Marchioness smiling, who required but the moment's reflection, to curb her displeasure, for which he had given her time; she added, "I may be excused, if I fail in the accurate appreciation of *un personnage de trop mauvais ton*, to be admitted into French good company; but I will trust to my Louisa for putting me in the way *de lui faire réparation d'honneur* in England; where I expect to find her presiding at every tea table—*et puis, nous irons aussi entendre ces miracles au parlement; n'est, ce pas-mon cœur?*"

"I said, I was afraid she must take them upon trust, for I had understood that women were now excluded from the gallery.

"To the eternal disgrace of our gallantry, I confess it," the ambassador said. "*Ah, les Ostrogoths!*" cried Madame de Sainval. "No wonder that reason should have power, where women are inadmissible."

"Would any of us have dared to utter such an implied sarcasm on the sex?" exclaimed Mr. Stanville. "In virtue of my claim, as its professed champion, I beg leave in our parliamentary language, to offer an amendment, by substituting the word *graces*, which, however it may strike us all *at this moment*, to be synonymous with woman, will certainly rescue a part of the sex at least, from the severity of Madame de Sainval's remark: which will then be reduced to this political axiom, 'that the triumph of reason can only be secured by the exclusion of the graces.' And this is undoubtedly the principle upon which those senators acted who voted the ladies out of the gallery."

Mr. Stanville, whose conversational talents are here displayed with so much brilliancy, is the brother to Lady Bedford: the charms of Louisa Riversdale make a deep impression on his heart; nor on the other hand is she by any means insensible to the polished manners, the cultivated understanding, and the splendid abilities of Mr. Stanville.

The character of Louisa is too susceptible: she transfers her affections from one object to another with a facility which derogates from that exalted dignity with which the author intended to endow her. She is very young, indeed;

not eighteen, but the author has conferred on this girl of eighteen all his own powers of discrimination, his own insight of character, his own accuracy of judgment, and maturity of reason.

It will here be very naturally asked what became of Polinski? the ardent lover, the accomplished prince? Louisa had given him unequivocal acknowledgments of the impression which his varied accomplishments had produced in her bosom. When he quitted Geneva, where he could no longer remain the tortured witness of her impending misery as the wife of Malcolm, he was permitted to correspond with her. What becomes of Polinski? Louisa is liberated, and his own engagement is also at an end: the lady to whom he was betrothed, it seems, thought he was dilatory in coming to claim her promised hand, and therefore conferred it on another. Once more, then, what becomes of the prince? had absence cooled his ardour, or had the charms of some third beauty fascinated his affections? No: but we are incidentally informed, not from the best authority indeed, that the only impediment to offering his hand where his heart is so entirely devoted arises *from the difference of religion*: but for that he would immediately have flown to the feet of his charmer: In this abrupt manner is Prince Polinski driven off the stage: his character is drawn with a great deal of spirit, we are interested in his fate, and he ought not to have been dismissed with so little ceremony. The difference of his religion and Louisa's must have been perfectly well known to him at Geneva; so that our author has been as unsuccessful in extricating himself from this scrape as he was in the other.

Mr. Stanville, then, is the next object of Louisa's love: but an unfortunate amour has implicated his honour, and he struggles boldly, but ineffectually to resist the impression of her charms. The story of Agathe, who has been the unhappy victim of Stanville's impetuous passion, is extremely beautiful; it is told with simplicity and feeling, and is altogether full of interest. But here again the author entangles himself in a net which he is obliged to break in order to escape from: Agathe is the mother of a babe of which Mr. Stanville is the father. Her disgrace is concealed in a convent in the south of France. Louisa Riversdale cannot accept the hand which upon every principle of honour and duty

must be the exclusive property of another! The sacrifice is mutual, and after having loitered away a considerable time in England with Louisa, who had now settled in her native country, it is determined that Mr. Stanville should confer the only reparation in his power on the girl whom he had seduced, namely, by marrying her. But it is clear that this would have been a miserable termination of the story: if Stanville had married Agathe, the heroine of the novel would have been left in the lurch—a poetical injustice quite inadmissible. How then is the difficulty obviated? Stanville sets out for France with the most honourable intentions, but—an unfortunate but—

“Upon his arrival at Languedoc, he was refused admittance to Agathe, whose letters had uniformly breathed impatience for his presence, and dependance upon him alone for restoring her to peace and reputation. He obtained an interview with the friendly cousin, who explained to him, that however steady the affection of Agathe had continued, his long absence and frequent delays, had at length given efficacy to the remonstrances of

the confessor, who held out the veil as the only adequate atonement for her fault; which, so far from being expiated by marriage with a heretic, would, on the contrary, he insisted, endanger the eternal salvation not only of her own soul, but of that of her child.”

Mr. Stanville actually returns to England without seeing Agathe, contenting himself with addressing a letter to her, expressive of his solicitude for her happiness! It is needless to add, that he marries Louisa.

The conduct of Mr. Stanville is very inconsistent with that high sense of honour which is represented as his ruling principle of action. In the rapid sketch here given, we have also noticed some other inconsistencies; but the novel is notwithstanding very far above the ordinary salmagundies that assume this name. A considerable knowledge of the human mind is displayed, and of foreign and domestic manners: fashionable vices are severely satirized, and virtuous sentiments and honourable feelings are every where inculcated. •

ART. X. *Amelia Mansfield. Translated from the French of Madame C \* \* \*, Author of Mariona and Claire d'Albe* 12mo. 4 vols. about 280 pages each.

THIS is one of those performances which are difficult to characterize without entering fully into their merits: Madame C. has endeavoured to shew, that “the most venial love may lead to unhappiness,” that “pride will harden the heart and mislead the judgment.” And are four volumes required to establish such a truism as this? The following is a brief outline of the story:

Amelia Mansfield is the grand-daughter of the Count de Woldemar, who, proud of belonging to a family which had given sovereigns to Saxony and Poland, determined to inflict an exemplary penalty on any of his descendants, who should contaminate the blood of his illustrious ancestors by a plebeian alliance. After having united his only son, Baron de Woldemar, to the haughty heiress of the Counts of Kybourg; and his two daughters, one to the Count de Lunebourg the father of Amelia, and the other to Baron de Geysa, his next object was to arrange the future marriages of his grand-children. Finding no better alliances than those which might be contracted within the circle of his own family, he made a will, by which he declared his grandson, Ernest de Wolde-

mar, heir to his title and fortune, provided that he should marry Amelia de Lunebourg, his grand-daughter. In case of Amelia's refusal he disinherited her, transferring her portion to Blanche de Geysa, his other grand-daughter, on the same condition; and if Ernest refused to marry either of his cousins, he then gave his title and property to Albert de Lunebourg, Amelia's brother, provided however, that he took the hand of Blanche de Geysa.

Amelia, the heroine of the piece, is an amiable, mild, and susceptible girl, while Ernest, her betrothed husband, exhibited when a lad so proud, domineering, and ferocious a temper, that she shrunk with horror from the alliance which her grandfather had prescribed for her, and determined never to submit to the odious bondage.—This determination was strengthened by her affection towards a young man, Mr. Mansfield, who was on a visit to her father; a man whose engaging manners and various accomplishments, forming a striking contrast to the brutality of Ernest, soon fascinated the yielding fair one. In short, they married: the pride of the family was not to be violated with impunity; the persecu-

tion, however, of Madame de Woldemar, the mother of the disappointed Ernest, is carried to an improbable excess. It is perfectly extravagant. The young couple live very happily at the chateau of Amelia's brother, Albert, during a twelvemonth: Mr. Mansfield, at length, grows tired of seclusion among Bohemian mountains, is ever devising excuses for occasional absence, becomes dissipated, debauched, and is killed in a duel which he fights with a Russian officer, about some singer with whom they are both in love. Amelia, with her child, a little boy, is left exposed to the unabated fury of her family, consoled, however, by the kindness of her brother Albert.

By and by she accepts a pressing and affectionate invitation from her husband's uncle, Mr. Grandison, to pass her time with him, at Bellinzonna, a small town in Switzerland, whither he had retired after a laborious life at sea. Amelia's days roll on very tranquilly here: Albert, says she, in a letter to her brother,

"I grow more and more attached to my uncle, and his kindness seems to increase in proportion. The winter is set in here: the roads are covered with snow, and the avalanches often carry away in their fall, trees, cottages, and even the inhabitants. My uncle is wholly employed in preventing and repairing the melancholy accidents which so frequently happen in these parts. In a journey that he took last winter across the Alps, he stopped several days with the monks of Mount St. Bernard. He was so much pleased with the utility of their establishment, that he immediately took the necessary steps to form a similar one here, and he is now busily employed in carrying his plan into execution. He has erected, at proper distances, on the great road which passes the chateau, high poles, to point out the path through the snow: to these poles are fixed great bells, in order that travellers who lose their way may, by ringing them, obtain quicker assistance. We have a dog trained to the discovery of those who are bewildered, in this hoary labyrinth; and, night and day, six men alternately watch, to succour any who may be in danger. I know that money alone could furnish all this, and, though we might applaud the man who should apply it to such a use, yet if he were contented with giving his orders, and not seeing himself to their execution, the project would not be worthy of Mr. Grandison. More than once I have seen him, at the sound of the signal of distress, fearlessly put himself at the head of his guides, for the purpose of encouraging them. Every day his house is the asylum of some wandering travellers: if they are poor, he gives them money; if rich, he lends them mules to convey them to Bellin-

zonna. All bless him, and call him, next to Providence, the greatest friend of the unfortunate. I cannot express to you how much this practical benevolence endears my uncle to me, and adds to the agreeableness of my present abode."

Ernest had already set out on his travels before the marriage of Amelia: he had now attained his manhood, seen various courts, and is represented as having in a great measure overcome his native impetuosity of temper. His pride had been so deeply wounded at Amelia's refusal of his hand, and her preference to one of the untitled vulgar, that he meditates a deep and diabolical revenge. He had heard of her retirement at Bellinzonna, and determined, under the disguise of a private gentleman, to introduce himself, secure her affections, and seduce her.

One pitiless night, after Mr. Grandison had retired to his chamber, Amelia heard the sound of one of the alarm-bells, swinging at intervals, upon the wind. It was with difficulty, and only after repeated entreaties, that she could persuade her uncle's guides to face the sleet, and risk their own lives among treacherous drifts of snow, in order to follow the cries of distress, and succour the lost travellers. They turned out, however, and after a long and perilous search, came back with some travellers who had been on the point of perishing. Mr. Semler was the assumed name of one, who had violently sprained his foot, in assisting his servant: he is confined some days to his bed, in the hospitable chateau of Mr. Grandison, attended by Amelia Mansfield. This Mr. Semler is no other than Ernest himself, who was traversing the mountains in disguise, for the accomplishment of his foul purpose. Amelia's kindness melts all his revenge: he writes to his young friend and Mentor, Adolphus de Rhemsberg, in strains of the utmost contrition and self-abasement, for his meditated perfidy towards the most virtuous, accomplished, and enchanting woman, that ever trod upon the surface of the earth. He had anticipated, with a devilish delight, the ruin of a female, against the influence of whose charms, the remembrance of an imaginary offence, he thought, would completely have secured him. He sees her, and is subdued! So many years have elapsed, that he continues under the same roof with his betrothed Amelia, and no feature, no tone of voice, no gesture

brings to her recollection the altered Ernest, the son of her relentless enemy, Madame Woldemar. A reciprocal attachment succeeds to mutual attention, and offers of kindness; the pride of Ernest prompts his flight, but his fondness detains him. He writes in the most peremptory tone to Adolphus, that the widow of Mansfield shall never become the wife of Ernest. He is aware that the hateful name of Amelia is never pronounced in the ears of his mother, without reviving emotions of inexorable anger: he is aware that the knowledge of his attachment would excite the deepest indignation; and that his marriage with her would call down a mother's curse, and be the occasion probably of her death. This is extravagant and improbable enough of all reason; but it is absolutely necessary, in order to place the hero and heroine in those critical and conflicting circumstances, without which every body knows that a novel would be unpardonably dull and stupid. Every thing, it is clear, must be sacrificed to the interest of a novel. The author who cannot excite and preserve interest by the delineation of a natural character, and the detail of probable circumstances, makes no scruple of peopling his pages with such monsters either of perfection or iniquity, as the world never saw.— Opposite and irreconcilable passions are blended and amalgamated to produce a *tertium quid*, a third something, which, however ridiculous, from its absurdity, shall at any rate make an impression by its novelty.

As to contradictory oaths, they are too common in real life to be the subject of censure in a novel; but we must go on with the story, and defer our remarks till we come to the end of it.

Ernest, under the name of Mr. Semler, passes several months at the chateau of Mr. Grandison without exciting suspicion. His fondness for Amelia cannot conquer his aversion for her child, the hated offspring of his hated and successful rival, Mansfield. When he sees the mother caressing her infant, he often behaves rudely; but even this is set down to a mere whimsicality of character, unaccountable indeed, but not sufficiently odious in the sight of Amelia, the amiable, mild, and *susceptible* Amelia, to counteract the impression of his seductive accomplishments. In short, under the platonic guise of friendship, she falls desperately in love with the stranger. Liv-

ing under the same roof, their reciprocal attachment cannot long be concealed from each other, and Ernest, maddened with the requital of his passion, now writes to Adolphus, that no power on earth, no consideration of duty or of pride, shall avail to prevent his marriage.

Mr. Grandison, who feels the sincerest interest in every thing which concerns his beloved Amelia, and who saw very clearly the attachment which had taken place between the young persons, waits not for solicitation, but makes an offer of his niece's hand, with an ample portion of his own fortune, to Mr. Semler. Ernest, when the cup of happiness was presented to his lips, refused to taste it: the recollection of his mother's antipathy to the object of his profoundest love and adoration, (he had not seen his mother for ten years!) induces him to decline the proffered bliss. Grandison, exasperated that Amelia's affections should be thus perfidiously sported with, without listening to any explanation, instantly turns his guest out of doors, with ignominy and in anger. In this forlorn situation Ernest forgets his birth, forgets his mother, forgets every thing but Amelia: he contrives to send her a note, intimating, that unless she meets him on the terrace at twelve o'clock that very night, to take leave of him before his departure to Woldemar, in order to obtain his mother's consent, the consequence will be fatal. Alarmed at this 'dreadful note of preparation,' Amelia proceeds to the spot, where she finds her Semler in a state of insensibility: he had been waiting an hour, and in the noble violence of his distress, he had gnawed the stone on which he had reclined his head. "In my impatient rage," says he in his letter to Adolphus describing his situation,

"I tore my hands with the gravel against which I pressed with all my strength; and this laceration, which I was unable to feel, was, nevertheless, the means of softening my anguish. The clock struck twelve: each stroke was a dagger to my soul. Had I remained in that situation another hour, Amelia would have found me lifeless at her door. I began to lose my recollection, and my distracted brain confounded all the surrounding objects, while grief remained like a dead weight on my heart. On hearing a slight noise at the door, every limb trembled; but, however singular it may appear, instead of listening attentively, the fear of destroying the hope I had just begun to indulge, induc-

ed me to cover my head with my cloak. In this situation I was found by Amelia, who, terrified at seeing me motionless, stooped down, and fearfully uncovering my face: "Henry, what do you desire of me? I am here." At the sound of that voice I underwent an entire change; the world, in which I was, disappeared; my heart became light and tranquil; a celestial vision snatched me from the torments of hell, to transport me into the regions of bliss; but this instantaneous removal from one extreme to another, had like to have proved fatal to me: I thought the moment of death was arrived; I was unable to breathe. Placing the hand of Amelia on my heart,—"Restore me," said I, in a voice scarcely audible, "or receive my last sigh." And I again fell lifeless on the stone. Oh, how powerful is love! She, who, but a few minutes before had been feeble and languid, no longer felt her indisposition nor her weakness: she raised me up, supported me to her chamber, placed me in a chair, and pressed me to her bosom. I felt her tears, they drew forth mine, and life returned.—Amelia fell on her knees, in gratitude to heaven. In extending my hand to her, she remarked it was bloody. "Oh, my Henry!" cried she, "What has happened to you? Speak; remove my fears."—"While you were absent, Amelia, I cannot say what may have taken place: I was labouring under the weight of a frightful dream, in which I could neither see nor feel any thing, but the fear of having lost you for ever.—You suddenly appeared, and it was too much for me.—But, my Amelia, is it not enough, that in you, as in Heaven, all is good, compassionate, delightful; and that your tenderness is now unreserved."—"It is, my Henry, and to grant you my confidence, I need not the explanation of the miserable state to which you were reduced: you love me, that is sufficient; the world contains nothing of equal value to me." Transported, I clasped her in my arms, and felt her heart beat against my own. Never was such beauty seen before! Her brilliant eyes swam in an ecstacy of delight! "I call Heaven to witness, that I will ever be yours: to you I devote the remainder of my life. Swear you will be mine, and accept my vows." She complied.

"O, Adolphus! Providence has proportioned our felicity to our pain; but love has more joys than sorrows, and this moment was not bought too dear."

In short, like another Julia, our heroine could resist the ardour of love, till he disguised himself in the shape of pity. *Je me sentois troubler de ses transports, ses soupirs oppressoient mon cœur; je partageois ses tourmens en ne pensant que les plaindre. Je le vis dans des agitations convulsives, prêt à s'évanouir à mes pieds. Peut-être l'Amour seul m'aurait épargnée; à ma cousine! c'est la Pitié qui me perdit.*

Ernest makes his escape from the polluted chamber of Amelia before day-break, and flies to Woldemar for the consent of an inexorable mother. Her inflexibility drives him to madness; the dread of her suspended curse on the one hand, and his ardent love for Amelia on the other, which he had repeatedly sworn should be sanctioned by marriage, induce a delirium. His situation becomes more and more alarming every day: he is unable to write to Amelia, who on her part becomes suspicious, from his silence, that she has been the victim of some soul seducer. Day after day, week after week rolls on, and she hears nothing of her lover; at length, in the anguish and distraction of her mind, she leaves her uncle, she leaves her child, and wanders about in the hopes of finding him. She learns that Semler, who had afterwards assumed the name of Adolphus, is in reality no other than Ernest. She follows him in disguise from place to place: at Vienna, on learning that he is to be present at a masked ball, she gains admission in a domino, watches his motions, hears indistinctly some earnest solicitations which he makes to Blanche, and in a fit of unfounded jealousy, slipping a note into his hand, signifying that Amelia is convinced of his perfidy, she plunges into the Danube. Ernest rushes after her through the different chambers of the palace, and the different streets of the town: sees her struggling with the waves, and brings her almost lifeless to the shore. She is recovered, however, and becomes doubly sensible of the fidelity of Ernest: she is taken to the hotel of Madame Woldemar, whose indignation is rekindled. Her brutal behaviour, in short, superadded to the fatigue of body and affliction of mind to which Amelia had long submitted, is too much for her feeble frame; she sinks under it, and the unhappy Ernest, clasping her lifeless body, expires also in an agony of distress.

This work bears marks of talent, but it abounds with improbabilities and extravagancies. It cannot escape the most superficial observer, that the object which Madame C\*\* professes to have had in view is totally lost sight of. "I have endeavoured," says she, "to show to what a pitch of unhappiness love, even the most venial, may lead." Rather ought she to have said, my intention is to shew the complicated crimes which follow from the guilty indulgence of an ill-fated passion.

The misery which Amelia suffers flows not from her venial love and legitimate marriage with Mansfield: he dies in a very short time after it had taken place, and she has a babe to employ her affections, and sooth her grief. She retires to the house of a generous and kind uncle, who anticipates every wish she has, and with whom she lives in the utmost harmony and happiness till her connection with Ernest.

Here we feel ourselves called upon to reprehend, with great severity, the voluptuous and exciting language in which this scene is depicted. From the pen of a female it is doubly poisonous.

This unfortunate Amelia, for whom our compassion is endeavoured to be excited in every page, had by her sentiments already prepared us for her fall. In one of her early letters to her brother, where she is describing Mr. Semler, she says,

“Albert, I am too well acquainted with love to mistake it. That word, which Mr. Mansfield sounded so sweet, I now repel with horror. Far from being pleased when that passion is descanted upon, I feel uneasy, as long as it is the subject of conversation. Nor is this all, my dearest brother! for that is only a disorder of the mind, which time may cure; but a reason exists, that will always preserve me from again being in love: a reason which I could wish to conceal from myself, and which I could not resolve to tell you, but to convince you of my unalterable determination. It is, that dire experience has inspired me with such an invincible horror of those ties, from which you expect all your happiness, that were I so unfortunate as to love again, and that I must either submit to a union with the possessor of my heart, or devote myself to his embraces—death would be my only resource; but were death denied to me, I am doubtful if my heart, if reason itself would side with virtue.”

Amelia's regrets, too, are less for the offence than the consequences of it: her sentiments, in the letter which she writes to Adolphus, vol. iii. p. 3, & seq. are extremely immoral, and the language of the lovers speaks less for the purity of the author's imagination, than for the warmth and excitability of her passions. “Oh Adolphus!” says this Heloise to her St. Preux, “would you believe it, all I reproach myself with is to have embittered your delight by my melancholy.” This refers to an allegation which it is not for us to repeat. Again she says, “do not, I beseech you, endeavour to persuade me I am not guilty. I wish to know that I am so—it is sweet to be so for you. The forfeit of my life for

you would be nothing; but to yield up my innocence, to forfeit the esteem of the public, these are sacrifices which I glory in making, since these alone can prove the excess of my fondness! Yes, in the infatuation which possesses me, I find a pleasing satisfaction in thinking, that it is for you that I am lost; and in alienating from me every virtuous mind, I detach myself from the whole world, that I may exist only by my love.”

This is that *venial* love which leads to such unhappiness: Amelia, the amiable Amelia, in whose mind and person are assembled all the virtues and all the graces, is not restrained by the consideration that she is already a mother, by the very presence, perhaps, of her child, from disgracing her character, and bringing disgrace upon her progeny. Her amorous feelings are more powerful than her maternal ones. This object for whom Madame C \* \* \* endeavours to excite such deep commiseration, leaves her child, and bearing an unborn one in her bosom, makes an attempt to commit suicide!

“Oh, but Amelia Mansfield is a novel that can do no harm—look at the moral of the story; she dies in the deepest distress, and together with her seducer, pays an ample forfeit for her offence:” such is likely to be the apology for these pages, which we cannot but warn our readers against as dangerous; for it is our most decided opinion, that a syllogistic moral, a dry mathematical inference, is utterly incompetent to destroy, or even to weaken the evil tendency of immoral sentiments, lascivious descriptions, and exciting scenes. On a former occasion, we stated our determination to give open warning, “if any thing tainted, any thing unwholesome should be brought to market.” We have performed this duty on the present occasion, and painful as it is, we will at all times perform it with the most scrupulous fidelity. There is something treacherous about this novel: under the pretence of instilling virtuous principles, it is calculated to enflame the passions of young persons, and corrupt their morals; there are many, very many pages in it, which we should shudder to see under the perusal of our daughters.

There are several minor faults in “Amelia Mansfield,” whilst many parts do credit to the skill of the author. The character of Madame Woldemar is unnatural to the last degree: in this coun-

try, at least, we may venture to say it never had a prototype; among the Saxon nobility perhaps it might. The character of Adolphus, too, a moralizing pedagogue, is somewhat extravagant; he is so strictly virtuous that, on discovering he is a bastard, he deserts his mother, and declines to close her dying eyes. Perhaps Madame C \* \* \* intended that we should extract a moral, too, from the conduct of this *virtuous* youth; perhaps she meant to shew us that the mother who brings an illegitimate child into the world, must expect that he should pluck by the roots all filial affection from his bosom, and fling it in his parent's face! An exquisite lesson!

Adolphus's letter (vol. iv.) to Madame Woldemar, in reply to one where she had desired him to use treachery towards his friend, contains many fine sentiments, powerfully expressed. Several of the conversations between Amelia and Semler are good, and his preparation of Amelia for the disclosure of his real name, his attempt to efface the odious remembrance of one which had already caused her so much persecution, is managed with great art. Indeed if there had not been a display of considerable talent we should have apprehended less mischief, and less pains than we have now taken would have been sufficient to expose and counteract it.

ART. XI. *Delphine: a Novel. By Madame DE STAEL-HOLSTEIN. Translated from the French. Three vols. 8vo.*

THIS novel has attained a celebrity much beyond its merit. It is the production of a lady connected with some conspicuous men in France, and its personages have by some been supposed to be the representations of real characters. This, therefore, must have been the cause of that avidity with which it has been generally received here and on the continent; an avidity which has given rise to two English translations, one in six volumes, and one in three. But let not the reader, who dreads wading through six volumes, therefore have recourse to the three, for he will find that these contain as much as the six---it is a mere mechanical compression---alas, our weary jaws declare that none of the yawn-exciting redundancies have been lopped off. Our objections to the novel are two, its dullness and its immoral tendency. We do not mean to say that it is uniformly fatiguing throughout, but are glad to acknowledge that there are passages which excite a strong interest, that the story itself is not ill imagined, that there is novelty, to an English reader at least, in one or two of the characters, and that if it had formed one volume instead of six it would have been read with interest, and have produced a considerable effect. The story is simply as follows: Delphine, at the moment of its commencement, is supposed to have been married when very young to Mons. d'Albemar, a respectable old man, who leaves her at the age of twenty a widow with a considerable fortune. Madame de Vernon, a cousin of the deceased Mons. d'Albemar, has an only daughter, Matilda de

Vernon, whom she wishes to marry to Leonce de Mondoville, but despairs of getting his mother's consent unless Matilda can bring with her a considerable marriage portion. Delphine, conceiving herself to be in some degree bound to make up for the neglect of her husband to his relations, and having at the same time a passionate regard for Madame de Vernon, though she scarcely feels any kindness for Matilda on account of the want of sympathy in their characters, presents her with the Andelys estate, and in consequence the marriage treaty goes on between the two mothers. The novel commences with the intelligence of the approaching arrival of Leonce from Spain to marry Matilda, and the very first letter, which is from Delphine to Matilda, begins thus: "I shall be extremely happy, my dear cousin, if I can promote your marriage with M. de Mondoville." Yet after having done all in her power to effectuate this match, she herself, the disinterested, amiable, philosophical Delphine, actually falls in love herself with Leonce, not at first sight but before she has ever seen him at all. She hears a high character of him from his tutor, Mr. Barton, a grave personage (who very foolishly hints to her that she would suit his pupil better than her cousin) and immediately falls desperately in love with him. Intelligence arrives of his having been assassinated in his passage over the Pyrenees, and of his lying at the point of death at Bayonne: in consequence of this Delphine exclaims,

"Yes! if he dies, I will devote to him the worship of my heart; I will fancy that I

have loved him, that I have lost him; and I will be faithful to the memory which I shall ever retain of him: it will be a pleasing sentiment, the object of a melancholy untainted with bitterness: I will request his picture of M. Barton; and I will ever preserve it, as the portrait of a hero in romance, of which the original no longer exists. I had already for some time begun to lose the hope of meeting a man who should possess all the affections of my heart: the matter is now reduced to certainty; and that certainty is all that is required, to resign myself in peace to advancing old age."

It appears to have been the intention of Madame de Stael, to exhibit in the two characters, of Matilda and Delphine, the effects of Christianity and Deism on the human character. They are both young and handsome women, but while all the graces of character are lavished on Delphine, every effort is made to render Matilda cold, unattractive, and even disgusting. Not so Rousseau—enemy as he at times was to the Christian religion, he yet makes Julie the most amiable of women, and when she dies, what deist does not admire her truly christian end!

Leonce recovers of his wounds, arrives at Paris, and, of course, falls in love with Delphine instead of Matilda. Now comes on the charming play of sentimentality: while she even makes him the first avowal of love, (p. 158.) while she gives him every encouragement, passing hours and hours of the utmost confidential intimacy with him, she would not, on any account whatever, jilt her cousin, Matilda; her union with Leonce is to be that of kindred minds alone! a mere refined Platonic attachment! It happens, however, that Madame de Vernon (whose character is drawn in a very masterly manner, and is by far the most striking of any in the work) has the sagacity to discover the alienation of Leonce from her daughter, and the address to destroy for the moment his attachment to Delphine, by artfully exposing some of her imprudent conduct to him. This leads us to notice the very blameable conduct of Delphine, in the affair of Theresa d'Ervins, a married woman, who has imbibed a most violent passion for M. de Serbellane. When this adulterous attachment is first made known to Delphine, by Mons. de Serbellane, instead of manifesting the indignation which a virtuous christian woman would not have failed to have

done, she recommends Theresa to the protection of her paramour.

"Yes!" said I "I shall not be afraid to demand of the man who has seduced her, to act as her guide and her brother, in this critical situation. Theresa is more impassioned than you: she loves you more ardently than you love her: it is therefore your duty to direct her: the one of the two parties who cannot live without the other, is the party subject to the other's dominion. Theresa has neither relatives nor friends in Paris: do you watch over her with the care of a generous and affectionate protector: repair the wrongs you have done to her, by those virtues of the heart which are all the offspring of kindness." I felt myself animated as I spoke these words, and laid my hand on M. de Serbellane's arm: he took hold of it, and approached it to his lips with an expression of feeling, of which Theresa alone was the object."

After some time this intrigue is discovered by the husband, and Delphine is guilty of the astonishing imprudence, to say the least of it, of permitting the lovers to have a parting interview in her house. This is discovered by the husband, who bursts into the room, and demands instant satisfaction of M. de Serbellane. They adjourn to a proper place, and the poor husband receives his *satisfaction*, that is to say, he is run through the body, and expires on the spot. By an act of generosity, on the part of Delphine, Theresa's reputation is saved, at the expence of her own: Mons. de Serbellane is supposed to have been concealed in her house as her lover; and the duel with M. d'Ervins is attributed to a political dispute: Delphine confides to Madame de Vernon the care of informing Leonce of the real state of the case, which she engages to do, and then wilfully neglects. In consequence, the impetuous Leonce, the victim of jealousy, instantly marries Matilda. In process of time, the treachery of Madame de Vernon is discovered, and then the smothered flame of Leonce's love bursts forth again with double fury. A reconciliation soon takes place between the lovers—they meet daily, pass hours alone together. Delphine glories in her love for the husband of her cousin, and satisfies her conscience with the hope that Matilda will remain ignorant of the attachment, and with their mutual determination that the connexion shall be purely spiritual. The consequences are sufficiently obvi-

ous; the fleshly man soon prevails in the impassioned Leonce, and it is not a little curious to observe how a female author, in a work meant for general reading, treats so delicate a subject. Delphine attempts to save herself in a way, in which, we believe, woman's virtue never was saved; namely, by throwing herself completely on the mercy of her lover. A more effectual method of preserving her chastity is, however, adopted by the penitent Theresa, who desires to expiate her own guilt by dedicating the remainder of her life to the service of God, in a religious community, and who prevails on Leonce and Delphine to be present at her religious profession. She avails herself of this solemn occasion, to make a most impressive appeal to their consciences, and at the moment of her quitting the world for ever, she conjures them to save their souls by renouncing a dangerous and criminal attachment, and prevails on Delphine to consent to fly all future intercourse with her lover. They are left alone in the church, and then ensues a scene which, we dare say, the author imagined to be very fine and impassioned, but to us appears no better than the raving and ranting of mad people.

"Let us remain here," said I to Leontius: "let us rest near the dead."—"No," said he, which still vibrates through my frame, "no resistance! follow me!"—My strength failed me: he clasped me round the waist, and dragging me with him, I found myself precisely in the front of the altar, at which the sacrifice of my fate had been consummated. I looked at Leontius, endeavouring to discover his intentions. His hair was dishevelled; his beauty, more remarkable at this moment than at any other of his life, assumed a supernatural character, and filled my soul at once with terror and love. "Give me your hand!" he exclaimed, "give it me! if it be true that you love me, you must stand in need, hapless Delphine, you must, like me, stand in need of happiness. Swear upon this altar, yes, upon the very altar from which we must for ever banish the frightful phantom of an odious marriage, swear never to acknowledge any other tie, any other duty than love: take an oath that you will be united with your lover; or I will this instant before your eyes dash out my brains against these marble steps, from which my blood will be spouted back upon you."

The consequence of this terrible scene is, that Delphine is seized with an illness which brings her to death's door. At

her recovery, is it not to be supposed that, now at least, all intercourse will cease between them? No such thing, however, takes place: their dangerous intimacy continues; and what is the most extraordinary is, that Mademoiselle d'Albemar, an old maiden sister of Delphine's late husband, a kind of mentor, who, in general, gives her good advice, does not now counsel a separation. "I do not well understand the boundaries that divide love and morality; destiny has denied me that experience, but to me it seems that, after the marriage of Leonce, you ought to have seen him no more; and having seen him, you ought not now suddenly to sacrifice him to the tempestuous virtues. I know not whether Leonce may have influenced me by his powers of pleasing, but, I own, *if there be a glory to be obtained by the woman who wanders from the path of morality*, it must surely be that of gaining the heart of such a man."

The harmony of the lovers is soon disturbed by the appearance of a M. de Valorbe, who makes pretensions to the hand of Delphine. Actuated, as she says, by a sense of gratitude for his having once saved Mons. d'Albemar's life, she gives him one of those gentle refusals which do not deter lovers from still wearing their chains. He is threatened with arrest, on account of his aristocratical opinions. Delphine promises him an asylum in her house, and as he is going to enter it, in the middle of the night, Leonce accidentally discovers him, and, stimulated to madness, by jealousy, he grossly insults him. A challenge ensues; and Delphine endeavours to prevent a duel, by appealing to the feelings of M. de Valorbe. This gentleman, after proving for a long time inexorable, makes a kind of bargain with her, namely, that if the affront which he had received from Leonce (which was at present a secret), should ever be made public, and he, in consequence, suffers in his reputation for not having resented it; in that case, as a compensation to him, Delphine should become his wife—to which she gives a tacit consent. Valorbe then quits Paris, to join his regiment, and soon after intelligence arrives, that his brother officers have received information of the affair, and oblige him to quit the regiment in disgrace. In consequence of this, the reputation of Delphine suffers so much at Paris, that she is pub-

licely affronted at an assembly, which has a prodigious effect on the irritable mind of Leonce, who is ever keenly alive to public opinion. Soon after this, Matilda, who has miraculously remained ignorant of what had been long known in all the circles of Paris, the attachment of her husband to Delphine, is at length informed of it; and in an interview with Delphine, demands of her to quit Paris, and abstain from all further intercourse with Leonce. This is acceded to, and Delphine goes into Switzerland, and becomes a boarder in the Abbaye du Paradis. It happens that Mons. de Valorbe has also taken refuge in this neighbourhood, and not finding her disposed to marry him, according to the tacit engagement she had entered into, makes use of a manœuvre to compel her. Through his means she is informed, that he is arrested for debt, at Zell, and anxious to make him at least a pecuniary compensation, she visits him in person, and he detains her in his apartment to so late an hour, that he imagines she will marry him to save her reputation. She however prefers to become a nun, and makes her profession in the abbaye du Paradis. Valorbe, in despair, tears open some wounds he had received in two recent duels, and dies miserably at Zell. In the mean while Matilda dies of her lying-in, at Paris, and Leonce, freed from his fetters, hastens to the convent, to claim Delphine, and is thrown into a paroxysm of rage and grief, to find her bound to celibacy by inevitable vows. M. de Lebencey, a protestant friend, advises her to break her vows and fly from the convent, to which, without the smallest difficulty, she consents. When she has escaped from her convent, and gained Leonce, she finds so cool a reception from him, owing to his nice sense of honour, which makes him rather averse to allying himself with a run-away nun, that she refuses to marry him. They remain, however, together, uncertain how to act, till at length the fate of Leonce is determined, as follows:

"At this moment a regiment passed under my windows, and a band of music playing a beautiful warlike march. Leontius, on hearing this, raised his head with an expression of dignity and enthusiasm so imposing and sublime, that for a moment, forgetting my sorrows, I looked at him with ecstasy, and drank once more the intoxicating draught of love. He divined my thoughts, and letting

his head fall on my hands, I felt his tears pour down upon them in abundance. The music ceased, and Leontius, having apparently recovered his composure, said, my soul is more tranquil, the celestial intelligence that watches over thee has inspired a salutary counsel. Adieu, my friend, I have need of repose, adieu till to-morrow!—"Till to-morrow," repeated I.—"Oh, yes," he replied: "adieu!"—and he left me without uttering another word."

Leonce therefore, set agog by the martial drum and spirit-moving fife, abandons Delphine, and hastens to join the combined armies, who are marching into France. Delphine, who very luckily meets with M. de Serbellane, determines to follow him, and chances to arrive at Verdun the very day that he is brought in a prisoner. He is condemned to be shot: she passes the night in prison with him; urges him to take poison, which he refuses; accompanies him the next morning to the place of execution; and having herself taken poison, which happens to operate precisely at the critical moment, they both expire nearly at the same time.

About two years are occupied by the events of this story; and during this short period our readers will observe, that the amiable Delphine promotes a criminal intercourse between Theresa and De Serbellane, which causes the murder of Mons. de Ervins; attempts to deprive her cousin Matilda of her betrothed lover; afterwards carries on a secret culpable intercourse with her cousin's husband; breaks an engagement with poor Valorbe; binds herself by a solemn religious vow, though at the same time she contemns the principle of that religion; breaks without the smallest scruple, vows thus solemnly contracted; urges Leonce to commit suicide; and, at length, dies herself a miserable self-murderer!

Besides the general dulness of this novel, there are passages bordering on the ridiculous. Of this kind are, "Hark you, Leontius," said I, with enthusiasm, "I love you." "Marriage a ceremony of death." "Delphine, I will see you this evening; you shall teach me your religion." Which put us in mind of Lady Bab, in *High Life Below Stairs*. "Shakspeare, Shakspeare! I don't know him, but I will read him one afternoon!" "You know not how expressive is the countenance of M. de Mondoville, and with what energy and beauty he can ex-

hibit grief; he had passed the night motionless in the same attitude; his hair was in disorder, *and he really looked remarkably handsome.*"

Even the last pathetic scene in the prison is disgraced by littleness. We shall, however, present our readers with a scene with which we were much pleased.

"Yesterday, Madame de Mondoville being absent, I was able to spend the whole day at Bellerive; Madame d'Albemar proposed to me a walk after dinner, telling me that a family from Languedoc, whose name she believed she knew, had come to live in her neighbourhood, and that she wished to go and enquire about them. We set off, and Madame d'Albemar appointed her carriage to meet us about a mile from Bellerive.

"When we came near the place she had pointed out, we saw at a distance a small but neat cottage, and heard voices and instruments, which appeared singularly harmonious. We drew near; a child, who was at the door making snow balls, asked us to walk in; his mother, hearing him, came out and met us; Madame d'Albemar immediately knew her to be Mademoiselle de Senanges, whom she had formerly met in company with M. d'Albemar, but whom she had not seen these ten years. Mademoiselle de Senanges, now Madame de Belmont, received Delphine in the most amiable and friendly manner. We followed her into the little apartment of which she made a drawing-room, and we there saw a man about thirty, sitting at a piano-forte, while a girl of eight was singing: he arose at our approach, when his wife went up to him, and gave him her arm to lead him towards us. We then perceived he was blind, but his countenance was pleasing and dignified, notwithstanding his loss of sight: an expression of tranquillity reigned in all his features, which silenced even pity.

"Delphine, whose heart is so accessible to kind emotions, was visibly affected, notwithstanding her endeavours to conceal it. She asked Madame de Belmont her motives for leaving Languedoc.—A law-suit, which was carried against us, she answered, ruined us entirely; I had before lost half my fortune, as an aunt disinherited me on account of my marriage. To support ourselves and two children we had only eight pounds a year left, and we chose rather to live in a country where we were unknown, than be obliged to keep up our former way of life without a fortune. This climate too agrees better with my husband's health than the heats of the south, and during the fortnight we have been here we have been perfectly well.

"M. de Belmont then congratulated himself on knowing such a person as Madame d'Albemar; he expressed himself with much propriety and elegance, and his wife recalling to mind with pleasure, that she had seen

Madame d'Albemar when but a child at her father's, spoke to her of their common connections with perfect serenity and simplicity. I considered her attentively, and in her whole manner I perceived not the least trace of any uneasiness; she appeared not to suspect that there was any thing in her situation to excite any extraordinary concern, and was long before she perceived that which we felt on her account.

"Her husband was desirous of showing us his garden, and he offered his wife his arm to lead him thither: she appeared to be so much in the habit of leading him, that when she left him to Delphine for a few moments to give some directions, she walked with anxiety, and appeared—not uneasy, for she has too little affectation to be disturbed without any motive—but altogether unaccustomed to move a step without serving as a guide to her husband.

"M. de Belmont interested us every instant still more by his wit and understanding; we led him several times to talk of his occupations, and of his own concerns; he always answered us with pleasure, appearing completely to forget that he was ruined and blind, and giving us the idea of a happy and tranquil man, who has never in his life had the least occasion to exercise courage or even resignation, only when he pronounced the name of his wife, or called her his dear friend, his voice had a tone I cannot define, but which echoed all the remembrances of his life, and pointed them out to us without expressing them.

"We returned to the house, the piano-forte was still open, and Delphine expressed to M. and Madame de Belmont a wish to hear, while present, the music that had charmed our ears at a distance. To this they assented, observing, that as they almost always sung trios with their daughter, their performance would be very simple. The father began a prelude on the instrument with superior talents and profound feeling. I know nothing so affecting as a blind man who gives himself up to the inspiration of music; it seemed as if the variety of sounds, and of the impressions thence arising, restored to him all nature, of which he had been deprived. The timidity naturally inseparable from such a disastrous infirmity prevents a man from conversing with others on the pain he feels, and he almost always avoids speaking of it; but when a blind man plays a melancholy tune he seems disclosing the secret of his sorrows; he rejoices at having at length found a language which permits him to touch the heart without fear of tiring it.

"The fine eyes of Delphine swam in tears, and I saw by the agitation of her bosom how much her heart was moved! But when M. de Belmont and his wife sang together, and their daughter, eight years of age, joined her clear and infantine voice with those of her parents, it was irresistible. They gave us a

harvest song of the peasants of Languedoc, the burden of which was :

“ Accordez-moi donc, ma mère,  
Pour mon époux, mon amant ;  
Je l'aimerai tendrement,  
Comme vous aimez mon père.

“ Dear mother, for my husband give  
The youth whose constant vows I prove :  
I'll love him fondly while I live,  
As you my father fondly love.

“ The little girl lifted up to her mother her charming eyes as she sung these words ; her countenance was all innocence, but educated by parents who live only on affection, she had already in her voice and look that melancholy which is so interesting at such an age, that melancholy, which is a presage of the fate that threatens the unconscious infant : the mother took up the same burden, singing,

“ Elle t'accorde ta mère,  
Pour ton époux, ton amant ;  
Tu l'aimeras tendrement,  
Ainsi qu'elle aime ton père.

“ Dear girl, I, for your husband, give  
The youth whose constant vows you prove ;  
Fondly you'll love him while you live ;  
As I your father fondly love.

“ At these words there was something so impassioned in the look of Madame de Belmont, and so much modesty immediately succeeded the emotion, that I felt myself penetrated with enthusiastic respect for these family ties, of which we may be so proud while they render us happy. At length the father sung in his turn.

“ Ma fille, imite ta mère,  
Prends pour époux ton amant ;  
Et chéris-le tendrement,  
Comme elle a chéri ton père.

“ Dear girl, your mother's steps pursue ;  
Take the fond youth whose vows you prove ;  
And love him with affection true,  
For such to me your mother's love.

“ The voice of M. de Belmont was lost as he uttered these words, and it was not without a considerable effort he recovered it, so as for all three to repeat the burden together to a mountain air, in which fancy seemed to hear the echoes of the Pyrenees.

“ Their voices were perfectly true, and the sonorous base of the husband gave a masculine dignity to the softer tones of the females ; their situation, the expression of their countenances, all was in harmony with the purest sensibility, from which nothing distracted the imagination, or even left it any thing to desire. Delphine has since told me that she was so much affected by this perfect union of every thing capable of moving the heart, that she wanted power to support it. Her tears had nearly suffocated her, when Madame de Belmont, almost throwing herself into her arms, said to her,—Amiable Delphine, I know you well, but do you suppose

we are unhappy ? Oh, how much are you mistaken ! And as if the music had in an instant established an intimacy between us, she seated herself by Madame d'Albemar, and said to her, When I knew you ten years ago, M. de Belmont had already loved me for some years, but as it was apprehended he would lose his sight, my relations objected to our marriage. He became completely blind, and I then no longer paid any attention to my family. Every moment's delay, when I was become so necessary to him, appeared to me insupportable ; and as I had neither father nor mother, I thought I had a right to determine for myself. I married him without the knowledge of my relations, and for some time I suffered enough from their threats to annul the marriage : but when they were thoroughly convinced that it was not in their power, they endeavoured all they could to ruin us, and succeeded. However, as I had been for some time under apprehensions that they would effect a separation between me and M. de Belmont, I was scarcely sensible of the loss of our fortune, my imagination being struck only with the misfortune I had escaped.

“ My husband,” she continued, “ instructed his son, I educated my daughter, and our poverty naturally bringing us closer to our children, affords us new enjoyments. When we are perfectly happy in our affections, perhaps certain misfortunes, which strengthen our ties by the power of circumstances, are favours of Providence. I should not venture to say so before M. de Belmont, did I not know that his blindness does not render him unhappy ; but this accident fixes him in the bosom of his family ; it renders my arm, my voice, my presence necessary to him every instant : he has seen me in the days of my early youth, he will always retain the same remembrance of me, and I may be permitted to love him with all the enthusiasm of affection, without the expression of my sentiments being checked by that timidity, which the loss of personal charms induces. I will say it before M. de Belmont, madam, he must hear what I think of him, for I will not quit him an instant, even to indulge myself in the pleasure of praising him. The first happiness of a woman is to have married a man whom she respects as much as she loves him ; who is superior to her in talents and frame of mind, and who decides on every thing for her, not domineering over her will, but enlightening her understanding, and supporting her weakness. Even on occasions when her opinion differs from his, she yields with pleasure and confidence to him who is responsible for their common lot, and can alone repair an error, even if he should commit one. That marriage may fulfil the design of nature, the husband should possess a superiority over his wife by his real merit, a superiority which she may acknowledge, and by which she may profit ; unhappy the women obliged to conduct themselves through

life to conceal the defects and littleness of their husbands, or to emancipate themselves from it by supporting the weight of existence alone. The greatest of pleasures is that cordial admiration which fills up every moment, gives an end to every action, is a continual spur to self-improvement, and imparts that true glory, the approbation of a friend who honours you by his love. Amiable Delphine, judge not of the happiness or unhappiness of families by the goods of fortune or of nature; learn the degree of affection, which conjugal love gives them to enjoy, and then you will know their share of earthly felicity.

"She has not told you all, my sweet friend," said M. de Belmont: "she has not spoken to you of the pleasure which she has found in the exercise of an unexampled generosity: she has sacrificed every thing for me, who had nothing to offer her but a life of continual sacrifices. Rich, young, and shining, she voluntarily devoted her life to a blind man without fortune, and who was the occasion of her losing that which she possessed. Among the treasures of heaven existed one of inestimable worth; and this has been bestowed on me to compensate a misfortune, which so many unhappy persons have experienced in a solitary state. And such is the power of a profound and pure affection, that it converts the most real afflictions of life into enjoyments; I please myself with thinking, that I cannot walk a step without the hand of my wife, and that I could not even feed myself, if she did not give me my food. No new idea would reanimate my imagination, did she not read to me the books with which I wish to be acquainted; no thought would reach my mind without the charms her voice gives it; all my moral existence, the image of herself, comes to me through her, and Providence, when it gave me existence, left to my wife the task of completing the present, which would be useless and painful without her assistance.

"I believe," added M. de Belmont, "I love better than any person, for all my being is concentrated in this sentiment; but how is it that all men do not endeavour to find happiness amid their family? It is true that my wife, and my wife alone could render marriage such a delightful state. Yet I have been deprived of the pleasure of ever seeing my children, but I persuade myself that they are all like their mother! Of all the images that my eyes have formerly admitted, only one has remained perfectly distinct in my memory, which is the person of my wife. I do not imagine myself blind when with her, so lively is the idea I form of her features. Have you remarked the sweet tone of her

voice? when she speaks she modulates it with softness and grace, as if she delighted in paying attention to the pleasures that are left me; I feel every thing, I forget nothing, a squeeze of the hand, an accent of emotion, is never effaced from my memory. Oh! how happy a state of existence, thus to taste affection and its charms! to enjoy it without ever experiencing those inconsistencies of the heart, which are sometimes produced by the splendours of wealth, or natural excellencies!

"Nevertheless, though my lot cannot be compared to that of any one upon earth, I must say to the young, the handsome; and the great, there is no happiness during life except in the marriage bonds, except in that affection of our children which is only perfect when we love their mother. Men, much more at liberty than women, think they may easily supply the enjoyments of domestic life; but I know not by what sweet power implanted by Providence in morality, the circumstances of life appear independent of it, yet ultimately they are determined by it alone. All bonds except those of marriage, want durability; some shocking event, or natural disgust, breaks ties presumed to be the most solid; opinion pursues you, opinion some way or other insinuates its poisons into your happiness; and should it be possible to escape its power, can the pleasure of seeing one another a few hours, be compared with the perfect intimacy of marriage? What would have become of me without her? of me who could only carry my misfortunes to one who was capable of being proud to share them. How should I have been able to struggle against the laws of society, disarmed as I am by nature? How necessary was the shelter of constant and sure virtues to me, unable to acquire any thing, and having to hope only the happiness that would not come to seek me! But I possess felicity, not consolations; and I boldly repeat, he who is not made happy by marriage is alone, yes, every where alone; for he is threatened sooner or later with living unbeloved."

We have not seen this work in the original, in which we have heard that it possesses the merit of a remarkably pure and elegant style. Of this advantage it is unluckily deprived in the present translation. The translator deprecates criticism for the first volume, the manuscript of which was destroyed by fire and replaced hastily. Unfortunately he has not the same excuse for the second and third.

## CHAPTER XIII.

## PHILOLOGY AND CRITICISM.

THE most important article in this chapter is Mr. Astle's splendid volume on the "Origin and Progress of Writing," which contains much curious information, yet scarcely adequate to the extent of its title. In Dr. Aikin's "Letters on English Poetry, addressed to a young Lady," will be found many valuable observations on this species of writing in general, and on the characteristic faults and excellencies of our native poets, illustrated by references to such of their productions as will inform and refine the taste, without running any risque of sullyng the purity or impairing the delicacy of the moral sense. The posthumous work of Mr. Pegge, entitled, "Anecdotes of the English Language," is rather amusing than useful and accurate; and the Baroness de Staël's "Observations on ancient and modern Literature," exhibit almost equal ignorance in the author and her translator.

ART. I. *The Origin and Progress of Writing, as well hieroglyphic as elementary; illustrated by Engravings taken from Marbles, Manuscripts and Charters, ancient and modern. Second Edition with Additions.* By THOMAS ASTLE, Esq. F. R. S. F. A. S. and Keeper of the Records in the Tower of London. 4to. pp. 240, 32 Plates.

THIS book treats better of the progress than of the origin of writing; and is rather to be classed among the efforts of the antiquary than of the philosopher. It is a work of great information, curiously compiled and curiously illustrated; yet the erudition is often of that crude and antiquated sort, which the bolder researches of modern sagacity have in a great degree exploded. Mr. Astle leans much on the compilers of the Universal History: they have stated well the opinions of their time; but a great mist has since been dispersed from the historic horizon.

The introduction contains very interesting anecdotes of the fortunes of literature and libraries; and thus sketches the plan of the ensuing work.

"The first and second chapters are founded on principles of philosophy, supported by facts, deduced from the histories of different nations.

"In the third chapter, which treats of the antiquity of writing, it was necessary to

have recourse to the most ancient historians, both sacred and profane; the latter of which are so involved in fable, that it was extremely difficult to separate the ore from the dross. However, the most respectable authors have been consulted, from whom has been selected such evidence, as appeared to be most rational, and to deserve the most credit. Several particulars concerning the civilization of ancient nations, occur in the course of this chapter, which may appear interesting, not only to the historian and antiquary, but also to the philosopher.

"In the fourth chapter it appears, that all alphabets are not derived from one, but that most of those now used, are derived from the Phenician. This chapter contains a general account of such as are supposed to have arisen from that source, which furnishes many important facts relative to the history, population, and the progress of arts and sciences, in the most celebrated nations.

"The fifth chapter, contains the History of Writing in different ages and countries, proved from ancient inscriptions, manuscripts, and other authentic documents, of which engraved specimens are given, and several rules are laid down, which may ena-

ble our readers to judge of their age and authenticity. This chapter necessarily contains much ancient history, and establishes many important truths, hitherto little known or attended to."

\* \* \* \*

"The sixth chapter treats of the writing of the Chinese, and of various Characters and Literary Signs, used both by the antients and moderns, for brevity, expedition, or secrecy. The facts which appear in the course of this chapter, fully confirm the doctrine laid down in the second and fourth chapters, *that all marks whatever are significantly compact, and that LETTERS do not derive their powers from their forms, but from the sounds which men have agreed to annex to them.*

"The seventh chapter treats of Numerals, and of Numeral Characters, which were probably used before letters.

"The eighth chapter treats of the Librarii, Notarii, and Antiquarii, among the antients: of Paintings and Ornaments: of the materials for writing upon: of Instruments for writing with: and some account of Inks, both antient and modern."

The first step toward the invention of alphabetic writing was indubitably picture-writing: this invention is thus traced.

"It will presently be demonstrated that men, even in their most uncivilized state, display a *faculty of imitation*, which enables them to delineate objects, and communicate information by rude pictures or representations. For example, a man who had seen a strange animal, plant, or any other new object, for which he wanted a name, would have been almost mechanically led to illustrate his description by *signs*: and, if they were not readily comprehended, by a *rude delineation* in the sand, on the bark of a tree, on a slate, or a bone, or on such materials as first presented themselves: these being handed about, naturally suggested the hint of using this method of conveying intelligence to a distant friend. The exercise of this faculty of imitation, so eminently conspicuous in the human species, will be found, on an accurate investigation, to have been common to all nations, and perhaps coeval with the first societies or communities of mankind.

"It is not probable that the art of *picture-writing* was brought to any degree of perfection by one man, or nation, or even by one generation; but was gradually improved or extended, by the successive hands of individuals, in the societies through which it passed; and that more or less, according to the genius of people, and their state of civilization; the ruder nations requiring fewer signs or representations, than the more cultivated. At first, each figure meant specifically what it represented. Thus, the figure of the sun expressed or denoted that planet only; a lion or a dog, simply the animals there depicted: but in process of time, when men acquired

more knowledge, and attempted to describe qualities, as well as sensible objects, these delineations were more figuratively explained; then the figure of the *sun*, besides its original meaning, denoted *glory* and *genial warmth*; that of the *lion*, *courage*; and that of the *dog*, *fidelity*.

"A still further improvement in civilization occasioned these delineations to become too voluminous; every new object requiring a new picture, this induced the delineator to abridge the representations, retaining so much of each figure as would express its species. Thus, for example, instead of an accurate representation of a *lion*, a slight sketch, or more general figure of that animal was substituted; and for a *serpent*, either a *spiral* or *crooked line*, like the letter S. Besides this, as there occurred a number of ideas, not to be represented by painting, for these it was necessary to attach *arbitrary signs*.

"The transition was not so great as at first it may appear. In all probability these signs were introduced slowly, and by degrees, and in such manner, as to be always explained by the context, until generally known and adopted.

"That such was the *origin* and *progress* of this invention, history, and the journals of travellers, furnish us with variety of proofs; hieroglyphics, in all their different stages, being found in very distant parts of the globe. Of these we shall mention some instances.

"Jacob d'Acosta relates, that on the first arrival of the Spanish squadron on the coast of Mexico, expresses were sent to Montezuma, with exact representations of the ships, painted on cloth; in which manner they kept their records, histories, and calendars; representing things that had bodily shapes in their proper figures, and those that had none, in arbitrary significant characters. It is here to be observed, that the Mexicans had long been a civilized people; so that this kind of writing may be considered among them as almost advanced to its most perfect state. Specimens of *Mexican painting* have been given by Purchas in sixty-six plates. His work is divided into three parts. The first contains the history of the Mexican empire, under its ten monarchs: the second is a tribute-roll, representing what each conquered town paid into the royal treasury: and the third is a code of their institutions, civil, political, and military. Another specimen of Mexican painting has been published, in thirty-two plates, by the present archbishop of Toledo. To all these is annexed a full explanation of what the figures were intended to represent, which was obtained by the Spaniards from the Indians well acquainted with their own acts. The stile of painting in all these is the same; and they may be justly considered as the most curious monuments of art, brought from the new world."

Our author proceeds to prove that alphabetic writing preceded the time of

Moses, and consequently had not a supernatural origin. The passage is satisfactory:

"The first mention of *writing* recorded in scripture, will be found in Exodus xvii. v. 14. 'And the Lord said unto Moses, write this, for a memorial, in a book; and rehearse it in the ears of Joshua; for I utterly put out the remembrance of Amalek from under heaven.' This command was given immediately after the defeat of the Amalekites near Horeb, and before the arrival of the Israelites at Mount Sinai. It is observable, that there is not the least hint to induce us to believe that writing was then newly invented; on the contrary, we may conclude, that Moses understood what was meant by *writing in a book*, otherwise God would have instructed him, as he had done Noah in building the ark, for he would not have been commanded to *write in a book*, if he had been ignorant of the art of *writing*: but Moses expressed no difficulty of comprehension, when he received this command. We also find that Moses wrote all the words and all the judgments of the Lord, contained in the twenty-first and the two following chapters of the book of Exodus, before the two written tables of stone were even so much as *promised*. The delivery of the tables is not mentioned till the eighteenth verse of the thirty-first chapter, after God had made an end of communing with him upon the Mount, though the ten commandments were promulgated immediately after his third descent.

"It is observable, that Moses nowhere mentions that the alphabet was a *new thing* in his time, much less that he was the inventor of it; on the contrary, he speaks of the art of writing as a thing well known, and in familiar use; for, Exodus xxviii. v. 21, he says, 'And the stones shall be with the names of the children of Israel, TWELVE; according to their names, like the engravings of a signet, every one with his name, shall they be according to the twelve tribes.' And again, v. 36, 'And thou shalt make a plate of pure gold, and grave upon it, like the engravings of a signet, HOLINESS TO THE LORD.' Can language be more expressive? Would it not be absurd to deny that this sentence must have been in *words* and *letters*? But writing was known and practised by the people in general in the time of Moses, as appears from the following texts, Deut. chap. vi. v. 9.; chap. xi. v. 20.; chap. xvii. v. 18.; chap. xxiv. v. 1.; chap. xxvii. v. 3. 8. By this last text the people are commanded to *write* the law on stones; and it is observable that some of the above texts relate to transactions *previous* to the delivery of the law at Mount Sinai.

"If Moses had been the *inventor* of the alphabet, or received letters from God, which till then had been unknown to the Israelites, it would have been well worthy of his understanding, and very suitable to his character,

to have explained to them the nature and use of this invaluable art which God had communicated to him: and may we not naturally suppose, that he would have said, when he directed the workmen to engrave names and sentences on stones and gold, 'And in these engravings you shall use the alphabetic characters which God hath communicated to me, or which I have now invented, and taught you the use of?' But the truth is, he refers them to a model in familiar use, 'like the engravings of a signet;' for the ancient people of the east engraved names and sentences on their seals in the same manner as is now practised by the great LAMA of Tartary, the princes in India, the emperor of Constantinople, and his subordinate rulers."

He then analyses the difference between picture characters and alphabetic characters; and thus describes the progress of substitution.

At present we shall pursue that part of our enquiry which relates to the formation of an alphabet.

"Let us then premise, that *arbitrary marks* are of different kinds. *First*, those used by the Chinese, many of which were originally picture-characters. *Secondly*, those used by the *notarii* among the antients, and by the present short-hand writers; and thirdly, MARKS for SOUNDS; such as elementary characters or letters, and musical notes.

"The marks of the *first* and *second* kind are very numerous, as will appear hereafter; those of the *third* are very few, as will presently be demonstrated.

"It seems obvious, that whilst the picture or hieroglyphic presented itself to the sight, the writer's idea was confined to the figure or object itself; but when the picture was contracted into a mark, the *sound* annexed to the thing signified by such mark, would become familiar; and when the writer reflected, how small a number of sounds he made use of in speech to express all his ideas, it would occur, that a much fewer number of *marks* than he had been accustomed to use, would be sufficient for the notation of all the *sounds* which he could articulate. These considerations would induce him to reflect on the nature and power of *sounds*; and it would occur, that *sounds* being the matter of audible language, marks for them must be the elements of words.

"Aristotle justly observes, 'that *words* are the marks of *thoughts*; and *letters*, of *words*.' Words are sounds significant, and letters are marks for such sounds."

"The learned author of *Hermes* informs us, 'That to about twenty plain elementary sounds, we owe that variety of articulate voices, which have been sufficient to explain the sentiments of so innumerable a multitude, as all the present and past generations of men.'

"As there are but a small number of

marks for sounds, called *notes in music*, so there are but a small number of distinct articulate sounds in every language. In different languages their number differs; and there are but few sounds in any two languages that are exactly the same; although by the great intercourse between the European nations, the sounds of different languages daily assimilate.

“Mr. Sheridan says, that the number of simple sounds in our tongue are twenty-eight. Doctor Kendrick says, we have only *eleven* distinct species of articulate sounds, which even by contraction, prolongation, and composition, are increased only to the number of *sixteen*; every syllable or articulate sound in our language being one of this number. Bishop Wilkins and Doctor William Holder, speak of about thirty-two or thirty-three distinct sounds.

“It has been said that among the Greeks and Romans, their written alphabet exactly accorded to the several distinct *sounds* and modes of articulation in their languages; so that each sound had its distinct mark, by which it was uniformly and invariably represented. Ten simple marks or characters have been found sufficient for all the purposes of numerical calculations, which extend to infinity.

“Seven notes comprise the whole of music: these, by their different arrangements, produce that variety of harmony which we so justly admire. If we would ascend higher than eight notes, we only begin another series of the same distances. Again, the *scale* doth not admit of a division into equal parts: this must correspond with the laws of sound: as every piece of music is but these notes varied, it must come to a close in the lowest note or its octave.

“It is evident, that from the confined nature of the organs, the simple natural sounds to be distinct must be few; and though artifice or affectation may invent a greater variety, they must be deficient in precision as they increase in number. Indeed there are several sounds proceeding from inanimate objects; as, the murmuring of a stream, &c. that are not adapted to the human organs of utterance.

“It would be digressing too far from our subject, to enter into a discussion concerning the number of sounds that are known to exist, nor is this necessary: for as *sounds* are few, the marks for them need not be many, but the marks for *things* are very numerous.

“It is however requisite for our readers to distinguish between *visible* and *audible language*. This distinction is justly made by St. Augustine, in the following words, “*Signa sunt verba visibilia, verba signa audibilia.*”

“The articulate sounds of vocal or audible language are resolvable into sentences, words, and syllables; and the analysis of language into *elementary sounds*, seems first to have led to the invention of *symbols*, or marks, for

mental conceptions. This invention must have taken place much about the time that men began to reform the barbarous jargon they first spoke, and form a language; for which purpose, the knowledge of elementary sounds and their powers, was absolutely necessary. The progress in this science, as has been already observed, must have been by degrees: men would begin no doubt, by distinguishing the *sound* of one word from that of another; this would not be difficult; then they would resolve words into syllables, which would not be so easy; but it is likely that they stopt there for a long time, perhaps for ages, before they came to the last resolution of syllables into the distinct *sounds* of which they are composed. This was a very extraordinary work of art, which could only be performed by those who had considered the laws of *sounds*; and could not be the result of *chance*, as some speculatists have imagined; for this was in fact the decomposition of a language into the *sounds* of which it was composed.

“The next step towards the notation of language, would be the delineation of a separate *mark* or *letter* to denote or stand for each sound; which *marks* though few in number, would admit of so great a variety of arrangements and combinations, as would be capable of producing an infinity of articulate sounds, sufficient for the composition of syllables, words, and sentences; and consequently for the notation of language.”

There is in the outline of this system great probability; yet the individual steps of the progress might perhaps by more investigation have been entirely told.

A story occurs in the book *De vet. lit. Hun.* of an innkeeper in Hungary, who could neither read nor write. He kept however strict accounts with his several customers. The sawyer he described by a saw, the smith by a hammer, the soldier by a musket, and the carter by a whip. Opposite to these emblems were chalked marks, which tallied with the ale consumed. By degrees the saw had been simplified into a zigzag, the hammer into a cross, the musket into a line, and the whip into a loop. And thus to picture-writing had succeeded symbolic writing; to representative marks, arbitrary characters. This fact is an abridged history of the progress of writing.

It seems equally natural and probable that the original picture-writing should slide into the flourishes of the Chinese, as that it should separate into the syllabic writing of the Shanskreet priesthood (for their numerous alphabet is surely a list of the elementary syllables of the language); or that it should pass on to our still simpler subdivision into letters.

The Chinese seem to have migrated from the center of civilization, when writing had only reached the first state: the Hindoos when it had reached the second state, and the Babylonians when it had reached the third state.

For all our modern alphabets are derived from the Babylonian.

Mr. Astle indeed chooses the Phenician alphabet for his prototype; and has (at p. 50) a table, and (at p. 64) a plate, which fully establish the resemblance, the relationship, the mutual dependence, the common descent; the analogous filiation of the Syrian, the Grecian, the Latin, the Gothic, the Arabic, Coptic and Æthiopic alphabets. But it is highly probable that the Phenicians of Tyre went to school at Babylon: and it is absolutely certain that the first alphabet originated in a nation speaking the Hebrew tongue: The names of the letters are in that language all significant. Now it is notorious that scarcely any part of the Jewish scriptures is extant in the provincial vernacular dialect of Jerusalem, but only in the court-language of Babylon. The Hebrew was that language. It may amuse our readers, if we repeat after Gregory Sharpe (Origin of Languages, p. 60.) the original designations of the letters.

The sound of the first letter of the alphabet is the first sound of animals. The name of it *aleph* signifies the ox, and the form of the letter bears much resemblance to the head of an ox.

The second letter *beth* has the outlines of a house, or booth, which is the meaning of its name. *Baia* in Tyrian is a house, in old Greek it is *aita*, in Latin *edes*, in Egyptian *ath*. The word may be connected etymologically with *baites* a sheep-skin; because the first roofs were of hides.

The third letter has a bunch on its back, and is called *gimel*, or the camel. The sound bears perhaps some resemblance to the snort of that animal.

The fourth has the form and name of *daleth*, a door. The sound of a door, or leaf, in closing, is not unlike the sound of this letter.

The fifth letter *he* implies demonstration, and means *behold*. Boderian thinks the figure to have originated in a hand pointing. Baxter has a surprising conjecture about the first draught of this letter, which he supposes to have represented mother earth and her son the sun, or Isis and Orus. As it represented the

goddess-mother, it came to be used, he thinks, for making female terminations. This last thought is putting the cart before the horse: feminine terminations must have been used in language long before alphabetic writing.

The sixth letter *vau* is a hook.

The seventh *zain*, instruments, or arms.

The eighth *beth*, a quadruped.

The ninth *teth*, a trumpet.

The tenth *yod*, a hand.

The eleventh *kaph*, a cup.

The twelfth *lamed*, a goad, or spit. Baxter says it is a ploughshare, and has thence its form.

The thirteenth *mem* is rendered spot, or contagion; but as this bears no resemblance to its form, which is complex, it has perhaps been shapen out of the figure which stood for the word *mother*, *mia* in Tyrian being mother. A cow is a more plausible form of origin.

The fourteenth *nun* is a fish; it is called *nachash*, serpent, in Æthiopic.

The fifteenth *samech* basis, pedestal; perhaps however from the root to destroy.

The sixteenth *ain* means eyes, which it seems to represent; and also, by a natural metaphor, fountains.

The seventeenth *pe* or *pa*, means the lip: it is made by a puff between the lips.

The eighteenth *tsaddi*, according to Caninius, signifies a huntsman's pole, or shepherd's hook; but Baxter says an eel-spear or trident, and would thence derive the city, or fishing town, Sidon. The word also signifies sides.

The nineteenth *gup*, or *koph*, is a monkey; hence the tail in the figure.

The twentieth *resh*, signifies head.

The twenty-first *sin* or *shin*, a tooth, from which it is plainly imitated.

And the twenty-second *tan*, is a *terminus*, or land mark, and therefore put last; but Baxter would have it mean a hammer.

Let us now turn from Babylon to the nursery; for nations, in the infancy of human society, had in the aggregate to take those very steps, which we now have learnt to compress within the limits of a childhood. How are our primers constructed? A for apple; B for bed; C for cow; D for dog; E for eel; and beside each letter stands the graven image of the most familiar object whose name it begins. In order to associate the sound, which is arbitrary, with the object, which is immutable, we depict them together. At first only the gays (as children call them) are attended to; and the letter

stands centinel in vain. By degrees the form of the letter is impressed no less distinctly than that of its emblematic companion. We then withdraw the gays, and expect that the D should suggest the first effort to pronounce dog; and the E eel. No doubt the Babylonians had their primers, which delineated distinctly the ox, the booth, the camel, and beside them the simplest outline, or mark, which would distinguish the aw, the be, the ka, abstracted from their original figures. The obelisks of Egypt are probably such primers. If the roof of the temple of Tentyra was a public almanac, why may not its pillars have been a public primer? The most familiar objects of primitive society came to stand for the incipient articulations which described them. Some of these articulations are not simple, as *tsaddi*; and thus double letters occur in the original alphabet, which could never have been the case, if, as our author imagines, the analysis of language into elementary sounds (p. 19.) had led to the invention of symbols. These symbols are mere abbreviations, not at all the result of philosophical analysis. It is high time that the European nations should begin to disuse their double, and their equivocal letters; and should apply the superfluous characters to the notation of other unrepresented simple sounds. An alphabet universally applicable is the first step to an universal language. Our alphabet is ill-named: the incipient and final sound of every letter ought to occur in its name. We should either call the *b* ebba or bab; the *d* edda or dad; the *f* effa or faf, and so forth. It is particularly worth the while of the English nation to perfect its alphabet; as it is likely to become the instructress of almost all the uncivilized portion of the globe; and as its language is alone fitted, by absence of inflection and simplicity of structure, to become the basis of a universal language. All anomalies should be laid aside: *mouses* not *mice*; *oxes* not *oxen*; *sheeps* not *sheep*; every departure from analogy is a needless task the more for every child, and for every foreigner, who is to partake the luxury and the advantage of knowing our literature.

The fifth chapter, which treats of writing in England, displays to advantage the peculiar and industrious examinations of our author. Concerning Phenicians and Chaldeans he leans on the inferences of others: concerning writing

in England his researches are personal comprehensive, and skilful. He produces admirable *fac similes* of many of our most curious manuscripts, and indicates with instructive detail, the marks of earlier or later execution. Of this chapter to produce a specimen will much tend to invite the reader to consult the original work, which to the studiers and commentators of our manuscript literature is of essential value.

"After the most diligent inquiry it doth not appear that the Britons had the use of letters before their intercourse with the Romans. Although alphabets have been produced, which are said to have been used by the ancient Britons, yet no one MS. ever appeared that was written in them. Cunoelin, king of Britain, who lived in the reigns of the emperors Tiberius and Caligula, erected different mints in this island, and coined money in gold, silver, and copper, inscribed with Roman characters. From the coming of Julius Cæsar, till the time the Romans left the island in the year 427, the Roman letters were as familiar to the eyes of the inhabitants, as their language to their ears, as the numberless inscriptions, coins, and other monuments of the Romans still remaining amongst us, sufficiently evince. However, we are of opinion that writing was very little practised by the Britons, till after the coming of St. Augustin, about the year 596.

"The Saxons who were invited hither by the Britons, and who arrived about the year 449, were unacquainted with letters. The characters which they afterwards used were adopted by them in the island, and though the writing in England from the fifth to the middle of the eleventh century is called *Saxon*, it will presently appear, that the letters used in this island were derived from the Romans, and were really Roman in their origin, and Italian in their structure at first, but were barbarized in their aspect by British Romans and Roman Britons. A great variety of capital letters were used by the Saxons in their MSS. of which many specimens are given in our plates.

"*Saxon capitals.* The capital letters in plates fourteen A and B, are taken from the *Textus Sancti Cuthberti*, written in the seventh century, formerly preserved in the cathedral of Durham, but now in the Cottonian library (Nero D. 4). In this fine MS. we find several of the capital letters which were used by the Greeks, the Etruscans, the Romans, the Visigoths, the Saxons, the French, and the Germans. The *Ϝ*, the parent of the Roman F, was not disused at the time this MS. was written. The Roman F, and also the F used by the northern nations, appear in the alphabet which we have engraven, as doth the M of the Pelasgians, of the Etruscans, of the Oscans, and of the Romans. The different forms of the letter O, in this

alphabet, were also common not only to the people last mentioned, but likewise to the Phenicians, and to the Greeks; the Y is not unlike the Greek  $\Upsilon$ . This alphabet alone bears strong testimony that the letters used by our Saxon ancestors are derived from the Phenician, the Etruscan, and the Greek letters, through the medium of those of the Roman. The capital letters in the fifteenth plate, No. 1, which are taken from a MS. written in the latter end of the sixth or the beginning of the seventh century, confirm this opinion. It is observable that the Pelasgian M, was used in MSS. so late as the eighth century. The third specimen in the eighteenth plate is taken from a copy of the four gospels in the royal library (1 B. 7). Our readers will observe both Roman and Saxon capital letters in this specimen, the former are used in the canons of St. Eusebius, which were probably written by some Roman ecclesiastic, the latter by one who had been educated in England.

"In the seventh and eighth centuries square capitals were occasionally used in England specimens of which are given in the fifteenth plate, No. 1, and in the title of No. 4, and an entire alphabet in the sixteenth plate. A great variety of capital letters used in England from the seventh to the tenth century inclusive, are exhibited in the eighteenth and nineteenth plates, which deserve the attention of those who desire to become acquainted with the manuscripts of our Saxon ancestors, and to judge of their age and authenticity.

"The Saxon capitals which vary from those now used are C, E, G, H, M, and W. The small letters are, d, f, g, r, s, t, and w, which are all Roman except the s and some notes of abbreviations used by the Saxons: many other abbreviations used by the Saxons appear in the eighteenth plate, No. 4. These notes of abbreviation are not the original members of an alphabet; they were the result of later reflection, and were introduced for dispatch. By an attentive observation of the different specimens of writing in England, we perceive the several gradations by which one form of a Roman character has imperceptibly changed into another. The Saxon D, says Mr. Whitaker, seems to have been only the Roman V at first, and to have been lengthened into the Saxon character, and enlarged into the present Roman W, by bringing the principal stroke somewhat lower, and closing the top in the one, and by redoubling the whole in the other. The W is unknown both to the Latin and its daughter languages, the French, the Spanish, and the Italian: it is composed of two characters, namely, of the V or U doubled.

"The writing which prevailed in England, from the coming of St. Augustin in 596, to the middle of the eleventh century, is generally termed *Saxon*, and may be divided into five kinds; namely, the *Roman Saxon*,

the *Set Saxon*, the *Running-Hand Saxon*, the *Mixed Saxon*, and the *Elegant Saxon*; which shall be considered in order.

"*Roman Saxon*. The Roman Saxon is that kind of writing which is very similar to the Roman, and prevailed in England, from the coming of St. Augustin till the eighth century. Specimens of this kind of writing are given in plate fifteen, No. 1. In this MS. the R and the E are more pure Roman than those which follow; this specimen is taken from the gospels of St. Matthew and St. Mark, formerly preserved in the Cottonian library (Otho, c. 5.) which is said to have been St. Augustin's book, but by the hand it seems to have been written in England, probably in his time. This fine book perished by the fire which happened in the Cottonian library in the year 1731.

"Another specimen in Roman Saxon characters, appears in the eighteenth plate, No. 5, which is taken from a MS. of the four gospels, in the royal library at London (1 E. VI.) written in England in the seventh century. The second page of this MS. is of a violet colour, in which are several letters in gold and silver. Prefixed to the gospels, is St. Jerom's epistle to Pope Damasus.

"The alphabets are, first, of the capital letters, which were in gold and silver; secondly, of the letters in which the heads of the chapters are written; and thirdly, of the letters which compose the text.

"The sixteenth plate furnishes a third specimen of Roman Saxon writing, which is taken from a fair copy of the four gospels of St. Jerom's translation, written in England in the latter end of the seventh century, with an interlineary Saxon version, written in the tenth century by Farmennus and Osrunus, two priests.

"This MS. is called the *Codex Rusworthianus*, because it belonged formerly to John Rushworth, of Lincoln's-Inn, Esq. It is now preserved in the Bodleian library at Oxford (D. 24. No. 3946.) Mr. Wansey says, it is little inferior in age to the Lichfield MS. or to St. Cuthbert's gospels, Nero, D. IV. At the end of this book, is the following passage, written in a hand similar to and coeval with the text. *Macregiul depinxit hoc Evangelium. Quicumque legerit et intellexerit istam narrationem, orat pro Macregiul Scriptori.*

"The square or angular capital letters, are very similar to those which appear in the Lichfield MS. and to those in the fifteenth plate, No. 1.

"The second alphabet is of the initial or uncial letters, (as they are usually called) in which the titles of chapters are written; the third, is of the Latin text, and the fourth, of the Saxon version. Concerning this valuable MS. see Wanley's catal. page 81.

"The fifth specimen in the fifteenth plate is taken from a fine MS. preserved in the church of Lichfield, called *Textus Sci. Ceddæ*, or St. Chad's gospels. This MS. was many

years ago presented to the church of Llandaff, by Gelhi, who gave for the purchase of it one of his best horses; it was deposited in the cathedral church of Lichfield about the year 1020, which being dedicated to St. Chad, the fifth bishop of that see, it hath thence been called his book. This MS. was written in England about the time of St. Cuthbert's gospels in the seventh century; in the margin whereof are several annotations in Latin and Saxon, and some in the ancient British or Welch, which last, Mr. Edward Lhuyd supposes to be of about nine hundred years standing.

"The fourteenth plate contains the fifth and last specimen which we have given of the Roman Saxon writing, and is taken from the *Textus Sancti Cuthberti* formerly preserved in the cathedral of Lindisfarn or Durham, and is now in the Cottonian library (Nero D. IV). The time when this most noble monument of Anglo-Saxon calligraphy was written is nearly ascertained by a Saxon note at the end of St. John's Gospel, in the hand-writing of Aldred, who was bishop of Durham from the years 946 to 963, whereby it appears, that the Latin text was written by St. Eadfrith, a monk of Lindisfarn, in the time of St. Cuthbert, who died in the year 687; when he, the above-mentioned St. Eadfrith, was elected bishop of that see, which he held till the time of his death, in 721; and that the curious and elaborate ornaments which are in this MS. the pictures of the cross, and of the four evangelists, and the capital letters, were drawn by St. Ethelwald, who was a contemporary monk with Bishop Eadfrith, and who succeeded him in the bishoprick of Lindisfarn, wherein he continued till his decease in 737. Bishop Aldred adds, that Bilfrith, a monk of the same church, adorned the outside of the book, with a silver cover gilt, set with precious stones; and that Aldred, a priest, added the interlinear Saxon version, with some marginal notes."

How desirable it would be for the society of antiquaries to employ certain persons, at a regular expence, to edit annually, some of the unpublished manuscripts here described. A fac simile of the first page or two might accompany every book. The manuscripts, which deserve a preference of care, are not those transcripts of the vulgate, which our author seems to prefer; but those which throw light on the historical antiquities, or on the original and native literature of the country. The pedigree of estates, if not of families, can often be illustrated by means of them: and it is a species of domestic pride, may we call it, in contradistinction to family pride, far more consonant with our mercantile habits, far more conducive to the value

of our acres, and far more rational in the eye of philosophy, to be desirous of dwelling on sports consecrated by the germinations of religion or the victories of freedom, than to care for genealogies, which, in proportion as they are pure, exclude the supposition of that robust strength, that unsophisticated health, and that enduring vigour, which are only the recompense of early privation and occasional toil.

The ninth chapter discusses the origin and progress of printing: Mr. Astle's account of this art is very neatly given in the following words.

"As the invention, or rather the introduction of printing into Europe, has been attended with the most beneficial advantages to mankind, some account of the origin and progress of that art may be acceptable.

"It has not been pretended that the art of printing books was ever practised by the Romans, and yet the names they stamped on their earthen vessels were in effect nothing else but printing, and the letters on the matrices, or stamps used for making these impressions were necessarily reversed, as printing types; several of these matrices are extant in the British Museum, and in other places, which are cut out of, or are cast in one solid piece of metal.

"Many hundred pieces of the Roman pottery, impressed with these stamps, have been found in the sands near Reculver in Kent, and on the eastern side of the isle of Shepway, where they are frequently dragged up by the fishermen. The art of impressing legends upon coins is nothing more than printing on metals.

"It is generally allowed, that printing from wooden blocks has been practised in China for many centuries. According to the accounts of the Chinese, and of P. Jo-yius, Osorius, and several other Europeans, printing began there about the year of Christ 927, in the reign of Ming-Tecung, the second emperor under the dynasty of Heou-Thong: several of these blocks, which are cut upon ebony, or on wood exceedingly hard, are now in England. The *Historia Sinensis* of Abdallah, written in Persic, in 1317, speaks of it as an art in very common use. Our countryman, Sir John Chardin, in his Travels, confirms these accounts.

"Printing, then, may be considered as an Asiatic, and not a European invention.

"The first printing in Europe was from wooden blocks, whereon a whole page was carved exactly in the same manner as is now practised by the Chinese, who print only on one side of their paper, because it is so exceedingly thin, that it will not bear the impression of their characters on both sides.

"The early printers in Europe printed only on one side of the paper for some time after

the introduction of the art; they pasted the blank sides together, which made them appear as one leaf.

"The European blocks were carved upon beech, pear tree, and other soft woods, which soon failed, and the letters frequently broke; this put them upon the method of repairing the block by carving new letters, and placing them in, which necessity seems to have suggested the hint of moveable types of metal; these were not so liable to break as the soft European woods, which had been before used. One great and obvious advantage of moveable types was, that by separating them they would serve for any other work; whereas the blocks of wood served only for one work; though the use of moveable metal types was a very fortunate discovery, yet they derived their origin rather to the imperfection or unsuitableness of our woods for printing blocks, than from any great ingenuity of those who first used them. In short necessity, the mother of all arts, introduced moveable types.

"It has been a matter of contest, who first practised the art of printing in Europe. Faust or Fust of Mentz, Gutenberg of Strasburg, and Coster of Haerlem, have each their advocates. The pretensions in favour of Fust seem to be the best supported; but we shall not trespass upon the patience of our readers by entering into a discussion of this matter, because such a discussion would, in our opinion, be of little importance, it having been generally agreed, that printing with moveable types was not practised till after the middle of the fifteenth century, although

prints from blocks of wood are traced as far back as the year 1423.

"It seems probable, that the art of printing might have been introduced in Europe by some European who had travelled into China, and had seen some of their printing tablets, as it is known that several Europeans had been over-land into China before this time; and what strengthens this probability is, the Europeans first printed on one side of the paper only, in the same manner as the Chinese do at present, but, however this may be, the progress of the art was as follows:

"First, pictures from blocks of wood without text.

"Secondly, pictures with text

"Thirdly, whole pages of text cut on blocks of wood, sometimes for the explanation of prints which accompanied them. And,

"Fourthly, moveable types. Specimens of all which are given in the *Idée générale des Estampes* just referred to."

An appendix concerning the radical letters of the Pelasgians closes the volume. The domestic erudition is the most valuable part of it. The printing is exquisitely beautiful. The illuminated engravings, the vellum paper, display to advantage the allied arts. The author will descend to posterity as an adept in diplomatic science, and a tasteful cultivator and patron of the connected branches of literature.

ART. II. *Anecdotes of the English Language, chiefly regarding the Local Dialect of London and its Environs, in a Letter from SAMUEL PEGGE, Esq. F. S. A. 8vo. pp. 234.*

THERE is some merit in the mere compilation of phenomena respecting the vernacular and idiomatic dialect of the multitude. They may serve, like insulated facts in chemistry, to prepare the generalizations of philosophy. The grammarian may deduce from them important contributions to the theory of language; the author may find among them expressions worthy of being ingrafted into the phraseology of composition.

The compilation of mere blunders is, however, the least useful department of philological industry. Mis-utterings and mis-spellings of words, whose derivation and orthography are notoriously settled, may, by being recorded, warn the careless and the ignorant against such intolerable repetition: but they can at most be employed to assist a farce writer in making his cockneys ridiculous. To enumerate them with apologetic complacence, is to endanger the purity of the

received diction. Too much of this blunder-mustering occurs in these anecdotes: they consist chiefly of vitious expressions, enumerated without censure.

The form of review most adapted to guard our speech against the intrusion of these metropolitan provincialisms, would be a perpetual commentary, a discussion, word by word, of the claims of each to retainer or dismissal. But this would be too voluminous for us, too tedious for our readers. We must restrict ourselves therefore to desultory annotations.

P. 22. The etymology of *cockney* is discussed. Junius had already settled the point: it is originally Welsh, connected with the root *coer*, indulgent, and means a spoilt child. In Brittany the woad, whence a sort of European indigo is made, is called *cocagne*, and, as it requires a loamy fertile soil, the name *pays de cocagne* is come to signify a plentiful country. This *cocagne* was used for ta-

tooting in early times. Probably, therefore, to *paint the person* is the species of indulgence whence *coceth*, effeminacy, has its name.

P. 25. Some nations have used the word *bull* as an augmentative: the English use the word *horse*, this being no doubt the largest animal of their acquaintance, before the southern breeds of oxen were introduced. Thus we have *horse-leech*, *horse-chesnut*, *horse-radish*, *horse-walnut*, *horse-emmet*, *horse-muscle*, *horse-crab*, *horse-godmother*, *horse-laugh*, *horse-face*, *horse-cucumber*, *horse-marten*, *horse-mint*, *horse-play*, &c. But our author seems incorrect in referring to this head the phrase *sick as a horse*: it is probably a corruption of *sick of his orts*, sick of the dainties he has eaten. *Orts*, though obsolete now, is to be found in Skinner and Junius: but a horse is not subject to vomiting.

P. 40. Some vague *prate* occurs about the abbreviation of those words ending in *our* and in *ck*. 1. The most desirable plan would be to spell the verbs *honour*, *favour*, and their derivatives *honourable*, *favourable*, with the *u*; and to spell the substantives *honor*, *favor*, without the *u*. Children and foreigners have often a difficulty in distinguishing our substantives from our verbs. 2. The substantives *publick*, *musick*, *frolick*, *traffick*, have nearly dropped the final *k*; but it would have been better to drop the intervening *c*, because the *c* is an equivocal letter, which stands for *s* in *mice*, *rice*, *chaise*, *witch*; for *ts* in *muck*, *rich*, *chair*, *chop*; and for *k* in *coffin*, *care*, *ache*, *antic*, &c. so that the less this letter is used, the less the difficulty of learning to read.

P. 51. *Unposible*, *unactive*, *unsufferable*, are unexceptionable words: the formative *un*, although Saxon, is so wholly English, that it cannot be annexed to words of Greek, Latin, and French origin, without exciting that feeling of displeasure which hybrid words usually produce. Besides, the syllable *in*, having a double or triple sense, is often equivocal, and should be used as rarely as possible. Scholars mostly prefer to inflect Greek roots with Greek formative syllables, Latin with Latin, and French with French; *atheous*, *indignant*, *indefeasible*; not *untheous*, *undignant*, *undefeasible*; but all Gothic roots, with the Gothic syllable, *unthrift*, *ungodly*, *unwalled*, *unawares*.

P. 55. *Shay* and *poshay* for *chaise* and *post chaise*. These are euphonious collo-

quial abbreviations, which perhaps merit adoption, because they rid the language of a gallicism, an anomaly, and an equivocation.

P. 58. It is said in the note that *quits* is bad English, and is a school-boy's adverb. A like reproach is made (p. 60) to *somewheres* and *oftens*. The regular mode of forming adverbs in all the Gothic dialects is to add *s*. Thus from the adjective *unaware* comes the adverb *unawares*; from the preposition *beside* the adverb *besides*; the adverbializing *s* also occurs in *backwards*, *forwards*, *upwards*, *downwards*, *homewards*, *darklings*, *straitways*, &c. In a note to the same page, the expression for *all that* or *afraid that*, as it is pronounced, comes in review: it signifies *notwithstanding that*. Perhaps it is a corruption of *after all that*, or *off all that*; or perhaps of *afar all that*, from the Anglo-Saxon verb *afaran*: the latter is most probable, and indicates the expedient form of writing the phrase.

P. 59. The comparatives *worser* and *lesser* are reviled: they are both Saxon, in which language *worse* means *bad*, and *less* means *small*. The corruption consists in joining *than* to the positive.

P. 92. *Ulpbolsterer* is declared against as a corruption. Whence does it derive? surely not from *uphold*; the *st* would in this case never have intruded. From the Anglo-Saxon *bolstre*, *bolster*, comes *bolsterer*, a maker of *tolsters*; the vowel prefixed is a mere coalescence of the article, as when we say *a newt*, *an apothecary*; or as when the French say *le L'antin* for the Antinous. But from *poult*, a chicken, should derive *poulter*, a dealer in chickens, and not *poulterer*.

P. 96. We are told that the ancient increment *alder* means *older*, whereas it means *of all*, and is a common prefix to superlatives in all the gothic dialects. Thus *aldirlevist lord* signifies *dearest of all masters*. To write,

“And in her arms she bore her *alder* youngest child,”

would have been good English, while this prefix, which also occurs in the less equivocal form *aller* was in use.

P. 173. The regular and familiar adverbs *afoot*, *aborseback*, are censured: they are regularly formed by prefixing the adverbializing *a*, like *aboard*, *adrift*, *aloof*, *adays*, *anights*, *abreast*, *ahead*, *aside*, and are equally entitled to reception. We might analogously say: What is *aclock*? This formative syllable is pro-

bably a contraction of the earlier form of the preposition now written *on*. It ought not to be confounded with the verbal augment *a*, which is of French origin, and which serves to transmute nouns into verbs, as from *base* to *abase*, from *certain* to *ascertain*, &c.; or with the participial augment *a*, which is of gothic origin, and which serves to form the participle present of the neuter, or middle voice. The hay is *amaking*.

“Thou, now *adying*, sayst thou flatt’st me.”

To go *ahunting*. But the active participle will not receive this augment: they are *hunting* the hare.

P. 177. The participial augment *y* is called an excrescence, a redundance, in *ybuilt*, *ybrought*, *yloved*. Where the participle is not distinguished by its termination from the preterite, it is surely some object to distinguish it by a prefix. The most convenient form which our verbs can assume, is to form the preterite in *ed*, and the participle in *en*: *show*, *showed*, *shown*; *owe*, *owed*, *owen*; *cast*, *casted*, *casten*; wherever usage offers the choice, it is desirable to employ the mixture of both conjugations.

P. 181. *Self* is a substantive, signifying *soul*. It ought to be united with the possessive, not with the personal pronoun. *His self*, *her self*, *their selvet*, (as Sir William Jones has observed), are purer expressions than the received ones. Our author, instead of attending to this fact, proposes to adopt the *bisself* of the Londoners in the nominative case only, and to continue employing in the accusative the barbarism *himself*.

P. 228. The participle *went* is from the verb *to wend*, which means *to turn*, and is scarcely obsolete. It is not a proper substitute for the past tense of *to go*, in such phrases as *I went strait forwards*. Why not resume *I goed*, or *I gang*?

P. 249. Mr. Pegge very properly censures Johnson’s dictionary, of which only the preface is well executed; but his criticism is too vague to be instructive. The late Dr. Geddes had, it is said, an interleaved copy of Johnson’s dictionary, in which he had inserted many words occurring in oriental books of travels, with proper definitions and vouchers. It is much to be wished that this, and all similar supplements to Johnson’s dictionary, were published; the smaller collections of words in magazines, and the larger in distinct volumes. Without such contributions from differ-

ent quarters, a complete English dictionary will hardly be achieved.

P. 259. The syllables *er*, *ist*, *ism*, and *ize* pass in review. Our author asks why we do not say *a bookist*, *a battist*, *a stationist*, as well as *a druggist*, *a tobacconist*, *an organist*? The syllable *er* is originally Saxon, connected with the word *herr*, master, and with the pronoun *er*, he, and is used in all the gothic dialects to form personal substantives masculine from verbs. So *bake*, *baker*; *drum*, *drummer*; *fish*, *fisher*. This syllable, closely resembling the Latin *or* and the French *eur*, has been frequently substituted to those syllables in words of French and Latin origin. So *stationer*, *trumpeter*, *governor*, *translator*; although the two last words are sometimes written with *or*. The syllable *ist* is of Greek origin: it seems connected with the root *to stand*, and signifies *a stander*. It is fitly used to inflect words of Greek derivation: *Κιβωρα*, *Κιβωριστής*; *organ*, *organist*; *Plato*, *platonist*; *analyze*, *analist*; *sophist*, *theorist*, *methodist*, *monarchist*. From an affectation of learning, probably, some authors have called themselves *tourists*, some apothecaries *druggists*, and a subsequent subdivision of this trade, *tobacconists*: these are all hybrid words. The formative syllable *ism* being of Greek origin, is not frequently combined with words of any other derivation: *Platonism*, *sophism*, *methodism*, *catholicism*, *theism*; except that in the schools of philosophy all opinions are classed in *isms*, and all sectators in *ists*. Materialism, puritanism, libertinism, jesuitism, jacobinism, protestantism, republicanism; materialist, spiritualist, idealist, Calvinist, philosopher, dogmatist, revolutionist, &c. several of which words are hybrid, or made up of different languages. The syllable *ize* is originally Greek: *to theorize*, *to philosophize*, *to cauterize*; but it is used very familiarly both in the French and English writers of late date, to form adjectives into verbs. So *human*, *humanize*; *provincial*, *provincialize*; *volatile*, *volatilize*, (and not *volatize*, as Mr. Burke writes); *familiar*, *familiarize*. There is an unwillingness to annex this syllable to all words of northern derivation, and to those adjectives of southern derivation, which do not terminate in liquids.

P. 267. Minsheu is probably right in the derivation of *haberdasher*; it was a nick-name given to the German jews, from their offering petty wares with the phrase *hab er dass*, *herr*,—*buy you this*, Sir. Mr. Pegge is probably right in deducing

*pollicary*, the older form of spelling, from *botanicario*; the derivation from the Greek *αποβολη* is an after-refinement.

P. 275. Corn-chandler probably is corn-cantler, one who sells or buys corn by the sample; from the French *echantillon*, sample, is derived the English word *cantle*.

P. 302. "We ought to reform our cards of invitation and acceptance," says Mr. Pegge. His reasons will amuse.

"*Compliments*—seem to mean *complyments*, and therefore cannot be used in the first instance of an invitation, as it rather appears to be the language of the *invitee* than of the *inviter*. A asks B to dine with him, B returns for answer, that he will *comply* with A's invitation. *Compliments*, therefore, ought to be the cardinal word of ceremony in the return, and not in the request. 'A good morrow morning to you\*'; an evening compliment, which I have heard made use of, as well as a morning one,

"*Wait upon*.—The answer to an invitation from A to B is, that B will do himself the pleasure of *waiting* upon A. This is contrary to all the rules of etiquette; for A, at whose house the scene is to lie, is bound to *wait upon* B, his guest. I remember when the language was, that A should say to B, on inviting him to his house, 'that he would be very happy to *wait upon* him in St. James's square.' Every man is to *wait* upon his guests, by himself, or his sufficient deputy, and not *they* upon him. In the first instance to *wait* means to *attend upon*: just the reverse of the French *attendre*, which signifies to wait for, or expect.

"There are many words and expressions in use among our forefathers, which would make very strange havock with our present modes of writing and speaking.

"I have received the *unvalued* book you sent me; Milton's verses on Shakspeare:†

"Mr. A keeps a very *hospital* table.‡

"I have visited Mr. B. this summer, and feel great *resentment* of the treatment I received.§

"I have lately read Mr. —'s history of —. It is a most *pityful* performance. Sir Thomas More's Edward V. 1641, is called his '*Pityful Life of Edward V.*'

"King Charles I. was very much reduced indeed; but the reduction of King Charles II. brought things right again.||

"Mr. A is as *humoursome* a man as I ever met with; though at certain times he can be as *humourous* as any body.—Shakspeare.

"I never saw any man more *important* than he was, when he came to beg I would

do him the greatest favour in the world; Comedy of Errors, act v. scene 1.—And I treated him *respectively*. Two Gentlemen of Verona, and Godwin's Henry VIII. p. 101.

"But I afterwards found that he was a man of the greatest *dissolution* in the world. Robertson's Charles V. vol. iv. p. 362.

"*Exceedingly* may be used independently as an adverb, but not as an augmenting adjective: as, 'I like it *exceedingly*;' but we cannot say '*exceedingly* well,' and should say '*exceeding* well,' i. e. more than well; as Shakspeare does the word *passing*.—'*Tis strange, 'tis passing strange.*'

"Where does he live? In a very *inhabitable* part of —shire, where his father lived before him. Richard II. act i. sc. 1.

"To the affectation of new-fangled modes of spelling words, we may add what has of late years happened to names and titles, some of which have been expanded, or altered, in the position of letters, or in their terminations, and in other particulars, contrary to long-established practice, however they may be warranted by ancient usage, insomuch that one scarcely knows them again when seen in their old new clothes.

"If every name of a person or place were to be restored to original spellings, we should not discover who was meant; nay, the simplest names have been so mutilated, that the learned editor of the Northumberland Household Book assures us that he has seen the plain, dissyllabical name of *Percy*, in various documents which have come before him, written *fifteen* different ways.

"The family name of the Earl of *Dysart* has so long been spelt *Talmush*, that one stares at the first view of the present mode of writing it—*Tollemache*. The peerage of Scotland, Crawford, Douglas, &c. and the heraldic writers, Sir George Montague, and Mr. Nisbett, give it as *Tallmash*.

"The name of *Littleton* is now studiously to be written *Lyttleton*, under pain of displeasure. The great lawyer, the head of that name, wrote it *Littleton*; and no lawyer of the present age would scruple to do it; as does his commentator, Lord Chief Justice Coke. I fancy that our friend Adam Littleton, the dictionary, would have whipped a boy for spelling it otherwise than as we find it at the end of his dedication, *Littleton*.

"Some words have got back again. *Falconberg* was for a long time *Falconbridge*, and is now got back again to *Falconberg*. Shakspeare has it both ways.

"I love to *learn*, sir, but I hate to *unlearn*. To you and I, sir, who have seen half a hundred years, it is re-funding.

"*Consequential*. 'Less consequential to the interests of life.' Mr. Steevens's note to

\* "Good-morrow; for, as I take it, it is almost day." *Measure for Measure*, act iv. sc. 2.

† "See a note on Richard III., act i. scene 4. edit. 1778.

‡ "Fuller, Ch. Hist. b. v. p. 197.

§ "See Life of Dr. Radcliffe, p. 92, edit. 1736. N. B. It is in Johnson's Dictionary.

|| "Life of Dr. Thomas Fuller, London 1661, 12mo. p. 104."

Twelfth Night, p. 189. Rather *consequenter*. *Godly*, adverbially, for *godlily*. Offertory.

“*Ungodly*, adverbially: ‘vainly, detestably, and *ungodly* employed.’ Appendix to Mr. Pennant’s Journey from Chester to London, 1778, 4to. No. III. in the resignation of the prior and convent of St. Andrew’s, Northampton\*.

“*Married*. He married *her*—she married *him*.—Rev. Mr. A. married them. *Il maria avec*.

“*Gentleman-like*. ‘He treated me in a gentleman-like manner.’ It should rather be ‘*Gentlemanly*,’ otherwise it is a reflection, as if his gentlemanship was affected, or mine was doubtful. ‘He treated me like a gentleman,’ operates both ways. I have heard it pronounced *gentlemanly*, without the second *l*.

“Dr. Robertson writes *brieves*, vol. ii. p. 133. So *beeves*, without a singular. The printers say *prooves*.”

P. 310. This author enters upon rules for coining new words. Some of these rules are most ignorantly laid down. So in page 311 he says, that *dinnerism* and *supperism* could be used; but not *teatism* and *coffeism*. Yes; if each of these meals were to become a subject of theoretical discussion, and were to divide the eating and drinking world into sects of opinion; if one half of the epicurean clients of fashion were enthusiasts for one meal, or one refreshment, and the other half for the others: then we might talk of dinnerists and coffeists conspiring to gallicize the manners of the British; and of teaists and supperists, who persevere in the rustic greediness of swallowing two cookings in a day.

We are told again (p. 312) that *miserability* is as regular a word as *irritability*. We use the verb to *irritate*; we therefore know that *irritable* means able to be irritated, and *irritability* the capability of being irritated. We do not use the verb to *miserate*; we do not know that the adjective *miserable* means able to be commiserated, for we use it in a different sense, as if it meant *miserly*: we are consequently not tempted to form *miserability*. But the verb to *commiserate* being in use, the verbal adjective *commiserable* being therefore intelligible, we should

not be offended at the coinage of *commiserability*, but should instantly understand it.

We are told that *scoundrality* is as regular a word as *scurrility*. No. *Scoundrel* not being a Latin word, will not so easily coalesce with the formative syllables of Latin origin, as *scurril*, which is a Latin word; nor can *scoundrel*, a substantive, be joined to the termination *ity*, without the intervening coinage of the appropriate adjective.

We are told (p. 313) that *starvation*, *botheration*, *roustation*, and *talkation*, are as defensible as *scandalization*. No such thing. From verbs of southern origin, whose infinitives terminate in *are*, it is regular to form substantives in *ation*: *create*, *creation*; *civilize*, *civilization*; *scandalize*, *scandalization*; *salute*, *salutation*; *commiserate*, *commiseration*. From gothic roots no such substantives can be formed: *starvation*, however popular, is a barbarism; the other words have never been pronounced but by the miss Slipslops of modern affectation.

We are told (p. 322) that the word *hospitality* should rather be *hospitability*. Just the reverse. Verbs, which can have no passive voice, can form no adjectives passive; but adjectives in *able* are adjectives passive. *Hospitari* is a verb of this kind; were we in translating Pliny to say, The chesnut-tree, when transplanted, will not *hospitate*, the verb would be neuter, and therefore ought not to form an adjective in *able*. From the Latin *hospitalis* we ought to have formed the adjective *hospital*, the substantive *hospitality*; but *hospitium* should have been rendered *hospice* not *hospital*; the awkward cacophony has occasioned the impurity. Instead of the intolerable word *hospice*, another word *hospitary*, or *hospitory*, might have been hazarded.

On the whole, these anecdotes of our language may indeed serve to be the cause of grammar in others, but have very feeble claims themselves to the merit of being compiled by an assiduous grammarian, or commented by an able philologist.

ART. III. *Observations on the Drama, with a View to its more beneficial Effects on the Morals and Manners of Society. In Three Parts. By EDWARD GREENE, Corresponding Member of the Literary and Philosophical Society of Manchester.* 8vo. pp. 60.

WITHOUT conceding to the drama and manners of society, as Mr. Greene, so powerful an influence on the morals in common with many others, attributes

\* “Of all their ungodly deeds which they have ungodly committed, Jude ver. 15.”

to it; "an influence even more forcibly operative, perhaps, than the most perfectly written system of ethics;" we are nevertheless very attentive to any remarks, which have for their object to rescue it from the meanness and degradation into which it is avowedly sunk. It should be recollected, however, in defence of our modern play-wrights, that before they can lead the public taste, they must consult it.

"Ah! let not censure term our fate, our choice,

The stage but echoes back the public voice;  
The drama's laws the drama's patrons give,  
And we that live to please, must please, to live."

So that if the manager of Drury-lane or Covent-garden were to turn *censor morum*, and make the amusement of his audience secondary and subordinate to the moral of his drama, like the starved apothecary in *Romeo and Juliet*, he would soon have to reckon "a beggarly account of empty boxes."

Had Mr. Greene confined his observations to the moral influence of the drama, we should have said concerning them, that although they had no novelty to recommend them, and although they were not set forth in a very forcible or new light, still that they were generally sound and good, and did unquestionable credit to the chastity of his mind. But we are not disposed to pay so high a compliment to the correctness of his critical as to his moral taste, finding, as we do, many remarks from which we are obliged to dissent. In a feeble and spiritless estimate of Shakespeare's merits, it is objected against him, that his plots are in some cases void of probability, the subjects of many of his pieces visionary, and grounded on the extreme of fiction, and the grossest superstition.—Mr. Greene continues to observe, that had Shakespeare allowed his judgement and reason to have repressed the wildness of his fancy and genius, it would doubtless have led him to have exploded his fairies, his witches, and his magicians, as beings out of nature and offsprings unworthy a mind so exalted as his own. Ghosts are of course unmercifully abused, and so much a matter of fact man is Mr. Greene, that in the construction of a tragedy every fictitious circumstance is to be avoided (p. 47), blank verse is condemned as being little calculated to portray nature as we

really find it, and the serious drama is considered as losing half its effects on the mind, when the dramatist quits the simple and intelligible language of nature, to soar into the regions of fancy." So a dramatic poet is to be confined to matters of fact, and his fabled pinions are to be clipped, lest he should soar into the regions of fancy!

Ghosts, indeed, have of late years been very fashionable, and at one time so essential were they considered to the success of a piece, that we remember a witty prologue to a new play, where the speaker, personating the author, begins by expressing his anxieties and fears for the success of his drama: he had submitted it to the revision of his critical friends; some had advised one alteration, some another.----Two or three—Mr. Greene might be one of the number perhaps—had objected against his ghost. "Absurd," says he, "you know very well in the present state of the times, it is the very life and soul of a performance;—give up the ghost!" So he concludes his prologue very emphatically by exclaiming in good earnest, "I shall die, if I give up the ghost!"

But to be serious: although we are disposed to reprobate as severely as Mr. Greene himself can do, the introduction of unsubstantial spirits on the stage, for the mere purposes of the nursery, for the amusement of grandams and the frightening of children; although we feel ashamed and disgusted at the "Castle Spectres" of the present day; at these figures

"Of ashy semblance, meagre, pale, and bloodless,"

which stalk with rustling armour, or with winding sheet, across the stage, coming in such "questionable shapes" that no one knows the object of their visit: yet must we condemn at once, as tasteless and inefficient, any attempt at the indiscriminate expulsion of these supernatural beings from the stage. Let them appear when the solemnity and high importance of the occasion require it; when some mystery is to be unfolded beyond the reach of human sagacity, or some powerful villain is to be appalled, whom no man dares resist. The Horatian precept is,

"Nec Deus interit, nisi dignus vindice nodus."

Mr. Greene affects to excuse Shake-

speare for the introduction of his preternatural beings, because a belief of their existence was general when he wrote: his ghosts and witches, &c. were brought forward in compliment to the opinions, and prejudices, and superstitions of the age. It is true, indeed, that we are too enlightened and humane at this time of day to burn an inoffensive decrepid old woman for witchcraft; but is Mr. Greene prepared to say that popular superstition, as to the existence of apparitions, is past away? On the contrary, the subject is shrouded in such impenetrable mystery, is wrapt in such awful indistinctness, as to be extremely impressive upon vulgar minds. Can any thing exceed the effect produced by the ghost of Hamlet's father? how admirably is the dialogue between Horatio and Bernardo calculated to throw a solemnity and fearfulness upon the story which is to be related, and how instrumental to the development of the murder is the shadowy, but

“Fair and warlike form,  
In which the majesty of bury'd Denmark  
Did sometimes march!”

The witches in Macbeth announce with a prophetic tongue the future thane of Cawdor, and the future king. On the morning after Duncan's murder, and before it is announced, Lenox tells Macbeth,

“The night has been unruly: where we lay  
Our chimneys were blown down; and as they  
say  
Lamentings heard i' the air; strange screams  
of death;  
And prophesying, with accents terrible,  
Of dire combustion, and confused events  
New hatch'd to the woeful time: The ob-  
scure bird  
Clamour'd the live-long night: some say,  
the earth  
Was feverous, and did shake.”

The poet probably did not confine himself to matters of fact here; and if Mr. Greene cannot forgive his excursion into the regions of fancy, we can only lament his obduracy. Will not the fine effect produced by Banquo's ghost sitting in Macbeth's chair at the supper scene, pardon his intrusion?

“Avaunt! and quit my sight! let the earth  
hide thee!  
Thy bones are marrowless, thy blood is cold;  
Thou hast no speculation in those eyes  
Which thou dost glare with!”

Well may Macbeth reply to the hardened taunts of his lady, who chides him that he had

“Displaced the mirth, broke the good meet-  
ing  
With most admired disorder;”  
well may he reply,

“Can such things be,  
And overcome us like a summer's cloud,  
Without our special wonder? You make  
me strange,  
Even to the disposition that I owe,  
When now I think you can behold such sights  
And keep the natural ruby of your cheeks  
When mine are blanch'd with fear.”

Nothing can be more imbecile, and we shall take the liberty of adding, more presumptuous at the same time, than Mr. Greene's attack upon the use of verse in the serious drama. If Mr. Greene had recollected that all the great dramatic exemplars of ancient and of modern times, are written in measured language; that Greece, and Rome, and France, and England, have invariably adopted it on their stage, he would have been struck with the presumption of opposing his solitary voice to an usage which has been sanctioned by the most polished people of the most polished countries, in their most polished times. “Can it be imagined,” says Mr. Greene, “that a man, whilst his mind is torn and agitated by a conflict of violent and opposing passions, or occupied in the contemplation of a great event, can so far lose sight of the more immediate subject, as to collect and arrange his thoughts in the studied measure of verse?”—Astonishing! Would Mr. Greene have a murder described upon the stage in the same mean language in which it would be delivered by an evidence before his lordship on the bench and “the court and jury sworn?” Poetry is the very language of passion, and it is the language too of nature. We certainly are not in the habit of conversing in numbers, and putting our familiar discourse into rhyme; but let an orator—whether he is an Indian savage or a British senator, whether a Logan or a Burke, is perfectly immaterial—let him be warmed and elevated, and, as it were inspired, with his subject; let his mind be “occupied in the contemplation of some great event,” or “torn and agitated by a conflict of violent and opposing passions;” this is precisely the occasion when he will spurn the low crawling language of com-

mon life, his emotions will give dignity to his utterance, and his language will be the genuine, the measured language of poetry. In our critique on Mr. Lewis's *Alfonso*, (see vol. I. p. 688) we have already given our sentiments as to the use of blank verse in the serious drama; we there stated it to be our opinion, and we state it to be our opinion now, that the diction of the tragic muse should ever be as lofty as her sentiments; to give them appropriate utterance they require the pomp and harmony of verse; poetry should bestow upon them all her grace and all her grandeur. There is a familiarity in the unmeasured dialogue, which although not unsuitable to the colloquial ease and carelessness of comedy, always derogates from the loftiness and dignity of tragedy.

One word more and we have done. Mr. Greene, as he is describing to us what tragedy and comedy ought to be, and what they ought not to be, says, (p. 57), that "the tragic muse should *confine* itself to the quiet haunts and to the natural scenes and circumstances of domestic life, in a forcible and affecting pourtray of individual suffering; *attaching itself solely to those instances which life is continually furnishing* of virtue struggling with, and rising superior to distress; and above all, in faithfully repeating the voice of nature herself."

If Shakespeare were to be tried by the canons of criticism, enacted by Mr. Greene, he would be found miserably wanting! We remember some veterinary anatomist who published a book, in which all the proportions which a horse *ought to have* were very peremptorily laid down: the standard distance from the head to the shoulder, from the shoulder to the

first rib, from the rib to the hip, &c. &c. was firmly established; but when our anatomist came to measure the proportions of the celebrated Childers (or Eclipse; it was one of the two) he found that not one of them accorded with his standard of perfection! The inference was very obvious: the horse was ill-made, and had not a good point about him; to be sure he was the swiftest horse upon the turf, but put together in the clumsy manner he was, he had no right to be so, and there must be some trick in it. Shakespeare is something in the like predicament; although he excels all other dramatists more than Childers or Eclipse excelled any other horse at Newmarket, the fact, according to Mr. Greene, *ought to be* very unaccountable. For, in the first place, Shakespeare was a fellow of infinite jest and "most excellent *fancy*;" and often soared into those regions which dramatists are forbidden to see. In the next place, his tragedies are all in blank verse: this is not the language of nature. In the third place, the magic of his wand was continually employed in raising ghosts, witches, fairies, and "beings out of nature," and only fit for old women and children. In the last place, far from "confining" his tragic muse "to the quiet haunts, and to the natural scenes of domestic life;" far from "attaching her solely to those instances which life is continually furnishing," almost all Shakespeare's tragedies have some monarch for their hero, the incidents of whose reign have very little reference to "domestic life," bear very little resemblance to its "natural scenes," and very rarely occur within its "quiet haunts."

ART. IV. *Critical and Philosophical Essays. By the Author of the Adviser. Vol. I. 12mo. pp. 336.*

IN the preface to a work we generally find an author giving some explanation of his plan, and his reasons for pursuing it; he frequently tells us the motives which influenced him to publication, and usually endeavours to conciliate the good-will of his readers, by offering some claims on their indulgence, and expressing a becoming consciousness of his imperfections. The pert and flip-pant preface to these *Critical and Philosophical Essays*, as they are arrogantly called, is of a singular nature, for it doubly aggravates the disgrace and ignominy which it affects to wipe away.

One half of this volume is devoted to considerations on Dr. Blair's *Lectures on Rhetoric*: without one atom of taste or genius, without one spark of learning or of science, this essayist has dared to ridicule the writings and insult the memory of a man, whose works have stood the test of liberal criticism, and are every day contributing to improve the morals, refine the manners, and chasten the taste of mankind.

The preface to this volume is as disgusting--and that is saying a great deal--as any part of its contents; the author tells us that he sent his essays down

to Oxford to be printed, and entrusted the correction of his proof sheets to a friend. When the work was printed and transmitted to London I looked over it, says he, and felt myself ashamed and disgusted at the manner in which much of it was written. All the copies were printed off, and it was consequently too late to cancel the work!

He acknowledges with a degree of *sang froid* which is very unusual, that his strictures on Dr. Blair are expressed "with a coarseness of brutality and an insolence of contempt that can possibly serve no other purpose than to defeat the end for which these essays were written."

Many similar expressions of contrition and repentance occur, but placed as they are here, serve less to soften than to aggravate the offence.

Because the copies were printed off it was too late to cancel the work! Can any thing be more gross and inexcusable than to publish a work deliberately, and with a full consciousness that it contains matter "coarse" and "cruel, insolent" and "brutal!" Is deliberate insolence and brutality to be compensated by an empty apology? The author of these essays will find that they are not; and although his preface is a sort of pillory in which he has voluntarily exposed himself as a punishment for his crime, he will experience more scorn than compassion. And deservedly so; for the culprit is no sooner descended from the scaffold than he shews a strong disposition to repeat the offence. In the preface itself he says--the passage is worth transcribing as it evinces the clearness of the author's conceptions and his ability to cope with the eloquent rhetorician--in the preface itself he says that "most of Blair's book is made up of mere assertions, unbacked by argument, or resting on the tottering basis of authority, which vacillates on the ground of hypothetical conjecture, and only delays its total ruin and entire annihilation, till the torch of reason and of truth approaches to discover its inanity and nothingness." What splendid imagery! how distinct and illustrative! The author proceeds to tell us that the only method by which men can be so formed as to fulfil the great end for which they were created, is, by being taught how to expand, to strengthen, and to refine all their intellectual faculties; but this cannot be done till those faculties are pointed out,

and the means by which they may be cultivated explained. This most important of all undertakings--has been attempted in the *Anthropoideia* or *Tractate on General Education*, &c. In this Tractate on general education, too, "the means are laid down, by which the imagination may be invigorated and expanded, so as to exalt man in the dignity of thinking beings, and to render him more capable of fulfilling the high and mighty functions attached to his station in the economy of nature." A great many other important subjects, gentle reader! are discussed in that admirable work, which great care is taken to inform you is "printed for Wallis, Bookseller, Paternoster Row;" where also, in all probability, may be had *The Adviser, or Moral and Literary Tribunal*, a work which the author acknowledges in another transient visitation of conscience, that "it breathes nearly throughout the whole of its course, more of the vindictive and merciless spirit of Paganism, than the mild forbearance of Christianity, *ardet instat, jugulat*; it rages, it rushes forward to the onset, it murders." Mercy on us, what a confession!

We have employed more words on the preface than we shall have occasion to do on the body of the work. The subject of the first essay is the stage, which I hold to be an object of great importance, says the author, because it might be made the instrument of directing the manners of a people to what is right, and of teaching them to acquire a taste for virtue.

"In order to relieve the dryness and *tedium* of general reasonings and remarks, I have chosen to give a particular critique on the method in which Hamlet was performed at Drury lane last winter, by which means the general observations appear to slide in, as it were, incidentally, and the reader is surprized into a truth before he is well aware of it, and while his interest is raised by attending to the merits of an individual performer; for whatever relates to *man*, and depicts any of his characteristic traits and features, always touches us more nearly than any mere moral and abstract reasoning and reflection."

After this pompous exordium, we expected a dissertation on the moral effects of the drama, some specific censures to have been cast on its impurities, and some valuable hints to have been given for its improvement; we expected the state of dramatic composition to

have been enlarged upon, and a comparison to have been made between its merits in this and other countries. But alas! alas! five and thirty stupid pages are employed in telling us that Mr. F—who performed Hamlet at Drury-lane on the 30th November, 1802, being his second appearance on the stage, is a young gentleman who stands about five feet six inches high, that he went to school at —, lived with a printer, &c. &c. that his gait is awkward, that he ranted here, and whined there, and bel-lowed somewhere else! that Polonius was not done well, the Ghost execrably, Mr. Suet's grave-digger pretty well, and that Mrs. Jordan's Ophelia was far beyond all praise. Thus endeth the first essay "on the stage!" In the second we have a long-winded translation of Miss Baillie's Count Basil into prose: this lady, who has the misfortune to be a great favourite of our author, is threatened with a renewal of his addresses on some future occasion. Count Basil is the unhappy subject of the present *critique*; act after act, scene after scene, sentence after sentence are paraphrased, and just such remarks introduced as might have been expected from any menial belonging to the theatre. Take an example: *ex uno disce omnes*. The following is our author's criticism on the character of Basil, the hero of the piece; "Basil is a soldier all over; military glory is his god; and he had always been a wonderful hero till this unfortunate love turned his head the wrong way, and he thought to set all right by shooting himself. I beg that I may not be imagined to offer the least disrespect to the author, by the apparently slighting manner in which I mention this pistol affair; but I have always considered suicide as so very vile and cowardly an act, that it never fails to raise my most sovereign contempt for the character that can have recourse to such a pitiful expedient, in order to sneak off from the stage of existence."

This will at once serve as a specimen of the style and of the criticism.

The next essay is on marriage, and we were vastly consoled by the information conveyed in the first sentence, where it is wittily observed, that as marriage is in itself a subject of a very prolific nature, the author does not intend to discourse on it much at large: he wishes that every female should have in her power, if she chose it, to unite herself in

the bands of wedlock at the age of sixteen, and every male at that of eighteen.

Religion is the subject of the third essay. One short extract shall suffice; our readers will not fail to mark how logically the inferences are deduced:

"It is natural for a mind which looks forward to a future existence, to anticipate with anxiety his condition beyond the grave. Those whom we love and esteem are placed in a state of happiness and enjoyment, while those who have incurred our displeasure are condemned to misery: hence the idea of futurity becomes accompanied with the hope of happiness and the fear of torment; but those ideas of happiness and torment are associated with persons from whom we are conscious of having received such sentiments. The lover connects the idea of happiness with that of his mistress, the miserable with those who have relieved their wants, and the criminal associates torment with those by whom he has been punished; hence futurity involves the idea of a superior being or beings, capable of imparting pleasure or inflicting punishment. To such being, or beings, the human passions which prevail in that barbarous state of society in which such phantoms are raised, are attributed. The Divinity becomes capable of anger, pleasure, and all the variety of passions which afflict the human breast: hence a natural propensity arises to appease and propitiate that being to whom our future existence is committed. Religion has thus its origin."

Was such wretched stuff ever before committed to paper! The essayist proceeds to trace the progress of natural religion from its source in the same style; and having traced it to his own satisfaction, he begins an attack upon the clergy, whose profession he *clearly proves*, ought in this enlightened age, when reason is become adult, and the phantoms of imagination are no longer mistaken for realities, to be entirely abolished! Public worship, as it has hitherto been carried on, is considered as altogether incompatible with true religion; to the ignorant and superstitious it must be detrimental, and to the enlightened and liberal, absurd and ridiculous. Music is the only rational plan of public worship which, as appears to him, can ever be adopted: "music conveys no definite ideas to the mind; it imparts a highly pleasurable sensation to the ear, and excites the imagination to call up correspondent images. Those ideas," our author continues in the same unintelligible jargon, "which in each individual are imputed to the Deity and his dispensations, would by attendance on such public worship be called up

in the mind, and associated with pleasurable sensations, and flights of imagination. Each individual would thus be allowed to enjoy his *own* peculiar opinion without being shackled and restrained by definite language."

The fourth and succeeding essays are solely occupied with abusing Dr. Blair. We have not often so painful a task imposed upon us as we found here, that of

reading a series of the most contemptuous and insulting observations that were ever penned. We have already enabled our readers to appreciate the talents of this "Critic" and "Philosopher:" and we should feel degraded in our own estimation, to enter upon a defence of the professor against so puny and malevolent an assailant.

ART. V. *Commentaries on Classical Learning. By the Rev. D. H. URQUHART, M. A. Prebendary of Lincoln, &c. &c. 8vo. pp. 540.*

IN reading the title of this work, we were induced to expect, what we have often wished to see ably executed, a treatise designed to vindicate, on rational and philosophical grounds, the present importance of classical literature, to delineate its branches, subjects, and extent, to open and clear its sources, to develop some of the more important canons of criticism, and by these means to lay a solid foundation for the ultimate improvement of the young and ardent disciple of literature, who is making his entrance upon these interesting fields of study. In such a work, to the bibliotheca of ancient writers, which would necessarily compose a part of it, we should expect to see joined a second bibliotheca of those grammarians and critics, to whose acuteness and labour the classic writers owe the principal part of their elucidation, and their restitution to a state of considerable purity, from the numerous stains and debasements which they had contracted in their passage through ignorant and barbarous ages.

Perhaps the word "Commentaries," adopted in the title-page, with which the idea of something profound and recondite is in popular use associated, led us to expect, in the treatise of Mr. Urquhart, a work of the nature which we have described. The author, however, in the commencement of his enquiry, cautions his readers to expect no laborious investigations, or acute observations of criticism, since his only purpose was to enforce an important truth, the utility of a liberal education to individuals and society. In his first chapter, he forms an estimate of the utility of classical literature to the various professions and orders of society, after which introduction the remainder of his work is occupied by an arranged description of the principal writers of Greece and Rome, including slight notices of their biography, and

some general criticism on the various characters of their composition. The arrangement and many of the observations are taken, we are told, from Laharpé; and in fact, though the passages thus borrowed are not distinguished, the style of a French critic is often discernible.

Though Mr. Urquhart has employed sixty-five pages in arguing the importance of ancient learning, we are of opinion, that comparatively little of this matter is strictly applicable to his purpose. He seems to consider, with a few exceptions, arts and sciences, politics and morality, as included in the discoveries and incorporated with the writings of the ancients. Hence we are to learn, that "the claims which our kindred have upon our affections are subordinate to the claims of our country." Hence the student of medicine is to derive his precepts, and here the painter to seize the ideal perfection of his art.

We are as little disposed as Mr. Urquhart to depreciate the genuine value of classical literature: we gratefully acknowledge that the improvement of the moderns results from the energies and exertions of the ancients; the day is, however, now past, when the ancients were our legitimate instructors in science. Still the enlightened study of their writings is highly delightful and ornamental, their languages remain exquisite specimens of skill, accuracy, and beauty, the acquisition of which is a most valuable discipline to the mind, their works are monuments of inestimable importance in the history of mankind, and those persons, if any such there are, who would wish to consign them to oblivion, would be a second race of Goths and Vandals.

Mr. Urquhart speaks of these "precious relics as at first casually found, and now happily secured from farther ruin." This however, except in a few

instances, is an incorrect statement of the fact. The chain of learning, though much attenuated, was never broken. We know that a very few centuries previous to the invention of printing, works of the greatest value were in being, of which scarcely a vestige can now be found.

The subject of the second section is the epic poetry of Greece, the writings of Homer, Hesiod, and Apollonius Rhodius. There certainly is a sense in which Hesiod may be styled an epic poet, as the readers of Dr. Bentley's remarks on Phalaris well know; in the modern use of the terms, he would, however, be classed with didactic writers. From this section, we select part of the criticism on the *Iliad*, as a specimen of the work.

"No subject could have been found to operate so forcibly on the feelings of the Grecians, as that of the siege and destruction of Troy. The recital of the interesting story must at once have gratified their vanity, excited their military ardour, and warmed their patriotism. That the choice of his subject was not more happy than the execution of his plan, is a commendation bestowed on Homer by the best critics of every age. Horace places him above the chiefs of the academy and the Portico; and though Plato would banish him, together with all other poets, from his republic, yet he confesses that his early respect and love for his writings, ought to chain his tongue; that he is the creator of all the poets who have followed him.

"The fable of the *Iliad*, divested of its episodes, is remarkably simple and concise. One of the Grecian generals, discontented with the commander in chief, retires from the camp, deaf to the call of duty, of reason, and of his friends; he scruples not to abandon the public weal to his private resentment; and his enemies, profiting by his misconduct, obtain great advantages over his party, and kill his bosom-friend. Vengeance and friendship induce him to re-assume his arms, and he overcomes the chief of the enemy.

"Whoever carefully peruses the *Iliad*, will find the execution of the work to be not less judicious than the plan, which was to demonstrate the evils arising from discord amongst rulers.

"The description that Homer gives of characters is throughout consistent, and his manner, though simple, is sublime. His images are finished pictures, his reflections are moral axioms. His imagination is rich in a superlative degree; and his knowledge is universal. He is of all professions; poet, orator, mathematician, philosopher, geographer, and artisan. In the order of his story

there is a variety, and in the relation of it an energy, which are produced by elevation of genius; and his verses, which delight the ear by their rhythm and their cadence, denominate him the true poet of nature.

"In reading the twelve first books of Homer, we are struck with the simple yet noble progress of the work. We admire the artifice of the poet, who suffers the intervention of the gods to terminate a battle between Menelaus and Paris, which must otherwise have terminated the war. Our attention is summoned to that part where Helen passes before the old Trojans, who regard her with admiration, and are no longer astonished at seeing Europe and Asia bleeding on her account. Her conversation with the aged Priam, when she makes known to him the principal chiefs of Greece, is particularly interesting. The scene between Hector and Andromache when the hero returns to order a sacrifice, and then departs from Troy never to re-enter it, has not been celebrated too often or too much.

"These are delightful episodes, which agreeably vary the uniformity of the principal action."

From the epic poets, Mr. Urquhart proceeds to the lyric, tragic, comic, and pastoral poets of Greece; and to its orators and historians. Plutarch claims a separate section, and a concluding section is allotted to the Grecian satire, that is, to the works of Lucian. A similar plan, with some variations of order and circumstances, is pursued in the enumeration of the Roman writers. But why, among the Greeks, is Callimachus forgotten? Why are the didactic poets omitted, Aratus, Nicander, and Oppian? How is the glory of Plato and Aristotle so obscured that their names are not mentioned? Did the work of Athenæus deserve to be unnoticed? Could no proper place among the Roman writings be discovered for the great work of the elder Pliny? By a strange anachronism, Bacchylides, the contemporary of Pindar, is made to flourish thirteen centuries before the christian æra. What is meant by the episode of Cacus, apparently ascribed (p. 363) to Lucretius?

The style is often inaccurate. We are told that it was the *plan* of the *Iliad* to demonstrate the evils arising from discord among rulers; rather the object; the plan is the disposition which is used for the accomplishment of the object.

Speaking of Herodian, it is remarked that the imitation of his style is more desirable than difficult: we suppose, more desirable than easy. In comparisons of this kind, a little care is requisite to

avoid blunders. A similar error we have heard noticed in Sir Richard Steele's dedication of the first volume of the *Spectator* to Lord Somers: "the surprising influence which is peculiar to you,

in making every one who converses with your lordship, prefer you to himself, without thinking the *less meanly* of his own talents."

ART. VI. *A Treatise on ancient and modern Literature; illustrated by striking References to the principal Events and Characters that have distinguished the French Revolution. From the French of the Baroness STAEL DE HOLSTEIN.* 8vo. 2 vols.

WE must let the baroness herself say what she has designed to perform in the work.

"The first part of this work will contain a moral and philosophical analysis of Grecian and Latin literature; some reflections on the effects produced upon the human mind by the invasions of the northern nations, by the revival of letters, and by the establishment of the christian religion: a rapid delineation of the discriminative traits of modern literature, with somewhat more detailed observations on the master-pieces in the Italian, English, German and French languages, considered agreeably to the general scope of the work, that is to say, with a view to the relations that subsist between the political state of a country, and the predominant spirit of its literature. I will endeavour to shew the particular character which eloquence assumes from this or that form of government; the moral ideas which this or that religious creed is calculated to beget in the human mind; and the effects of imagination that are produced by the credulity of certain nations; the poetical beauties that belong to the influence of climate; the degree of civilization that best promotes the strength and perfection of literature; the various changes that have been introduced into the art of composition, as well as into manners, by the different modes of existence of women, before and after the establishment of the christian religion; and, finally, the universal progress of knowledge, resulting from the mere succession of ages. These will constitute the materials of the first part.

"In the second, I will examine into the state of lights and of literature in France since the revolution; and I will hazard a few conjectures respecting what ought and will be their future state, if we are one day to enjoy the possession of republican freedom and morality. The analogy of the past will lead me to a knowledge of what is yet unknown; and by re-stating the observations I will have made in the first part of this work, respecting the influence of a particular religion, a particular form of government, or particular manners and customs, I shall be enabled to draw some inferences relative to my supposed future state of things. In this second part will be seen, at once, both our present degradation and our future possible perfection. This subject must sometimes lead me to observations on the political situation of France for

these ten years back; but I shall touch on it only as far as it is connected with literature and philosophy, without diverging into any digression foreign to my general purpose.

"As I survey the revolutions of the globe, and the succession of ages, one great idea is ever uppermost in my mind, from which I never allow my attention to be diverted, I mean that of the perfectibility of the human race. I cannot bring myself to think, that this grand work of moral nature has ever been abandoned; in the ages of light, as well as in those of darkness, the gradual advancement of the human species has never been interrupted.

\* \* \*

"To this philosophical creed do I cling with all the faculties of my mind. I see, among its chief advantages, that it inspires an high sense of self-esteem, a lofty elevation of soul; and I appeal to every mind of a certain cast, if there be in this nether world a purer enjoyment, than that bestowed by this conscious elevation. To it is it owing, that there are still moments, in which all these mean grovelling beings, with all their sordid calculations of self-interestedness, fade away and sink before our eyes. We raise and re-invigorate our faculties, by contemplating the future state of knowledge, of virtue and of glory: certain vague impressions crowd in upon us, and sentiments which we cannot well define, that alleviate the load of life, while the whole moral man swells with the pride of virtue, and swims in the overflowings of happiness. If all our efforts were to be strained in vain, if our intellectual labours were to be exerted to no purpose, but irrevocably swallowed up in the oblivious gulph of time, where is the object which a virtuous man could propose to himself in his solitary meditations? For my part I have, throughout this work, incessantly reverted to every circumstance that tends to evince the perfectibility of the human species. Nor is this to be confounded with visionary theories: it is the result of observation, and stands on the evidence of facts. It is wise, indeed, to guard against that sort of metaphysics that derives no support from experience; but neither should it be forgotten that, in times of degeneracy and corruption, the name of metaphysics is given to every thing that is not circumscribed within the narrowness of self-love, or that does not coincide with the calculations of self-interest."

The first thought that will occur to

every man's mind in perusing the title-page to these volumes, will be the prodigious confidence of the writer, not merely in her own talents, (of those Madame Stael has a right to be confident) but in her own extensive and omnifarious erudition. A Treatise on Ancient and Modern Literature! setting Englishwomen aside, we believe, in our conscience, that there is not a man in England who would be impudent enough to affix such a title to his book. But impudence is a word, whose meaning is subject to geographical modifications, and with little danger to morals, we may allow it to be under the influence of climate and situation; what would be immodest in England, is not even indecorous in France. The baroness writes as volubly as she converses; this is often the case with our own countrywomen, but happily they do not think themselves at all times privileged to talk and to publish.

It cannot be supposed, that Madame Stael is acquainted with the subject upon which she writes; she can, however, reason upon it, as if, and probably as well as if she was. This trick of pretending to look for the philosophy of things, without understanding the things themselves, is one of the characteristics of the age. Young men catch a few metaphysical phrases and technical terms, and set up forthwith for philosophers; just as many a rascal, who can prepare a mercurial pill, advertises himself as a physician. This it is that has rendered metaphysics so common and so perfectly worthless: no preparatory study, no previous knowledge is required; as in the Cabala, a few words are sufficient to open the storehouses of science and nature!

Not having the original work before us, we cannot always tell whom we are to accuse of ignorance, the authoress or the translator. It is probably Madame Stael who tells us, that "the monotony of the Pindaric hymns, which is so irksome and fatiguing to us, was esteemed quite the reverse at the Grecian festivals;" of course, this lady must be a judge of Greek metres and Greek music! "We are told that *Euripides*, a tragedy of *Æschylus*, had such an astonishing effect on the spectators, that pregnant women were fearful of the consequences that might attend their being present at its representation, but its terrors were those resembling the infernal regions." This complication of inaccuracies must

exist in the original. "Death held forth a much less gloomy aspect to the ancients than to the moderns; their belief in paganism calmed their fears, by representing a future state in the most brilliant and pleasing colours." This also is Madame Stael's mistake; she has read Homer, and forgotten the ghost of Achilles. But when we see that *Alcestris* is, in one sentence, made of both genders, and in another find *Æschylus* mentioned as living after *Sophocles* and *Euripides*, we perceive that the translator is even more ignorant than the writer. This last passage is a complete specimen of mistranslation.

"There is a very visible improvement in the three great tragedians, *Æschylus*, *Sophocles*, and *Euripides*; there is even too much distance between *Æschylus* and the two latter, to be able to account for his superiority by the natural progress of the human mind, in so short a space of time; but *Æschylus* had seen nothing but the prosperity of Athens, *Sophocles*, and *Euripides* beheld their reverse, their dramatic genius was brought forward and ripened, calamity has its fecundity; no moral conclusion can be drawn from the works of *Æschylus*, he scarcely ever unites the sufferings of the body with those of the mind by any reflections."

It must be the translator also who says, that the comedy of *Nurees* prepared the minds of the populace for the accusation of *Socrates*. We know not which of the two has been crude enough to rank *Tacitus* among the Greek historians. Such blunders as *Regner*, *Lodbrov*, and *Soper de Vega* are probably English. These volumes have no errata, and we are left to guess at the meaning of such inexplicable riddles as the following: "Persecutions, calumnies, sufferings of every hue, would become the lamentable lot of those who boldly think and soundly *torcalize*."

The praise of style is also to be divided between the French and English writer. "The whole moral man swells with the pride of virtue, and swims in the overflowings of happiness." This Persian flower has been reared in a French hot-house. "With what fine bursts of indignation has not the aspect of Crime filled the mouth of Eloquence!" This too is exotic eloquence; but when we read of "mistress cities," of "the sound writings of accomplished wits," and find *esprit* every where rendered with the vile and vulgar phrase must not be imputed to Madame Stael.

The chapter upon the philosophy of the Greeks, is a most astonishing specimen of female effrontery.

"The minds of the Greeks were entirely engrossed by the study of the different systems of the world; the smaller the progress they had made in science, the less they were acquainted with the extent of the human understanding; that of the philosophers must be pronounced very confined in what was considered deep, and at all inexplicable. Pythagoras declared, *"that there was nothing real but what was spiritual, and that the material had no existence."* Plato, whose imagination was so brilliant, ever returns to whimsical metaphysics, relative to men and to love, where the physical laws of the universe, and the verification of sentiments are never observed. There is nothing more irksome and fatiguing than the study of that species of metaphysics, which has neither facts for its foundation, nor method for its guide; and it is surely impossible not to be convinced of this truth, in reading the philosophical writings of the Greeks, notwithstanding we fully admit the beauty of their language."

\* \* \* \*

"The Greek philosophers were very limited in numbers, and being unable to obtain any assistance from the light of former ages, they were compelled to make their studies universal; it was therefore impossible for them to proceed to a great length in any one of them, and they wanted that method which can only be acquired by an accurate knowledge of the sciences.

"Plato could not have arranged in his memory, that which the aid of method enables the young men of modern times to do with the greatest facility."

Reader! it is a Frenchwoman who tells us this of the Greek philosophers, who assures us that Aristotle was truly great, *considering the age in which he lived*; i. e. considering that he had the misfortune to be born an Athenian, not a Frenchman! and who informs us that the Greek historians never connected their ideas with causes. "You are a very simpli-

city 'oman! 'Oman art thou lunatics? For shame 'oman."

Of the dark ages, Madame Stael of course knows nothing; of Italian literature she knows little; of Spanish less. Concerning the literature of the North, she shall deliver her own hypothesis.

"There appears to be two distinct kinds of literature still extant, one derived from the east, the other from the north; the origin of the first may be traced to Homer, that of the last to Ossian.\* The Greeks, the Latins, the Italians, the Spanish, and the French of the century of Louis XIV. belong to that style of literature which I shall call the eastern. The works of the English and German, with some of the Danish and Swedish writings, may be classed as the literature of the north. But before I attempt to characterise the English and German writers, I think it necessary, in a general manner, to consider the principal difference of the two hemispheres of their literature.

"The English, as well as the Germans, have, without doubt, often imitated the ancients, and drawn very useful lessons from that fruitful study, but their original beauties, carrying the stamp of northern mythology, have a certain resemblance to that poetic grandeur, of which Ossian is the most splendid example.

"It may, perhaps, be remarked, that the English poets are celebrated for the spirit of philosophy which appears in all their works, and that the ideas of Ossian are not the ideas of reflection, but a series of events and impressions. I answer to this objection, that the most habitual images and ideas of Ossian are those which recall the shortness of life, the respect for the dead, the superstition connected with their memory, and the duty that remains towards those who are no more. If the poet has not united to those sentiments, morals, maxims, or philosophical reflections, it was because the human understanding at that period was not yet capable of the abstraction necessary to draw philosophical inferences; but the emotion caused by the songs of Ossian, disposed the mind to the most profound meditations.

"Melancholy poetry is that which accords

\* "I here repeat what I have before said in the preface to the second edition. The songs of Ossian (a bard who lived in the fourth century) were known to the Scots, and even to some Englishmen, before they were formed into a collection by Macpherson. In tracing the origin of the northern literature to Ossian, I have only intended, as will be seen by the sequel of this chapter, to point him out as the first poet to whom we can ascribe the peculiar character of the northern poetry. The fables of the islanders, the Scandinavian poetry of the ninth century, the common origin of the English and German literature, bear the strongest resemblance to the striking characteristics of the Erse, and of the poem of Fingal. Many learned men have written upon the Rhunic literature, and the poetry and antiquities of the north. These researches are resumed by Mallet, and nothing more is necessary than to read the translation of some of the odes of the ninth century which he has given, such as Regner Lodbrog, Harold the Valiant, and others, to convince ourselves that these Scandinavian poets had the same religious ideas, the same warlike images, and paid the same respect to women that we find in Ossian, who lived nearly five centuries before them."

best with philosophy; depression of spirits leads us to penetrate deeper into the character and destiny of man, than any other disposition of the mind. The English poets which succeeded the Scots bards, added to their descriptions those very ideas and reflections, which those descriptions ought to have given birth to; but they have preserved from the fine imagination of the north, that gloom which is soothed with the roaring of the sea, and the hollow blast that rages on the barren heath, and, in short, every thing dark and dismal, which can force a mind dissatisfied with its existence here, to look forward to another state. The vivid imagination of the people of the north, darting beyond the boundaries of a world whose confines they inhabited, penetrated through the black cloud that obscured their horizon, and seemed to represent the dark passage to eternity.

"We cannot decide, in a general manner, between the two different styles of poetry, of which we may fairly say Homer and Ossian were the first models."

That any person, who can read, should have been so ignorant and so foolish as to set up such an hypothesis as this, is perfectly wonderful: "The English poets who succeeded the Scotch bards!" Will Madame Stael have the goodness in her next edition to inform us who are they? "The same religious ideas in the Runic poems and in Ossian!" Will Madame Stael have the goodness to point out the resemblance? "Ossian is reproached with his monotony: this fault exists much less in the different English and German poems which have imitated his style." Here again we must confess our ignorance of English literature, and request the baroness to tell who these English poets are. The trifling questions, whether the Ossian of Macpherson ever existed, and whether, if he did exist, he were not an Irishman, and not a Scotchman, a fact as destructive as his non-existence to the authenticity of these poems, are overlooked by Madame Stael; and if their authenticity be admitted, she has forgotten that they appeared not in a language intelligible to any civilized nation, till about the time of her own birth; and that Chaucer, and Spenser, and Shakspeare, and Milton, whom we Englishmen consider as the great founders and masters of English poetry, lived some time before Madame Stael was born, and will continue to live some time after Madame Stael is forgotten.

Among her remarks on Shakspeare, the baroness tells us, that "when a man is represented of a weak mind, and an inglorious destiny, such as Henry VI.

Richard II. and King Lear, condemned to perish; the great debates of nature, between existence and non-existence, absorb the whole attention of the spectators." We neither understand the meaning of this passage, nor the similarity of character and situation in the three kings. The three parts of Henry VI. she says, have an unlimited success in England, whereas not one of them has ever been acted within the memory of man. "Otway, Rowe, and some other English poets, Addison excepted, all wrote their tragedies in the style of Shakspeare." More information this for illiterate Englishmen!

"The English language, although not so harmonious or pleasing to the ear as the language of the east, has, nevertheless, by the energy of its sound, a very great advantage in poetry; every word that is strongly accented, has an effect upon the mind, because it seems to come from a lively impression. The French language excludes from poetry a number of words as being too simple, which are really noble in English, from the manner in which they are articulated. I shall offer one example: When Macbeth, at the moment he is going to seat himself at the festive table, sees the place that was destined for him filled by the shade of Banquo, whom he has just assassinated, he calls out with terror, '*The table is full!*' and all the spectators tremble. If these same words were to be repeated in French, '*La table est remplie,*' the greatest actor in the world could not make the audience forget their common acceptance. The French pronunciation does not admit of that accent, which ennobles every word by giving it animation."

This attention to words, instead of the meaning and passion which they convey, is one of the characteristics of French taste. We once heard a Frenchman, a man of talents and letters, descendant upon the inimitable and untranslatable beauties of Racine; and the example he adduced was "*Roi de rois!*" These words, he said, excited a sublime elevation of mind, by affecting the ears of the auditors, and the mouth and larynx of the speaker, which could not have been produced by the same expression in any other language, ancient or modern.

"The English are great writers in verse, and carry eloquence of mind to the highest degree; but their works in prose scarcely partake of that life and energy which is found in their poetry. The English reserve for their poetry all which belongs to the imagination—they consider prose but as the language of logic: the only object of their style is to make their arguments understood, and not to create an interest by their expressions. The

English language has not yet acquired that degree of perfection of which it is susceptible, as it has been employed oftener in commercial affairs than in literature, as much more correctness and refinement is required in a language to write good prose, than to write good verse.

"Some English writers, notwithstanding, such as Bolingbroke, Shaftesbury, and Addison, have the reputation of good writers in prose; nevertheless, their images are deficient in energy, and their style in originality. The character of the writer is not imprinted in his style, nor his internal emotions felt by his readers. It seems as if the English feared to give way to inspiration, except in their poetry; when they write in prose, a sort of modesty or bashfulness seems to keep their sentiments in captivity.

"The English transport themselves into the ideal world of poetry, but we seldom or ever find any animation in their writings upon existing subjects. The French authors are justly reproached with their egotism, their vanity, and the importance which each one attaches to his own person, in a country where the public interest had no place. But it is nevertheless certain; that an author, in order to acquire eloquence, must express his own sentiments; it is not his interest but his emotion, it is not his self-love, but his character, that must animate his writings.

"In England the spirit of business is applied to the principles of literature, and all appeal to the feelings and every thing that can in the least influence the judgment, is interdicted in those works of reason. Mr. Burke, a most violent enemy to France, has, in his work against it, some resemblance to the eloquence of that nation; and although he had many admirers in England, there are some who are tempted to accuse his *style* of bombast as much as his *opinions*, and to find his manner of writing incompatible with justice."

On this last paragraph we shall only remark, that if Madame Stael will examine the writings of Mirabeau, the most eloquent assuredly of modern Frenchmen, she will find in them *some resemblance to the eloquence of Mr. Burke.*

"*Why are the French possessed of more grace, taste and gaiety, than any other European nation?*" This is the title of the seventeenth chapter. Here again we must revert to the geographical modifications of modesty. In her answer to this question, Madame Stael has well and ably traced the source of those false and fawning manners, which are called grace and gaiety in France, and of that total want of all manly sense and all manly feeling, which in the same language is denominated taste.

"France then was the only country where

(the authority of the king being consolidated by the tacit consent of the nobility) the monarch possessed an absolute power, in fact, the right of which, notwithstanding, was undetermined; this situation compelled him to study even his courtiers, as constituting a part of that body of victors, which granted and secured to him France, their conquest.

"The delicacy of the point of honour, one of the delusions of the privileged order, compelled the nobility to decorate the most abject submission with the forms of liberty. It was necessary that they should preserve in their connection with their master a spirit of chivalry, that they should engrave upon their shield "For my mistress and king," that they might be thought voluntarily to choose the yoke which they wore, and thus blending honour with slavery, they endeavoured to bow without debasement; grace was, if I may be allowed the expression, in their situation a necessary policy, as that only could give the appearance of choice to obedience.

"The king, on his part, duly considering himself in some instances as the dispenser of glory, the representative of public opinion, could recompence only by applause, and punish only by degradation; he was obliged to support his power by a kind of public assent, which his will, without doubt, principally directed, but which shewed itself frequently independent of all that will. Ties of the most delicate nature, and prejudices artfully conducted, formed the connection of the first subjects with their governor. Those connections required great art and quickness of mind; grace was requisite in the monarch, or at least in the dispensers of his power; taste and delicacy were necessary in the choice of favours and favourites, in order that neither the commencement nor the limits of the royal authority might be perceived. Some of its rights must be exercised without being acknowledged, some acknowledged without being exercised, and moral considerations were embraced by opinion, with such subtlety, that one bad stroke of politics was universally felt, and might be the ruin of a minister, notwithstanding any support that government should be inclined to give him.

"The king, of course, must call himself the first gentleman of his kingdom, that he might the more readily exercise a boundless authority over gentlemen; and to strengthen that authority over the nobility, a certain portion of flattery was necessarily directed to them. Arbitrary power not even then allowing a freedom of opinion, both parties perceived the necessity of pleasing each other, and the means of succeeding therein were multiplied.

"Grace, and elegance of manners, gradually passed from the customs of the court into the writings of the literary. The most elevated station, the source of all favour, is the object of general attention; and, as in all free countries, the government gives the impulse to public virtue; so, in monarchies, the

court influences the mental genius of the nation, because an universal wish is excited to imitate that which distinguishes the most elevated rank.

"When the government is so moderate, that no cruelty is apprehended from it, and so arbitrary, that all the enjoyments of power and fortune depend only on its favour, all those who aspire to that favour ought to possess a sufficient degree of mental tranquillity to render themselves amiable, and sufficient dexterity to make that frivolous accomplishment conducive to material success. Men of the first class of society in France, often aspired to power, but they ran no dangerous hazards in that career; they gam'd without risking the loss of a large stake, uncertainty turned only upon the extent of their advantage; hope alone then animated their exertions; great perils give additional energy to the soul and to the reflecting powers, but security gives to the mind all the charms of ease and readiness.

"The animation of gaiety, still more than the polish of grace, banished the remembrance of all distinctions of rank, without, in reality, destroying any; by means of this, *grande'es* dreamed of equality with kings, and poets with nobles, and inspired even the higher ranks with a more refined idea of their own advantages, which after a short forgetfulness were remembered again with renewed pleasure; and the highest perfection of taste and gaiety was the result of this universal desire to please."

"The influence of women is necessarily very great, when all events take place in the drawing-room, and when all characters are judged by their conversation, in such a case women become a supreme power, and whatever pleases them is assiduously cultivated. The leisure which monarchy left to the generality of distinguished men in every department, conduced very much to bring the pleasures of the understanding and of conversation to perfection.

"Power was attained in France neither by labour nor by study; a *bon mot*, some peculiar gracefulness, was frequently the occasion of the most rapid promotions; and these frequent examples inspired a sort of careless philosophy, a confidence in fortune, and a contempt for studious exertions, which led every mind to be agreeable and accommodat-ing. When diversion is not only permitted, but often useful, a nation ought to attain the utmost point of perfection to which it can be carried.

"Nothing similar to this will ever be witnessed in France, whilst under a government of a different nature, however it may be constituted, which will be a convincing proof that what was called French genius and French grace, were only the result of monarchical institutions and manners, such as they have for many past ages existed in France."

Whatever be the truth of the prediction, there is good sense in these remarks. We are far from designing to pass any general and indiscriminate censure upon Madame Stael; we blame her for affecting to discourse *de omni scibile*, for talking of the Greek philosophers as familiarly as Thomas Taylor, and of the English poets as boldly as if she were competent to be their judge. We would hint to her, that it is not every *Englishwoman*, nor *Englishman* either, who can understand Shakespere and Milton. It is a pleasanter task to listen to her when she is speaking upon subjects within the sphere of her own knowledge and observation.

"A bold and very difficult stratagem, allowed under the ancient government, was the art of offending against the manners without wounding taste; and to make a mockery of morality, by proportioning delicacy of expressions to indecency of principles. Happily, however, this talent is as ill adapted to the virtue as to the genius of a republic; as soon as one barrier was overthrown, the rest would be disregarded, the relations of society would no longer have the power to curb those whom sacred ties could not restrain.

"Moreover, extraordinary quickness of genius is requisite, in order to succeed in this dangerous style, which unites grace of expression to depravity of sentiments; and by the strong exercise of our faculties, to which we are called in a republic, we lose that ingenuity. The most delicate touches are necessary to give to immorality that grace, without which even the most abandoned of mankind would repulse with disgust the pictures and principles of vice."

That this talent is as ill adapted to the virtue as to the genius of a republic, no one will be disposed to deny; but we must doubt whether there be not such a disposition in Frenchmen to this talent, as would unfit them for a republican government, even if they possessed courage enough to establish one. "The morality of the French," says Madame Stael herself, "is perverted by the ardent desire they feel to distinguish themselves in any way, but most by the brilliancy of their wit. When the qualities they already possess are insufficient for this purpose, they have recourse to vice, in order to render themselves conspicuous."—Something of this will exist among individuals in all countries; but woe to the country whereof this can be the national characteristic. Because this is the national characteristic of France, we do not expect that mental and moral conva-

lescence there, to which Madame Stael, with patriotic and praise-worthy hope, looks forward.

On the prevailing faults of French literature, we find the following remarks:

“ Since the revolution, the French have launched into a fault that is particularly destructive to the beauties of style; they wished, by employing new verbs, to abridge all their phrases, and render all their expressions abstruse; but nothing can be more contrary to the talent of a great writer. Concision does not consist in the art of diminishing the number of words, and it consists much less in the privation of images; what we should be ambitious of attaining, is a concision like that of Tacitus, which is at once both eloquent and energetic: energy so far from being prejudicial to that brevity of style we so justly admire, that figurative expressions are those by which the greater number of ideas are retraced in the smallest compass; neither can the invention of new words contribute towards perfection of style. Masters of the art may secure the reception of a few, when they are involuntarily created by a sudden impulse of thought; but, in general, the invention of words is a sure symptom of a sterility of ideas. When an author permits himself to make use of a new word, the reader, who is not accustomed to it, stops to judge it, and thus breaking in upon the attention, hurts the general and continued effect of the style.

“ All that has been said of bad taste, may be applied to the faults of the language which has been employed by many writers, for these ten years past. Nevertheless, there are some of those faults which more particularly belong to the influence of political events, which I propose to discuss in speaking of eloquence.

“ When philosophy makes a new progress, style must necessarily proceed on to perfection; the literary principles that may be applied to the art of writing have been almost all developed, but the knowledge and study of the human heart, ought each day to add to the sure and rapid means which have effect upon the mind. Every time that an impartial public are not moved and persuaded by a discourse, or a work, the fault must lie in the author; but it is almost always to what is deficient as a moralist, that his fault, as a writer, must be attributed.”

This last sentence, though in the main true, is contradicted by one of the best observations which occur in these volumes. “ Among the Greeks,” says the baroness, “ envy sometimes existed between rival candidates for fame; but in these days it has passed from them to the spectators, and by one of the most unaccountable caprices that ever affected the mind of man; they are jealous of the efforts made with an intention of adding to their pleasures, and to secure their ap-

probation.” For this jealousy, Madame Stael has elsewhere assigned a reason true, but not exclusively true. “ When a nation is daily acquiring new lights, it looks with fondness on great men, as its precursors in the career which it has to run; but when a nation is conscious that it retrogrades, the small number of superior minds that escape from the general degeneracy, appear, as it were, enriched with its spoils. It no longer takes a common interest in their successes, and the only emotions it feels are those that are prompted by envy.” It cannot be said, that either England or France are conscious that they are going back in knowledge and power; yet that this envy of talents exists in France, Madame Stael has herself informed us, and we have no hesitation in believing her, knowing it to be true in England. The causes are many and various; that craving after distinction is one which, as it leads to vice, is always accompanied with envy. Another cause is, that literature is become fashionable. Literature in fashion, is like flowers that pine at a parlour window; that knowledge which is only acquired as an accomplishment, is little better than ignorance; emulation has been the motive, and envy will be the result, if indeed there be a metaphysician subtle enough to say where we shall place the hairs-breadth line of demarcation between the two. Whether or no men have dwindled, it is certain that books have, they have shrunk from folios to duodecimos, and it would be easy to prove, that as they have dwindled they have degenerated, and that their effect has lessened with their value. There are more authors in England now than there were in the days of Elizabeth, and more readers; but, excepting in experimental science, there is certainly less knowledge. This subject, were we to investigate it, would lead us too far astray; suffice it to observe, that novels, metaphysics, periodical criticism, and conversational criticism, which is its legitimate ape, have all contributed to the degeneracy. Abstracts of knowledge are sought, as travellers buy portable soup, and the one is as poor nourishment for the mind as the other for the body. Opinions upon all literary subjects are bought ready made, or pass from one to another, as Goldsmith tells us the koumiss is transmitted from chief to slave at a Tartar feast.

Such works as this before us have their share in the evil, they are like those un-

wholesome liquors which fill the stomach with flatulence instead of food. *Non è peggior ladro d'un cattivo libro*, say the Italians. We have a vulgar proverb, which says "all that does not poison fattens;" but it is false, physically and metaphorically; the stomach may be filled, and yet defrauded of its nutriment; and, in like manner, will the mind be debilitated, if words, and only words, be presented to it. What there is good in these volumes, would have been better, if brought together in an essay, and that essay a very few pages in length. As it is, we cannot but feel that it is wearying and unprofitable work to sift a bushell of

chaff for the sake of half a dozen grains of wheat.

Madame Stael is a clever woman and an accomplished woman; but something more than cleverness and accomplishments are required for the composition of a Treatise on Ancient and Modern Literature. She possesses more talents than either of her parents, who were both extraordinary persons. Some such progressive amelioration as our feeders aim at in wool and mutton, is carried on by nature with the human mind. If the Neckar family be continued for a few generations, it will probably produce genius.

ART. VII. *Letters to a Young Lady, on a Course of English Poetry.* By J. AIKIN, M. D. 12mo. pp. 297.

WHOEVER casts his eye on the ponderous size and formidable numbers of the volumes which form a complete collection of English poetry, will be immediately sensible of the great utility of a work like that before us.

The neglect with which the classics of the last age are treated by the young persons of the present, a frequent topic of complaint with more experienced readers, is surely matter for regret rather than surprise. Should a novice in literature, particularly if a youthful female, summon up resolution to attempt a thorough methodical perusal of these mouldy archives of the muses, what will be the probable consequence? Puzzled by the obsolete phraseology of some parts, bewildered by the pompous rant of others, disgusted by the grossness of this writer, insulted by the puerilities of that, and wearied by the prolixity of the whole, she will hastily turn aside from the fatiguing task of winnowing the unsorted heap, tamely to receive from the hand of fashion the grotesque fancies of the day for the venerable costume of our ancestors, works unmeritedly extolled for those undeservedly forgotten, the feeble imitation for the nervous original, the flowery for the pithy, the new for the excellent. A kinder task could not therefore have been undertaken for the benefit of the rising generation, than that of pointing out those portions of English poetry most deserving the attention of a young lady, the characteristic excellencies and defects of each writer, and the order of reading best adapted to form a correct and unbiassed taste. The reputation of Dr. Aikin, as a judicious and impartial

critic, is such as will inspire his fair pupils with respect and confidence, and the public voice will probably echo our assurance, that they could not have found a safer or more pleasing guide through the flowery paths of poesy.

Our author has not thought it requisite to open his series of letters with "any preliminary discussions of the theoretical kind, concerning the abstract nature of poetry in general, and its several species," considering the practical mode of acquiring a taste by the perusal of the best models as the most eligible. "To assist his pupil in forming an ear for the melody of verse" was his first object, and with this a chronological order was evidently incompatible, as it was desirable immediately to bring forward "those perfect examples of the art, which necessarily imply many previous attempts." Accordingly, Pope's Pastorals come first under inspection; Windsor Forest, and several more of that author's smaller pieces, are then pointed out; after which Dryden, Waller, Prior, and some others, are introduced to the notice of the scholar, before her preceptor permits her return to the works of Pope; fearful, he says, "lest fascinated by his beauties, she should fix her taste so exclusively upon him, as to regard every deviation from his manner as a defect." Its comprehensiveness is in fact the grand characteristic of Dr. Aikin's poetical system; to every branch of the art, to every species of merit, he labours to give a fair and equal chance of obtaining the applause of his young reader, and to this principle of impartiality is to be ascribed the seeming neglect of order in which his

train of poets succeed each other. We say the *seeming* neglect, for Dr. Aikin assures his correspondent, that he has in fact proceeded by a "method, perhaps scarcely perceptible to her, but never absent from his own mind." The leading principle of this method appears to be, after forming the ear to a nice feeling of the harmony of verse, to lead on the expanding mind from the simplest to the most complex and recondite forms of the poetic art. Thus, from shorter essays in the heroic measure, he goes on to the epic translations of Pope—to his satires and those of Young. To rhyme succeeds blank verse and its great master, and after the standard of excellence in this style has been fixed, the immortal Milton, his imitator Philips, some other didactic poets, Akenside, Thomson, and Young's Night Thoughts, follow. The masters of the lyric strain succeed. From personification to allegory the step is easy, and the venerable Spenser arises attended by his circle of satellites. The deepest mazes of the Parnassian Grove are now unthreaded, and disclose to view "the Witty Poets." Some minor bards then approach in a mingled throng, and Goldsmith, Johnson, and Cowper, the glory of modern times, conclude with dignity the long procession, and rest their immortal works on the altar of the muses.

Such is the plan of the volume before us. With regard to execution, its style is marked with the clearness, nervous conciseness, and easy elegance of the writer. Some, perhaps, will wish that the remarks had been multiplied and farther extended, and that a larger number of quotations had been interwoven; but it appears to have been our author's aim rather to point out the sources whence rational entertainment might be derived, and a correct taste acquired, than authoritatively to lay down a poetical creed, and require a uniformity of sentiment from his young pupils on points which may well be left to the different decisions of different minds.

It must not, however, be imagined, that the candour of our author has prevented him from expressing in strong terms his admiration and his dislike, or that his remarks are wanting in originality, because usually in conformity with the public taste, and the judgment of enlightened critics. But the following examples will better explain his views, and

exemplify his manner, than any remarks of ours.

"I now, my dear Mary, mean to treat you with a rarity—a writer *perfect* in his kind. It may be a doubt whether perfection in an inferior branch of art indicates higher talents than something short of perfection in a superior; but it cannot be questioned that, by way of a study, and for the cultivation of a correct taste, a perfect work in any department is a most valuable object.

"Dean Swift is in our language the master in *familiar poetry*. Without the perusal of his works no adequate conception can be formed of wit and humour moving under the shackles of measure and rhyme with as much ease as if totally unfettered; and even borrowing grace and vigour from the constraint. In your progress hitherto, although it has been through some of our most eminent poets, you cannot but have observed, that the necessity of finding a termination to a line of the same sound with that of the preceding, has frequently occasioned the employment of an improper word, such as without this necessity would never have suggested itself in that connexion. Indeed, it is not uncommon in ordinary versifiers to find a whole line thrown in for no other purpose than to introduce a rhyming word. How far rhyme is a requisite decoration of English verse, you will judge from your own perceptions; after perusing the best specimens of blank verse. It is manifest, however, that when employed, its value must be in proportion to its exactness, and to its coincidence with the sense. In these respects, Swift is without exception the most perfect rhymers in the language; and you will admire how the very word which by its meaning seems most fit for the occasion, slides in without effort as the echo in sound to the terminating word of the preceding line. Even double and triple rhymes are ready at his call, and, though suggesting the most heterogeneous ideas, are happily coupled by some of those whimsical combinations in which comic wit consists.

"The diction of Swift is the most complete example of colloquial ease that verse affords. In aiming at this manner, other writers are apt to run into quaintness and oddity; but in Swift not a word or phrase occurs which does not belong to the natural style of free conversation. It is true, this freedom is often indecorous, and would at the present day be scarcely hazarded by any one who kept good company, still less by a clergyman. Yet he has known how to make distinctions; and while many of his satirical and humorous pieces are grossly tainted with indelicacies, some of his best and longest compositions are void of any thing that can justly offend. It is evident, indeed, that Swift, though destitute of genius for the sublimer parts of poetry, was

sufficiently capable of elegance, had he not preferred indulging his vein for sarcastic wit. No one could compliment more delicately when he chose it, as no one was a better judge of proprieties of behaviour, and the graces of the female character.

"From the preceding representation, you will conclude that I cannot set you to read Swift's works straight forwards. In fact, your way through them must be picked very nicely, and a large portion of them must be left unvisited. It should be observed, however, to do him justice, that their impurities are not of the moral kind, but are chiefly such as it is the scavenger's office to remove."

After recommending the perusal of Pope's translations of the *Illiad* and *Odyssey*, he thus proceeds.

"If the task which I have enjoined you should prove tiresome before it is finished, you may interpose between the two translations the perusal of the remaining original works of the same poet; such, I mean, as I can properly recommend to a lady's view.

"Whether the 'Epistle of Eloisa to Abelard' be among this number, is a point which I feel a difficulty in determining; yet its celebrity will scarcely suffer it to be passed over in silence. They who are afraid of the inflammatory effect of high colouring applied to the tender passion, will object to a performance which, as the most exquisitely finished of all the author's productions, is, from its subject, rendered the more dangerous on that account. And true it is, that if the picture of violent desires, unchecked by virtue and wisdom, is to be regarded as too seductive, notwithstanding any annexed representation of the sufferings to which they give rise, not only this poem, but much of the real history of human life, should be concealed from the youthful sight. But surely such a distrust of good sense and principle is unworthy of an age which encourages a liberal plan of mental cultivation. To be consistent it ought to bring back that state of ignorance, which was formerly reckoned the best guard of innocence. The piece in question, it must be confessed, is faulty in giving too forcible an expression to sentiments inconsistent with female purity; but its leading purpose is to paint the struggles of one, who, after the indulgence of a guilty passion, flew to a penitential retreat without a due preparation for the change; of a

'—wretch believ'd the spouse of God in vain,  
Confess'd within the slave of love and man.'

Such a condition is certainly no object of emulation; and the poet has painted its miseries with no less force than the inconsiderate raptures which led to it. The impression supposed to be left by the story upon

better regulated minds, is that which prompts the prayer,

'O may we never love as these have lov'd!'

"The 'Rape of the Lock,' styled by the writer an heroï-comical poem, though one of his early productions, stands the first among similar compositions in our language, perhaps in any other. Besides possessing the author's characteristic elegance and brilliancy of expression in a supreme degree, it exhibits a greater share of the inventive faculty than any other of his works. The humour of a piece of this kind consists in the mock dignity by which a trifling subject is elevated into importance. When such a design is executed with judgment, all the parts should correspond; the moral, therefore, should be ironical, and the praise satirical. For attaining consistency in these points, the spirit of the age and the character of the poet were well suited.

"I must here let you into a secret, which, while it may justly excite your indignation, may preserve you from deception. That extravagant devotion to your sex which, perhaps, was a serious passion in the age of chivalry, came in process of time, and especially as modified by the licentiousness and levity of the French nation, to be a mere affair of compliment. The free admixture of women, which gave so much splendour and amenity to the French court, soon vitiated their manners; and even while they enjoyed the greatest influence, they ceased to be respectable. Wholly occupied with the care of rendering themselves desirable to the men, they neglected the culture of their minds and the duties of their sex. They who possessed beauty, relied upon that solely for their power of attraction; while those less favoured by nature sought a compensation in the graces. Although thus really debased, they did not exert a less absolute dominion over courtiers and men of pleasure as frivolous and vitiated as themselves; but in the mean time they lost the attachment of the sober and rational, and became objects of contempt to men of wit. In this state of things, the high-flown language of adoration was intermixed with sly strokes of satire; and at length, so much irony was joined with the praise, that a woman of sense would have regarded it as an insult.

"Pope had been educated in the French school of literature. His earliest ambition was to be reckoned a man of wit and gallantry in the modish sense; and having naturally a cold and artificial character, he was well fitted to assume the part most conducive to the interests of his reputation. The personal disadvantages, too, under which he laboured, and which precluded his success as a real lover, accustomed him to fiction in his addresses to the sex, and probably infused a secret exasperation into his feelings when they were concerned.

"These observations are meant to be introductory, not only to the burlesque poem before us, but to other pieces, in which the female sex is mentioned in a more serious manner."

Every mother will feel her obligations to Dr. Aikin for the care with which he has excluded every thing absolutely unfit for the eye of her daughters, and the skill he has here employed in extracting an excellent moral from a piece of a dubious kind, which its celebrity did not allow him to omit. Every woman ought to express her thanks for the merited stigma which he has affixed on the contemptuous insulters of her sex.

With his observations on the first volume of Cowper's poems, which may serve to shew our author's power feelingly to appreciate, and accurately to discriminate the peculiar beauties and characteristic features of a real poet, we conclude our extracts and our article.

"The great popularity which the name of Cowper has obtained is a sufficient testimony to the merit of his productions, which were so far from appearing with any peculiar advantages, that his first publication had nearly sunk under the dislike attached to a narrow and gloomy system of religion. The lamented author passed his life in an obscure retreat from the world, doubly darkened by the shades of a morbid melancholy; and nothing could have forced him upon the public view but a blaze of genius not to be repressed by unfortunate circumstances. His works are now become an inseparable part of the mass of approved English poetry, and they could not fail to engage your notice without any care of mine to point them out. I cannot hesitate, therefore, to include among the subjects of my observations, an author who sooner or later must come into your hands, and has so good a claim to the reputation he has acquired.

"The pieces principally composing the first volume of Cowper's poems are arranged under the heads of Error, Truth, Exposition, Hope, Charity, Conversation, and Retirement. These topics are treated in a familiar and desultory manner, with a continual reference to those religious principles which are commonly termed methodistical; and a vein of severe rebuke runs through them, which the author himself afterwards admitted to be too acrimonious. Yet in the midst of his doctrinal austerity, a truly benevolent heart is perpetually displaying itself, joined with a noble spirit of freedom and in-

dependence. Keen and sagacious reflections upon life and manners, and frequent sallies of genuine humour, are interspersed, which must be relished by readers who are no friends to his system of divinity: yet even the latter in many instances stands apart from peculiar doctrines, and presents only sentiments of pure and exalted piety.

"The verse is heroic couplet, generally of a loose and careless structure, and the diction is for the most part simple and prosaic. There are, however, strains of poetry wrought with care, and glowing with the fervour of genius. An air of originality pervades the whole; and though well acquainted with classical literature, no writer is less of a borrower. All the pieces under the enumerated heads will amply repay the perusal: but you will perhaps find most to please you in those of Charity, Conversation, and Retirement. In the first of these are some admirably energetic lines against the slave trade, which was an object of his rooted abhorrence. The 'Altar of Liberty' is a fine fancy-piece; and the idea of venerating the Power by what may be called the anti-sacrifice of letting fly 'A captive bird into the boundless sky,' is a most happy conception.

"Conversation" abounds with excellent sense and humour. You will be diverted with the picture of the formal visiting party, where,

'The circle formed, we sit in silent state,  
Like figures drawn upon a dial-plate;

and from which,

'The visit paid, with ecstasy we come,  
As from a seven years' transportation, home.'

"Of the serious parts, you will, doubtless, distinguish the Disciples at Emmaus, as a story told with the grace of true simplicity.

"The exquisite representations of the Melancholy Man, in 'Retirement,' were too faithful copies of what the writer saw and felt in himself. How poetical, and how touching, are the following lines!

'Then, neither heathy wilds, nor scenes as  
fair

As ever recompensed the peasant's care,  
Not soft declivities with tufted hills,  
Nor view of waters turning busy mills;  
Parks in which art preceptress nature weds,  
Nor gardens interspers'd with flow'ry beds,  
Nor gales that catch the scent of blooming  
groves;

And waft it to the mourner as he roves,  
Can call up life into his faded eye,  
That passes all he sees unheeded by:  
No wound like those a wounded spirit feels,  
No cure for such, till God who makes them,  
heals."

## CHAPTER XIV.

## MISCELLANIES.

\* THE most important article in this department of our work, is the series of British Essayists from the Tatler to the Mirror, edited by Mr. Chalmers. The periodical essays, which under various names, and with various degrees of merit, have issued from the British press during the last century, form too striking a feature in our national literature to be ever forgotten or neglected ; and the public, we doubt not, will be sensible of its obligations to Mr. C. for his convenient and correct edition of these esteemed writings, which though it cannot be considered as perfect, is unquestionably the best that has hitherto been published. The Prize Essays of the College of Calcutta will excite an interest, exclusive of their intrinsic merit, as the first fruits of an institution most truly honourable to its noble founder, and more indicative of a great mind than the most splendid conquests. The only remaining works that require to be noticed are those under the name of Selections, Beauties, or Anas ; the compilers of which contrive to gain a dishonourable livelihood, by basely stealing the most attractive passages from our standard authors, in order to pamper the idleness and imbecility of those to whom the labour of thinking for themselves is an intolerable burthen.

ART. I. *An Accurate Historical Account of all the Orders of Knighthood, at present existing in Europe. To which are prefixed a Critical Dissertation upon the Ancient and Present State of those Equestrian Institutions, and a Prefatory Discourse on the Origin of Knighthood in general ; the whole interspersed with Illustrations and Explanatory Notes. By an Officer of the Chancery of the Equestrian, Secular, and Chapteral Order of Saint Joachim.* 8vo. 2 vols. pp. 555.

MR. BURKE was in an error when he stated the age of chivalry as gone ! Upwards of twenty orders of knighthood have been created within the last century ; two of them owe their origin to the gallant achievements of the British arms within the last four years. The Sicilian Order of St. Ferdinand and of Merit was instituted in the year 1800, in honour of Lord Nelson, who safely conducted the royal family of Naples from a merciless enemy to the shores of Sicily. The other to which we allude was also created in honour of the same hero : this is the Imperial Order of the Turkish Crescent, instituted in the year 1799 by Sultan Selim III. It is a remark which could not escape the compiler of these volumes, that this event forms a memorable æra in the annals of the eighteenth century ; for it is singular

enough that the Ottomans, against whom the first order of knighthood, that of Malta, was professedly established, should have instituted a military one to recompense the bravery of a christian and a hero, and expressly to commemorate a victory gained on their own coasts, and upon which depended their existence as a nation.

If the age of chivalry had really expired, such a work as the present would have been interesting to the historian, as concentrating in a small compass many authentic documents respecting the origin and constitution of those establishments, which have produced so sensible an effect on the state of society in Europe ; if on the contrary the age of chivalry is actually reviving, a double interest must be excited : institutions of this sort, indeed, are not likely to

shoulder away so long as the profession of arms is honourable, and military enterprise held high in admiration.

Orders of chivalry existed in very remote antiquity, and to trace the origin of them would be an enquiry rather curious than useful. Romulus established an order of Equites consisting of three hundred noble youths; the members of this order had a horse and ring presented to them at the public expence, on condition that they appeared on horseback whenever the state required their services; and Dionysius in describing the *transvectio*, which was a solemn procession, instituted in honour of Castor and Pollux, says that every man bore the ornaments which had been presented to him by the general as a reward of his valour. Plutarch also tells us, that when the Equites had served out their legal time, it was customary for their horse to be led to the seat of the two censors in the forum, where each gave an account of his services, and after an examination into his merits, was discharged accordingly with glory or disgrace. The investiture of the sword and shield among the Germans, as mentioned by Tacitus, was obviously an order of merit, at once the reward of valorous achievements, and an incentive to the performance of them.

The spirit of chivalry which took its rise in times of turbulence and barbarism will not be suffered to languish even in periods of peace and civilization: among barbarous nations, arms, as it is the most useful, so it is the only honourable profession: it is well known that during several centuries, in those ages when science was uncultivated, and the arts of peace were considered as ignoble, every high-born gentleman in Europe was a soldier; his body was trained to feats of hardihood and prowess, and his whole mind was given to the acquirement of military skill. His sports were military: tournaments and jousts were at once an exercise and an amusement to him. In the feudal ages the weak were exposed to the insolence and rapacity of the strong; all was anarchy and violence, till the sallies of an oppressor upon the innocent and defenceless were repulsed by some more generous and more powerful individual. For the purpose of protecting the oppressed, and of securing their own possessions from rapine and plunder, individuals of rank associated, and strengthened their association by a

religious ceremony; admission into these associations was deemed the highest honour, the qualifications required of the candidate were not of vulgar attainment, and the ceremonies of his admission were solemn and impressive.

That these chivalrous institutions should be preserved in periods of peace and civilization will not surprise us, if we consider that the virtues of knighthood have led to that civilization which we now enjoy, and must ever be essential to its existence. Humanity, generosity, courtesy, and fidelity, were no less knightly virtues than valour and prowess: to the genius of chivalry we are indebted for the high sense of honour which peculiarly distinguishes military men, and for that humanity with which the operations of war itself are carried on, and which strips it of half its horrors. Orders of knighthood however were not always instituted for military purposes, the support of the christian religion being generally a partial object at least: the most noble Order of the Garter had its origin in the gallantry of Edward the third, a virtue for the refinements of which we are also indebted to chivalry, and the order of St. Lazarus of Jerusalem was instituted upon a principle of benevolence. The particular duty of the last fraternity "was to superintend and heal those who were labouring under the ravages of the leprosy; and to that end a celebrated hospital at Jerusalem, of which St. Lazarus was the patron, was especially consigned to the patron, as a receptacle for lepers." That other than military objects were in view, and the extermination of the enemies of christianity by the sword is indisputable, since the order of knighthood is yet conferred on females, and there are in existence at this day four orders solely instituted for the ladies.

These were doubtless deviations from the original institution, in whatever age or in whatever country that institution sprung. In the feudal times men of opulence, in addition to the superiority of their armour and their weapons over the common people, had also the advantage of fighting on horseback. This was so striking a distinction that an *equestrian* order would obviously arise from it. Mr. Gibbon says, that between the age of Charlemagne and that of the Crusades, a revolution had taken place among the Spaniards, the Normans, and the French, which was gradually ex-

tended to the rest of Europe. The service of the infantry was degraded to the plebeians, the cavalry formed the strength of the armies, and the honourable name of *miles* or soldier was confined to the gentlemen who served on horseback and were invested with the character of knighthood.

In perusing the very brief—too brief dissertation which is prefixed to these volumes upon the existing state of knighthood in Europe, we find that chivalry is considered as the offspring of the Crusades. It is true, indeed, that after the final reduction of the Holy Land the spirit of chivalry burned with the highest ardour among adventurers at home, but it was because they could not indulge their enterprising genius abroad. The spirit of chivalry sprung from the manners of the age, and notwithstanding the temporal honours and the advantages which the crusader enjoyed in this world, and the hopes of happiness which were held out to them as a remuneration of their pious toils in the next, so many thousand—so many million persons would not have assumed the cross had they not been already animated with that enthusiastic spirit of chivalry which in later times became more refined and more manageable. Perhaps the institutions of chivalry, though certainly not the spirit of it, originated in the customs of duelling, and judicial combat, which prevailed over Europe for so long a time. During the private wars which afflicted Europe for so many centuries, a considerable degree of personal emulation as well as resentment would arise in the bosom of those leaders, who had perhaps frequently struggled with each other in the field of battle. And as assassination died away from the cowardly spirit which it indicated, the challenge to single combat succeeded, where the skill and prowess of the contending parties had ample room to display themselves. The hero of these ages disdained to take his enemy by surprise: he fought for victory, but he also fought for glory, and this could not be attained unless his adversary commenced the combat upon equal terms. Each party vindicated his honour, and professed to be the champion of truth, virtue, and religion. These single combats were rather encouraged than restrained by the civil power, and indeed the more from those defects in judicial proceedings, those uncertainties of proof arising from the

want of written documents, which prevail among a rude unlettered people. As these combats were appeals to heaven they were regulated with all the formalities of a solemn judicial process, and would naturally keep alive that jealousy of honour which became a fundamental principle of knighthood, and which every member of the order swore to maintain with his sword, when at his investment he received a slight touch on the cheek or shoulder, as the last blow he could suffer to be inflicted on him with impunity. It is needless to remark that the custom of duelling and the trial by judicial combat prevailed a considerable time in Europe, though not in England, before the Crusades.

Selden does not allow of judicial combat in *England* before the Norman conquest: the old Saxon laws of Alfred, Edward, Athelstane, Edmund, Edgar, are silent on the subject; nor says he, as I remember, have the monkish stories of that age any authority for the proof of it. But in the laws of William the first it is decreed, that if a Frenchman appeal an Englishman of perjury, murder, theft, manslaughter, or robbery, *Anglus se defendat per quod melius voluerit, aut judicio ferri aut duello.* (Selden. *Duello*, chap. vi.) He considers the custom as having been derived from the Lombards, and quotes an old Italian historian (Carol. Sigon. *de regno Italiae*, lib. ii.) to prove the prevalence of the custom: *Longobardorum antiqua est consuetudo, ut crimina vel maxima singulari praelio purgarentur, quæ postea per leges translata per multa tempora observata est.*

Now if there was any thing chivalrous in these decisions as well as superstitious, although orders of knighthood might not be instituted till the period of the wars for the recovery of the Holy Land, yet, it is evident, that the spirit which gave birth to these institutions, the high spirit of chivalry prevailed long before, and arose out of the turbulent and ferocious manners of more early times.

The oldest order of knighthood is that of St. John of Jerusalem, instituted in the year 1048; but we read of the creation of individual knights in much earlier periods of history. The dignity of Knights of the Spur, or Bachelors, is often mentioned in the Saxon times: in a charter of Kenulph, king of Merceland, of the year 806, to the Abbey of Crowland, he confirms to the Abbey, *Eleemosynam quam Algarus miles etiam*

dudum meus dedit illis in Baston et in Repingale. The same knight is mentioned in a confirmation of Witlaf to the same monastery: item donum Algari militis, silicet, Northland in Baston. Item donum ejusdem Algari militis in Repingale; and there is added in this of Witlaf, item donum Oswini militis in Draytona. [Vide Selden. Titles of Honor, Part II. Sect. xxxiii.]

The ceremonies and circumstances, says Selden (ut sup. Sect. xxxiv.) at the giving this dignity in the elder times were of two kinds especially, which we may call *courty* and *sacred*. The courtly were the feasts held at the creation, giving of robes, arms, spurs, and the like; whence as in the stories of other nations, so in those of ours, *armis militaribus donare*, or *cingulo militari*, and such more phrases are the same as *militem facere*. The sacred are the holy devotions, and what else was used in the church at or before the receiving of the dignity, whence also *consecrare militem*, was to make a knight. Those of the first kind are various in the memories that preserve them, and yet they are rarely or never without the girding with a sword, *until in later ages*, wherein only the stroke on the neck or shoulder, according to the use at this day, hath most commonly supplied it. The ancientest mention of any courtly ceremonies used at the creation of a knight with us is in that of King Alfred, his knighting his grandchild Athelstan, that was afterwards king. Nam et avus (saith William of Malmesbury, de gest. reg. lib. 2. cap. 6.) *prosperum ei regnum olim imprecatus fuerat, videns et gratiose complexus speciei spectatæ puerum et gestium elegantiam; quem etiam et præmature militem fecerat, donatum chlamyde coccinea, gemmato baltheo, ense Saxonico cum vagina aurea.*

These instances, to which others might be added, are sufficient to shew that the chivalrous ceremony of knight-hood long preceded the times of the Crusades, although incorporated fraternities of knights were not known till about that period.

As a specimen of the manner in which the work which has called forth these observations is executed, we shall extract the account which is given of the Knights of the Holy Cross, or the Teutonic Order.

“The commencement of its establishment, is to be ascribed to a devout German,  
ANN. REV. VOL. II.

who, with the permission of the then existing patriarchs, built and endowed an hospital for the sick pilgrims, who were his countrymen; and likewise a chapel to the honour of the mother of our Saviour. In a short time many pious Germans were disposed to maintain so excellent an institution; the men of Bremen and Lubeck, in particular, distinguished themselves to a most eminent degree, and exhibited the utmost zeal for the good of this foundation. They not only courageously protected the pilgrims, during the siege of Acre, (the Ptolomæus of the ancients,) but many of them became hospitalers, and took care of the wounded and sick.

“Many persons of high rank likewise attended on the hospital; and Pope Cælestin the III. formerly instituted this society into a order, under the title of the Brothers of the German House, and of the Hospital of our blessed Lady of Jerusalem.

“His Holiness permitted them to elect a chief from amongst their own members; and thereupon, they unanimously nominated Henry de Wallpott, a person descended from a very ancient and noble family, and who in the year 1191, had become a professed monk of the Order of St. Augustin.

“The ensign of the order, is a black cross with a border of silver; and it is worn upon a white mantle, on the left side. The knights also bear this cross with their arms, upon a white field, in the same manner as was granted to Henry de Wallpott, in 1193, by the Pope abovementioned. They have likewise the same cross upon the left breast of their daily outward apparel; and round the neck, they usually wear a gold black enamelled cross, surmounted with a knightly helmet of massy gold, covered with a coating of dark blue enamel. This cross is somewhat of an oblong form; and it is worn suspended from a rich watered black ribbon of the breadth of three fingers. But this cross has been frequently altered and augmented; and John de Brienne, king of Jerusalem, in 1206, adorned the same with a cross of gold.

“Heriman de Salza, the fourth grand master of this order, having by his consummate prudence and superior abilities, found means to terminate the unhappy dissensions existing between Pope Honorius the III. and the Emperor Frederick the II. that prince being desirous of conferring upon the grand master a signal mark of his gratitude, he to that end, not only granted the dignity of Prince of the Empire, to him and his successors; but likewise gave him his especial permission, to charge the arms of the order with the Imperial Eagle. His holiness, as a proof of his esteem, presented him with a ring of great value; enjoining him to wear the same constantly. Since that epoch it has ever been customary, so soon as a new grand master is elected, to invest him with this ring, in memory of a transaction equally meritorious and remarkable.

U u

" Finally ; in 1250, during the administration of Conrad, Landgrave of Thuringia, the fifth grand master, Louis the IX. King of France, embellished the four points of the cross, with four fleurs-de-lis of gold, as a remembrance of the sense he entertained of the services rendered to him by the order.

" The knights acquired so much reputation, and such great esteem, by their valour, as induced Conrad, Duke of Masovia and Cujavia, to send an ambassador in 1229, to their grand master, Herman de Salza, demanding his friendship, and requesting that general, in case of need, to assist him with his forces against the Prussians.

" Wishing to attract the order into his states, the duke granted to the knights, the countries of Culm and Lobau ; and whatever they might conquer from the Prussians ; to the end that the latter might be deprived of all their possessions, in his dominions.

" This donation he sent to the grand master ; and it was afterwards confirmed by Pope Gregory the IX.

" During the regency of Herman de Salza, the order of the knights of Porte-Glaives, existing in Livonia, under their General Volquin Schenk, was, by the command of the Pope abovementioned, united with this order.

" This union was effectuated at Rome in the year 1293, according to some opinions ; or in 1294, according to others. The knights were then become so powerful, that they were nearly masters of all Livonia and Prussia ; insomuch that they erected nine bishoprics, viz. four in Prussia, and five in Livonia. They likewise founded Elbing, Marienburg, Thorn, Dantzic, and Königsberg in Prussia, and several other cities of less importance, in the same country.

" In 1295 they completely subdued all Prussia, and reduced it entirely under their domination ; although it had five times revolted against them.

" The order made no small progress likewise in Livonia, where it became master of Courland and Semigallia ; and in 1288, it brought the whole province under its absolute dominion.

" This illustrious order being so powerful, the principal cares of the knights were turned towards the maintaining themselves in the possession of their conquests ; and to repel the attacks of their hostile and formidable neighbours.

" Their territories were frequently invaded by them, and on that account they were compelled to wage heavy wars against the natives of Lithuania and Russia. Although they gained considerable advantages over these people ; nevertheless, such successes were more than counterbalanced by the loss of their principal establishment, at Acre in Syria. This disaster happened during the administration of Conrad de Feichtwangen, the XI. grand master. In 1291, Mulech Seraph, Sultan of Egypt, made himself mas-

ter of that city, and the remainder of the knights were obliged to quit that country.

" Expelled from Syria, they formed a momentary establishment at Venice. Soon after they chose Marburg in the country of Hesse, as the chief residence of their order ; and even now a magnificent palace belonging thereto, still subsists in that city. Powerful considerations however, in 1306, induced Godfrey de Hohenlohe, the grand master, to transfer the seat of the order to Marienburg in Prussia ; and since then no provincial grand master has existed in that country.

" The order not only suffered on account of the burthensome wars in which it was engaged ; it was convulsed and torn by intestine divisions, during a long series of years. Under the administration of the grand master Conrad de Jungingen, Uladislaus Jagellon, the then reigning king of Poland, endeavoured to profit by these internal feuds. With the assistance of Witold, Duke of Lithuania, he attacked Prussia ; but the general of Livonia coming opportunely to the aid of the grand master, in the year 1403, peace was concluded between Poland and the order. This peace was of no long duration ; it was broke by Ulrich de Jungingen. Such an infraction of treaties made it necessary for Uladislaus Jagellon to combine his whole forces with those of his father Witold. By these means, the king assembled an army of 150,000 men, with which he attacked the army of the grand master, amounting only to 83,000. The battle began near the village of Tonnenberg, on the 15th of July 1410, O. S. and the slaughter was prodigious on both sides. The most authentic accounts of those times, maintain that the Poles lost 60,000 men, and the knights 40,000 men, in this memorable and well fought engagement.

" The government of the order becoming extremely oppressive, several countries and cities formed an alliance against the knights. It was concluded at Marienwender ; and in 1453 the greatest part of Prussia had detached itself from the order, and put itself under the protection of the king of Poland.

" This transaction gave rise to a warequally violent and bloody. In 1506 peace was concluded by the interposition of the Pope ; and at Thorn the following treaty was made and ratified by the Polish monarch, Casimir the IV. and the grand master of the order : viz. that Pomerelia and the territories of Culm and Mielvelan, and likewise the cities of Ernland, Marienburg, and Elbing, should be ceded to the crown of Poland ; and, that the remainder of Prussia should appertain to the order ; the grand master receiving the investiture thereof ; it being considered as a fief belonging to the kingdom of Poland, and held by military tenure.

" At length, in the XV century, the knights were totally dispossessed of Prussia : Albert de Brandenburg, then grand master, having embraced the Lutheran religion,

Sigismund, king of Poland, his cousin, solemnly invested him with the sovereignty of that country. This event took place at Cracow, on the 5th of April 1525; and thus Prussia became a possession of the house of Brandenburg. From that period it has been denominated Ducal Prussia: and Frederic the III. margrave of Brandenburg, and elector of the Holy Roman Empire, in 1701 procured the same to be erected into a kingdom, the Emperor Leopold the first, having granted an Imperial concession to that effect.

"In the mean time, Walter de Kronberg, the new elected grand master, retired to Mergentheim in Franconia, and stiled himself administrator of the grand mastership in Prussia, and master of the Teutonic Equestrian order, in the countries of Germany, Italy, and their dependencies. As such he was recognised as a sovereign prince of the empire; was likewise received as a member of the circle of Franconia; and the order has enjoyed these dignities to this day.

"In 1700 the possessions of this order were divided into 11 bailiwicks: viz. 1 Alsace; 2 Austria; 3 Tyrol; 4 Coblentz; 5 Franconia; 6 Biesen; 7 Westphalia; and 8 Lorraine; which are of the roman catholic communion: and 9 Hesse; 10 Thuringia; and 11 Saxony; which three last are of the Lutheran faith. But such protestants as are admitted, must in all other respects conform to the statutes of the order; and attend the chapter at Mergentheim, whensoever it is held.

"The Emperor Joseph II. diminished very considerably the possessions of the order, situated in his states: and the late treaty of Luneville must have deprived it of two principal bailiwicks; those of Alsace and Lorraine.

"The present grand master, is his Royal Highness the Archduke Charles Louis, second brother of the reigning emperor of Germany, born September the 5th, 1771. He succeeded to that dignity upon the death of his uncle the late elector of Cologne."

It appears from the extract which we have just made, that the compiler of these volumes gives an account of the insignia of the different orders of knighthood now existing in Europe, and the origin of them; the ceremonies of investiture are generally added, their constitution, and present state of decadence or splendour, &c. &c. &c. The number of orders now existing is *sixty-six*: three of them are chapteral, which elect their own grand masters; one papal; eight imperial; thirty-two royal; five electoral and archiepiscopal; thirteen ducal or princely; and four destined particularly for the fair sex. "It is worthy of notice," says the editor, that "England

is the only country wherein there is no established military order, as in the Hereditary Imperial States, in Russia, in France, Spain, Portugal, Sweden, Naples, Savoy, Prussia, Florence, the Duchy of Wirtemberg, Hesse Cassel, and several other states of the Empire: nor any for artists, as at Rome, in France, and in Sweden, where sciences and the liberal arts have not been overlooked." This is an unaccountable mistake to have made, since the Order of the Bath was instituted by Richard the second, as a military order, and the author himself says, in another part of the work, that "it is almost equally distributed amongst, or conferred upon, the most deserving members of the diplomatic corps: general officers who have served with reputation, and naval commanders, whose valour and achievements, independent of court intrigue, ministerial favour, or parliamentary preponderance, have obtained for them this mark of sovereign beneficence." In the united empire, no one who is an officer in the army or navy, or who enjoys any post under the crown, or in virtue of the king's commission under the sign manual, can accept any foreign order, without a royal warrant or permission being first obtained, and duly registered in his majesty's College of Arms. At present this favour is never refused, but in former times a more jealous conduct was pursued: our editor has related an anecdote of Elizabeth from the account of M. de Wicquefort. "Henry the fourth of France having given the Order of St. Michael to Nicholas Clifford and Anthony Shirley, as a reward for the services they had done him during the war; these two gentlemen returning to England, the queen ordered them to be put in prison, and commanded them to send back the order, and to take proper steps that their names should be erased from the register." She said, "that as a chaste spouse should look only on her husband, so ought a subject to look up to that sovereign whom God has established to reign over him. I will not allow," said the queen, "that my sheep be marked with a stranger's mark, nor that they follow the whistle of a foreign shepherd!" See "L'Ambassadeur et ses fonctions par M. de Wicquefort, p. 99. Sec. ix, Liv. 2. de l'edition de Cologne 1689.

In an advertisement prefixed to this work, it is stated to be compiled from various authentic pieces of manuscript:

—“from the historical collections of Eichler, and M. Archenholtz, (late librarian to his Serene Highness Frederic II. Landgrave of Hesse-Cassel,) and particularly from original documents, deposited in the archives of several modern orders, which by commands of the sovereigns, have, by the secretaries of those orders, been especially communicated to the editor. To which are added copious explanatory notes, and illustrations drawn from Collins's Peerage; Clark's concise History of Knighthood; and many eminent authors who have wrote upon the subject.”

“In the body of this compendium will be found the names of those British noblemen and gentlemen, who are, or have been invested with foreign orders, during the reign of his present majesty; and in most instances, the causes, for which they have received those distinctions, are impartially demonstrated. This work is calculated for the information of those who study modern history, or who travel on the Continent.”

These volumes are dedicated to Lord Nelson, who is the patron of the work, and whose name, wherever it occurs, is mentioned in terms of the most odious, contemptible, and disgusting adulation. We understand that the author of this work, which is printed at Hamburg, is a German, M. Ruhl: to an anonymous editor we are indebted for the notes, many of which are very curious and amusing. In a note to the account of the order of the Bath, the editor says, that “this name was conferred upon it, and the knights were obliged to bathe themselves before they could receive the golden spurs.” The editor cannot mean to imply, surely, that the ceremony of bathing was introduced by Henry the Fourth, when he created the forty-six knights on his coronation. The ceremony is much more ancient, but, perhaps, had been interrupted, and the Knights of the Bath might have been so denominated from the revival of it on this occasion. They certainly did bathe themselves on this occasion. Selden, whom we must refer to again, as we have not Froissart before us, thus gives the historian's words: “Celle nuit,” says he, speaking of the Saturday before his coronation, “y veillerent tous les escuyers, qui devoient estre faitz chevaliers le lendemain, que fuerent le nombre de XLVI. et eurent tous ses escuyers, chacun sa chambre, et chacun sa baign, ou ils se baignerent celle nuit; et lend main le duc de Lancastre, les fit

chevaliers a sa messe, et leur donne longues cottes verdes a estreits manches, fourres de menuver en guise de prelates, et avoient les dits chevaliers sur la senestre espaule, un double cordeau de soye blanche a blanches houpells pendans.” The ancient Franks are supposed to have practised bathing before they conferred knighthood. “The custom of bathing, vigils, and such like,” says Selden, “were in some use in the elder times in France, at the giving this order of knighthood” (Knights Bachelors). And in an old book of chess-play, written by a Frenchman, and translated by P. Caxton into English, it is said “when the knights been made, they been bayned or bathed. That is the sign they should lead a new life and new manners. Also they wake all the night in prayers and orisons unto God, that he would give them grace that they may get that thing that they may not get by nature. The king or prince girdeth about them a sword in sign that they should abide and keepen him of whom they have taken their despenes and dignity.”

But the custom of bathing on receiving knighthood, prevailed in England long before the Order of the Bath was instituted. Henry the First, purposing the marriage of his daughter Maud, the empress, to Geoffry of Anjou, to knight him at Roan, in the year 1127, on Whitsunday following desires the earl his father, ut filium suum nudum militem ad ipsam Pentecostem, rotomagum honorifice mitteret, ut ibidem cum coequævis suis arma suscepturus regalibus gaudiis interesset. This young gentleman, with five more of like quality, attended by twenty-five squires, were bathed (according, saith du Favin, to the custom of France; but I cannot doubt, is the remark which Selden makes, but that Henry the First used the customs that were agreeable to his own country also, though he gave the order in his duchy of Normandy) and then coming in robes proper for the ceremony, received the dignity by having horse and arms given them. Illuscente die altera, balneorum usus, uti tyrocinii suscipiendi consuetudo expostulat (saith John the monk of Maire-monstier, as du Favin cites him) paratus est. Comperto rege a cubiculariis quod Andegavensis, et qui cum eo venerant, ascendissent de lavacro jussit eos ad se vocari. Post corporis ablutioem, ascendens de balneorum lavacro comitis Andegavorum generosa proles

Gosfredus, bysso retorta ad carnem induitur, &c. &c. Vide Seld. Tit. of Hon. Part II. chap. iii. sect. 24. and chap. v. sects. 33 and 45.

Mr. Gibbon, describing the rise of chivalry, which he considers as having taken place between the age of Charlemagne and that of the crusades, remarks that superstition mingled at this period in every public and private action of life; "in the holy wars," says he, "it sanctified the profession of arms, and the order of chivalry was assimilated in its rights and privileges to the sacred orders of priesthood. The *bath* and white garment of the novice, were an indecent copy of the regeneration of baptism:

his sword, which he offered on the altar, was blessed by the minister of religion; his solemn reception was preceded by fasts and vigils; and he was created a knight in the name of God, of St. George and of St. Michael the archangel." Chap. lviii.

We have dwelt so long on these volumes, that we must now take our leave of them, regretting that a more detailed account of the installation of the Knights of the Bath, of its rules and orders, &c. should not have been given, whilst many continental orders are enlarged on which are in comparison perfectly insignificant.

ART. II. *The principal historical and allusive Arms borne by Families of the United Kingdom of Great Britain and Ireland, with their Authorities, collected by an Antiquary; with a Representation of the Arms on Copper Plates.* 4to. pp. 552.

THE jewel of this book is the dedication.

"To the Ladies of the United Kingdom.

"In contemplating the diversified ornaments of the creation, there are none which impress the mind with so much delight as the beautiful forms of our fair countrywomen. The most perfect symmetry, grace, and elegance, are comprised in their construction—the delicately blended tints of their complexions, the animated and interesting expression of their features, the general combined effect of their persons, arrest our admiration and regard.

"But when to these personal attractions are added soft and ingratiating manners, that flexibility of disposition, which at once soothes and corrects the rugged and boisterous nature of man, that attendant sympathy which mitigates his sorrows, or heightens his enjoyments; and, above all, that seemingly innate tendency to piety, compassion and benevolence, so conspicuous in the far greater proportion of them; can they be considered otherwise than as the greatest boon of Providence?

"It is natural therefore, that men should be candidates for the estimation and approval of those whom they so much venerate; and certain it is, that the applause and partiality shewn by the more amiable sex to the adventurous and intrepid, has been, if not a leading inducement, yet a concurrent one, to daring and heroic actions; and, as the following sheets chiefly consist of a detail of such actions, to whom can they be so aptly inscribed, as to those who have a powerful secret influence in producing them,

By their devoted humble servant,

THE EDITOR."

We consider this as perfectly original, believing that no antiquary, however

much he may have been the devoted humble servant of the ladies, ever addressed them so tenderly before, or presented so appropriate an offering to them as a quarto volume of heraldry.

The design of the author is to collect the histories of all allusive arms. This he has executed with sufficient diligence, and sometimes with more than sufficient credulity, as when, upon the authority of family tradition, he believes that a Saxon landholder defeated a thousand Norman soldiers by mounting his men on bulls. The following verses, which are the tenure of the lands of Rawdon, he believes to have been written in William the Conqueror's reign.

"I William, King, the thurd yere of my reigne,  
Give to thee, Paulyn, Raydon, Hope, and Hopetowne,  
Wyth all the bounds both up and downe,  
From Heaven to yerthe, from verthe to hel,  
For the and thyn, ther to dwel,  
As truly as this kyng-ryke is myn;  
For a cross bowe and an arrow,  
When I sal come to hunt on Yarrow;  
And in token that this thing is sooth,  
I bit the whyt wax with my tooth."

This savours as little of the "antiquary" as his dedication.

The engravings in this volume are the very worst that ever were published. The elephants trunks are shaped like trumpets. The lions look like lawyers; the eagles like owls, and the owls like antiquaries. The common birds are not like any in heaven above; the common

beasts not like any in earth below, and the common fish not like any in the waters under the earth. The griffins and spread eagles are like devils, and the hippopotamus resembles a Frenchman taking snuff.

ART. III. *The Decameron, or ten Days' Entertainment of Boccaccio, translated from the Italian. Second edition, corrected and improved. To which are prefixed, Remarks on the Life and Writings of Boccaccio, and an Advertisement. By the Author of Old Nick, &c.* 8vo. 2 vols.

LITTLE need be said upon an old translation of a well-known work. The editor has corrected a few inaccuracies, and has chastised the manners, if not the morals of Boccaccio. The life of the author is very ably drawn up, and the remarks which he has prefixed, have been selected with sufficient care. It would have added considerable value to these volumes, if each tale had been prefaced with a reference to the original story, where it was known, and

to those which have grown out of it, where it had been imitated. This would have given it an historical utility.

Why is not the *Teseide* of Boccaccio reprinted? A sufficient sale would surely be found in England, for we have a national interest in the story, which has been made our own by Chaucer and Dryden, and by that play wherein Fletcher is said to have been assisted by Shakespeare.

ART. IV. *Women: their Condition and Influence in Society. By JOS. ALEX. SEGUR. Translated from the French.* 12mo. 3 vols. pp. 1012.

THE design of this amusing work, the author tells us in his preface, is

“To demonstrate the equality of the two sexes, different as they may be; and to prove that every thing is compensated between them;—that if the one seems to be endowed with peculiar qualities, not possessed by the other, we cannot deny the other advantages equally to be valued;—that where corporeal strength is wanting, strength of soul supplies the deficiency;—that our domination over the female sex is but a continued usurpation;—that they have dexterously availed themselves of every opportunity of re-establishing, at least for a time, the balance between us;—that in these moments of transient equality, they have evinced an ability for every thing, equal to ours; and that, with the exception of inventive genius, their intellectual faculties are not inferior to our own.”

With this view M. Segur has ransacked the historic annals of almost every age and country, and collected a large and curious body of facts, exhibiting the situation of women in different stages of society, their employments, their rank, &c. &c. We feel, however, that all the use is not made of these facts to which they might have been applied, and after having perused the pages before us, when we turned to those of professor Millar, where he treats on the same subject,\* we were sensibly impressed with the superiority of our countryman, who traces in a more brief and philosophic manner, the general effect which different de-

grees of civilization in society produce on the condition of females, and the reaction, as it were, of female influence upon the state of society.

Throughout the animal creation nature has made a distinction, obvious and unquestionable, between the physical powers of the male and the female. The human race forms no exception: man excels woman in strength, activity, patience of fatigue, and courage—if that can be called courage which arises from a consciousness of greater muscularity and superior force. What then has she given to woman? BEAUTY,

— Καλλος,

Ἄντ' ἀσπίδων ἀπασίων

Ἄντ' ἐρχέων ἀπάντων

Νικᾷ δὲ καὶ σιδήρεον,

Καὶ πῦρ, καλὴ τις ἔσται.

This beauty, however, which the elegant and refined voluptuary of Teos celebrated as so triumphant and irresistible in the person of woman, may be ascribed without flattery to her mind; and although the soul, indeed, is destitute of sex, the distinction is, scarcely less obvious and unquestionable between the mental, than the corporeal qualities of man and woman.

Much has been said of late years by Mrs. Wolstonecraft, and her disciples, concerning the state of humiliation and bondage in which the female sex has been confined by us lords of the creation,

\* “Observations concerning the Distinction of Ranks in Society.” Chap. i.

who, in all ages, and all countries, are accused of having kept them in subjection, by keeping them in ignorance. However we may ridicule certain absurdities in the schemes and suggestions of these visionary reformers, some of their hints are worthy of attention, and have been attended to. Whether the female mind is capable of those eagle flights into the regions of philosophy and science, which a Bacon and a Newton took, is a question scarcely worth the trouble of debating; a thousand instances have already been adduced by various writers, to disprove the mental inferiority of females, and it is universally acknowledged, that their minds are capable of infinitely higher cultivation than it has usually been their lot to receive.

The affections of the female are far stronger and more lively than those of our sex; the thousand instances of their heroic conduct during the French revolution, have settled this fact for ever. No personal fatigue could overcome them, no personal danger could for one instant deter them from seeking in the foulest dungeons, the father or the child, the husband, or the lover. Months after months have they been known to secrete from revolutionary vengeance, some object of their affection, when the discovery of the concealment would have been inevitable and immediate death. Were a friend arrested, their ingenuity never relaxed a moment in contrivances for his escape: were he naked, they clothed him; were he hungry, they fed him; were he sick, they visited him; and, when all efforts were unavailing for his deliverance, often did they infuse into his sinking soul, their own courage to meet death with fortitude, and even with cheerfulness. In infancy they nourish us, in old age they cherish and console us; and on the bed of sickness, the exquisite delicacy of their attentions, the watchings they will undergo without a murmur, the fretting querulousness they will bear with complacency, the offensive, the nauseous offices which they are at all times ready to perform, demand from us more than every return of attachment, kindness, and gratitude, which it is in our power to confer.

These qualities are not the offspring of civilization; they are characteristic of the sex, and proudly distinguish it in every quarter of the globe. This is that excelling beauty which nature gives to woman, in ample recompense for infe-

rior deprivations; this is that beauty which indeed turns the edge of the sword, and makes the spear fall pointless. Every traveller through inhospitable wilds and pathless deserts, confirms the grateful testimony of Ledyard to the compassion, and sympathy, and tenderness of woman, and authorises us to estimate the degree of civilization in any country, by the degree of respect and kindness which the female sex receives.

M. Segur begins his work by considering the state of women in the age of the patriarchs, and illustrates the customs of these ancient shepherds, by the marriages of Jacob with the daughters of Laban. He then proceeds to their situation among the Egyptians and Chinese, the most early civilized people in the world: among the former, notwithstanding the climate, females were extricated from their bondage sooner than in the neighbouring countries; the customs of the Chinese are as immutable as the laws of the Medes and the Persians, and they are scarcely less jealous of their females at the present day than they were in the remotest antiquity. "The Egyptians used great care in forming the minds of their daughters; the Chinese, on the contrary, have always left them in a state of ignorance, well adapted for that obscurity to which their excessive jealousy would confine them.—Idolaters of beauty, the Chinese are for ever at the feet of the beings whom they persecute." Authors, however, differ so much in their accounts, as to the situation of women in ancient Egypt, that it is not safe to draw any positive conclusions concerning them.

Greece was broken into small republics, and the state of the women varied according to the precepts of moralists and the decrees of legislators: in Athens, while matrons were confined to domestic offices, and were guarded from the eyes of men, moralists, legislators, and orators, alike bowed to the graces and accomplishments of an Aspasia. The severe laws of Lycurgus inured women to athletic exercises, and by exposing their beauties without the disguise of dress, he flattered himself that young men would resist the fascination to which they yielded, where concealment gave an edge to desire.

Women obtained considerable deference in Rome, during the early ages of the republic; a Roman matron gives us, to this day, an idea of every thing

that is chaste, dignified, and noble. Under the reign of the emperors they partook of the general corruption, and were involved in, if they did not absolutely contribute to, the dissoluteness of the age and the consequent fall of the empire. At length Christianity arose, and into whatever country its precepts have penetrated, women, by becoming more intrinsically respectable, have been more respected: the disorders of the passions have been corrected, and latent unsuspected virtues have been elicited.

M. de Segur is of opinion that the barbarians of the north, who overran the Roman empire, brought with them the first germ of that gallantry which so long remained in Europe.

"If, in the south, Asiatic manners rendered the women wretched; if these people, by turns slaves and tyrants, had for them a sensual love, but little esteem; if they passed all at once from worshipping to despise them, from an idolatrous regard, to the excess of an inhuman jealousy; in the north, on the contrary, the Scandinavians and the Celts regarded the women as their equals and their companions, and even sought to merit their approbation by efforts of courage and generous achievements. These are the nations who contributed most to spread throughout Europe that spirit of equity, of moderation, and of politeness, which forms the distinctive character of our manners. We may, perhaps, assign one cause for this. Among the Scandinavians their fortunes were limited, and nearly equal; their manners were simple, and the passions only unfolded themselves late, and in unison with their reason. They were more restrained under a severe climate: and if we revert to the religion of the Celts, we shall find that one of its most revered tenets was, that the Deity interfered even in the smallest things; and that every phenomenon which appeared was only a method whereby the divine spirit manifested his will. Thus visions, involuntary motions, sudden and unexpected desires, became the admonitions of heaven, and merited the respect of those who felt them, and served as the organ of the Deity.

"The women, who, for the greater part, seem less influenced by reflection than by the instinct of nature, appeared to this people, as I have observed, to be better adapted than the men for filling this honourable ministry; and on this idea rested the principal base of their influence. They carried them along with them in their expeditions, followed their counsels, and sought in their esteem motives to brave every danger; and, in their ill-success, they feared more their reproaches than the sword of the enemy.

"We may perceive with the most superficial glance, in this simple and hasty sketch of the esteem in which women were held by

the men of these barbarous countries, all the first ideas of chivalry, which the nations of the north diffused, when they inundated Europe. A taste for heroic adventures, and a desire of glory, had for a long while carried many Scandinavian warriors, to penetrate into countries the most remote, in order to render their names illustrious. A constant habit of rapine continually exposed the weak to sudden attack; and superinduced the necessity of defenders. Every young warrior, eager of renown, took upon himself the noble charge of protecting the fair sex, and followed his taste in pursuing an adventurous career.

"The multitudes of Scandinavians, which established themselves in France, Spain, England, and Italy, carried with them the taste of chivalry; and this passion, since restrained within very just limits, produced the refined politeness which has for so long a time formed a part of our manners.

"This first impulse of chivalrous gallantry among the nations of the north, was far from possessing all that delicacy and fascination which it afterwards acquired in Europe, by the admixture of the tenderness of the Spaniards, the elegance of the French, and the splendid romanticity of the Moors.—All the first notions were conceived without being developed: respect for the sex, love, devotion, the enthusiasm of glory, and a constancy which yielded every thing to one single object. These foundations were laid; but they were yet covered by a shade of coarseness and simplicity, which, even in the means of pleasing, announced a rude tenderness, and left more to be seen of the warrior than the lover."

We next come to the condition of women in Asia. Wherever the religion of Mahomet prevails, there the domestic slavery of the female sex is confirmed. Mahomet, says our author, wishing to stifle all those passions which he thought sufficiently strong to counterbalance his own influence on the minds of his followers, felt that though he could restrain men from intoxication by prohibiting the use of wine, it would be in vain to attempt to triumph over love. M. de Segur does not seem to have dived into the policy of Mahomet; many texts of the Koran are calculated to check the uncontrolled indulgence of sexual gratification. Mahomet is the only lawgiver who enforced a positive and general interdiction of the use of wine; the climate of Arabia, it is probable, he thought would sufficiently inflame the blood, and required rather a moderating than a stimulating beverage. Mahomet certainly did not wish to "triumph over love;" no one was a more ardent votary of the sex than himself, and this

very prohibition, perhaps, was intended to preserve his disciples, not merely from impairing the faculties of their minds, but the vigour of their bodies. The prophet, however, was jealous of their power, and succeeded in undermining that empire which beauty in a warm climate is so calculated to enjoy.

It is curious enough that M. Segur, after having argued against the efficacy of seclusion and confinement in preserving the chastity of women, should, in the next page, regret the destruction of convents in France! those sacred retreats, as he calls them, where virtue rested in peace, where young females were preserved from snares, and where their education was promoted!

The devotion of one sex to the charms of the other was never so reverential and profound as during the age of chivalry: in this gallant period of history, the ladies took an ample vengeance. The prostrate knight was proudly recompensed for his most perilous achievements at the joust, the tournament, and the battle, by a smile from his fair one. As commerce extended, the arts and occupations of peace succeeded to these military amusements, and as chivalry declined, gallantry declined with it.—M. Segur is disposed to believe that the women, alarmed at the feebleness of their sway, by a sort of tacit agreement and co-operation, produced by a sense of their interests, betook themselves to letters, as the means of resuming a firmer and more permanent influence.

“The sciences were cultivated, but more especially literature. A general impulse directed the mind of all to the study of languages: it was not possible to pass suddenly from an ignorant and military life to scientific meditation; men wished to know how the ancients thought, before they reflected themselves. This was the natural course of ideas. The knowledge of languages being diffused, the philosophy of the ancients came into vogue; but according to the character and temper of the minds: Aristotle and Plato produced several prophets; the Aristotelian philosophy occupied the universities and the cloisters; the Platonic enchanted the poets, the lovers, the sentimental philosophers, and the women. These had emulated the men in courage, during the flourishing æra of chivalry; they were now unwilling to yield to them with respect to the sciences, and they every where instructed themselves. One saw, says M. Thomas, religious poets, women of high rank taking part in controversies, haranguing the popes in latin, exhorting them, as well as kings, to declare war against

the Turks. The Greek language, so magnificent in the poems of Homer, dazzled with renewed lustre. At that period, the verses of this sublime bard, pronounced by the mouth of a beautiful woman, excited enthusiasm in every soul, and kindled in every heart all the ardours of love.

“The women, however, did not confine themselves to the dry study of languages and abstract theology, less satisfactory to their imaginations than poetry, which is subversive and consequent to it, occupying the mind with images and the soul with sentiments. They succeeded in it; and what at first was resorted to merely for amusement, became to them a source of glory and success.

“But their self-love demanded still greater triumphs. In their eyes, talents are valuable only by the homage which they procure to them. Formerly the knights fought and died for them. This tender frenzy having subsided, they wished to be celebrated by the poet's song; they wished that he should neglect his own glory to exalt theirs; that all literary works should have women for their theme, and that, in verse and prose, all Europe should resound with the praises of a sex that feeds upon incense. Their will was a command, and gallantry soon diffused itself throughout literature, as it had participated in the lustre of military achievements.

“Boccaccio was the first, who, in a Latin work concerning illustrious women, set the example of this tender adulation. Whilst the men still devoted themselves to intrigue and war, the women shone in the exercises of intellect. The courts of Naples, Florence, Mantua, Milan, were schools of grace, instruction, and taste. To please, to love, to write, to expect, and to receive homage, these were the employments of women's lives.”

Notwithstanding that in his preface M. de Segur had stated that the object of his book was to demonstrate the equality of the sexes, there are many opinions delivered in it which convey but a very questionable compliment to the ladies. M. de Segur contends that that pure and steady friendship which is so often displayed in the other sex is little known among females: if a woman be the friend of another woman, says he, self-love, rivalry interpose between them, change their sentiments, or secretly apprise them that they are liable to change. Elsewhere he asserts that “every thing which is moderate is a torment to women; great movements and repose alternately please them, and without the powerful attraction of self-love, which induces them to endure every thing in order to obtain homage, and which causes them to submit to chains in the hope of one day imposing

them, they would not voluntarily have suffered any superior sway. Force alone could have brought them under subjection. When the passions are kindled they are capable of rising to the most heroic actions, or of falling into the most odious excesses." If they are less susceptible of friendship, however, he acknowledges that in them the torch of love burns with a brighter and more ardent flame than in the bosom of the other sex; "love," says he, "is made for them, and they for love."

As to the intellectual faculties of the sex, M. Segur considers their genius "as creative only in modifications." We are at a loss to comprehend the meaning of this delicate distinction; their understanding, he continues, more subtle than profound, defines with more grace than accuracy, with more elegance than logic. All energetic ideas, he contends, are denied to women; they think, but they can rarely meditate; they bring to perfection, they seize with greater vivacity than we do all the superficial relations, which they present with a grace which is peculiar to them. Examples to the contrary are of no avail: these he chooses to consider as exceptions, and although M. de Segur has employed at least one half of his three volumes in sketching the characters of illustrious women, and although this one half is a refutation to the reasoning contained in the other, he is not to be convinced.

Among the numerous examples of female superiority, that afforded by Catherine the first of Russia is conspicuous. M. de Segur has given us the history of this very extraordinary woman, but the narrative is full of anachronisms from an original blunder as to the date of her birth. She is stated to have been born in 1702; it was in the year 1711 that she extricated the Czar from his perilous situation before the Grand Vizier on the bank of the Pruth! Catherine was born in 1687; Peter espoused her in 1711; and crowned her with his own hand at Moscow in 1724.

In no country, perhaps, has the influence of women been more decided than in France, and M. de Segur did right to select his own country, as affording a history of the reign of beauty. He goes back to the gallant period of Francis I. and marks the oscillations of their empire during the successive reigns, interspersing the narrative with several amusing anecdotes. It may be observed, however, that this is rather a history of gallantry than of any thing else; it is a history of the influence of courtizans upon the monarch; and this influence, it is obvious, depended very much upon his character and temperament. At last we come to the stormy period of the revolution, which, as we have already remarked, gave occasion to a thousand godlike instances of heroism, and affection, and fidelity.

ART. V. *Gleanings in England, descriptive of the Countenance, Mind, and Character, of the Country, with new Views of Peace and War.* By MR. PRATT. Vol. III. 8vo. pp. 680.

THREE thousand one hundred and fifty pages and upwards of these *Gleanings* has Mr. Pratt, by his own account, "laid at the feet" of the public, and his pages have been successful.

Lottery tickets are scarcely more at the disposal of blind chance, than are the literary productions of this generation. Three years ago a translation was published of the *True History of Mexico*, by Bernal Diaz, himself one of the conquerors. This accurate and most interesting detail of one of the most splendid events which has ever been recorded in history now lies upon the publisher's shelves, or is to be found at the book-stalls, priced at half its value: for the public are contented with Dr. Robertson, a writer who either did not read what he ought to have read, or suppressed the

facts he found which contradicted his own theories. Dr. Percy, to whom for his exquisite taste the people of England are more indebted than to any other living author, has published two works, both of exceeding importance, which have been equally unsuccessful. The "*Northern Antiquities*" are often quoted, yet never reached a second edition. The *Chinese Novel*, the most indisputably Chinese, has scarcely been heard of. We have particularized these three works of many, because they who read merely for amusement, can scarcely find more amusing than these. Yet these works have obtained no sale in an age when Mr. Pratt finds purchasers for three thousand one hundred and fifty pages and upwards of his *Gleanings*!

It is not our intention to exercise any

critical severity upon the Gleanings of this gentleman. Some talents, *sui generis*, he does indeed possess; and in an age when the indulgence of private malignity, whether in prose or verse, never fails to obtain public approbation, Mr. Pratt has some claim to indulgence for the indiscriminating good will with which he flatters all his contemporaries. They who will read his volumes would probably not have employed their hours better, and they will not rise the worse from the perusal of sentiments uniformly friendly to good morals and kindly feelings. Of the summer insects who come within our reach we destroy without compunction such as are noxious, but it were cruel to shorten the life of the golden-chafer or the butterfly; let them enjoy the summer while it lasts.

With these feelings we proceed to give that attention to this volume which is due to the popularity of the author.

The first letter is chiefly designed as introductory to what Mr. Pratt calls Native Sonnets. Of these we extract two, which are characterised by an individual feeling, and have therefore an interest superior to what is commonly found in such compositions.

*"Sacred to a first Impression."*

"Primæval object of my spotless heart,  
In life's fresh morn, ev'n in my tend'rest  
youth;

When it was pure as thine, and not an art;  
The world calls wise, had warp'd fair na-  
ture's truth.

"O, by what various fate and fortune hurl'd,  
What giddy turns of human weal and woe,  
Since those blest times, my wand'ring steps  
have hurl'd,

Thro' all the strange diversities below!

"Yet, tho' ten years have thrice been told,  
sweet maid!

Sincelast we met—ev'n in thy dying hour—  
To the chill grave where I beheld thee laid,  
How oft has mem'ry flown and own'd thy  
pow'r?

"Paid thee the tribute of a heart-sprung tear  
In climes remote, yet hop'd thy spirit near!"

\* \* \* \*

*"To the River Ouze."*

"What tho' fair stream, from prouder deeps  
I come—

The wealthy Maeze, and the Imperial Rhine!  
On thy green banks I find myself at home;  
My wonder theirs, but my affection thine.

"Amidst the ozers that crouch thy side,  
In times long past, my earliest lyre I strung;

At the rude numbers felt a poet's pride,

And thy still wave listen'd to my song;

"And fancy smil'd, alas! and I was blest;

But, ah! how soon thy ready aid I sought,  
Wild with the anguish throbbing in my breast,  
O God! forgive the still repented thought!

"Grief's madd'ning thought, in passion's  
phrenzied hour,

Ere sorrow own'd the sway of reason's god-  
like power."

Mr. Pratt dates at the commencement of his volume from the fens of Huntingdonshire, where he leads us to the cottage of his father's old huntsman, now a mole-catcher, at the age of ninety-three!

"And, lo! seated on a brown bench, cut in the wall within the chimney place, in a corner of yon rude cottage, he presents himself to your view. Behold his still ruddy cheeks, his milk-white locks, partly curled and partly strait—see how correctly they are separated in the middle, almost to the equal division of a hair—a short pipe in his mouth—his dame's hand folded in his own—a jug of smiling beer warming in the wood ashes—a cheerful blaze shining upon two happy old countenances, in which, though you behold the indent of many furrows, they have been made by age, not sorrow—the good sound age of health, without the usual infirmities of long life—exhibiting precisely the unperceived decay so devoutly to be wished. On the matron's knee sits a purring cat; at the veteran's foot, on the same hearth, sleeps an aged hound, of my father's breed, in the direct line of unpolluted descent; or a 'true chip' of the old block,' as John phrased it; and who, by its frequent and quick-repeated whuffle, or demi-bark, seems to be dreaming of the chace—an antique gun is pendent over the chimney—a spinning-wheel occupies the vacant corner by the second brown bench, and a magpie, with closed eyes and his bill nestled under his wing, is at profound rest in his wicker cage. To close the picture, the mole-bag, half filled with captives of the day, thrown into a chair, on which observe a kitten has clambered, and is in the act of playing with one of the soft victims which it has contrived to purloin from the bag for its pastime, while the frugal but sprightly light from the well-stirred faggot, displays on the mud, but clean walls, many a time-embrowned ditty, as well moral as professional; such as 'God rest you, Merry Gentlemen'—'The Morning is up, and the cry of the Hounds'—'The Sportsman's Delight'—'Chevy Chace'—and 'The Jolly Huntsmen.'"

Omit the sentence 'his dame's hand folded in his own,' which savours more of the sentimental than the natural, and this description would appear well if transferred by Barker to the canvass.\*

\* We had written this as a deserved compliment to the author and the artist before we knew that Mr. Barker actually designed to make the portrait.

As the huntsman lives at Warboys, Mr. Pratt extracts an account of the famous witches of that village. If his other extracts had been made from books equally rare, or equally interesting, we should set a higher value upon his volume than it at present deserves. Some good observations upon this superstition are annexed. A very excellent passage upon the same subject might have been appended as a note from Cato's letters, a work written upon temporary politics, but containing much matter of sterling and permanent value. The names of Gordon and Trenchard should be dear to all lovers of civil and ecclesiastical freedom. Here we will quote a good anecdote from Mr. Pratt.

"It is not many years since an inhabitant of Boston, in New England, took a fancy to accuse his neighbour of witchcraft, and the crime being clearly proved, the poor culprit suffered according to law. The contagion spread, and their Sessions-house was crowded with witches, as much as our Old Bailey with pick-pockets. To the tribe it brought fees, and so far was well. But a man having been cheated by his lawyer, made oath that said lawyer was a wizard. This was too much, the clan was in danger. The Court had a special meeting, and unanimously determined, that they would not receive any more information against wizards. The by-law had the effect of a charm, and sorcery was no more."

A similar circumstance occurred within our own knowledge. In some extensive mines in Wales the men frequently saw the devil, and when once he had been seen the men would never work any more during that day. This evil became serious, for old Beelzebub repeated his visits as often as if he had a design to injure the proprietor. That gentleman at last called his men together, told them that it was very certain that the devil never appeared to any body who had not deserved to be so terrified, and that as he would keep no rogues about him, he was resolved to discharge the first man that saw the devil again. The remedy was as efficient as if he had turned a stream of holy water into the mine.

This subject leads Mr. Pratt to an enumeration of our popular superstitions, which is well terminated by the following.

"But the grand soothsayers of the present day amongst us are the Almanack-makers,

and of these the immortal Moore is lord of the ascendant. This sublime personage enjoys, in one respect, a prerogative said to be attached only to our Sovereigns. The King of England, and Moore, the almanack-maker, never die; nay, the latter has in one point the advantage: the successors of royal personages, though represented generally by the word king, have their Christian appellations of John, Henry, William, and George, but this immutable conjuror in chief is always one and the same, Francis Moore, Physician! He is the creed of the common people of England, in all matters that relate either to time or occurrence, peace or war, fair weather or foul. He can count the rain and snow that have fallen upon the face of our island, in the course of our winter's solstice, to a single feat or drop; and he knows as intimately what is doing in the sun, moon, and planets, as what is transacting in this nether sphere. He is, likewise, in the secret of first and second causes, and is as familiar with the planets and conjunctions as he is with the man in the moon. But notwithstanding this universal knowledge, terrestrial and celestial, you will be charmed with his modesty—considering how dogmatic and dictatorial most great men are—when I tell you, that although he knows to the nicety of a fraction how many potentates will be hurled from their thrones, and how many usurpers will seize the sceptre—for he is to the full as great a politician as he is an astrologer—he offers every thing with the diffidence that characterizes a truly great mind. In a word, he is our only vox stellarum, hieroglyphical, chronological, meteorological, and ecliptical philosopher, since his first rising amongst us to this present almanack for the year of human redemption. Of course the dispersion of his predictions exceeds that of any other conjuror of the empire, in the ratio of at least a hundred to one. How, indeed, should it be otherwise, since he is looked upon as oracular in all things; and I could not but smile the other day, when, on going into the shop of one of my principal booksellers to enquire after a work which has of late much attracted public notice, I was informed that the success of the book I asked for would, in point of sale, yield but to one author alive or dead; and that one, said the bookseller gravely, is the celebrated and everlasting Francis Moore, philosopher, physician, astronomer, and almanack-maker!"

This amusing paragraph is an admirable specimen of the puff by induction. The appendix contains a very curious addition to this part in these items.

"1. Three hundred and fifty thousand of Moore's Almanack are sold yearly!

"2. In order to prepare so large an edition, it is necessary to be four months working at press!

"3. And each sheet is obliged to be set up at two or three different printing-offices, or it would be impossible to prepare so enormous an edition within the time!

"4. What is to be published the next year begins printing in May!!

"5. A single bookseller, in his first order, takes fifty thousand!!!

"6. A man, high in office in the city of London, exclaimed confidentially to a friend of the Gleaner's, 'By G—d, Sir, there will be no war! *Moore's Almanack* predicts a year of prosperity! and at *this time* speaks only of peace; and I would sooner believe in *Moore* than in Bonaparte or Mr. Addington!!'

Some letters follow upon the misfortunes of men of letters, and this leads to an account of the Literary fund. We gladly take the opportunity of stating the real merits of this celebrated institution, differing indeed from this benevolent writer in the view which we take; for we see with our naked eye, and he looks through Claude spectacles that cast a sunshine upon every thing.

Beyond all doubt, a society for the advancement of literature is wanting in England. Booksellers must regard their own interest; and if occasionally, as in the instance of Ritson's *Ancient Romances*, they incur a certain loss because the thing itself is honourable, such instances occur so rarely that they are indeed honourable where they do occur. We have no academy, and the indolence of our universities is proverbial abroad, even to infamy. A literary fund is therefore wanting, which should be at the expence of publishing such works of acknowledged utility as no bookseller would undertake, because of their uncertain or slow returns. Such a society, employing able men upon worthy pursuits, would be a national benefit, and would actually prevent the want which these associated gentlemen profess to relieve. An individual is now, at his own single expence, publishing the remains of Cimbric Literature. The name of Owen Jones, this munificent benefactor of letters, should be mentioned with that honour which will always accompany it hereafter. The funds of such an establishment would be well employed in publishing a translation of these remains, and in collecting, after his example, the genuine poems, tales, or chronicles, existing in the Erse or the Gaelic. In like manner should they preserve the early monuments of our Anglo-Saxon and Anglo-Norman ancestors. They should republish those valuable speci-

mens of our old language, which are become so scarce as to be well nigh useless. They should publish the inedited works of those great men upon whom England prides herself, and who are indeed the glory of England, but whose manuscripts will be left to moulder as long as our universities remain what they are. We speak of the works of Roger Bacon, of Cudworth, and of Jeremy Taylor. They should have recompensed poor Richardson, the compiler of the Persian and Arabic Dictionary, who destroyed himself, because he found no reward for that mighty labour. They should still recompense the patient and modest man who has devoted eighteen years to the compilation of a Welsh dictionary without the hope of reward. We could easily extend this summary of what such a society ought to do; let us now examine what these gentlemen have done, and what they profess to do.

Mr. Pratt is the encomiast of the society, and he says, "from a statement of the sums paid by the committee of the fund, since its first establishment, it does not appear that any one applicant can have received, on an average, more than fifteen pounds." We will correct his calculation by saying, that the liberality of the general committee has extended to a donation of twenty pounds. And this is all that they have done, this is all that they purpose to do; no hope is held out for the future, no employment afforded. The poor author who applies in his distress to these literary churchwardens receives little more than the parish would have allowed him in the course of twelve months for the support of himself and family as paupers.

Mr. Pratt now opens upon a new subject; his correspondent having been gratified by his verses to "Poor Toby," he is led to comment upon dogs in general, and the virtues of those "*inestimable appendages to human society*." A long story is related, upon Dr. Duncan's authority, of a dog who preserved his master, and was the means of discovering a murder. The story itself is curious and interesting, but is sadly diluted with that sentimental water gruel washy stile which is the abomination of this book. The next theme is cruelty to animals; and here the author, with a proper and English feeling, reprobates the conduct of those statesmen who deduce English courage from the practice of bull-baiting; pre-

cious logicians! they did indeed prove that they themselves were "*redeemed by no virtue*;" that their private feelings were as detestable as their political conduct; that they are as hardened to all humanity as they are to all shame; and that they would as wantonly abuse their power to increase the sufferings of the brute creation, as they have abused it to the increase of human misery. It was their system to brutalize the people whom they oppressed, and they acted consistently.

This subject of cruelty to animals introduces quotations from Cowper, and from the life of Cowper, for Mr. Pratt is in truth a Gleaner. He then travels to London, and here a new world of subjects is opened to him. The female fashions are thus well ridiculed.

"I have it, therefore, in contemplation to propose a duty upon the legs, arms, shoulders, and bosoms of those ladies who undress in the highest style of fashionable nakedness. In our tax on window-lights only such a portion of distance is allowed betwixt one pane of glass and another, and the tax operates on its passing the given bound. This might be a good precedent for regulating what I have thoughts of calling the *nudity-tax*. The point of decency would very easily be settled, and to that point every lady might go; but the exposure of every inch beyond, whether above or below, would be subject to the tax.

"Besides the usual rewards to informers, there might be a certain number of persons licensed by government. These might go their rounds to espie the nakedness of the land; a kind of inspectors, in the way of excise officers, invested with authority to measure limbs exposed, gauge bosoms displayed, &c. whenever it is obvious the degree of nakedness allowed by law is exceeded. At the same time to avoid all this danger of the fair sex being annoyed in public by these examiners, the legislature would do well to establish a proper number of nudity-offices, where ladies, on entering their names, and going prepared with the precise point of denudation they determined upon, might obtain certificates, and pay the price of every joint, from the taxation part of the ankle upwards to the knee, and from the limited point of the arm to the unlawful part of the shoulder, and so downwards again. Only it might be advisable to increase the weight of the tax according to the nature of the parts to be exposed. A lady, for instance, should not have the privilege of wholly uncovering her bosom, nor of entirely baring her shoulders, without reference being had to both the personal and political mischief that may be done to civil society in an exhibition, and should be taxed accordingly.

"It might save trouble, also, if such ladies as are legally entitled to go great lengths, and take all liberties with the public, should exhibit their right so to do. This might easily be managed by forming the certificate itself into an ornament, on the cap, wig, train, apron, or any other part of the body, before or behind, that happens to be shaded, with the word *permit* in legible characters, either stamp or wrought, no matter how simply or splendidly, either in beads, spangles, foil, or jewels. The *permit* will, indeed, not only prevent the importunity of the nudity surveyors, but will be hung out as a signal to the spectators who have a taste for naked figures."

The markets, the shops, the theatres, are all visited by this Gleaner. He describes the prisons, and the misery of their tenants, with some feeling; but this feeling, with all the theatrical sentimentalism which accompanies it, terminates in some wretched common-place reasons, to make his readers feel satisfied that all things are as they should be. The prisons of London, he says, are more splendid in their external appearance than either Buckingham House, or St. James's Palace! Doubtless this must be a consolation to the debtors who are living upon bread and water within! Who can doubt that the splendour of the prison must alleviate the sufferings of the prisoner? that a culprit at the bar must be flattered to see counsellors and judge dressed out in robes and wigs purely on his account? and that hanging is a cheerful operation to the party concerned, because the people make a holiday on the occasion, and call it hang fair?

"We must not take our ideas," says Mr. Pratt, "from any thing which our moralists or malcontents say of the general hardship of our places of confinement." Moralists or malcontents!—we recommend this synonym to Mrs. Piozzi's notice for the next edition of her liberal and accurate work. This morsel has been sugared for those readers who take up the book at the tea table, and love to be told that they live in the best of all possible times, and in the happiest of all possible societies. Mr. Pratt has too good a heart to keep on in this story; upon enquiry, he says, it appears, that more than twenty thousand persons are at this time prisoners for debt;

"—let us therefore coolly enquire what is the sum of evil which the imprisonment of debtors brings upon our country.

"It seems to be the opinion of the late

computists, that the inhabitants of England do not exceed six millions, of which twenty thousand is the three hundredth part. What shall we say of the humanity or the wisdom of a nation that voluntarily sacrifices one in every three hundred to lingering destruction!

"The misfortunes of an individual do not extend their influence to many; yet if we consider the effects of consanguinity and friendship, and the general reciprocation of wants and benefits, which make one man more dear, or necessary to another, it may reasonably be supposed, that every man languishing in prison gives trouble of some kind to two others who love or need him. By this multiplication of misery we see distress extended to the hundredth part of the whole society.

"If we estimate at a shilling a day what is lost by the inaction, and consumed in the support, of each man thus chained down to involuntary idleness, the public loss will rise in one year to one hundred thousand pounds; in ten years to more than a sixth part of our circulating coin.

"I am afraid that those who are best acquainted with the state of our prisons will confess that my conjecture is too near the truth, when I suppose that the corrosion of resentment, the heaviness of sorrow, the corruption of confined air, the want of exercise, and sometimes of food, the contagion of diseases, from which there is no retreat, and the severity of tyrants, against whom there can be no resistance, and all the complicated horrors of a prison, put an end every year to the life of one in four of those that are shut up from the common comforts of human life.

"Thus perish yearly five thousand men, overborne with sorrow, consumed by famine, or putrified by filth; many of them in the most vigorous and useful part of life; for the thoughtless and imprudent are commonly young, and the active and busy are seldom old.

"According to the rule generally received, which supposes that one in thirty dies yearly, the race of man may be said to be renewed at the end of thirty years. Who would have believed till now, that of every English generation, an hundred and fifty thousand perish in our gaols? that in every century, a nation, eminent for science, studious of commerce, ambitious of empire, should willingly lose, in noisome dungeons, five hundred thousand of its inhabitants; a number greater than has ever been destroyed in the same time by the pestilence and sword!"

Without calling Mr. Pratt a moralist or a malcontent, we will forgive him his

synonyms for the humanity of this passage.

In his advertisement the author expresses an earnest wish that the ten concluding sheets might be first perused, as they are devoted to a heart-felt consideration of the important circumstances of the country at the present moment. Gentle reader, what were we to expect when thus requested to begin the book at the end on account of its immediate importance? We looked for a scheme to pay off the national debt, or a method of securing our fleet against a submarine attack, or a plan of fortification for London, or directions how to march to Paris, or something equally important and equally practicable. No, gentle reader, we have first, a picture of the gaieties of London taken from the newspapers, paragraphs respecting routs, and balls, and grand dinners, and the fashionable arrangements of the week from the Morning Post; and this is called a grand metropolitan moving picture! It is indeed an important picture: the country must indeed be miserably degraded in morals and intellect when the public papers are filled with such trash; when the "fashionables," as they are called, can take a pride in having their follies and prodigalities advertised, and when they are not punished for the publication, with general contempt. Next comes a sketch of the debates upon the war, remarks upon the speed of the mail coaches, an account of the arrival of the definitive treaty, a list of public charities, and an extract from Langhorne's Hymn to Humanity. In truth, after having perused these ten sheets we cannot conceive how the country is to be benefited by them at the present moment, unless they be served out to the volunteers as cartridge paper.

We have now finished the Gleanings; if Mr. Pratt will give us for the future pictures with less varnish, we shall be glad to take up his volumes. The present work has too many extracts, and too much *prattle prattle*; but Mr. Pratt has taken measure of the public taste, and knows how to fit it. That his works should last is a secondary consideration.

ART. VI. *Essays by the Students of the College of Fort William in Bengal: To which are added, the Theses pronounced at the Public Disputations in the Oriental Languages, on the 6th of February, 1802.* 8vo. pp. 228. Calcutta printed.

THESE essays, as the *frugum primitia* of an institution established on the soundest principles of justice and of wisdom, and which bids fair to revive the drooping learning of the east, will be welcomed by every lover of science, and every friend to humanity. It is well known, that the Marquis of Wellesley, among other important services which he has rendered to the East India company, founded a college at Fort William for the instruction of the junior civil servants of the company, in all those branches of literature and science, which may be deemed necessary to qualify them for discharging the duties of different offices, constituted for the administration of the government of the British possessions in the East Indies. It is not so generally known, perhaps, what those branches are, and on how very extensive a basis this establishment is founded. Presuming that most of our readers will feel the same gratification that we did on being made acquainted with the collegiate studies, we make no apology for transcribing, from the second volume of the Asiatic Annual Register, the following concise account of them: It is enacted, that "professorships shall be established as soon as may be practicable, and regular courses of lectures commenced in the following branches of literature, science, and knowledge: Arabic, Persian, Sanscreeet, Hindustanee, Bengal, Telinga, Mahratta, Tamula, Canara languages; Mahomedan law, Hindoo law; ethics; civil jurisprudence, and the law of nations; English law: the regulations and laws enacted by the governor-general in council, or by the governors in council at Fort St. George and Bombay respectively, for the civil government of the British territories in India; political economy, and particularly the commercial institution and interests of the East India company; geography and mathematics; modern language of Europe; Greek, Latin, and English classics; general history, ancient and modern; the history and antiquities of Hindustan and the Deccan; natural history; botany, chemistry, and astronomy."

"The essays and theses here published, were composed by the students, under the following statutes enacted by his excellency the most noble the governor-general, patron and visitor of the college of Fort William.

"Statute VI. Of public disputations in the oriental languages.

"Whereas it is necessary, that the students destined to exercise high and important functions in India, should be able to speak the oriental languages with fluency and propriety; it is therefore declared, that public disputations and declamations shall be holden in the oriental languages, at stated times, to be prescribed by the council of the college."

"Statute VII. Of exercises in English composition.

"Every student shall compose one essay or declamation in the English language, during the course of each term.

"The subject of these essays or declamations shall be proposed by the council of the college."

The disputations in oriental languages were held at the college hall on the sixth of February, 1802, being the anniversary of the commencement of the *first* term of the college. After the distribution of the prizes and honorary rewards, the honorable the acting visitor, George Hilario Barlow, Esq. in absence of the noble patron and founder, who was called to a distant quarter of the empire, addressed the students in a short appropriate speech, expressive of his satisfaction at their general good conduct and proficiency.

This volume contains nine essays; three "on the advantages of an academical institution in India, considered in a moral, literary, and political point of view," respectively by Mr. Martin, Mr. Elliot, and Mr. Bayley; three "on the best means of acquiring a knowledge of the manners and customs of the natives of India," by Mr. Hamilton, Mr. Martin, and Mr. Metcalf; three "on the character and capacity of the Asiatics, and particularly of the natives of Hindoostan," by Mr. Wood, Mr. Martin, and Mr. Newenham.

Here it is impossible not to be struck with the wisdom and judgment which dictated the choice of these subjects. The object of the *first* is clearly to direct the attention of the students to the nature and views of the institution of which they are members, to impress them with a just sense of its importance, and of the value of those advantages which are now within their reach, and which, if they suffer to pass away without profiting by them, must be dishonourable to their character, and detrimental to their interests. The *second*, by enquiring the best means of

obtaining a knowledge of the manners and customs of the natives of India, takes for granted the necessity of such knowledge; and in plain language tells the students, that whatever situation they occupy, whether they are employed in the legislative, judicial, or commercial line, an acquaintance with the hereditary usages and opinions of those for whom they legislate, and with whom they have any dealings, must be the foundation of every liberal, and politic, and just principle of conduct. In the *third* essay, a still more enlarged and comprehensive view of the subject of the second, seems to be recommended. The question, as it is stated for discussion, seems to say to the students, "a knowledge of the manners and customs of the Asiatics is necessary, but it is not all that is necessary; you must mark the operation of these manners and customs, and observe what effect they produce upon their *character* and *capacities*; you must apply your knowledge. In order to conciliate the affections of those under your sway, and secure their fidelity, make yourself acquainted with their character, that you may not unintentionally, and through ignorance do violence to their prejudices, and shock their feelings."

Before we read a line of any one of these essays, such were the reflections which came across our minds on looking over the contents of the volume, where the subjects of them are stated. It is time to notice the essays themselves, which do credit to the good sense, and what is more, to the good feelings of their respective authors.

The more important and immediate advantages of an academical institution in India are so obvious, that it can excite no surprise if the three gentlemen who employed their pens in the enumeration of them, should coincide in their opinions, and cast their eyes on the same objects. So striking indeed is this coincidence, that there is scarcely a sentiment in any one of the first three essays, which is not to be found in one of the other two.

Mr. Martin, after anticipating the discovery of many treasures of literature, which an intimate acquaintance with oriental languages alone can bring to light, proceeds thus:

"But these studies, though valuable in themselves at all times, derive additional importance when considered in a political point of view. 'Justice is the pillar which sup-

ports the fabric of human society.' Its strict and impartial administration has, almost in every age and country, been esteemed the firmest bond for conciliating the affections, and securing the obedience of its subjects. If, therefore, any specks may have arisen, to dim the lustre and stain the purity of a system, so essential to the happiness of millions, and in which their interests are so deeply involved; whatever tends to dissipate and erase them, excites our gratitude, and engrosses our attention. The clouds which have obscured its path will now retire and disperse; while the success which must inevitably crown the steps of industry, will enable us to introduce the solid advantages of European literature; will promote the cultivation of wealth, by giving vigour and dispatch to business; and will be the means of accelerating the progress of civil society, by enlarging the channels of intercourse. Our credit too, as a nation, is interested in marking the progress of our conquests, not by the vain effusion of innocent blood, or the destruction of millions of the human race; but by a generous and liberal communication of the arts and sciences; while policy requires, that the people, whom our arms have rescued from the galling bonds of Asiatic slavery, should, while they acknowledge the necessity, experience the benefits of their submission.

"If then it be of acknowledged moment to acquire the principles of general knowledge, and to render ourselves acquainted with the languages of those countries which we may hereafter govern, it is of proportional importance to consult the experience of history; as a field, exhibiting the varied operations of the human understanding, and a theatre, representing the various changes and passions of the human heart. Unfurnished with any ideas on general policy, and unaccustomed to contemplate the objects which wise and salutary laws ever have in view, we should be totally unable to form any just estimate of the systems of ancient legislators, or of their influence on the general happiness of the people. History, by pointing out the objects of true worth and value, teaches us to despise the brilliancy of those martial exploits, which, though they may have procured the temporary applause and admiration of mankind, have ever been condemned by the calm and dispassionate suffrage of posterity. It will encourage us, by the numerous examples which it displays of a noble disregard to private interest, when opposed to the great claims of society, to love, and imitate those qualities which we admire and extol in others; and will prompt us to resist the progress of that degenerate spirit, which sacrifices, without a blush, the considerations of duty and interest to the base indulgence of sloth and appetite.

"But there is no feature in the institution that shines with brighter or more distinguished lustre, or that more demands our gratitude and esteem, than the asylum it affords against

that ridicule and contempt, which moral excellence too often meets with in society.— However great our qualifications, or brilliant our endowments, unless supported on the firm basis of religion and morality, they can sparkle only with a tinsel brilliancy. If in delineating the character of one who claimed the admiration of mankind, after having ascribed to him eloquence, valour, and every accomplishment that is most shining and captivating, it were to be said, that he indulged in every vicious inclination, was unaccompanied by truth, and uninfluenced by virtue; by that one stroke alone the whole character would be sunk and degraded.

“ ’Tis the last key-stone  
That makes the arch; the rest that there were  
put  
Are nothing, ’till that comes to bind and shut:  
Then stands it a triumphal mark! then men  
Observe the strength, the height, the why,  
and when  
It was erected.”

How honorable are such sentiments as these; what a pledge do they afford, that if the individual who now utters them should at any future period of life be promoted to any rank or station where his power and influence are conspicuous, he will exert them in the distribution of justice, and the defence of innocence.

Mr. Elliot has thus expressed the same feelings:

“ In a moral point of view, the advantages of an academical institution will be equally conspicuous. Pleasures and amusements, unless restrained within moderate bounds, soon lead to extravagance and licentiousness. Coming into the country at an early age, it can hardly be expected that young men should have any strong or fixed ideas of the truth of their religion; and whatever they may have, are too often obliterated by a constant intercourse with men, who are, perhaps, as deficient in moral principle as in their knowledge of the true religion. Nor is this all: a very short course of dissipation places them in the power of men, who want not the inclination to render them instrumental in the perpetration of the most dishonest and unworthy actions, to the disgrace of their country and the dishonour of the religion which they profess. As we believe our religion to be infinitely more pure than that of India, and our morality more refined, it is incumbent on us to shew that our actions are not at variance with our ideas; and to evince the truth of that religion, by displaying its efficacy on our conduct. The paths of vice hold out so many, and such powerful allurements, that nothing but a firm and solid foundation of religion, integrity and morality, can resist their power. It becomes therefore a primary object of the institution to check, in the very beginning, the progress of dissipation and vice; to instill

the principles of religion and virtue; to enforce the necessity of order and industry; and to warn the inexperienced of the dangers and snares which await them in their passage through life.

“ I cannot omit to observe two circumstances, which will tend very greatly to conciliate to the British government the good will and esteem of the natives of India, and which may be ranked among the principal advantages of this institution.

“ The first is, the great advantage which is hereby extended to natives of learning and abilities. India has been long descending by slow degrees into the gulph of barbarism and ignorance, and learning and the arts have been gradually falling into disrepute and obscurity. The ample field which this institution proposes to itself, comprehending the languages, literature, arts, and sciences of all the more polished nations of Asia, will not fail in a few years to assemble the most learned men from all parts, by affording them suitable encouragement. Nor does it end here. The student will come into active life with a taste for eastern literature, and extend that patronage so happily begun; the shoots of science will again spring up and flourish, and the east will regain its once well merited celebrity.

“ The other circumstance I had to mention, is the conviction which will be afforded to the natives of India, of the earnest desire of the supreme government, that they may not be ruled by men, ignorant of the genius of the country and its inhabitants; but by those who, from a regular course of diligence and study, have attained a perfect knowledge of the subject. This will inspire a confidence that the laws will be administered with justice and impartiality; that every respect will be shewn to their usages and customs, and every indulgence to their prejudices; in fine, they will cease to consider themselves as a conquered people, and unite with one soul in a general wish for the permanency and prosperity of the British empire.”

Of the essays “ on the best method of acquiring a knowledge of the manners and customs of the nations of India,” we are rather inclined to give preference to Mr. Martin’s; Mr. Metcalf, however, is a powerful competitor for the palm.— Mr. Hamilton is busied about the importance of acquiring this knowledge, rather than about the means of obtaining it; and he is totally ignorant of a truth which is brought forward and enlarged on by both the other gentlemen, namely, that the genius and character of a people is often to be inferred from their language, and that language, therefore, is not merely the key of knowledge, but is knowledge itself.—Mr. Martin says,

“ So intimate is the connection between

language and manners, that to acquire an accurate knowledge of the latter, an attentive examination of the structure of the former has ever been deemed necessary. So sensible were the Romans of the influence of language in forming the manners of men, that it was their most serious care to extend, with the progress of their arms, the use of the Latin tongue; and, we need only advert to those languages now existing in the world, to observe, that they receive their peculiar character from the national character of the people who speak them.

“Our own language, for instance, agreeable to the studious, reflecting, and phlegmatic disposition of the people of England, displays its power of expression, chiefly on grave subjects, and on the stronger emotions of the mind; whereas the language of the French, sympathizing with their delicacy, refinement, and sensibility, surpasses our own in expressing the nicer shades of character, is copious in whatever is delicate, gay, or amusing, and is perhaps the happiest language for conversation in the world. An examination of the structure of language must be always attended with great advantages, as being very nearly connected with the philosophy of the human mind.”

Mr. Metcalf makes the same remark:

“The general character and peculiar genius of a people, may also be collected from their language. From the openness and boldness of expression in our own, we discern evident marks of that nobleness of mind and freedom of spirit, which dignify the Briton; whilst the politesse and suavity of diction in the French tongue, bespeak that gaiety of disposition, and elegance of manners, which adorn the well educated inhabitant of France. Thus every language carries in itself the stamp of the nation who converse in it, an assertion confirmed by observation of the oriental languages; in every sentence of which appear that humility and slavish submission, or that haughtiness and despotic insolence, which have ever been the characteristics of Asiatics, in the respective situations of subjects and sovereigns, dependents and lords.”

“Whether the religion or government, climate or education, produces most effect on the national character, is a problem which, though frequently discussed, has never been satisfactorily resolved;” Mr. Martin therefore dwells upon these several causes, which undoubtedly co-operate in forming the national character. On the effects of religion, indeed, he has only glanced: he might, with advantage, have noticed some of the most striking instances of its operation. If he had adverted to the mild genius of the Peruvians at the time of their discovery by Pizarro, clearly de-

rived from the object of their worship, and the superstition inculcated by their Incas, and contrasted it with the ferocious character of the Mexicans, also derivable from the savage rites of their religion; if he had noticed the effects of polytheism, and the obscene and licentious mythology of the ancients, it would have illustrated an argument which, however, Mr. Metcalf doubtless thought was too obviously true to stand in need of illustration. The manners and habits of a people, moreover, are to be in a great measure inferred from the nature of the government to which they are subject, the laws by which their conduct is regulated, and the education which prevails among them.

We are very much disposed to think that *climate* too operates more powerfully than is generally imagined; Mr. Hume altogether denies the influence of physical causes on the genius and nature of man. We are strongly disposed to think that moral causes, such as government, religion and education, are, in reality, but effects flowing from physical ones.

After all, perhaps, it is by social intercourse, as Mr. Martin observes, that a knowledge of the character and circumstances of any nation can be, with certainty, attained. The christian missionaries enjoy “peculiar opportunities of investigating the spirit of Hindoo theology, and of explaining the structure of their language.” From these zealous and inquisitive men, therefore, who must, of necessity, make it a principal object to encourage and promote the most unreserved communication, it is that we must rely for the most copious and valuable information, as to the manners and customs of the natives of India.

The “character and capacity of the Asiatics” are treated of in three essays, respectively, by Mr. Wood, Mr. Martin, and Mr. Newnham, who agree in representing them, as indeed most of the authors have done, as indolent, cruel, and abject. The influence of climate is not overlooked by these gentlemen; Mr. Wood concedes a great deal to it, and seems very much of our opinion, that religion and government are secondary causes, and climate a primary one. Climate and religion, says he, most forcibly conspire to determine the character of the natives of Hindoostan; the former paves the way for any impression the latter may be willing to establish, which, when once received, it throws also every obstacle in

the way of its removal. The cruelty of the Hindoos, like that of the Mexicans, is no doubt attributable to the bloody rites of their religion: "thousands of human victims have been thrown to smoke on the polluted altars of their horrid deities; deities, whose crimes, if upon earth, society could not endure; and those bosoms, which have been fondly imagined the asylum of love, of meekness, and humanity, are found to be the receptacles of every debasing crime, and every malignant passion." The abjectness of the Hindoo is moreover confirmed by the *secondary* influence of that institution, which obtained, before the records of authentic history, the institution of casts, by which the station of every individual is irrevocably fixed, and "the walk of life marked out, from which he must never deviate, and whose barriers it would be impious to pass." An institution like this, it is clear, must deaden every noble faculty of the mind, it must smother every spark of ambition, and nip every bud of genius. The expertness acquired in some of their manufactures, is scarcely worthy to be mentioned in the consideration of this subject.

"If we examine," says Mr. Martin, "into the capacity peculiar to the Asiatics, we shall find them to possess a larger portion of ability than is generally supposed. Indeed we have every reason to suppose, that the sun of science, as well as of religion, first arose upon the eastern world; and that the polished nations of Europe, who now excel antiquity in arts, and vie with it in arms, are indebted to Asia for their cultivation, and many of their best attainments. The Asiatics, it is probable, had climbed the heights of science before the Greeks had learned their alphabet; and while the forests of Europe were stocked with a few wild, uncultivated savages, these were collected into populous cities, the seats of arts, of luxury, and of despotism, Asia too has given birth to some of the greatest monarchies of the world; to that of the Assyrians, the Medes, and the Persians. The foundations of astronomy are said to have been laid in Babylon; and from the Magi of Persia, Pythagoras is declared to have acquired the principles of that knowledge, which procured him the applause and veneration of the Greeks. Hindoostan was infinitely more enlightened than it is at this day, and its inhabitants a civilized, a commercial, and even a warlike people; and at the time that the Greeks imagined themselves the only great people upon earth, Confutsee had planted morality and good government in China. Thus we see that literature, taste, and science originated in Asia, and by a gradual dif-

fusion, in the course of time spread themselves over Greece and Italy. Such then having been once the state of the sciences and arts among the Asiatics, it cannot be unreasonable to suppose, that their ability still remains unhurt and vigorous; and that those sparks of genius, hitherto smothered or enfeebled by the noxious climate of oppression, might, under the congenial influence of a milder government, and more favourable laws, again be fanned into a flame."

Many specimens of ancient architecture still remain; the chief edifices were erected for religious purposes, and, according to Mr. Newnham, attract admiration, merely from the time and labour necessary for their construction, the architecture possessing little merit either for regularity or elegance. Astronomy and the sciences, he continues, were formerly studied in Hindoostan, but they seem to have been known only to the Brahmins, and by the indolence of that race they are now almost forgotten.

"If the arts had been carried to a high degree of perfection, some traces of that perfection would have remained; but we find the mechanical instruments of the native, simple and unimproved, and his tools for agriculture and building, such as a nation emerging from a state of nature would first have invented. I mean not to assert, that many of the arts known and esteemed in Europe, have not had their origin in this country. It is probable that Hindoostan was one of the first countries which emerged from barbarism; but there is no appearance of its having at any former time greatly excelled that degree of civilization, such as it is, which exists at this day."

\* \* \*

"The Indians at present under the British dominion, particularly those near the seats of government, appear inclined to dismiss many of their prejudices. The richer Hindoos, in particular, affect to despise many of their former customs, to which the destructive persecutions of the Mahomedans only served to rivet their affections; they, however, rather copy the follies than the virtues of Europeans, and endeavour to excel them in luxury and expence, rather than in knowledge. They have acquired the same freedom of behaviour, without the generosity and independence of spirit; and they are more eager in the acquirement of riches, without the same enterprize and honesty of principle. To over-reach the stranger by the lowest artifices of despicable chicane and intrigue, is considered by the trading Hindoo as his calling. If the passions have not the same influence over him as over the more vigorous and impetuous European, the influence of the virtues is still less; if he is less quick in resenting injuries, he is utterly in-

sensible to every feeling of gratitude. To vegetate in sloth is the delight of the Hindoo, and he is never roused to exertion but by the calls of necessity, or to gratify his ruling passion, avarice. He is dastardly in spirit, and will seldom stand a contest with an open foe, but is rather inclined to injure his enemy secretly. When transported with anger, he vents his rage with feminine impotence, in the vilest and foulest reproaches; but this fury is quickly damped, if likely to be resented by force."

Justly is it observed by Mr. Newnham, that that country can never be called civilized, where 'the priest stands before the altar of his idol, his hands reeking with the blood of the newly slaughtered victim; whose laws permit the son to expose to the flood the being who gave him birth; when oppressed by years, and unable to labour for the support of life;\* where the youthful widow is compelled to finish a short life upon the pile of her deceased husband, or else must survive his loss in ignominy or servitude; and where the woman who has long been barren, offers her first born to her god, by exposing it to the birds and beasts of prey, or suffering it to be carried away by the flood of the Ganges!' Will it be credited, that several of these unnatural cruelties were perpetrated in the presence of Europeans, at the last Hindoo festival in the island of Saugor, in December 1801?

"The only effectual expedient for the improvement of this idolatrous and deluded people, appears to be the civilizing influence of the christian religion. It is, perhaps, too audacious an attempt for philosophy or human policy. Philosophy, indeed, has already acknowledged that the difficulties of the attempt appear insuperable; but though the superstitions of the natives are certainly great obstacles to the propagation of truth, these superstitions are not to be deemed invincible. We cannot believe that the Hindoos are an exception to the human race. History affords many instances of nations who have yielded up their ancient and inveterate prejudices to the truth of the gospel. Besides, it is a fact, that this very country has felt its power, and that there are numerous classes of the natives who profess obedience to the christian faith.

"Protection from prosecution for religious opinion, is the chief encouragement to the investigation of truth; and it is not wonderful, that little success followed the cruelties

of the Portuguese, and their persecuting zeal. This protection is now afforded by the British government. The dissenting Hindoo may be expelled from his cast, but no violence can be used against his person, and his rights, as a subject, remain unimpaired. This protection, and the general mildness of the British government, must in time animate the natives to make some attempt to share with us in the daily evident benefits of general knowledge. The reflection of mind necessary for the attainments of general knowledge, will lead them to the examination of principles. Truth and its evidence will then be displayed to their view; and, in this way, we may hope that their superstitions will gradually lose strength, and in time disappear."

We shall not have occasion to dwell long on the theses contained in this volume; they are three in number.† The first was pronounced in the Persian language, by Mr. Lovett, on this position: "An academical institution in India is advantageous to the natives and to the British nation." This subject is so nearly the same with that of the first three essays already noticed, that we shall be excused from enlarging on it. We cannot pass it over, however, without a compliment to the extensive reading displayed by our orator. It was opposed by Mr. C. Lloyd, and Mr. G. D. Guthrie; the moderator was Lieut. John Baillie, professor.

The second disputation was held in the Bengal language. Mr. Martin defended this position: "The Asiatics are capable of as high a degree of civilization as the Europeans." In his essays, Mr. Martin had more than once acknowledged the co-operative influence of climate: here he thinks it necessary to retract a little; but it really was not necessary, at least according to our theory on the subject. If the Hindoos were left entirely to themselves, it is probable that ages might roll away before they would extricate themselves from the shackles in which their Brahmins bind them; if they made any advance towards civilization, the motions, like that of the hour-hand of a watch, would be too slow to be perceived. Mr. Martin is obliged to look about for extraneous assistance, for the introduction of christianity. If there be one more distinguishing feature

\* In China infanticide is allowed and practised; but Sir George Staunton tells us, that a child is bound to support his parents in distress, the brother his brother, and so on; even the most distant kinsman has a claim upon his relation. To this obligation Sir George attributes the exclusion of mendicancy from the empire.—REV.

† They are printed in the original language, and a translation is annexed to each.—REV.

among christian nations, says he, than another, it is the intelligence and spirit of enquiry which pervades them all; every thing that relates to the animal, intellectual and moral worlds, has there been sifted and explored; and arts the most useful to mankind have been discovered. The flame of science, once kindled, has been communicated to every description of men among whom christianity has been known, and every succeeding age has added something to the limits of the former, while throughout every country where mahometanism is professed, the same deep pause has been made in philosophy. This, he continues, appears the only way in which we can account for the decline of eastern knowledge, and it is only from the sun of christianity that we can look for the dissipation of this awful gloom. To all this we very heartily assent; but surely it is not necessary to detract an atom from the influence of climate, in order to allow that it may be counteracted by the combined influences of christianity on the one hand, and of British government and British laws on the other.

The position of this thesis was opposed by Mr. Bayley and Mr. Hodgson; the moderator was W. C. Blaquiére, esq.

The third disputation was held in the Hindoostanee language; the position is, that "The Hindoostanee language is the most generally useful in India." It was defended by Mr. Bayley. Owing to the intercourse of the merchants of Arabia with this country, but particularly to the frequent invasion of it, and ultimate settlement in it by the Moosulmans, a considerable number of Arabic and Persian words became engrafted on the original and current language of the natives, which was the Sunscrit or Bhakha; of these three languages, then, the present Hindoostanee is compounded. The court of Delhi having made choice of it, as the medium in all affairs depending on colloquial intercourse, it became more extensively known, and was at length used universally in the courts of the Moosulman princes. Mr. Bayley makes a division of it into three dialects, varying according to the prevalence of one or other of the languages composing it; which dialects arose, he says, from the different degrees of intercourse and communication between the Moosulmans and the natives. In the first or pristine dialect, there is a smaller admixture of foreign words; hence this is more nearly related

to the original dialects of the country. In the second, or what Mr. Bayley calls the familiar dialects, the number of foreign words bears nearly an equal proportion to the original ones. In the third, or court, dialect, Arabic and Persian words are by far the most numerous. It is a little singular, that the language which Mr. Bayley designates by the appellation of the Hindoostanee, should, according to his own account, be only a dialect of it; it is to this third or court dialect that he seems to restrict the term. I grant, says he, that peculiar *dialects* are spoken by the inhabitants of several districts and provinces of India, yet I assert that no one of them is so generally useful and necessary as the Hindoostanee; nor will this assertion appear to be too bold, when it be considered that however extensive a country may be, and how numerous soever the dialects spoken in it, still the language of the court and metropolis will always be most generally known and understood, and must of consequence be that most worthy of attention and cultivation by foreigners. Mr. Bayley establishes his proposition, among others, by the following arguments:

"In the whole of the vast country of Hindoostan, scarce any Moosulman will be found, who does not understand and speak the Hindoostanee.

"Every Hindoo also, of any distinction, or who has the least connection either with the Moosulman or the British government, is, according to his situation, acquainted more or less with this language.

"It is moreover the general medium by which many persons of various foreign nations settled in Hindoostan, communicate their wants and ideas to each other. Of the truth of this indeed we ourselves are an evidence, as well as the Portuguese, Dutch, French, Danes, Arabs, Turks, Greeks, Armenians, Georgians, Persians, Moghuls, and Chinese.

"In almost all the armies of India, this appears to be the universally used language; even though many of the individuals composing them be better acquainted with the dialects peculiar to their respective districts.

"Nearly from Cape Comorin to Kabool, a country about 2000 miles in length, and 1400 in breadth, within the Ganges, few persons will be found in any large villages or towns, which have ever been conquered or much frequented by Moosulmans, who are not sufficiently conversant in the Hindoostanee; and in many places beyond the Ganges, this language is current and familiar."

To these facts it is added, that although the Hindoostanee language does not boast of many prose compositions or

works of science, yet that many elegant tales and beautiful poems are composed in it. Commercial, military, and political correspondence is carried on in it; the instructions of the learned natives, and all their disputations and arguments on subjects of literature, are conducted in it; and in every case where a native wishes either to compose or to dictate any thing to be written, he constantly arranges his ideas, and explains his meaning in the Hindoostanee. The position was opposed by Mr. Lovett and Mr. Lloyd; the moderator was John Gilchrist, Esq.

After the full account which we have given of the contents of this volume, we have but little to say relative to its general merits. The essays are certainly not of the highest order of excellence: the importance of the subjects proposed, would have sanctioned much ampler and more comprehensive dissertations. They are, nevertheless, extremely respectable: it will be recollected that they are the production of students, who, as they ascend the hill of science, will have a more extended horizon open to their view. Their annual essays, too, serve the important purpose of directing their attention to those topics which are most likely to repay their studies, with the gratitude and attachment of the natives, who are submitted to their government, and with the confidence and esteem of their employers the honourable company in Great Britain.

"Those," says Mr. Barlow, in his address to the students on the distribution of prizes and honorary rewards; "those who are yet but imperfectly acquainted with the nature and objects of that institution, will

learn with equal surprize and satisfaction, that students recently arrived in India, have this day ably maintained a public disputation in the Oriental languages.

"The establishment of the college of Fort William has already excited a general attention to Oriental languages, literature, and knowledge, which promises to be productive of the most salutary effects, in the administration of every branch of the affairs of the honourable company in India. The numerous and important benefits to be derived from this institution, cannot, however, be justly estimated from the experience of the short period of one year, which has elapsed since it commenced its operations. But, if succeeding years shall exhibit advantages proportionate to those which have been already manifested, this institution will realize the most sanguine expectations which have been entertained of its success."

Under the auspicious government of the Marquis of Wellesley, it will long be remembered, that Seringapatam was stormed and taken, and the power of the mighty Sultaun of Mysore annihilated, by the death of Tippoo; nor will it be forgotten, that an equal praise belongs to him, as the regenerator of India, by the foundation of the college of Fort William. We cannot close this article better than in the words of Mr. Lovett: "May his genius, as it at first conceived the undertaking, long continue to watch over and protect it! May the learning and virtue, of which he is an example, long flourish within its walls! And may its effects be seen to the latest ages, in the peace, happiness, and prosperity of this invaluable appendage to the British empire: increased strength to its domestic resources, and increased glory to its illustrious name!"

ART. VII. *The Tourifications of Malachi Meldrum, Esq. of Meldrum Hall.* By Dr. ROBERT COWPER. 12mo. Two vols. about 450 pages.

IT has been said, probably with truth, that there are few persons who at some period or other of life have not experienced a desire to visit foreign countries, and compare the manners of different people with the manners of their own countrymen. Malachi Meldrum, esquire, for a number of years had been periodically seized with a vehement desire of this sort—immediately after turnip-sowing. It might have been well, perhaps, if some of our young gentry, who have squandered so much of their time and money in making the "Grand Tour," had paused and cogitated upon the pro-

priety of the thing, like Malachi Meldrum, esquire, of Meldrum-Hall, before they made up their mind upon it. This prudent gentleman paused and cogitated, year after year, till an accidental glance at the family looking-glass revealed to him the ominous existence of three or four grey hairs on his forehead; this discovery, together with the silent but expressive eloquence of Mrs. Dorothy Meldrum and the children, who, from some unguarded soliloquies which escaped him, had suspected that something was working in the mind of Malachi, at length contracted the intended

sphere of his peregrinations, and determined him to content himself with an unexpensive and less perilous tourification in his own country.

Notwithstanding this change of his plan, it was sometime before he could summon courage to disclose it to his family: Mr. Meldrum became reserved, and lost all his wonted hilarity. This state of restraint, so unnatural to him, however at length grew intolerable, and one Saturday evening after supper was the appointed period for the important disclosure: "an unusual taciturnity bordering upon gloom, hung over the fire-side;" but Mr. Meldrum taking an extraordinary pull or two of Dorothy's October felt himself so stout, that after a conciliating glance of affection towards his wife, the affair at last came out, and met with less opposition than might reasonably have been anticipated. Indeed it must be acknowledged that he shewed a good deal of generalship in not suffering the enemy to rally his forces after the shock of the first onset: an extra tankard of October, and the promise of bringing home for the girls a load of fine things, had considerable effect. Conversation was not suffered to flag, and Malachi, who has a remarkably sweet voice, and is exempt from that vice which is common to singers, of declining to gratify their friends, or requiring so much solicitation as to take away all the merit of assenting, proposed at the very first pause in conversation to sing his wife her old favourite song.

"My dear," said I, lifting the tankard half way to my head, and replacing it softly on my knee, as if something very important was pressing upon me; "my dear," said I, "suppose I sing you your old favourite, the Forsaken Shepherd; I am much mistaken if it had not a little influence with somebody some years ago; a slight leer accompanied this; and I find my voice in fine pitch for the Yellow-hair'd Laddie to night. Dorothy's handkerchief was replaced in her pocket, and the corner of her apron was also carelessly thrown aside. The song, to be sure, was main long; but that I had in view, as I was sure my audience would be fast asleep before I fairly got through the half of it. She accepted the offer as a compliment, with much kindness and gratitude; and I proceeded singing, and saying, as I saw best befitting my audience or non-audience.

"*The Forsaken Shepherd.*

"The sair-hearted Sandy aside the bare tree  
Sat sighing and sabbing, and the tear in his ee;

And though chill blew the blast, and fast fel  
the snaw,

He sang to the desert his lassie awa'.

O, why are ye good, and why are ye fair?

My red swoln ee will see you nae mair;

Ye ha'e left me to weep, and ye ha'e left me  
to die;

And the lads a' around join in sorrow wi' me.

"Nae mair on our hills will thy smiles chase  
awa'

The deep groan of grief, and the tears as  
they fa';

The pale furrow'd cheek in its want shall  
consume;

And the pipe shall be heard nae mair in the  
broom.

The lasses may sing, and dance trim on the  
green,

When ye, O nae langer amang them are seen:  
The best form o' beauty nae mair shall divide

The bonny young lad and his bonny young  
bride.

"But a' things bring sorrow and sadness to  
me:

My life drew its spark from the beam o' thy  
ee;

Now it falls like the leaves strew'd along the  
black burn,

Since my lassie wi' summer nae mair will re-  
turn.

But ay, be thou happy, and the best on the  
green,

May thy bonny laddy ilk morning be seen;  
Though I maun lament to the rain and the

snaw,  
Thy charms and thy goodness for ever awa'."

On Monday morning, then, Malachi Meldrum upon Habby, duly caparisoned, and his man Shadrach, equipped with his master's portmanteau upon Black Tom, set off upon his tourification. It was a fine morning, and the scenery brought to his remembrance some Scottish stanzas, which many years before he had penned, for the amusement of Dorothy and the bairns; we cannot transcribe the whole, but there is so much accuracy and life in some of the descriptive passages, that we are tempted to select a few stanzas.

"But O its could—nae chirping bird

The snaw shaks frae its wing;

Wee sits thou quivering in the bush,

And hears the tempest sing.

"Thy wee bit feathers stand on end;

Thy wings hing o'er thy feet;

Nae leaf's to turn yon wintry wind,

Or shade the frae the sleet.

"The lammy, frisky on the know,

He waits a safer morn;

For heavy, heavy, hing the flakes,

Iced on the bending thorn.

"Its louder yet—thou dreadfu' storm;  
Thou bursts thy ruthless way;  
And, whirling round the ilka cloud,  
Lets in the morn sae bla!

"Dread was the night—and dread's the  
morn;

Where's a' the hours o' May?  
Whan will ye spread your bonny leaf,  
And gie us unco' day?

"When will ye spread your bonny leaf?  
When sprinkle round your dew?  
And frae thy thorn, my bonny rose,  
Thee shall I ever pu'!

"Again the cock!—you curling reek  
Rows up the louring sky;  
And labour's early, glimmering lamp,  
Blinks welcome on my eye.

"Strong the cauld chilling arm o' death  
Seem'd o'er the warld to reign:  
Thou cheery taper! thy sma' beam  
Gies us a warld again.

"O toil! ye smoothe the care-worn bed;  
The heather's like the down;  
The pillow that bears up thy head  
Is safer than a crown.

"O hear ye, frae yon turf-clad ha',  
The morning hymn sae fine!  
Hear ye the father's orison,  
Sae humble, sae divine!

"In joy and peace he welcom'd night;  
In joy and peace he raise:  
The blazing ingle o' the morn  
Bad a' be pray'r and praise.

"Blyth shines the face, strong beats the  
heart,  
Warn'd wi' a soul like thine:  
Thy life, thy hope, my hoary carl!  
Thy life, thy hope, be mine,"

After some ludicrous adventures our  
travellers arrive safe and sound at the  
Saracen's Head, where they stop to break-  
fast.

"Having got this extraordinary affair off  
my hands, and also got the waiter's news, in  
order to give Shadrach half an hour more to  
furbish up his buckskin breeches to his satis-  
faction by the kitchen fire, I thought it  
would not be amiss to take a small stroll  
through the town, in the proper stile and  
spirit of a tourificator. Though I had been  
in the same town almost every week of my  
life, and had been again and again in almost  
every hole and pore in it; yet in a scientific  
point of view I found I knew nothing at all  
about it.

"Partly for my amusement, and partly  
with a view to qualify myself for this mighty  
expedition, I had in the Re Rustica-way  
travelled down from Old Varro and Colum-  
elia, to Young and Anderson; I had

thumbed over the pages of Cronstedt and  
Linné; and many a weary winter night had  
I turned over the elaborate pages of the re-  
nowned Dr. Adam Smith. It was now my  
time to turn these studies to some account,  
by adding farther to my own stock, or by  
bestowing knowledge and information where  
it seemed to be lacking among others.

"Accordingly I sallied forth, staff in  
hand: and wherever the sound of the ham-  
mer, or the treddles, or even the whistling  
of a taylor was to be heard, thither I bent  
my steps. The blacksmith, necessarily situ-  
ated near the Saracen's Head, first attracted  
my attention; and I entered the smithy with  
a countenance formed, as well as I could,  
both to conciliate respect, and to inspire con-  
fidence. The blacksmith, resting his elbow  
upon the lever of the bellows, exchanged a  
pinch with me. He satisfied me as to the  
angle a hobnail ought to be pointed to; and  
he was loud and long on the general abuse  
and cruelty of fitting the horse's foot to the  
shoe with vile heels, &c. instead of fitting  
the shoe to the foot. 'And, as to the farrier-  
business,' added he, 'as a shoer of horses,  
I am obliged, from old custom, and in spite  
of my teeth, to be a practitioner; but it  
would be a blessed tenderness to all horses,  
ill or well, for they are both subject to the  
farrier, either to prevent, or remove diseases;  
—that both farrier and groom should have a  
mark put upon them at the market-cross.'  
In recompence for this, and a great deal  
more, I gave him a chemical dissertation  
upon iron, and the easiest and cheapest  
modes of exciting heat; and I shewed him  
how his forge, which was like something  
hastily and temporarily reared up in the cor-  
ner of a waste house, might be Rumfordized  
to the greatest possible advantage.

"Passing on, my weaver had just thrown  
Paine's Age of Reason into the little basket  
at his elbow, which held his pins; and  
thumping away at his loom, was silently un-  
saying all that his pious father and mother  
had taught him. On talking to him about  
the beautiful and immense labours of the  
loom, he gravely uttered, 'that while the  
minds of men were hampered with creeds  
and confessions, and while civil liberty,  
pressed to death by aristocratical statutes and  
edicts, existed only in name, we can look  
for nothing,' said he, 'but grovelling imper-  
fection in the operations either of the soul or  
of the body of man.' This last word he  
pronounced with prodigious emphasis. My  
hour of politics and polemics not being yet  
come, I endeavoured to divert the attention  
of the weaver to his warp and woof, by re-  
marking, that though the loom had existed  
since the days of Tubal-Cain—the weaver  
looked at Tom Paine, and then at me—De-  
dalus, I mean, said I, and had, no doubt,  
in so many thousand years, undergone divers  
alterations and improvements, yet much re-  
mained to be done, and much might be ex-  
pected in this age of ingenuity; and I did

not despair of living to see the day when the shuttle would be the only fixed part in the loom, and all the other machinery whirled round it by water or by steam. The weaver never hesitated at the possibility or impossibility of my scheme; but it immediately occurred to him, that if the thing actually took place, the whole race of weavers would be starved, nay extirpated; whereupon he laid his shuttle softly upon the web, mended a broken thread, imposed silence upon his heels, and commenced a most vehement philippic against his brethren of mankind, whose ingenuity, he said, was only exercised in abominable contrivances to degrade, and to lessen the numbers of mankind, thereby rendering them the more manageable: and in the heat of his indignation he swore most furiously, that all the wars of modern times were carried on for this very purpose.

"The loom thus got out of sight again, and so far too, that I concluded it impossible to bring her again into action; and as I have a mortal aversion to anger, and all profane swearing, I quietly wished my weaver, with all his souls, a good morning.

"I directly crossed over the street to where I saw a tailor on his shop-board, enlivened by the morning sun, and seemingly at peace with all the world, chanting an old Scots song, his work seemingly going on all the better for it: to be sure I had little to expect here from my merry taylor, for the purpose of a tourificator, and as little to give, where a pair of scissars, a thimble, and a needle, constituted the principal apparatus of the artist. I was therefore a good deal at a loss how to proceed; but a good song being always a good thing, and also transferable to Meldrum-hall; and as I also stood in no little need of something to adjust my nervous system after the weaver's analysis of modern politics; so with as little ceremony as possible, I leaned myself on the shop-board, and begged the taylor not to be interrupted in his song, which, beside being very beautiful, I said, was quite new. The lad, not at all disconcerted, took his pinch of snuff, and set his arm vigorously a-going again, saying 'it was a new thing he had somehow picked up,' written, he understood, by a gentleman in the neighbourhood; and, added he, 'all people did nothing but talk good of that lady before she left this country; a curse upon that England, it takes away all our best folks.' Little did my taylor know he was making his best eulogium on one of my best friends, and who, if she mixed more with the world, with her incomparable talents and elegance, would carry the world before her; but that seems not much to be bragged of, and I dare say she has chosen the better part. While I was apostrophising thus, the taylor was going on—'As you seem to like the song, sir, I will begin it again.' My bow, and

my thanks, and a new threaded needle, set him a going.

"*L. M. S.'s Farewell to the Highlands.*"

"Ye mountains sae grey, which hide the  
blue heav'ns;  
Ye hills green wi' birk, and spangled wi' dew;  
Ye rivers which mix your wild voice wi' the  
morning;  
O must I, sweet highlands! must I bid you  
adieu!  
And then, in thy forest's sac braid-mantling  
bosom,  
Sweet cottage, where pleasure and happiness  
dwell?  
Must I, wet wi' tears, my bonny Kinrara!  
O must I for ever—can I bid thee farewell!

"Farewell then, dear highlands—O farewell,  
Kinrara;  
Ye sons of the hills, a long, long adieu!  
How long your Comala O will ye remember,  
Far parted I'll sigh on Kinrara and you.  
Bleat on, then, ye lammies; and proud in  
your forests  
Be thy steps, thou gay roe, and thine, bound-  
ing deer!  
Sweet Spey, on thy banks, and thy far-ga-  
thering waters,  
May happiness shine, and be mine the last  
tear.

"Here a most inviting opportunity offers, were I to adhere to the footsteps of my brethren of the staff, to thrust in a disquisition concerning the Scottish music, and to follow it up with ample eulogium; but reserving this till a season when I have more materials about me, and when I have not a musical taylor at my elbow, I shall only observe what surely has, or ought to have been observed long before I was born, that every singer, public as well as private, ought to be bodily employed during their performance. I am certain my little taylor would not have sung half so well had he been sitting prim and erect in his chair, with all his needles sticking idle in his sleeve; and what is it but this which makes the lass's melody at her wheel, and the young lady's with her netting by the parlour fire so pleasing."

The knight of the thimble tipt him another ditty, and no one knows how long this pastoral contest might have lasted—for Mr. Meldrum was tuning his pipe to the taylor, if an unlucky accident had not spoiled all their singing. Snip's brother was a great chemister, and could talk of nothing but the Priestlands and the Lavoshys, of oxheads, and carbunns, and fluggistone; he was at this very time trying some unlucky experiment, and it so happened, that with the inflammability of his gas, and the combustibility of his apparatus, he had set fire to his laboratory: the fire ex-

tending to the taylor's shop, &c. &c. Mr. Meldrum, however, made his escape, and in his hurry mistook his road to the Saracen's Head. Now this incident certainly does not speak much in favour of his active benevolence. Nero, we are told, amused himself with fiddling while Rome was burning: Mr. Meldrum, instead of working at the bucket, took to his heels till he found a resting place which commanded a lonely and romantic view; and while the taylor's shop-board was in flames amused himself, *it being the summer season*, with the recitation of a descriptive Ode to Winter! However, we are not disposed to quarrel with him; a hundred brawny arms could be found to pump the fire-engine, and in sorrow be it spoken, few are the singers who strike the lyre with the same spirit, delicacy, and feeling of Malachi Meldrum, esquire. Our tourificator's range is not a very extensive one: his musical meditations are interrupted by the appearance of a gentleman of the old school, Mr. Shuttlesworth the weaver, with whom he holds much sapient conversation on divers subjects of policy and commerce. To this delay succeeds another by an unexpected meeting with one of the most bewitching little madcaps in the world, Miss Watson, who draws him away with her to dinner, so that we really arrive at the end of one of the two volumes before Mr. Meldrum has discharged his first morning's breakfast bill at the Saracen's Head!

Evils seldom come alone, as the saying is: Malachi will never get back to the inn. First the weaver stops him and talks politics, then that fascinating gipsy, Miss Watson, sings songs to him, and by and by comes the parson, who is also a bit of a poet, and discusses literary subjects. The parson indeed is a heterodox sort of a gentleman---not in his religion but his literary creed: who, of all writers in the world, should he fall foul of but of Virgil? That Virgil was a flatterer is very true, poets very commonly are so---now, do not let Mr. Meldrum have the slightest suspicion that we make any personal allusion, that we mean to remind him of his own well-merited eulogies on the reigning monarch, and on his prime minister, Henry Addington, esquire---Virgil too was a notorious imitator. But did not he improve upon his originals? Is not the Georgics, without exception, the most correct and polished poem in existence, and may we not pre-

sume that the *Æneid* would have come down to us in a more finished form had the author lived to correct his manuscript?

The parson, too, has a mind to revive the old controversy on the authenticity of Ossian's poems; or more properly, perhaps, he has arbitrated between the parties, and settled the business by splitting the difference. His statement of the case is probably a very just one, that Macpherson collected a great number of original fragments, "and, aided by a man of ability, superior it was believed to his own, he arranged into an epic what was possible, and it is to their honour that our feebleness appears to denounce the patch-work. Those poems which had little connection with Fingal, or Temora, or where Fingal and Temora could be carried on without them, were published in their insulated state; but I would not aver, says the parson, that the soldering hand had not been upon them too." We are not much disposed to agree with him in opinion, that "an hundred years hence, people may talk about the thing, but they will care little whether James Macpherson, esquire, or Ossian, the son of Fingal, was the bard." People a hundred years hence will, probably, be as anxious as we are to trace the progress of poetry, to mark the periods of its splendor and obscurity, and connect them, as illustrative of the human mind, with the state of society in those particular periods. In this view of the question it was of importance to fix the date of Ossian's poems; Mr. Macpherson has thrown darkness over a subject which it was in his power to have enlightened. Well, well, we must leave Virgil, and Ossian, and Fingal, and Macpherson, and return to our friend Malachi, or we shall be guilty of what, of all things in the world, is most unpardonable, a breach of good manners.

Mr. Meldrum, and the little party who had increased around him, at length reaches the hospitable house of Mr. Watson: after dinner the bottle circulates with sufficient celerity till it is suspended by Captain Hamilton's narrative of the story of Jessy Hawthorn. The character of the Captain's grandfather is admirably drawn, and as to Jesse, let him who can read the tale without emotion, without feeling all his best affections excited, depart into the wilderness.

Before the evening began to close Mr. Malachi was warned by a confounded

twinge in the toe, that he was going to have a fit of the gout, and this put him in mind that he was too far away from Dorothy and the arm chair. So he wisely determined to return to Meldrum Hall. "During my hours of respite, in this same paroxysm," says he, "I put my memorabilia together in such a manner as if they had immediately occurred, lamenting and grieving bitterly all the while, that my tourifications, from which I had promised myself so much renown, as well as entertainment, should have terminated in less than a day, and not more than a dozen of miles from my fireside."

From the specimens we have given, our readers will be able to calculate upon the quantum and degree of amusement they will find in these little volumes.

ART. VIII. *The Wanderer; or a Collection of original Tales and Essays, founded upon Facts; illustrating the Virtues and Vices of the present Age. In which are introduced the oriental Travels of a learned Mahometan of the last Century. Interspersed with original Poetry.* By CHARLES FOTHERGILL, Esq. 12mo. 2 vols. about 300 pages each.

THE incidents of some of these tales are amusing enough, but they are told in such florid high-flown language, as to border upon the ridiculous. The travels of Abdallah show a considerable acquaintance with the manners, customs, and superstitions of the east. In a very pompous, self-sufficient introduction, the

We have been so much gratified with Mr. Meldrum's remarks on men and manners, with his characters and observations, and have been so much delighted with the poetical effusions which flow from him so freely, that he has our hearty good wishes for a speedy recovery from his gout, and we trust that he will extend his peregrinations to some different quarter.

Mr. Meldrum is a good-natured sort of a gentleman, and therefore he will not be offended with us if we advise him in future to pay a little more attention to grammatical accuracy. In our last extract of is twice used for *for*: *would* and *should* are perpetually changing places, and in the poetry, *singular* and *plural* are not always confined to their proper limits.

author reprobates the idle trash which is now so widely circulated under the various titles of romances, novels, adventures, &c. as injurious to the cause of virtue. After this affectation of chastity, we were at once surprised and disgusted to meet with some very licentious descriptions and lascivious scenes.

ART. IX. *The Pic-Nic.* 2 vols. 12mo.

COLONEL Greville, the projector of a foolish plan for rendering the follies and dissipations of the higher class more notorious, was the projector also of this

foolish paper. It has since changed its name for the Cabinet; but these literary upholsterers, joiners, or cabinet-makers, are miserable workmen.

ART. X. *Coxsop illustrated by a Series of Views in or near the Park of Weston-Underwood, Bucks, accompanied with copious Descriptions and a brief Sketch of the Author's Life.* 8vo. pp. 51, and 13 plates.

A Due tribute of respect to a poet most deservedly popular, though not so popular for his merits as his opinions. The prints would have been appropri-

ately inserted in his poems, and the descriptions might have been advantageously curtailed into notes.

ART. XI. *Observations upon Duelling.* By an Irish Barrister. 8vo. pp. 30.

THIS Irish barrister writes the very worst English that we have ever seen,

and he reasons as ridiculously as he writes.

ART. XII. *Verulamiana; or Opinions on Men, Manners, Literature, Politics, and Theology.* By FRANCIS BACON, Baron of Verulam, &c. To which is prefixed a Life of the Author by the Editor. 12mo. pp. 320.

THIS is merely a selection from the works of Lord Bacon, introduced by a brief biographic sketch. We noticed a similar compilation in the preceding vo-

lume of our Review (page 702), and have no other observations to make on the present.

ART. XIII. *Beauties of Dr. John Moore, selected from the moral, philosophical, and miscellaneous Works of that esteemed Author, &c. By the Rev. F. PREVOST and F. BLAGDON, Esq.* 8vo. pp. 482.

SCRAPS from Dr. Moore's works, thrown together without arrangement. The preface announces a series of such beauties. It would be well if the laws

to protect literary property were extended to abridgments, and such mutilations as these.

ART. XIV. *Addisoniana.* 12mo. 2 vols. pp. 502.

THE editor of this publication asserts that more than a thousand volumes have been looked over to supply the materials. They must have been looked over very carelessly if only 343 articles could be collected from them, many of which are mere extracts from the *Spectator*, and the other works of Addison, and others

only repetitions of the same worthless information which is elsewhere in the same volume given under a different title. The original matter consists of a few letters of no great value between Addison and Mr. Wortley, with facsimiles of Addison's writing.

ART. XV. *The Polyanthea; or a Collection of interesting Fragments, in Prose and Verse: consisting of original Anecdotes, Biographical Sketches, Dialogues, Letters, Characters, &c. &c.* 2 vols. 8vo. pp. 808.

AN excellent book for the sofa or the drawing-room window-seat: he must have a very fastidious appetite, who does

not relish some or other of the various dishes set before him by this industrious editor.

ART. XVI. *Flowers of Literature, for 1801 and 1802. By the Rev. F. PREVOST and F. BLAGDON, Esq. vol. 1. to be continued annually.* 8vo. pp. about 500.

ONE of the many catchpenny compilations of needy ignorance.

ART. XVII. *A Narrative of the Loss of his Majesty's Packet, the Lady Hobart, on an Island of Ice in the Atlantic Ocean, 28th of June 1803. With a particular Account of the providential Escape of the Crew in two open Boats. By WILLIAM DORSET FELLOWES, Esq. Commander. Dedicated, by Permission, to the Right Hon. the Postmaster General.* 8vo. pp. 46.

SUCH a narrative as this is no subject for literary criticism: let those who can weep over the imaginary sorrows of the hero of a novel close their volume and turn to the real distresses here exhibited. The following critique is more to the purpose than any we can write:

"We have perused this report with a mixed sentiment of sympathy and admiration. We are satisfied, that in the loss of the packet and of the public correspondence, no blame is imputable to Captain Fellowes, to his officers, or to his seamen. In their exertion after the ship had struck on the floating mass of ice, and in their subsequent conduct, they appear to have shewn all the talents and virtues which can distinguish the naval character.

"Let a proper letter be written in our names to the friends and family of the very worthy French officer who perished. And we shall be solicitous to learn the entire recovery of the other passengers, who met such dangers and sufferings with the most exemplary fortitude.

"Mr. Freeling will return the narrative to Captain Fellowes, with our permission to

him to communicate it to his friends; or, if he shall think proper, to give it to the public. It cannot fail to impress on the minds of all who may read it, the benefit of religion, and the consolation of prayer under the pressure of calamity; and also an awful sense of the interposition and mercies of Providence, in a case of extreme peril and distress. To seamen it will more especially shew that discipline, order, generosity of mind, good temper, mutual benevolence, and patient exertion, are, under the favour of Heaven, the best safeguards in all their difficulties.

"With respect to Captain Fellowes, we feel highly gratified in having it in our power so immediately to give to him a promotion, which we have reason to believe will be particularly acceptable.

(Signed)

"AUCKLAND.

"Aug. 16, 1803.

"C. SPENCER."

The French officer here alluded to was Mr. Charles Rossé, who had just been taken prisoner of war before the fatal wreck: in a moment of delirium he sprang overboard and perished. This attention to his friends and family does honour to the British character.

ART. XVIII. *The British Essayists; with Prefaces, historical and biographical; and a general Index.* By ALEXANDER CHALMERS, A. M. 45 vols. 12mo.

THE works included in this collection are the *Tatler*, *Spectator*, *Guardian*, *Rambler*, *Adventurer*, *World*, *Connoisseur*, *Idler*, *Mirror*, *Lounger*, and *Observer*. Great Britain, we believe, is the only country of Europe in which attempts have been made, by means of essays published daily or at short intervals, to purify the morals and refine the manners of the higher and middling classes of society. Some of our ablest writers have contributed largely to this valuable object, and by an engaging mixture of gaiety and seriousness, of wit and argument, have reformed many indecours, rendered unfashionable many follies, and impeded the progress of many vices. The talents displayed in these publications, the entertainment with which they abound, the morality by which they are dignified, and the illustration which they afford, respecting the state of society and manners which characterised the last century, give them an undoubted claim, to be considered as a permanent part of British literature: notwithstanding, therefore, the numerous separate editions which have appeared of these valuable works, it gives us pleasure to announce to the public a new and uniform impression of the whole carefully corrected from the earliest editions, furnished with a complete general index, and enriched with biographical and historical prefaces.

The *Tatler*, *Spectator*, and *Guardian*, contain more remarks on manners and the state of society, and abound more in allusions to temporary occurrences than any of their successors; but this circumstance, which rendered them more extensively useful on their first appearance, and will make them hereafter of peculiar value to the historian and antiquary, is the very reason why, with the change which society is constantly undergoing, a considerable degree of obscurity will gradually steal over them. The only method of obviating this disadvantage is by the judicious aid of notes to supply the requisite illustrations in proportion as the characters and events referred to, begin to fade from the public mind. We expected to find in the edition before us, that such an obvious duty had not been neglected; and that the researches of Mr. Chalmers would have formed an example and model to the

future editors of our essayists; in this hope, however, we have been almost wholly disappointed, the only additional matter being contained in the prefaces which are devoted to biographical sketches and miscellaneous particulars relative to the history of the several works composing the present series.

The preface to the *Tatler* commences with a general summary, somewhat heavily written, of the topics which have principally attracted the notice of our essayists. To this succeeds a biographical memoir of Steel, and a history of the *Tatler*, with some account of Swift, J. Hughes, Harrison, and the other occasional contributors to the work.

The success of the *Tatler* gave birth to no less than thirteen rivals during its publication, and when it was brought to a conclusion a spurious continuation of 52 papers was begun by Swift and Harrison: which so far imposed on the world as to be printed at least three times as the fifth volume of the genuine *Tatler*, though of very inferior merit and questionable morality.

The *Tatler* terminated in Jan. 1710, and on the first of March in the same year the *Spectator* made its appearance. Of this celebrated work, as well as of the *Tatler*, Steel was the editor; he also furnished the greatest number of the papers. From his friendship with Addison he had derived much valuable assistance in the progress of his former work, and received still more in the present, the amount of the papers attributed from satisfactory evidence to this excellent writer being no less than two hundred and seventy-four. The extensive reputation of the *Spectator* invited the contributions of several other men, distinguished for rank or abilities; of these the principal were Hughes, author of the *Siege of Damascus*, Budgell, Pope, Byrom, Lord Hardwick, Parnell, and Bishop Pearce.

The remarks of Mr. Chalmers, on the style and general character of Addison's papers, are very judicious, and his statement concerning the respective shares of Steel and Addison, in the papers relative to the hero of the work, Sir Roger de Coverley, will probably for the future, silence the idle disputes that have arisen respecting the consistency of a character which has been unthinkingly considered

by most persons as entirely of Addison's invention.

"Sir Roger was not the creature of Addison's, but of Steele's fancy; and it is not easy to discover why all writers on this subject should appear ignorant of a fact so necessary to be known, and so easily ascertained. In Tickell's edition of Addison's works, and in every subsequent edition, (Dr. Beattie's not excepted) No. 2, is reprinted, but ascribed to Steele, with an apology for joining it with Addison's papers, on account of its connection with what follows. Steele, in truth, sketched the character of every member of the club, except that of the Spectator. The merit, therefore, of what Dr. Johnson calls 'the delicate or discriminated idea,' or 'the original delineation' of Sir Roger, beyond all controversy, belongs to him; and the character of the Baronet, it must be observed, is, in that paper, very different from what Dr. Johnson represents. His 'singularities proceed from his good sense,' not, I allow, a very common source of singularities, in the usual acceptance of that word; and before he was 'crossed in love by the perverse widow, he was a gay man of the town.' And with respect to the care Addison took of the Knight's chastity, and his resentment of the story told of him in No. 410, which is certainly a deviation from the character as he completed it, we may observe, that the original limner represents him as 'humble in his desires after he had forgot his cruel beauty, insomuch that it is reported he has frequently offended in point of chastity with beggars and gypsies,' though he qualifies this by adding, that 'this is looked upon, by his friends, rather as matter of raillery than truth.' He is represented as now in his fifty-sixth year, and the story, therefore, of his endeavouring to persuade a strumpet to retire with him into the country, as related in 410, some think by Tickell, was certainly unnatural.

"The truth appears to have been, that Addison was charmed with his colleague's outline of Sir Roger, thought it capable of extension and improvement, and might probably determine to make it in some measure his own, by guarding, with a father's fondness, against any violation that might be offered. How well he has accomplished this needs not be told: yet he neither laid hold on what he considered as Steele's property, nor did he wish to monopolize the worthy knight. Sir Roger's notion, that 'none but men of fine parts deserve to be hanged;' and his illustration of this curious position, in No. 6, were written by Steele. The first paper, relating to the visit to Sir Roger's country seat, is Addison's, the second Steele's, the third Addison's, and the fourth Steele's; and this last has so much of the Addisonian humour, that nothing but positive evidence could have deprived him of the honour of being supposed the author of it:

the same praise may be given to No. 113, also by Steele. The sum of the account, however, is this: Sir Roger's adventures, opinions, and conversation, occur in twenty-six papers: of these Addison wrote fifteen, Steele seven, Budgell three, and Tickell one; if, as is supposed, he was the author of the obnoxious No. 410. It must be observed too, that the widow-part of Sir Roger's history was of Steele's providing, in No. 113, and 118. Addison, no doubt, attended to the *keep* of Sir Roger's character, and Steele, with his usual candour, might follow a plan which he reckoned superior to his own; but it cannot be just to attribute the totality of the character either to the one or the other."

In December 1712, the Spectator having been brought to the end of the seventh volume, was for a time suspended. Steele retired from the editorship, and in March 1713 commenced a new daily series of periodical essays, under the name of the Guardian. Of this paper 175 numbers were published, 71 of which were written by the editor, and exhibit several specimens of his very best manner; 51 came from the pen of Addison, and the remainder were furnished principally by Berkeley, Pope, and Tickell. The political aspect of the times was now becoming very critical, and Steele being a man not only of warm feelings but of extravagant habits, quarrelled with his bookseller, abruptly terminated the Guardian and immediately commenced the Englishman, which, from its political character, has been excluded by Mr. Chalmers from this collection. Soon after Budgell, with the assistance of Addison, resumed the Spectator, a plan in which Steele appears to have had no share. Of this continuation only a single volume was published, to which Addison contributed about a fourth part.

The Hanoverian succession and rebellion of 1715, with its consequences, divided the nation into furious parties, and the advantages of addressing the public, through the medium of periodical essays, being now well understood, a multitude of political works on this plan made their appearance, intermixed occasionally with observations on literature and manners: none of them, however, obtained more than temporary celebrity.

After a long interval, appeared in March 1749 the first number of the Rambler, a work of very considerable intrinsic merit, and displaying surprising vigour of mind in the author, especially when it is considered that the whole of the assistance received by him did not

amount to half a dozen essays. Mr. C. has shewn, contrary to the general opinion, that a considerable part of the Rambler was almost, in a manner, rewritten, previously to the publication of the second edition, the alterations considerably exceeding 6000. We are by no means disposed to estimate Dr. Johnson's powers, as an essayist, at the same rate which is demanded for them by the present editor. The great and distinguishing merit of this kind of writing is to combine utility with amusement, so as to attract the notice of those to whom sermons and serious books afford no temptation. The Tatler and Spectator were taken in at the coffee-houses, were admitted to the toilette, were the subjects of general conversation; softened in some by their wit and sprightliness, the rude moroseness of the "sterner virtues," and in others inspired a love of decency, of order, of piety, by depicting religion as she appears,

"When gay good-humour dresses her in smiles:"

so that a manifest amelioration of public morals was observed during the publication of these invaluable essays. The sale of the Rambler, on the other hand, when circulated in single papers, never exceeded five hundred, and though its merits were at once acknowledged "by scholars and men of taste," it failed in attracting the notice of those classes in society, whom a well conducted periodical work is peculiarly qualified to influence. The Rambler was published regularly twice a week till March 17, 1752, on which day it closed. In the month of November, in the same year, the Adventurer made its appearance, under the superintendence of Hawkesworth, who was powerfully supported by the abilities of Johnson, Bathurst, and Joseph Warton. Being more accommodated to the public taste, the sale of the Adventurer was considerably greater than that of the Rambler, yet when compared to the older essayists, its literary inferiority is very striking. It extended to 140 numbers, two of which appeared every week. Soon after the commencement of

the Adventurer another periodical work, under the name of the World, was instituted by E. Moore; and being largely assisted by men of wit and of fashion as well as of literature, it proved a genuine and worthy successor of the Tatler and Spectator. Its merit was immediately acknowledged by the public, and the sale of above two thousand copies conferred on the editor both celebrity and profit. Lord Chesterfield contributed twenty-three papers of exquisite wit, and Mr. Cambridge twenty-one, replete with delicate humour and good taste. Horace Walpole, Soame Jenyns, Sir James Marriot, the Earl of Orrery, the Earl of Bath, Lord Hailes, and other distinguished characters, furnished occasional assistance, chiefly on subjects of wit and humour, and a few papers on more serious topics, together with that beautiful poem "The Tears of Old May-day," came from the pen of Loveybond.

In 1754 appeared the Connoisseur, almost every paper in which was the joint production of Coleman and Thornton; its characteristic is liveliness, and its highest praise is that of innocent amusement.

The next series of essays in the collection before us is the Idler, originally published in a weekly newspaper, called the Universal Chronicle, from April 1758 till the same month 1760. Of this Dr. Johnson was the main support. Its principal object is entertainment and party-politics, nor did it ever obtain much celebrity.

The Mirror, afterwards continued under the name of the Lounger, began to be published in January 1779, by a society of young men at Edinburgh. These, together with the Observer, by Mr. Cumberland, conclude the selection; and are destitute of the prefatory remarks and biographical anecdotes, which distinguish the former essayists, because most of the writers are yet living.

On the whole Mr. Chalmers has collected a considerable quantity of curious and amusing information, relative to our essayists, and we doubt not that the public will afford him a liberal patronage.

ART. XIX. *Bibliothèque Portative des Ecrivains François; or, Choix des meilleurs Morceaux extraits de leurs Ouvrages. Par MM. MOYSANT et DE LEVISAC. Second Edition. Large 8vo. Two vols.*

THIS selection is arranged upon the plan of our bulky *Elegant Extracts*, and is too much occupied with long pieces from Racine, Fenelon, Moliere, DeLisle,

Voltaire, La Fontaine, J. B. Rousseau, Bruyere, and Buffon; the works of whom are in every one's hands. The editors would be doing a real service to the British public by filling a *single, moderate sized* volume with specimens of the very best manner of those French authors whose writings have as yet scarcely penetrated into this country.

Our objections to the mass before us are, that it is much too large, and entirely superfluous to those who are in possession of the classical authors of France: in a moral point of view it is, as far as we have examined it, wholly unexceptionable: to all persons, therefore, it will be an innocent, and to many, a valuable possession.

**ART. XX.** *Annals of Public Economy: containing Reports on the State of Agriculture, Commerce, and Manufactures, in the different Nations of Europe, for the Year 1802. Collected by HENRY REDHEAD YORKE, Esq.* 8vo. pp. 550.

FROM the preface it appears, that the author, in a late visit to France, became acquainted with the principal writers on agriculture, statistics, and public economy in Paris; and upon the strength of communications promised by them, began the work at present before us. More than three-fifths of its contents relate to France, and are but of trifling importance to foreigners: the editor characterizes these as "important documents, with which he has been

favoured by the Agricultural Society of Paris, and several distinguished members of the National Institute of France:" if, however, he had taken the trouble of inspecting the dull quartos of Peuchet; the Journal des Mines, and other monthly publications, in the French language, he would have procured almost all these "important documents," without laying himself under any obligations to the "distinguished members of the National Institute."

**ART. XXI.** *The Castle of the Tuileries; or, a Narrative of all the Events which have taken place in the Interior of that Palace, from the Time of its Construction to the 18th Brumaire of the Year VIII. Translated from the French, by FRANCIS LATHOM.* 8vo. Two vols. pp. about 800.

THE castle, or rather palace, of the Tuileries, so called from its being situate in a tile-ground, was begun in 1564, by Catharine de Medici, widow of Henry II. of France, and regent of that country during the minority of her son, Charles IX. It was finished by Henry IV., and adorned by Louis XIV., under whom Le Notre directed the plantation of those fine alleys of chesnut, elm, and lime trees, which constitute the favourite public walk of the Parisians. Many good statues were at that time placed in the garden; but the best have been added since the campaigns of Bonaparte. Louis XV. inhabited the palace during his minority; and Louis XVI. after his captivity; it is now the residence of the First Consul. The architecture of the building is rather laboured than beautiful: the subordinate parts want magnitude; the whole wants simplicity. The columns are fluted and bandaged, the niches and statues are numerous, the orders of architecture are varied; but the profusion of minute ornament gives a gothic confusion to a structure on grecian principles. The building, however, is vast and imposing;

the three pavilions, lifting to the skies their pyramidal roofs, and connected by wings reposing on arcades, form a grand outline; and the station, or implacement, would confer majesty even on an inferior edifice.

Contiguous to the terrace of the garden is situate the riding-school, rendered celebrated by having been fitted up to receive the National Assembly. Hence this spot has become the theatre of many prominent incidents of the Revolution. Of those connected by association of locality with the Tuileries, M. Soulavie (such is said to be the name of the original author) here undertakes a separate account. His power of interesting must depend on the merit of the anecdotes themselves; in which many amusing particulars occur, that had not before been compiled, or at least not evulgated here, and which reflect, if not a steady light, yet checkering gleams of illustration, on the monstrous contour of the Revolution.

The author throws his remarks into the form of dialogue, and of dialogue with an imaginary Count Bedford, whom he places at Paris on the 10th of August,

Y y

and whom he accompanies, as cicerone, throughout the castle. It has been surmised that the name should have been printed Beckford, as the Duke of Bedford was in England at the time specified; but we know not if this conjecture be not equally contradicted by proof of alibi.

The translation is executed not merely with fidelity, but with attention: idiomatic and obscure passages are englished with felicity and expounded with research; the style is very free from gallicisms, and very natural, easy and unaffected.

## CHAPTER XV.

## COMMERCE.

ART. I. *A Commercial Dictionary, containing the present State of Mercantile Law, Practice, and Custom; intended for the Use of the Cabinet, the Counting-house, and the Library.* By JOSHUA MONTEFIORE. 4to.

MILITARY manners are favourable to the graces; and to the pleasures of the earlier, though not of the later stages of life. They are easily superinduced on young men; they agreeably exert the body and adorn the person, they require few or no accomplishments of mind, they favour a luxurious idleness and an amusive dissipation; and they excite expectations of danger and renown, which excuse the omission of the prospective virtues, while they indulge the admission of the prospective hopes. But military manners spoil men for commerce. It is a long, a difficult task, the result only of very careful education, to generate habits of industry and frugality; and to infuse that information respecting some given division of commercial labor, which fits a man to excel in it. The overraving inspection, which teaches these habits, commonly superinduces also a certain meekness and shyness, which soon evaporate at drill and at the mess: but with them the industry and the frugality. The pleasures of exhilarating exercise and robust exertion cannot be tasted without infringing on the disposition to submit to confinement. A determination to pursue advancement in life by plodding perseverance is the very reverse of a determination to pursue it by spirited hazard: the first is the commercial, the second the military ambition. It is greatly to be feared therefore that the present danger of the country, which perhaps could not have been adequately met without an interruption of the usual division of labor, will be eventually and permanently mischievous to its commercial character.

“The blessing of Judah and Issachar will never meet (says Lord Bacon with his quaint energy) that the same tribe or nation should be both the lion’s whelp,

and the ass between burdens. Neither will it be that a people overlaid with taxes should ever become valiant and martial.” The apparent incompatibility of heavy taxation and military fashions, which has hitherto been observable, probably arises from the idleness which military life inspires. Soldiers fear danger less than labor, and must not be checked in this, if we would preserve their vigor. But idleness earns little and accumulates nothing, and is to the tax-gatherer more niggardly than avarice. Taxes have seldom been opposed by a soldiery.

If Great Britain was a continental state this exchange of national habits might be not unwise. It would there be essential to national defence: it would there be conducive to the extension of empire. “Perish commerce, live our independence,” would have been a rational motto for the states of Holland. But we cannot help suspecting that London might have trusted a little more to its navy, and to its regular army, without incurring so much expence, or hazarding so much prosperity. Keep your shop, and your shop will keep you, says Dr. Franklin, but where master or man are often on parade, ’tis a great chance; but the till is poor, for want of watching; or, for want of catching. There are orders, which better deserve attention than those of the commanding officer. The gazettes begin to announce commissions of both sorts for captains and lieutenants. It is no merit to stand at ease before an assignee. One day of industry avails more than a whole week on the porter’s wages of a marching volunteer.

It should be understood that courage is the most common gift of nature to animals; that all the military virtues are qualities of easy attainment, which flourish most among barbarians and boys

that to excel in them requires rather training than education, and is not a mark of refinement but of the want of it; that they inroad on the purity of domestic morals and probably on the humanity of the general character; that in all families the idle boy is very rationally flung into the army; and that the more it is left to the lowest classes of the people to supply first soldiers, and then officers from the ranks, the more robust, bold, and trustworthy the troops.

Poets and historians by applauding military exploits, which mostly consist in employing a hundred men to beat ninety, have given a *ton* and a reputation to soldiering, which prompts nations to the most destructive and rebarbarizing actions, which bodies of men can commit. Let the army take its natural place as the basis not the pinnacle of civilized society.

To productive industry on the contrary public opinion assigns an inferior rank and a secondary value. Yet where are we to seek the chosen nests of human happiness and culture but in the cities of the industrious, and the commercial. To Tyre, Corinth, Athens, and Alexandria, not to the Sparta or the early Rome of the ancient world, we turn for the diffusion of ease and the condensation of magnificence, or for the far-fetched refinements of sensual and intellectual luxury. It is to Barcelona, to Florence, to Venice, that the modern world is indebted for the revival of the civilizing arts and the restoration of literary enquiry. It is to Lisbon, to Amsterdam, to London, that the remotest shores of earth owe their novel concatenation and their prospering intercourse.

Nor is commerce less favourable in detail to the best interests of society than on the collective scale of estimation. Commercial men can afford to make early and disinterested marriages. They must put to hazard so much more than a wife's dower, that it is less important to their prosperity to wed a fortune, than to wed a capital unincumbered with settlements and jointures. What is the consequence? that the most accomplished and meritorious women in the country are every where the wives of merchants, the women who are selected not for their property but for their properties. The domestic happiness and interior elegance which results is obvious: whoever compares the families of our city-gentlemen with

those of our country-gentlemen must be struck with the far superior character of the former.

There is scarcely a peculiarity in the French character, which may not be traced to the *military* education of their exemplary class, the nobility. At home and by themselves they lived, as at lodgings, hardly attentive to personal cleanliness, not at all to that of the apartment. Every thing had the air of a make-shift, nothing of comfort: madame received you where she was powdering, monsieur in his great coat and slippers. To appear well attired and escorted at balls and public places, were, as in a garrison-town, the pivots of solicitude. Any thing was read, even philosophy, if it assumed the form of a licentious novel. The nuptial bed was invaded with as little ceremony as the women's tent in a camp. Courage, honour, the manners and the prate which conciliate for the hour—these were virtues; but probity and fidelity seemed qualities, which told less among men, who are monthly shifting their quarters.

In legislation again the spirit of the soldier is fatal to liberty and justice. The law of nations begins with the maritime code of Rhodes, the consequence of commerce. The earliest attempts of the Romans at equity and precision in the nicer cases of property begin with the visit of Hadrian to Alexandria, and with what he learnt there of commercial jurisprudence. What of constitutional liberty there is in Europe, has all begun in the corporation-towns, whose elective administrations all grew out of the guilds and purses of the tradesmen, and whose charters were all purchased of the nobility, for the purpose of instituting intelligent and impartial jurisdictions, such as parliaments of land owners knew not how to bestow. The rudiments of civilization were scattered in the north by the Hanseatic cities, who preserved along the edges of Europe some attention to refinement, while the middle zone was trampled into a desert by the feuds of barons, or the wars of kings.

In order to increase the commerce of the country, and it is capable of great increase, an important step is to diffuse a knowledge of the objects with which it is most conversant, and of the places to which it most frequently has recourse. No sudden changes can ever be effected in the habits of nations: a demand once begun may be increased or diminished;

but it is not easily created out of nothing, or annihilated. Hence the legislative encouragement of commerce will usually consist in removing the impediments; which monopoly-companies, injudicious regulations, arbitrary duties, deficient security, or imperfect conveniences, may oppose, rather than in any positive bounty or encouragement to intercourse.

By colonizing the distant situations which promise to become emporiums, a government may, however, lay the foundations of a speedier interchange than the mere adventurous spirit of the merchant would else bring to bear. These it is for the philosophic geographer to indicate.

It is with far more pleasure, therefore, that we meet with a dictionary of commerce than with a dictionary of the art of war: and we congratulate Mr. Montefiore on the taste which leads him rather to lay an offering on the shrine of the creative than of the destructive power. This work contains a well-made selection of geographical articles, which describe the situations and productions of the principal trading places; and a very instructive legal explanation of those terms and cases with which commercial men are likely to wish to become acquainted. A convenient specimen, inasmuch as it includes some legal and some geographical articles, will be those included between Bargain and Berbice.

“ *Bargain*, a contract or agreement in buying and selling. Most contracts and bargains in trade, between merchant and merchant, are negotiated by brokers. See *Agreement*, *Brokers*.

“ *Bark*, a general denomination given to small vessels, but which is particularly appropriated to those which carry three masts without a mizen-top-mast. The colliers distinguish by this name a ship without ornament on the prow or stern.

“ *Baroche*, a town of Cambaya, in the dominions of the Great Mogul. It was formerly a place of great trade, and it is now inhabited by weavers and manufacturers of cotton cloth. Here is raised the best cotton in the world, and excellent bastas are manufactured. The English and Dutch had formerly factories here, which are now abandoned.

“ *Barratry*, is where the master of a ship or the mariners defraud the owners or insurers, whether by running away with the ship, sinking her, deserting her, or embezzling the cargo. See *Shipping*, *Marine Insurance*.

“ *Barter*, an exchange of one species of goods for another, which was the original

method of trading before money was in use, and is still practised in the American colonies, and parts where cash is scarce. The extreme facility given to commerce by money has almost put an end to barter or exchange of articles, except in so far as mercantile men set off their reciprocal demands, when there are such, previous to paying the balance in money. This, if the term may be used, is a half species of barter. The articles are bartered in so far as they pay for each other without the intervention of money. Thus, in one sense, it is barter, but in another it is not, as the value of each article is reckoned in money, and not estimated by a certain quantity of the others.

“ The species of barter now most practised in this country is amongst tradesmen in the building line, who execute work for work to a great extent, each setting off his labour and materials at certain prices, called *measuring value prices*. By this means a tradesman, who only does one branch of building, may undertake a complete construction, and have a profit on the whole by doing business in his own line for the different persons employed.

“ The invention of money has not altogether put an end to barter, yet it has entirely prevented it from appearing in its real form in the books of merchants, as each article is stated there in its money value, and each sale is supposed to be paid for in the circulating medium of the country, even in cases where no money whatever is made use of in the transaction.

“ *Basle, Balle, or Basil*, the capital of one of the Swiss cantons, which bears its name; being nearly in the centre of Europe makes it a sort of centre for the business of exchange, and for drawing and re-drawing. It is famous for letter-press printing, and in general its central situation gives it an advantage in whatever is of a nature to be generally distributed in Europe; and there are in it numbers of commercial houses that act as agents, and on commissions for merchants of different nations.

“ *Bassora, Balsora, or Basrah*, is situated on a river named by the Arabians *Schat el Arab*, which is formed by the union of the Euphrates and Tigris. This place is rich, and of greater trade than any one in Arabia Deserta; its possession was a long time disputed by the Arabians, Persians, and Turks, but the last remained masters of it.

“ Bassora, like Bender Abassi, gained considerably by the destruction of Ormus, and here are now seen ships from all parts of Asia and Europe; and the English and Dutch in particular make a considerable figure, having their factors here to transact business, and dispatch their letters by land, which is done by way of Damascus and Aleppo. The Portuguese also have a settlement here, though they make little advantage of it.

“ Almost all the trade passes through the  
Y y 3

hands of the Indians, Persians, and Armenians. The caravan of Bassora is one of those that carries to Bender Abassi a part of those rich goods with which that trade is supported; and the same caravan brings back, in return, the products of India, China, Japan, and Europe, of which Bender is depository, staple, or storehouse for Persia and the three Arabias.

" Besides this commerce with Bender Abassi, and that which Bassora maintains on the sea coast with the Indians, Moors, and Europeans, whose ships arrive here every monsoon, this city has also a very considerable one with Bagdat, which is not at a great distance, and is commodiously seated for a transportation of its commodities by the Tigris; and the same with Aleppo and the rest of the Ottoman empire in Asia, whence caravans set out, and a part of them always destined for Bassora.

" *Bavaria*, one of the circles of the German empire, adjoining to Austria and Bohemia; a mountainous country, containing various mines of copper, and some of silver, besides quarries of marble. This circle is divided into three principal provinces; the electorate, subdivided into Upper and Lower Bavaria, the Upper Palatinate, and the Archbishopric of Saltzburg. The revenues of the elector arise principally from a monopoly of the salt, corn, and strong beer consumed in the country or exported. The article of tobacco also the elector engrosses to himself. He also enjoys certain tolls on the Danube, and other navigable rivers. The subject, however, is miserably impoverished by these monopolies, insomuch as the peasants make their chief subsistence from the herds of swine fed in the woods. Here is a great deal of valuable fir timber.

" *Bayonne*, in the south of France, seated near the mouth of the river Adde, which forms a good harbour. The trade of this town is considerable on account of its contiguity to Spain, and the wines brought thither from the adjacent country. The Dutch take a large quantity of wine in exchange for spirits and other commodities. This place is also famous for hams and chocolate.

" *Bazar*, the name for a market-place in all parts of the Levant, as well as in Egypt, Persia, and the East Indies. The bazars of Ispahan and Tauris, in Persia, are of great extent, the latter particularly, which contains above 15,000 shops.

" *Beacon*, a signal made by a fire on some eminence near the sea, to give notices of invasions, and which no man may set up without lawful warrant and authority, this being a branch of the royal prerogative, and which is usually vested in the lords of the admiralty. Beacons are also placed as marks either on land or on rocks, to indicate to vessels how to steer. By 8th Elizabeth, c. 13, the masters, wardens, and assistants of the Trinity House, may set up beacons and marks for the sea, in such places near the

coasts or forelands as to them shall seem meet. And any person who shall take or cut down any steeple, tree, or other known and established thing standing as sea marks, shall forfeit 100l. and on non-payment, be *ipso facto* outlawed. See *Light-houses*, *Trinity-house*.

" *Beaucaire*, a city of Languedoc, in France, situated on the Rhone; famous for a fair, which is held every year on the 22d of July, and though it only lasts three days, is attended by people from all parts of Europe, and where every sort of article known in commerce almost may be found.

" In the way of barter and exchange, the usual business done does not fall much short of half a million sterling, besides about 250,000l. more in ready money.

" Beaucaire is about 20 miles from the Mediterranean sea, and consequently communicates easily with all the countries on its borders, and, by the canal of Languedoc, with a great part of the interior of France and the ocean.

" *Beer*. See *Customs*, *Excise*, *Exportation*, *Importation*.

" *Belfast*, a town in the county of Antrim, in Ireland, which has a considerable trade, particularly in linen.

" *Belgrade*, a city of Turkey, in Europe, and capital of Servia, seated on the confluence of the Save and the Danube. Its rivers are convenient for commerce, and, as the Danube falls into the Black Sea, the trade is easily extended to different countries, which renders it the staple town in these parts, and the Danube flowing to Vienna, commodities are equally conveyed from thence. The shops are but small, and the sellers sit on tables, and dispose of their commodities out of a window, for the buyers never go inside. The richest merchandizes are exposed to sale in two bezesteins or bazars, built crossways. There are two exchanges built with stone, and supported by pillars, not unlike the Royal Exchange at London.

" *Benares*, one of the first cities of the East Indies, situated on the north bank of the Ganges. It carries on a considerable commerce, particularly in silks and cotton cloths, both plain and coloured. Here are a number of commodious caravanseras, in which the commodities are exposed for sale; and as they are sold by the manufacturers themselves, strangers have them at the first hand, and of course cheaper than in most other towns of India, where the Banians, Jews, and Armenians purchase them to sell again. The manufacturers, before exposing any thing for sale, must obtain from the proper officer the royal stamp on every piece of cloth or silk, under penalty of a fine, besides corporal punishment.

" *Benecarlo*, a city in the province of Valencia, in Spain, the country round which produces excellent wines. The white wine is famous, as also a deep coloured thick red

wine, often used for the adulteration of the French wines, in order to imitate port.

"*Bengal*, a country of Hindoostan Proper, bounded on the west by Orissa and Bahar, on the north by Bootan, on the east by Assam and Meckley, and on the south by the bay of Bengal. Its extent from east to west is upwards of 400 miles, and from north to south above 300. The country consists of one vast plain of the most fertile soil, being annually overflowed by the Ganges, as Egypt is by the Nile. The bay of Bengal is the largest and deepest in the world, and the Ganges being navigable for a great distance up the country, affords every facility for conveyance of the commerce of this country. A trade is here carried on with Agra, Delhi, and the provinces adjacent to these superb capitals, in salt, sugar, opium, silk, silk stuffs, muslins, diamonds, and other precious stones. There is also a valuable inland trade carried on with West Patna, and a variety of other places throughout India. Patna is the principal place in the world for the cultivation of opium. Besides what is carried into the interior, there are annually exported between 3000 and 4000 chests, each weighing 300 pounds. This opium, however, not being prepared and purified, like that of Syria and Persia, is far from being so valuable. There is also a material trade carried on by the natives, chiefly with the district of Catek, a district of some extent a little below the westernmost mouth of the Ganges, the port of which is Balasore, and whence the people of Catek carry on a navigation and trade with the Maldivé islands, and also with the country of Asham. Forty vessels, of 500 or 600 tons each, are sent from the Ganges to Asham, laden with salt, which yields 200 per cent. profit; they receive in payment, silk, ivory, musk, eagle-wood, gumlac, and a small quantity of gold

and silver. With respect to the immense trade carried on by the East India Company with Bengal, see *East India Company*; see also *Calcutta* and *Madras*.

"*Berbice*, a country of Guiana, on the north-east coast of South America, situated on a river of the same name, in N. lat. 6 deg. 20 min. and 60 deg. W. long. about eight miles west from the mouth of the river of Surinam. This colony was established by the Dutch in the beginning of the 17th century; and in the year 1720 there were six sugar works, besides some plantations of indigo and cacao. It has, notwithstanding the climate is extremely unhealthy, and the soil inferior to Surinam and Demerary, greatly flourished. Berbice was taken by the English in 1796, but restored to the Batavian republic by the treaty of peace of 1801."

Both these classes of articles are executed with great propriety: the author has selected his materials from the term reporters, and commercial writers of the most acknowledged authority, and has included a great mass of result from the most recent decisions. This combined intelligence has been compressed into moderate compass; and is well adapted for the library both of the merchant and the statist. Unlike his predecessor Peuchet, Montefiore has neither overloaded his earlier articles with a needless incumbrance of detail, nor stripped his concluding pages to a disappointing bareness. His utility will not be confined to Great Britain alone, it will favour the continental adoption of that precise legislation concerning property, which grows out of commerce alone, and is the basis of all civilization.

## CHAPTER XVI.

## MILITARY HISTORY AND TACTICS.

THE only historical article in this department of our work is Captain Walsh's "Journal of the late Campaign in Egypt." The author does not aspire to the rank of a military critic, although the events of which he was a witness are well worthy of a commentary; he claims no higher praise than that of a faithful narrator of what he has seen; and as far as we can judge from internal evidence, and the concurrent testimony of others, he appears well entitled to the character of impartial authenticity. The volunteer associations have given birth to several rudimental publications, among which "The Manual for Infantry" recommended by the Duke of York; Colonel Herries's "Instructions for Cavalry," and the extracts from Citizen Fossé's work "on the Defence of Picquets," stand conspicuous for their utility.

ART. I. *Journal of the late Campaign in Egypt; including Descriptions of that Country and of Gibraltar, Minorca, Malta, Marmorice, and Macri. With an Appendix containing Official Papers and Documents. By THOMAS WALSH, Captain in his Majesty's Ninety-third Regiment of Foot, Aid-de-Camp to Major-General Sir Eyre Coote, &c.* 4to. pp. 350. 41 plates.

THE only valuable part of Captain Walsh's book (which indeed constitutes by far the larger proportion of it) are the military details: of these a perspicuous account is given in plain, unornamented, but correct language; and the verbal descriptions are illustrated by maps and plans that bear every appearance of authenticity. From the author's official situation he has been enabled to give fuller details of the operations of that part of the army commanded by Sir Eyre Coote, than have yet appeared before the public: by collating therefore the work before us with Major Wilson's account of the campaign, already noticed in our former volume, a complete history of the transactions of the British army in Egypt may be collected. The battle at the landing of the troops and the two subsequent actions, in the last of which General Abercrombie fell, are described nearly with equal detail, and with satisfactory agreement, by Major Wilson and Captain Walsh. When

Major-General Hutchinson, on whom the supreme command devolved, quitted the peninsula of Aboukir, in order to carry on the war to the walls of Cairo, Major Wilson was included in the division of the army selected for this purpose, and of course his attention would be principally directed to this part of the campaign. Major-General Coote, as second in command, was left with the remainder of the troops before Alexandria; and after the reduction of Cairo and the return of General Hutchinson, he was entrusted with the direction of the operations to the westward of this town till its surrender: of these proceedings Captain Walsh, being aid-de-camp to General Coote, has given a very particular account, without however neglecting the more distant operations, of which he was not an eye-witness. The journal commences with the entrance of the armament into the Mediterranean, and concludes with the surrender of Alexandria.

ART. II. *A short Treatise on the Use of Balloons and Field Observators, in Military Operations.* By Major-General MONEY. 4to. pp. 20. Two plates.

FROM the example of the French, who have been indebted for their success in some very important battles to the use of balloons, in observing the motions of the enemy, General Money proposes the adoption of this instrument, with suitable officers, as an established part of the British army. But in stormy weather the balloon is incapable of being used, the general therefore advises, that every army should besides be furnished with two or three field observators, or frame-works of light timber, about forty

feet high, furnished with platforms and ladders, to enable a commander, by means of an officer posted on one of these, to acquire more extensive and accurate intelligence respecting any hostile movement than can be gained by the usual methods of reconnoitring. The observator may be set up and taken down in an hour's time, is of little expense, of easy carriage, and, if necessary, may be prevented from falling into the enemy's hands, by being burnt in a few minutes.

ART. III. *A Manual for a Volunteer Corps of Infantry.* 8vo. pp. 108.

WE notice this little volume, not because it is a subject of criticism, but in order to inform such of our readers as are interested in the matter, that the instructions herein contained "are re-

commended by his Royal Highness the Commander in Chief, for the use of the several corps of volunteer infantry throughout the united kingdom."

ART. IV. *The Volunteer's Guide, &c.* By an Officer in the Third Regiment of Loyal London Volunteers. pp. 64.

A Perspicuous account of the manual and platoon exercise, illustrated with wooden cuts of the different motions;

forming a convenient pocket remembrancer for young soldiers.

ART. V. *On the Defence of Picquets, relative to Service in the Field; for the Use of Officers of Infantry; or, Extracts from a work entitled, Ideas of a Military Man on the Defence and Attack of Small Posts.* By CITIZEN FOSSE, formerly Lieutenant-colonel, now Pensionary of the Republic of France. Translated from the French by Colonel T. 18mo. pp. 24.

IN these few pages are included the heads of the observations, which it is incumbent on the commanding officer of every picquet on field service to make, relative to the safety of his post, and his means of an-

noying the enemy. We strongly recommend it to all volunteer officers, as it is admirably adapted to inspire them with that alertness and circumspection which is the very soul of military enterprize.

ART. VI. *Instructions for the Use of Yeomanry and Volunteer Corps of Cavalry.* By Colonel HERRIES, of the Light Horse Volunteers of London and Westminster. Part I. 8vo. pp. 256.

THE attention and activity of Col. Herries are well known to the public, from the high state of discipline by which the corps that he commands is most honourably distinguished. The volume be-

fore us contains the best instructions for volunteer cavalry that we are acquainted with, and well deserves to come into general use.

ART. VII. *Review of a Battalion of Infantry, including the Eighteen Manœuvres; illustrated by a Series of engraved Diagrams. To which are added, the Words of Command, with an accurate Description of each Manœuvre.* By ROBERT SMIRKE, Jun. 8vo. pp. 60.

THE system of General Dundas is strictly followed throughout this volume, in which Mr. Smirke has combined graphical with verbal description, so

as completely to explain all the manœuvres of a battalion before the reviewing general.

**ART. VIII.** *Elements of War; or Rules and Regulations of the Army in Miniature; shewing the Duty of a Regiment in every Situation.* By NATHANIEL HOOD, Lieutenant, H. P. 48th Regiment. 12mo. pp. 157.

THE complaint made by volunteers and young officers, against the regulation book, is, that it is rather too concise. Mr. Hood's little volume is, for the most part, an abridgment of this, and therefore wholly useless.

**ART. IX.** *A Treatise on the Art of War; containing the Principles of Offensive and Defensive Operations; with Rules for carrying on the Petit-Guerre, or War of Posts; and the Methods of Attack and Defence in Sieges.* Extracted from the *Encyclopædia Britannica*. 8vo. pp. 304. Twenty-four 4to plates.

IT was suggested to the proprietor of the *Encyclopædia Britannica*, that in the present circumstances of the country a republication, in a convenient form, of the article *Art of War*, might be of service: the proprietor (Mr. Bell) took the hint, and the work before us made its appearance.

The imminent danger of invasion has summoned the nation to arms: the shop-keeper, the manufacturer, the farmer, and the gentleman, have offered their voluntary services in defence of their country. The number of citizen soldiers is so large, and the duties of the regular service so pressing, that the discipline of the volunteers must almost wholly depend on the exertions of their own inexperienced officers, who must derive their knowledge almost entirely from books.

The works required for this purpose, beside the regulation book, are those which explain at full length, and in the plainest manner, whatever relates to the discipline of the battalion or squadron, and the service of light troops, both horse and foot. In the forming of sieges, and the conduct of battles, the only business, and the only difficulty of the volunteers will be to obey implicitly the orders of those who have been professionally brought up to the study of tactics. We are not sensible, therefore, of the slightest advantage to be derived from this treatise by any but regular officers, and we cannot suppose, that any of these would be destitute of books infinitely better qualified to teach them their duty than the work in question.

**ART. X.** *Rules and Regulations for the Field Exercise and Manœuvres of the French Infantry, issued August 1st 1791. Translated from the French, with explanatory Notes,* by JOHN MACDONALD, F. R. S. F. A. S. late Lieut. Col. of the Royal Clan Alpine Regiment, Commandant of the Royal Edinburgh Artillery, and Captain of the Corps of Engineers on the Bengal Establishment. 8vo. 2 vols.

IT is the duty of every British officer who aspires to a thorough mastery of his profession, to be acquainted not only with the system of tactics adopted by his own countrymen, but also with that in use among the other nations of Europe. Above all, it is incumbent on him to be versed in the manœuvres of the French army, against which his active opposition will almost always be directed. Lieutenant-Colonel Macdonald has studied with attention the mechanism of the French army, the movements of

which seem characterized by rapidity, as those of the British are by firmness and compactness. The principal differences, and advantages and disadvantages of the two systems are pointed out in the notes to this work, the text of which is the common regulation book of the French infantry: the plates by which the manœuvres are illustrated are numerous and well executed, forming altogether an extremely valuable addition to the travelling library of a British officer.

## CHAPTER XVII.

## RURAL ECONOMY AND GARDENING.

THE last year has not produced much of value in farming or gardening. The Agricultural Survey of Peebles, by Mr. Findlater, is drawn out to an unnecessary length, and is more important for its statistical than its agricultural details. The new edition of Dr. Hunter's *Georgical Essays* presents a copious but not very judicious selection of memoirs; garden experimentalists seem to be confided in too much, and practical agriculturalists to be unwisely neglected. The prize essays of the Highland Society contain much valuable information, and though peculiarly calculated to be of use to the proprietors and cultivators of the more neglected parts of Scotland, will be perused by every one for whom natural history and rural economy have any charms.

ART. I. *Georgical Essays.* By A. HUNTER, M.D. F.R.S. L. and E. 4 vols. 8vo. pp. about 570 each.

THE two first editions of the *Georgical Essays* have, we believe, been long out of print; the first was published about the year 1771, the second in 1777. The York Agricultural Society, which gave birth to them, has been dissolved nearly twenty years, and the publication was discontinued before that time, in consequence of the death of several of the most active members. Dr. Hunter has survived many of his old friends, and, by the aid of others who have succeeded them, has expanded the original work from one volume into four. Nor is it to stop here: Dr. Hunter purposes to make the present the basis of a *more extensive* publication. "It is my intention," says he, "to draw into one focus all that is widely diffused through numberless volumes of agricultural information; and, in so doing, I expect to be able to exhibit to the favourers of agriculture a field well cultivated, and free from all unsightly and noxious weeds. In this proposed collection there will be some papers that never appeared in public, but by far the greatest number have been published in different periodical works." At the conclusion of the fourth volume we have some further particulars as to the extent of the proposed plan. "In order to mark the progress of agri-

cultural improvements, I have it in contemplation to publish two volumes annually, in the manner of this selection; but in the execution of the design I shall be directed by the opinion that the public may entertain of the present publication."

On comparing the first volume of the work before us with the second edition of the *Georgical Essays*, which chanced to be on our shelf, we find the contents pretty nearly the same; two or three of the *Essays* inserted here are not in our edition; but all, we believe, contained in that are to be found in one or other of these volumes. The present is a selection, and a good one; we are told that it contains several original papers, but by far the majority are well known to the public. Dr. Hunter has not scrupled to extract very freely from the transactions of Literary Societies, County Reports, Magazines, &c. &c. He ought to have distinguished the original essays from those which had already been published. We have seen a *great many* of these in different modern publications; many more may have escaped us, which are, nevertheless, familiar to many of our readers; on which account it is unsafe to notice any particular papers, lest they should not be so new to others as to us. Dr. H.

ought to have referred us to every volume which has contributed to enrich his own: he has given us this reference only occasionally.

Whether the public is much benefited by thus pouring, as Sterne calls it, from one phial into another, we are not quite decided in our opinion. The books from which a variety of these Essays are taken are not dear. The Agricultural Surveys, indeed, are numerous and bulky, and often have a small kernel to a coarse large husk, which we are obliged to any body for removing.

As a collection we do not hesitate to

speak highly of the present: theoretical and practical agriculture are blended together, very few trivial papers are admitted, many are the production of Dr. Hunter's own ingenious pen; and where such men as Mr. Curtis, Dr. Anderson, the Earl of Winchelsea, Mr. Henry, Mr. Somerville, Mr. Forsyth, Dr. Wilkinson, Dr. Garnet, Sir John Sinclair, Mr. Kent, Arthur Young, &c. &c. &c.; where men of so much science and experience are laid under contribution, much ingenious speculation and valuable instruction may be very confidently expected.

ART. II. *The Farmer's Magazine, a Periodical Work, exclusively devoted to Agriculture and Rural Affairs.* Vol. III. 8vo. pp. 516.

WE are disposed to think that this is an useful and well-supported publication. One does not look for the flowers of rhetoric, and the grace of composition, in a farmer's magazine; when a gentleman has made any successful experiment in the fattening of his sheep and oxen, or in the management of his turnip and potatoe crops, the particulars and result of which he is desirous of making known to the body of farmers, he must descend a little, and accommodate, to use the vulgar phrase, his conversation to his company. A considerable portion of these communications, too, are from farmers themselves; and it must be acknowledged, that this class of correspondents take particular care not to render their precepts or explanations obscure by consulting brevity too much. In the pages before us there is certainly a great deal about it and about it, a great deal of unprofitable chat; but as the work is *exclusively* devoted to agricultural and rural affairs, it is not likely to be

read with any high expectation or avidity by any but agriculturalists themselves. Now, after the labours of the day, when the tired farmer takes his pipe in one hand and his magazine in the other, he goes on and on, whiff after whiff, and sentence after sentence, and it really is of very little consequence to him whether he comes to the end of his chapter first, or the end of his pipe.

A number of this work appears periodically once in three months; the original communications are numerous; and when we see such names as Dr. Hunter and Sir John Sinclair attached to some of them, we may infer considerable respectability as to the general conduct of the publication. Very ample and useful reports are given of the state of agriculture in different parts of the kingdom, more particularly in the North; works connected with rural economy are reviewed; dissertations, controversies, hints, queries, and replies, fill up the pages, and help to relieve the monotony.

ART. III. *A General View of the Agriculture of the County of Peebles, with various Suggestions as to the Means both of local and general Improvement of Agriculture.* By the Rev. CHARLES FINDLATER, Minister of the Parish of Newlands, in the County of Peebles. With a Map of the County, and other Engravings. 8vo. pp. 413.

THIS report was drawn up at the solicitation of Sir J. Sinclair for the board of agriculture; from the occurrence of some circumstances with which the public is uninterested, however, it is not published under their sanction; but for the sake of uniformity and facility of reference, it is nevertheless divided into the chapter and sections which are prescribed by the board for county reports.

The county of Peebles or Tweeddale is bounded upon the north by Mid Lothian; upon the east by Selkirk; upon the south by Dumfries; upon the west by Lanark. Its greatest length from N. to S. is about 30 miles; its greatest breadth from E. to W. about 20. It contains 229,778 English or 183,823 Scottish acres: the real surface, however, of so mountainous a country must con-

siderably exceed the plane of its base, as measured for the construction of a map.

The climate in such northerly latitude and high elevation must be late : corn harvest seldom commences before the second week in September, or closes before the latter end of October. The winters are rigorous, and the turnip crop is often lost, unless consumed by Christmas or new year's day ! We recommend Mr. Findlater to attempt the introduction of the Rev. Mr. Munning's excellent method of preserving the turnip crop : Mr. M. published a small pamphlet about two years ago, in which he has given very ample instructions on this subject.

By far the greater part of the soil of Tweeddale never was, nor probably ever will be, turned up by the plough : of the lands under culture, there is a great variety of soil, such as moss, clay, sand ; moss and clay, moss and sand, clay and sand ; and these mixtures, which Mr. F. considers as purely artificial, are in every variety of proportion. Though tradition reports that a great variety of wood once grew in the county, few vestiges of it remain, and those are miserably dwarfish : the only specimens of the wood of former times are stunted trees found in mosses. Mr. Findlater has the following note upon this subject.

" The wood most commonly found in our peat mosses is birch or hazel. Oak is sometimes, though rarely found ; black, heavy, and hard, like ebony. Single trees of oak, of considerable size, have been found in mosses near the top of high hills.

" It is pretty remarkable, that, in the moors of Carnwath parish in Lanarkshire, adjoining to the higher parts of Tweeddale on the north-west, at an elevation as high, and under a climate as unpropitious as any part of Tweeddale, most places seemed to have obtained their names from woods ; such as Harwood or Hartwood, Girtwood or Greatwood, Woodside, Woodend, &c. &c. There are no vestiges of such woods above the surface, but abundance below the mosses. Fir (unknown in Tweeddale mosses) is found in some of these, long and straight, indicating its having grown in thickets. Its fibres are so tough that they are twisted into ropes for halters and teathers : the splits of it are used for light, by the name of candle fir—Strong marks of great convulsions in nature.

" Some farmers have taken the hint of burying fir, for roofing, in mosses, in order to insure its incorruptibility."

Among the subterranean riches of the county are to be enumerated white and

red freestone, whinstone, slate, coal, and limestone.

Chap. III. As we do not feel ourselves shackled by the prescribed forms of the board of agriculture, it will not be necessary to follow Mr. Findlater chapter by chapter, and section by section ; we shall content ourselves with stopping now and then to notice any thing interesting, curious, or useful. It is interesting to learn, in consequence of the increasing sentiments of liberality among the landed gentry, of security among the tenantry, and of wealth in both ; that the comfort, accommodation, and style, of farm-houses throughout Scotland have of late years been much improved. " In consequence of the firm establishment of monarchy, and the dissolution of aristocracy ; of the abolition of heritable jurisdictions, and the substitution of independent judges, unconnected with the subjects of their own jurisdiction, and having no personal interest in their own decisions ; the security of the tenantry as well as of all the lower orders in society is confirmed : general industry has kept pace with growing security, and the situation of every rank is altered greatly for the better."

A high character is given of the Tweeddale farmers, who are represented as industrious, enterprising, and well-informed ; we cannot join in complimenting their tardiness to adopt modes of improvement introduced by gentlemen farmers. That they should have resisted for forty years, in contempt of positive rewards and obvious advantage, the improved system of husbandry, as it is called, the ameliorating rotation of corn, green-crop fallow, and artificial grasses, is a strong symptom of obstinate and stupid adherence to old practices.

We are not going to discuss the oft-agitated question, ' which are most advantageous to a country, large farms or small ones ? ' but the fact is worth noticing in the discussion, that the managers of extensive concerns acquire a generosity and liberality of character, which others who are buried in petty-fogging details, in scraping up the cheese-parings and candles' ends of traffic, are not likely to acquire ; confidence between merchants scarcely knows a limit. The fact, perhaps, is too notorious to require evidence, but an instance or two occur and we shall give them : The richest traffic on the face of the earth, perhaps,

was carried on in Porto Bello during forty days in the year, when the wealth of America was exchanged for the manufactures of Europe. No bale of goods, says Robertson in describing it, is ever opened, no chest of treasure is examined; both are received on the credit of the persons to whom they belong, and only one instance of fraud is recorded during the long period in which trade was carried on with this liberal confidence. All the coined silver which was brought from Peru to Porto Bello in the year 1654 was adulterated with a fifth part of base metal. The Spanish merchants, with sentiments suitable to their usual integrity, sustained the whole loss, and indemnified the foreigners by whom they were employed. The fraud was detected, and the treasurer of the revenue in Peru, the author of it, was publicly burnt. Sir George Staunton tells us, that the goods of the English East India Company, both as to quantity and quality, are taken by the Chinese at Canton for what they are declared in the invoice; and the bales, with their mark, pass in trade without examination throughout the empire.

There is something whimsical and ludicrous enough, to be sure, in putting one leg of the compass on a Chinese or Porto Bello merchant, and the other on the humble head of a Peebleshire farmer; but really according to Mr. Findlater—*si parva licet componere magnis*—the same principle prevails here. The sheep farms being the most extensive, and requiring the largest capital, the storemasters, as they are called, constitute the most opulent class and are the best informed: between these farmers and their wool-buyers, the system of intercourse is so liberal, that the goods are often bought without been seen, and sold and delivered without fixing the price. The prevailing characters of the lower order in this county are sobriety, industry, and a sense of religion; a spirit of independence is kept alive, which revolts against the idea of subsisting upon charity. Mr. F. assures us, that most of them contrive by their own industry and frugality alone, not merely to feed and clothe their children, but to give them an education, so far as learning to read;

very frequently they are also taught writing and a little arithmetic, though more commonly the young people themselves obtain instruction in these last branches from their first earnings of wages, by attending night schools in winter after their working hours. In return for this parental care, children are rarely deficient in their filial duties; they support their aged parents according to their abilities, and there are not wanting instances of day labourers supporting aged parents, past their labour, without being indebted to any charity whatsoever. This corroborates the truth of the remark which President Washington made in his address to the senate and house of representatives, at Philadelphia, ten years ago, that "knowledge, while it makes us sensible of our rights as men, enforces our obligations as members of society." In conformity with this well-grounded opinion, that great man recommended in the speech alluded to,\* the senate "to provide by law, as soon as conveniently may be, for the establishment of schools throughout the state, in such a manner that the poor may be taught gratis." It is with unaffected concern that we have lately heard accounts, too well authenticated, of the declension of parochial schools in Scotland; after long experience has completely proved the various moral and political advantages resulting from a general diffusion of knowledge among the lower classes of society, it is to the last degree disgraceful that the channels by means of which it used to be distributed should be choaked up and the current impeded. Mr. Chrisiston, one of the masters of the high school of Edinburgh, in a pamphlet published about two years ago† gives this melancholy statement; he says that the wretched income of some established teachers, particularly parish schoolmasters, is becoming every day worse. Many of them do not earn half so much as a journeyman mason. The unhappy old men who are in the profession must continue in it, as they are too old to learn any other; but many of them, unless the income be rectified, will have no successors. This event has taken place already; there are many parish schools vacant, because no man will

\* It was a congratulatory address on the suppression of a cabal, delivered in the senate house, December 6, 1794.

† Entitled "The General Diffusion of Knowledge one great Cause of the Prosperity of North Britain," &c.

accept of them with so small a reward for severe labour. Accounts have been received, he says, from 427 parishes. The average income for each schoolmaster seems to be from 23*l.* to 24*l.* a year: the amount of the income of the schoolmaster, in each of the 427 parishes, was taken from his own affidavit, sworn before a justice of the peace. There is good reason to think, that when the list shall be completed for the whole of North Britain the average will be still lower. Of the 427 parishes the income of six is less than 10*l.* a year each. One is 6*l.* 18*s.* 10*d.* Several of the schoolmasters say that they could not live without the aid of their relations: a journeyman mason can earn 30*l.* a year.

In one of Mr. Findlater's notes (which, by the way, constitute a valuable portion of this volume, embracing a variety of topics connected with the civil and ecclesiastical policy and laws of Scotland), he informs us that the court of presbytery, with concurrence of the county commissioners, can compel the heritors (or landed proprietors) of every parish to make provision of a legal salary for a schoolmaster, and to build an house for the schoolmaster's residence, and a school for teaching in. Now the *maximum* legal salary cannot exceed 11*l.* 10*s.* 2*d.* 8-12th a year, the *minimum* is 5*l.* 11*s.* 1*d.* 4-12th, one half is payable by the proprietors, the other by the occupiers of the land. The schoolmaster, he further tells us, is almost always constituted *precentor* (the person who leads the singing of psalms in church) and clerk to the kirk-session!! Mr. F. estimates the average emolument of the Scots parochial schoolmasters at 20 guineas a year, which coincides very nearly with the returns actually received when Mr. Chrisiston wrote; and if they are completed is perhaps perfectly accurate. The *wages* of teaching must necessarily be very low: they vary from a shilling to eighteen-pence a quarter for reading English, and from half a crown to three shillings for reading, writing, and arithmetic; the scholars too paying only for the precise time of attendance!

It would be derogatory to make any apology for dwelling so long on a subject of such importance.

Chap. IV. "From various causes, says Mr. F., Scotland was more late in being relieved from the oppression of feudal aristocracy than her sister kingdom. The last act of parliament to that effect, and for which we are indebted to our

rebellion in 1745, being so recent as the year 1748." Rent we are told is yet paid in money, in kind, and in personal service; in Tweeddale, however, the proportion of rent paid in kind, or personal service, is very trifling; the more enlightened among proprietors entirely relinquishing all rent of this species.

"By act of parliament 1748, the arbitrary unspecified services of use and wont, an obligation to which was inferred at common law, though not expressed in the lease, are all abolished. They would seem, formerly, to have furnished a pretext for endless vexation and oppression of the tenantry; even so far as to devolve upon them most of the public taxes imposed by parliament upon the proprietors of the land. No prestation is now exigible from the tenant, but what is expressly stipulated in his lease; with exception of such legal burdens as are already, or shall be directly imposed upon him by act of parliament; and also of his adstriction to the mill."

This adstriction to the mill is called *thirlage*; it infers an obligation upon the tenant to grind his grain at that particular mill to which the lands he occupies are *thirled*; i.e. which possesses the exclusive privilege of manufacturing the grain of these lands. It has been conjectured that formerly the great baron obliged all his tenants to bring their whole grindable produce to his mill, as a sure method of ascertaining the quantity grown, and of collecting, as rent, his own stipulated proportion. The portion retained is called *multure*; this abominable remnant of vassalage died away so lately as in the year 1799, when an act was obtained to enforce the commutation of thirlage into an annual payment in grain, according to the award of a jury appointed by the sheriff of the county where the mill is situated, "if the servient and dominant tenements are in different counties." Only under this circumstance?

The rate of thirlage varied in different baronies, both as to the proportion of produce which the mill had the exclusive right of manufacturing, and as to the proportion retained as *multure*.

"Thirlage not only subjects the tenant of the thirled lands to an higher rate of *multure*, but also to various other burdens and vexations. If the mill to which he is adstricted should be out of repair—let his demand be ever so urgent, or his grain in ever such risk of being spoiled, he must allow the miller a proper time for reparation (some say six weeks from the time of application) before

he is entitled to go elsewhere for service. The thirled tenant is subjected to many occasional services, from which the free tenant is exempted; such as the upholding of the water dam dike; the upholding, frequently, of mill-fanners and mill sieves, and the carriage of millstones, when needed; he furnishes fuel for drying his grain; he transports his grain to and from the mill—furnishings provided for him by the miller at free mills; he attends also at the drying process, sifts his own meal, and performs the greater part of the most laborious work; in all of which, his time and labour (in reality, or at least in probable imagination) are not well husbanded."

**TYTHES.** The clergy of Scotland are supported upon fixed stipends or salaries, modified out of the tythes of the lands by the court of session: These stipends are estimated to average 100*l.* a year, besides the dwelling house and glebe, consisting of about 10 acres. The Scots clergyman is bound to residence; and his charge can be declared vacant upon six weeks absence without leave to that effect, obtained from his presbytery: he can hold only one benefice. A degree of exception, however, is very properly admitted, as an excitement to literary effort, in regard to holding professorships in universities, when these are removed at such a small distance as not to obstruct, in any great degree, the performance of parochial duties.

**Chap. XIV. Rural Economy.** Justices of the peace have powers vested in them for the regulation of wages! "They, however, very wisely refrain from interfering in matters which can alone be properly regulated by the price of the market." The rate of wages for hired indoor servants was lowered by almost one-half from the deficiency of funds for the employment of labour through the scarcity of crops in 1799 and 1800: they are now rising, but have not yet attained, by perhaps a fourth says Mr. F. the existing rate previous to the years of scarcity. Day labour in this part of Scotland is very low: a stout labourer, *working by the piece*, will earn from sixteen to twenty-pence a day, without victuals: a woman shearer, hired through harvest, gets from 20 to 25 shillings with board; a man from 25 to 30.

**Provisions.** In sheep farms **THE SHEEP DYING OF DISEASE ARE USED AS FLESH-MEAT** under the designation of traik!!

**Manufactures.** A woollen manufactory was established at Inverlaithan by Mr. Brodie, well-known for his Shropshire

iron-works: the iron-works have of late been so much more profitable a concern that the woollen has been less attended to. There are a few stocking looms in Peebles, and one or two manufactories of coarse cloths (Mr. F. recommends the establishment of one at the village of Linton, where there is water to drive machinery of a considerable weight) abundance of lime, freestone, coal, and peat, and a turnpike road of only 16 miles to Edinburgh.

From long disuetude the Scots *poor laws* may be considered as obsolete.

"The evil of sturdy begging has, in a great degree, ceased—having been consigned to the remedies of starving, or the gallows; and the real poor have been left to depend, chiefly, upon voluntary charity, without any legal provision—probably the best footing on which the matter can rest, both as to the poor and their providers. From the enormous extent to which poor's rates have arisen in England, it is probable, that great caution will be used in attempting to organize this subject, as to Scotland, into any very strictly defined legal system."

Of course there are no officers in Scotland known by the name of *overseers* and *churchwardens*; the poor having been generally throughout Scotland supported by voluntary contributions.

"Though the statute poor's laws in Scotland may be considered as obsolete, from disuse; there is, nevertheless, a consuetudinary law for poor's rates, though seldom, and never generally acted upon: and it would be well, if the necessity of acting upon it could altogether be superseded. Unlike to funds employed in productive labour, which reproduce themselves, together with a profit, funds, employed, in support of the poor, are altogether annihilated. If an individual, or a society are possessed of funds sufficient to maintain an hundred persons for a twelve-month; supposing these hundred supported, idle—the fund perishes in the use, and is no longer in existence: if, however, it had been applied to the support of an hundred, as the wages of productive labour, in agriculture, trade, or manufacture, it is equally evident, that such labour would, at the end of twelve months, have replaced the fund, with a profit that might be added to it, which might enable it for the ensuing twelve months, to support an hundred and ten or twenty—affording, thus, additional subsistence for an increasing population. Were the whole funds of society devoted to alms, and consumed in idleness, mankind would soon revert to the savage state, having nothing for subsistence but natural produce; and the one half might repeatedly eat up the other, before population was reduced to that limited

number which natural produce would suffice to support."

In large towns, however, workhouses, &c. have been established and poor's rates assessed.\*

We have already said that the notes constitute a valuable portion of this volume. The first gives a summary account of the civil and ecclesiastical jurisdiction and duties. The second is a very interesting one explanatory of the various Scottish tenures of property. The fourth contains some general observations on what Mr. Findlater calls the *generic character* of the former—gives a history of the origin and explains the nature of different sorts of leases—and discusses the question concerning the best size of farms. In another note we have a general defence of usury, and the last is a very useful attempt to bring into disrepute the idle and ignorant prejudices which were fostered by Lord Kenyon, against

monopoly, forestalling, and regrating. Mr. Findlater, however, has not displayed all the force which is inherent in his argument: the cases which he has stated are to the point, but he might have varied and increased them.

Two appendixes close this volume. No. I. gives an account of *Whim*, the seat of Sir James Montgomery, and contains some observations upon the culture of *flow-moss* and of *ploughable-moss*, from information communicated by that gentleman. No. II. contains an essay on the diseases of sheep, drawn up from communications furnished by Dr. Gillespie, physician in Edinburgh; together with hints by Dr. Coventry, professor of agriculture in the university. With notes suggested from observations in Tweeddale, &c.

In the course of this work we found a great many words which are scarcely intelligible on this side the Tweed.

ART. IV. *Facts and Observations relative to Sheep, Wool, Ploughs, and Oxen, &c.*  
By JOHN LORD SOMERVILLE.

THAT the various qualities of our native wools might be much improved nobody, we suppose, will be inclined to doubt; indeed, in proportion as agricultural pursuits have not been thought unworthy the attention of some of the most enlightened men in the country, so a due attention has been paid to every minutia of practice capable of improvement; and much praise is due to those who have, in many instances, made expensive experiments, and laid their results before the public. Amongst others, the noble author before us is entitled to a large share of commendation for the spirit with which he has entered into these pursuits. The conclusions he draws from the experiments that he has made with the Merino breed are as follows: That they will bear our climate very well, if they are cotted, in the severest weather; that they have an aptitude to fatten; and that they will produce wool equal to the growth of Spain, and in a much superior quantity per sheep than any of our native breeds. It also appears, that a cross with the South Down or Ryeland produces a very valuable stock, retaining all the good qualities of the respective breeds; with the addition of a superior quantity and quality of

wool. These are important considerations, and as far as we are able to judge, the experiments detailed by his Lordship, which seem to have been as fairly made as is usual on these occasions, will confirm what is advanced in favour of this breed. At the same time we must remark, that these trials having been made in Devonshire, they will not hold good for the more northerly districts of the kingdom; and we have seen so much of the Quixottism of sheep-breeding, that we trust, till it has been fairly tried all over the kingdom, breeders will not be mad enough to give up many highly valuable breeds for the sake of this which is so strenuously recommended.

We much wish a little more attention to method had been paid in the relation of the experiments, and that the author had confined himself solely to what he has been eye-witness of, rather than have added so much on what has been effected in other parts of Europe. As a fair specimen of the style and reasoning of the noble author, we give the following quotation.

"Land of the vale of Taunton might have supported coarse-woolled sheep in size, had they been pushed in first year's grass, or bu-

\* On the subject of poor laws, we wish to refer our readers to the observations of Mr. Malthus, in his quarto edition of the "Essay on Population." REV.

ried in red clover up to their eyes, and the refuse mown afterwards for hay; but this was buying a good thing too dear; it is not the size of individual sheep, but the quantity of good meat and wool per acre which must enrich the farmer, and feed the public. It is to be lamented that we are such slaves to size, and that the eye can hardly resist it. A medium is most desirable; but if extremes are to be admitted, without a doubt the small sheep, fine in its grain, is a more marketable commodity. The rich will have it, because its quality is superior; in short, because it eats better; the poor man will find its joints more adapted to the strength of his purse; and the dearer meat is to be, the more this argument applies; for legs and shoulders of mutton cannot conveniently be cut, and retailed in pieces. There remained, then, but the manufacturer, the mechanic, and the middle class of housekeeper, to prefer coarse-grained meat; so we reasoned when we first sent this Ryeland mutton to market, but these were the very people who greedily bought it at a penny per pound advance in price, and that too in a manufacturing district. But we are told that sailors, colliers, and keelmen, are sure customers for these over-fat joints; so they are, and long may they enjoy them! Fresh meat is fresh meat to a man coming from sea, but if he stays long in harbour, and were once to break pale, and get a taste of better mutton, perhaps it would be no easy matter to bring him back again. We are told too, that coarse fat mutton is best for salting: mutton is not at all well suited to this purpose, beef and pork take salt better. If men are to be kept on salt meat, be it so; if they are to live on mutton, let that be good in quality. One of the first cutting butchers in London has often been heard to say, that he could not afford to buy fat coarse-grained sheep; for that, besides the loss in spine fat, which he was obliged to cut from roasting joints, there was not lean enough to support the fat, which therefore roasted away; and that so long as meat bears a better price than fallow, so long he must deal in South-downs, and sheep of that description. We have said thus much, because false arguments are too often used to enforce adoption of heavy sheep, in districts ill suited to them. Where land is deep and strong enough to bear long-woolled sheep, there let them be bred; but let them not be foisted, by false arguments, on land unable to maintain them; by so doing, the public is most essentially injured. Our combing and coarse-wool manufacturers must be supplied, and therefore our strong land should be allotted to carry coarse, heavy sheep; but if, on the same false principle, one is to be pushed every where to the exclusion of the other, I, for one, am old-fashioned enough to prefer clothes to carpets, a necessary to a luxury. If carpets are to be exported, well and good; they may, perhaps, pay as well as coarse woollen sent to South America, or elsewhere; but if carpets are to

be consumed at home, as they have been for some years past, the manufacturer, indeed, is fed by what he earns; but for any addition to the national revenue, he may as well sit with his hands behind him, and at once be fed from the pocket of the richer classes: it is only receiving with one hand and paying with the other; the nation will not be enriched; and the same thing may be said of every article of luxury consumed at home. This is very unfashionable doctrine without doubt, but it is too true. In treating of Ryeland sheep, it may not be amiss to remark, that they are not a mountain sheep, as many suppose, but are bred in the vales of Hereford and Ross, on the very same land with the Hereford oxen.

"How many favourite theories will be knocked on the head by this one fact! If the same land breeds the smallest and finest woolled sheep, it breeds also the largest oxen in our kingdom. A country must be envied, which, without minute attention to the science of breeding, can turn out two opposite animals in size, so good in their kind; it teaches us that more dependance is to be placed on the breed or race of animals than we are at first aware. We offer no comment on circumstances seemingly so contradictory; we only record them as facts."

Lord Somerville greatly recommends salt as an article of diet for sheep; the fondness of many animals for it has long been known, and also that it is usual in some countries to give it to sheep. The benefit to be derived from this mode of practice to the general health of the animal we are not disposed to controvert, but we cannot so readily allow it to be a specific for the *rot*; this disorder, we are very certain, is caused by the animal taking the embryo of the *fluke* with its food, and it is not likely that the small quantity of salt allowed to each sheep should destroy them.

On the subject of ploughs, a copy of a letter from M. de Neufchateau is given; the purpose of which was to answer some objections made by him to Lord Somerville's *patent* double-furrow plough, and to give an account of a ploughing match being won by this implement; as the result of the match was already known, this might as well have been omitted; coming from the *noble patentee*, it has too much the appearance of a puff.

The rest of this work is taken up with an account of the cattle shew instituted by his Lordship. For his indefatigable attention to this subject, and the admirable disposition of the premiums, he has our unqualified commendation; a

due medium in size and condition is, without doubt, much more advantageous to both the grazier and consumer, and if with this the recurrence to oxen as beasts

of labour, can be effected, Lord Somerville will have deserved well of his country.

**ART. V.** *Observations on the Utility of cutting Hay and Straw, and bruising Corn for feeding of Animals, arranged and elucidated, not by Chemical Test, but Agricultural Practice, with a full and particular Description of the best Machines for that Purpose; with approbationary Certificates annexed. Also a new and valuable Discovery, of the utmost Importance to the agricultural World, by which means every Farmer may separate the more nutritious Parts of his Straw for feeding Animals, from the Refuse, which may be used for Litter.* By WILLIAM LESTER, Farmer and Engineer, Piccadilly. 8vo. pp. 34.

AFTER this curious advertisement it is needless to say, that these pages are a puff on Mr. Lester's chaff engine. However, it is the puff direct, and there is no quackery in the case; for Mr. Lester's chaff engine, which cuts with a single knife, or a fly wheel, and which is capable of cutting chaff to any given length, has received very ample testimony of its superiority.

Mr. Lester conceives that the most nutritious part of straw is the saccharine substance contained immediately above its joints. It will be found, says he, by examining the straw of corn, that the greater part of this substance is contained in these cavities in the form of pith, "which being scraped out with a pen-knife, when the knots are cut longitudinally, and put upon the tongue, the sweets are immediately perceptible." Mr. Lester's "new and valuable discovery, of the utmost importance to the agricultural world," of separating the more from the less nutritious parts of straw, was thus accidentally made:

"About eighteen months ago I was applied to by one of the managers of a very large intended manufacturing concern, for the purpose of making paper from straw, and offered a large sum of money if I could produce an engine, that would separate the knots from straw, as they then employed a considerable number of hands to cut them out with shears. This I at that moment conceived next to impossible; but from an accidental observation some months after, in cutting some strong wheat straw, I found the knots to fly, by the concussion of the knife, to a considerable distance from the machine, beyond the parts that contained no knots. From this observation I concluded, that the object was discovered that was so interesting to the paper-maker. Having a winnowing machine stand-

ing by the straw engine, I put the cut straw into it, and passed it through, when I found the knots, from their gravity, come through the sieves like corn, and the other blowing away as chaff. I now found the possibility of constructing an engine for the complete separation of the knots from cut straw, and immediately went to the paper manufactory, intending to make a contract for the engine they so much desired; but to my utter disappointment the works were stopped; for what reason I know not. Had it been for the want of an engine to take away the knots, I am confident I could have set them to work again; but I candidly confess, it was this application, and this disappointment, that drew my attention to the process for agricultural purposes, the importance and propriety of which, practice alone will demonstrate. The mode is simple, and the expence trifling, within the reach of every farmer; it is only to cut his straw, and either heave it down before a wind, or throw it with a shovel, which will always separate the heavy substance from the light, in exactly the same way as dressing of corn. The separation will be complete if the straw is cut an inch long."

Mr. Lester has given a list of various agricultural machines which he makes, and their respective prices. By some accident Mr. Lester has omitted to inform his readers of a new discovery, which he might fairly have claimed: if a tradesman has an assortment of new articles for sale, he puts his advertisement into the newspaper, and pays his five shillings for it. By advertising his wares in the shape of a pamphlet, on wove paper, and with descriptive engravings, Mr. Lester has discovered the art not only of saving his own five shillings, but of transferring a great many such sums from other people's pockets into his own. This is the age for discovery!

ART. VI. *The Sporting Dictionary, and Rural Repository of general Information, upon every Subject appertaining to the Sports of the Field; inscribed to the Right Honourable the Earl of Sandwich, Master of his Majesty's Stag Hounds. By WILLIAM TAPLIN, Author of the Gentleman's Stable Directory.* 8vo. 2 vols. about 500 pages each.

THIS will be a very acceptable present to the 'Squire Westerns of the present day, and indeed to those high-blooded gentry who aspire to be *knowing ones*, and would be glad of the lesson upon easier terms than it is commonly taught. Mr. Taplin is highly impressed with the importance of his work, and claims justly, for aught we know to the contrary, considerable merit on the score of originality. He says that the various publications which annually issue from the press under sporting titles, "having been repeatedly re-copied, and repeatedly transmitted from one generation to another, are replete with matter nearly obsolete, and sports long since buried in oblivion!" He also tells us, we will take his own words, for to remodel the sentence would destroy its beauty, that "what has issued from the press under titles of attractive similitude have been much more the efforts of theoretic lucubration than the result of practical knowledge or personal experience." With all the pomp and grandiloquence of Gibbon, Mr. Taplin assures us that

"Numerous and diversified as the subjects are, they will be found largely treated on,

ART. VII. *A Description of a Patent Hot-house, which operates chiefly by the Heat of the Sun, without the Aid of Flues, or Tan-Bark, or Steam, for the Purpose of heating it. To which is added an Appendix, containing Remarks upon a Letter from T. A. Knight, Esq. on the Subject of Mr. Forsyth's Plaster. By JAMES ANDERSON, LL. D. F. A. S. E. &c.* pp. 248. 8vo.

IN hot-houses of the common construction, the panes of glass which form the roof are disposed somewhat in the manner of slates, each pane lapping over the other, and thus allowing a communication of the external with the internal air, between the upper and under surface of the two glasses. Now as air enlarges in bulk in proportion to the increase of the temperature, it is obvious that the internal air, whenever it is warmer than that of the atmosphere, will be constantly escaping by the crevices in the roof, and its place in the hot-house will be supplied by cold external air through the key-hole and other apertures, thus producing a constant draft, and requiring the aid of fire to keep up the due degree of warmth.

and satisfactorily explained: not as has been too much the case in former publications, by the effusions of literary fertility, but clearly demonstrated upon the practical knowledge, and individual experience, of the author; who, disdaining the subservient trammels of imitation, has not presumed to enter into a diffuse disquisition upon any sport or subject in which he has not been personally and principally engaged. If the mind of man can be candidly admitted to derive some gratification from its universality of rational attainment, so it is the greatest and most consolatory ambition of his life, to have engaged in every sport, and to have embarked in every pleasure, upon which these volumes will be found to treat; without a deviation from the line of consistency, a debasement of dignity, or a degradation of character."

Seriously, these volumes contain a good deal of information respecting dogs and horses, cocks and bulls, stags and foxes, &c. &c. &c. *ad infinitum*. The birth, parentage, and education of celebrated racers are given under their respective names. Four or five engravings, one illustrative of the improved mode of shoeing, and another of the age of a horse as indicated by his teeth, are added; in short, the book is altogether useful enough.

The hot-house of Dr. Anderson's construction is built entirely of wood and glass, so as to intercept as few rays of the sun as possible, consistently with the stability of the building. It consists of two chambers or stories, the lower with a flat ceiling of glass, the upper with a roof whose pitch or angle is of the usual magnitude. The lower ceiling, the roof and in short every part of the building is made as perfectly air tight as possible, the doors even, when properly closed admitting hardly any air. A small hole is made near the bottom of the upper chamber to communicate with the atmosphere, and the two chambers are connected with each other by a pipe with four openings, fixed into the roof and passing straight down about two o

three feet lower than the ceiling of the ground-floor chamber: the top of the pipe is open to the external air, but may be closed at pleasure by a stopper; the bottom of it is also open, and two lateral apertures are made, furnished with valves, one of which communicates with the upper chamber close to the roof, and the other with the lower chamber close to the ceiling. The building being thus constructed, and the top of the pipe closed with its stopper, the lower side valve being also closed, the bottom of the pipe and the upper side valve being open, as soon as the rays of the sun enter the building, the particles of heated air will rise through the rest and accumulate in two strata, one beneath the roof and the other beneath the ceiling; a quantity of cold air, in proportion to the enlarged bulk of that which is heated, being forced through the side hole, near the bottom of the upper chamber. In the course of an hour or two the stratum of air in the upper part of the lower chamber will have increased in thickness till it becomes parallel with the open extremity of the pipe of communication; all the surplus therefore of heated air will rise up the pipe, and be discharged under the roof of the upper chamber, by means of the side valve. This process will be going on as long as the sun shines on the house, so that towards evening the upper chamber or reservoir will be

filled with hot air. Upon the removal of the sun's light the air of the house will begin to cool, though very slowly; its dimensions will in consequence contract; and to supply the vacuum that would thus be formed, a current of cold external air begins to set in through the side hole, near the bottom of the upper chamber; but as the pipe is the only communication between the two chambers, and as it opens into the upper one just under the roof, it is obvious that no cold air can get into the lower chamber till the whole of the heated air in the upper one has first passed in; and before this takes place, except in very severe and cloudy weather, the rays of the sun will again find their way into the house, and furnish a fresh quantity of heated air. In severe weather, Dr. Anderson preserves the heat of the house at a proper degree, by means of a single Argand lamp.

We have no doubt that houses on this construction will be found more regular in their heat, and much more economical than those on the usual plan, though we are by no means disposed to attribute to them so vast a superiority as Dr. Anderson does; who, though he is himself possessed of a hot-house built according to his own plan, declines giving us the result of any experiments made in it, on account of "various unavoidable mistakes in a first construction."

ART. VIII. *A Treatise on the Culture and Management of Fruit Trees, &c.* By WILLIAM FORSYTH, F. R. S. & F. S. A. Gardener to his Majesty at Kensington and St. James's. 8vo. Third Edition.

IN our former volume, p. 767, we have given a particular account of this valuable work, and have noticed the controversy between Mr. Forsyth and Mr. Knight, relative to the efficacy of the new mode of treatment introduced by Mr. Forsyth, in renovating the vigour of decayed and worn-out trees. We shall, therefore, content ourselves with extracting, without further comment, the postscript to the present edition.

"Since the printing of this third edition was completed, I have been fortunate enough to have derived an accession of most respectable testimonials, tending to remove any doubts that may have arisen in the public mind respecting the verity of my statements on the subject of my composition.

"The visit which I had the honour to receive from the undersigned gentlemen was wholly unexpected on my part; originating, as I am given to understand, solely from a conversation among themselves, and a desire

on the part of some of the company to remove the doubts of the others.

*To Mr. Forsyth, Royal Gardens, Kensington.*

SIR,

"As you had the goodness lately to give us an opportunity of examining several trees in Kensington Gardens, in the various stages of renovation, or filling-up with new wood; and as reports have been circulated, tending to discredit the efficacy of your process;—we feel it an act of justice, not only to you, but to the country, which is deeply interested in your discoveries, thus publicly to declare, that the statements you have published on the subject contain nothing more than the truth.

J. C. LETSOM, M. D. F. R. S. &c.

WILLIAM WOODVILLE, M. D.

JAMES SIMS, M. D.

WILLIAM NORRIS.

JOSEPH HART MYERS, M. D.

ASTLEY COOPER.

EDWARD COLEMAN.

H. N. WILLIS, F. R. S. &c.

*London, Nov. 17, 1803.*

Z z 3

"I also avail myself of this opportunity to add a discovery which I have recently made; and which, as being calculated to save time and labour, may deserve attention.

"Instead of paring away the bark, as had heretofore been the practice, and covering the stem with the composition, I now merely scrape off the loose bark, and apply a mix-

ture of cow-dung and urine only (made to the consistence of a thick paint), with a painter's brush; covering the stem carefully over. This softens the old scabrous bark, which peels off during the following winter and spring, and is succeeded by a fine smooth new bark.

W. FORSYTH."

ART. IX. *Prize Essays and Transactions of the Highland Society of Scotland. To which is prefixed an Account of the principal Proceedings of the Society since 1799. By HENRY MACKENZIE, Esq. one of the Directors.* vol. 2d. 8vo. pp. 540.

WE welcome with peculiar pleasure the appearance of a second volume of the transactions of this philosophical and truly patriotic society. It had been too much the custom to consider a large proportion of the western and Highland districts of Scotland, from the poverty of the soil and inclemency of the seasons, as condemned by nature to perpetual sterility. The only valuable produce of which they were supposed capable, was that of a hardy and valiant race of soldiers, whom it was both politic and humane to allure from their storm-clad mountains, and send them to sustain in every climate the untarnished honours of the British standard: at the command, and under the guidance of their hereditary chieftains, from every rocky island, from every piny mountain, from every grassy glen, poured forth, battalion after battalion, an uninterrupted stream of heroes, eager to confirm their claim to the high unconquered spirit of ancient Caledonia. Nor have their efforts been in vain: Canada and Holland, Egypt and India, have witnessed their enduring patience of every hardship, and the disciplined impetuosity of their native valour. But peace, as well as war, has her triumphs: to establish villages amidst the waste, to drain the black morass, and cover its unsightly barrenness with green herbage, to border the lonely torrent with bleach fields, and swell its murmurs with the sound of the loom; to establish seats of commerce upon the unfrequented shores, and to draw food and wealth from the inhospitable sea—these are the great objects of the Highland Society, these are its claims to the esteem and respect of the public.

The first article in the volume before us is an elaborate essay by the late Dr. Walker, Natural History Professor in the University of Edinburgh, on the origin, properties, and uses of peat.

Peat is produced from the successive decay of trees and smaller vegetables in all countries, where the heat is not sufficient to effect their total decomposition. Some of the peat-mosses are of modern formation, but by far the greater number, in countries that have been long inhabited and civilized, are of very ancient origin. In the bogs of Scotland are found the horns of the bison, of the elk, and a still larger animal of the stag-kind, although these animals have from time immemorial been extinct in the island. The deep peat-mosses, containing the trunks of trees, are probably the most ancient, having been formed by the successive decay of several generations of timber: of this a remarkable instance is noticed by Dr. Walker in Strathclyuny, in Invernessshire.

"This is a very high inland tract, being the water-shed of the country between the two seas. It has formerly been a very thick extensive fir wood; but there are now only some very old scattered trees standing in it. These have all flat bushy heads, leaning to the east, but the trunks are large, and consist of the finest timber. This wood having worn out of itself, has left behind it a thick body of peat moss, formed during the long period of its growth and decay. Large roots of fir trees, which had evidently been broken over by the winds, were observed in this place. Some of these roots, with part of the trunk, in their natural position, were seen at the bottom of the peat stratum, placed in the gravelly loam on which they had grown; but above this loam there was a stratum of peat, about three feet deep, evidently formed during the growth and decay of these trees. In some places the old roots of other fir trees were seen two or three feet immediately above the former, with their fangs spread horizontally, having three or four feet of peat above them. It was clear that these roots belonged to trees of another generation, and of a date much posterior to the former; for they had only begun to grow after the trees rooted in the loam had utterly decayed, and after the three intervening feet of peat had been formed by their growth and decay; and again over

these last roots, situated about three or four feet deep in the peat earth, an aged fir was growing on the surface. There were here then three generations; or, as it were, three tire of trees, visibly placed above one another. This renders it probable that many of our deepest peat mosses, not shifted by water, have been produced by two, three, or more generations of trees, which have grown successively above one another at different and distant periods."

The antiseptic property of peat is very remarkable; and not only are the horns of animals, extinct for many centuries, preserved in it to the present day, but timber and even human bodies remain a long time without exhibiting any signs of decay when buried in peat. Nor does this antiseptic quality reside alone in the mass of peat, for it communicated in a very considerable degree to the brown-coloured water which flows from it. Captain Cook, having to water his ship on the coast of Terra del Fuego, was obliged for this purpose to have recourse to a brook,

"The water of which was of a reddish hue, like that which runs from the turf bogs in England. This, no doubt, was moss water. He was, at first, suspicious of its quality, and used it sparingly; but after having it long aboard, and in warm climates, it proved the best water he took in during the whole voyage. It would appear from his account that it never became putrid; and it is highly probable that moss water, or water artificially impregnated with peat, would be more salutary, and remain longer unchanged, especially in the hot latitudes, than any other river or standing water whatever."

Peat mosses in their natural state, or even when simply drained, are not capable of bearing any valuable agricultural crops; but by being covered with calcareous earth, either in the form of quicklime, or shells, or marl, it is consolidated, and in a short time converted into good pasture ground, which by judicious arrangement may be brought to bear the usual courses of tillage.

A singular and successful method of reclaiming the peat-mass of Kincardine was practised by the amiable Lord Kaim, and his worthy son Mr. Drummond.

"The moss consists of about fifteen hundred acres, and is in general from three to ten feet deep; it is bottomed by a fine clay, which, on cultivation, turns out a fertile soil. When the superincumbent moss is floated away in canals to the Forth, this clay becomes the object and the reward of the cultivator.

"The improvement of the moss in this way began in the year 1768; and in May 1796, about four hundred acres were reclaim-

ed and cultivated. On these acres there were raised two thousand four hundred bolls of grain, and they supported fifty-four horses and two hundred and one cows, where formerly there was no sustenance to any creature except moorfowl. They had upon them one hundred and two brick houses, and seven hundred and sixty-four inhabitants, all fully employed, and living comfortably, where no human creature ever lived before."

Some extremely valuable facts by Lord Meadowbank, respecting the use of peat as a manure, are contained in the second paper of the present volume. From this it appears that if three parts of peat and one of fresh farm-yard dung are mixed together, a general fermentation of the whole mass ensues, and in the course of a few weeks it is converted into a black free mass like garden mould, which in a course of cropping is found to be fully equivalent to an equal weight of farm-yard dung. But the most advantageous way of preparing peat is, first to weaken its texture by mixture with leaves, weeds, or any sort of litter, and then to expose it to the vapour of animal matter in a state of putrefaction. "In this way," says Lord Meadowbank, "the carcass of one dead horse, with sawings of timber and peat, prepared ten ton of manure in somewhat less than ten months, and it was turned over only once, and that at the beginning of the ninth month, when a small quantity of lime rubbish from an old wall was added, in order to quicken the preparation."

Another valuable memoir by Dr. Walker, entitled "Remarks on the Cattle and Corn of the Highlands" is contained in this volume. Its interest however, being chiefly local, must be our excuse for taking no further notice of it. For the same reason we shall pass over some other papers by different correspondents, relative to the management of black cattle on the Highland farms, and other branches of rural economy peculiar to Scotland.

Mr. Somerville of Haddington is the author of a paper concerning the management of heath or heather, which is annually burnt in order to induce a crop of fresh shoots for the sheep. The proper time for burning the heath is as early in the spring as possible; the old shoots are at this time almost sapless, and therefore take fire readily; the roots are not injured, and the ashes serve very opportunely as a manure and stimulus to the

young shoots, which soon put forth in great luxuriance; but if the heath is burnt when it is in flower, the whole plant is consumed to the very roots, and killed. When a piece of ground is required to be permanently freed from heath, a top dressing of lime is infallibly effectual, and is attended with this additional advantage, that it remarkably encourages the growth of white clover and the finer grasses.

The encouragement of the Scottish fisheries forms an important object of the Highland Society, and the volume before us contains several very interesting memoirs, relative to the natural history, the commercial and economical value of herrings and salmon.

Respecting the first of these fishes, Dr. Walker has communicated an extremely curious and interesting memoir; of this we shall not attempt to give an abstract, but shall state the author's opinion respecting some controverted points in the natural history of this animal. The spawning time of the herring extends from the beginning of March till the middle of October. The manner in which they deposit the spawn is unknown, but their favourite situation for this purpose is a coarse gravel, at the depth of ten or twelve fathoms. The spawn generally comes to life in the end of April or the beginning of May; in June the fry is between one and two inches long; by September they have attained the length of three or four inches, at which period they disappear. It is the opinion of the fishers that the herrings are not of a sufficient size to be meshed in the nets till they have completed their third year. The food of herrings is very little known; during their continuance on the British coasts they become sensibly leaner, and no food has ever been discovered in their stomachs. Dr. W. however has been informed that, in the sea to the N. W. of the Shetland isles, large masses of a mucilaginous substance, filled with pea-like globules, have been found floating on the surface (probably a species of Medusa) on which the herrings have been observed to feed. The great body of herrings appears certainly to come from the deep Arctic seas for the purpose of spawning; one of these shoals was seen by Provost Finlay of Campbelton, an experienced fisher, and was estimated by him at twenty leagues in length and four

or five in breadth; the heads of all the fish were directed to the S. E. and the weather being fine the shoal came quite to the surface of the water. The herrings of the west coast are in general two or three inches longer than those on the east coast. Dr. W. does not, however, consider them as a distinct species, but imagines, (in our opinion, with much probability) that the western sea, on account of its being more tempestuous, is occupied by the oldest and strongest shoals.

Mr. Mackenzie has also communicated a paper on the same subject, in which we observe some difference of opinion between him and the professor. Mr. Mackenzie supposes the large herrings to be a distinct species, and to spawn twice in the year: viz. about the middle of August and at Christmas: after the first spawning they retire to the deeps, and do not return till towards Christmas: this appears, however, to apply chiefly to the large herrings of Dunbar and the eastern coast. The largest herring ever taken was caught about five years ago by the fishers of Musselburgh, and weighed full six pounds.

The volume before us is also enriched by a particular and authentic account of the Dutch herring fishery, and a translation of the ordinance of the states of Holland and West Friesland, respecting the sorting and curing these fish.

If it was consistent with our plan to give a more particular account of the works that come before us, we should abstract with great pleasure two valuable papers relative to the salmon, by Dr. Walker and Archibald Drummond, Esq. and an interesting treatise on the Scottish fisheries by Mr. Melville. The appendix to this volume is chiefly occupied with a method, invented by Mr. Bremner, a minister in Orkney, of converting, in a few minutes, a common ship's boat into a life-boat, for which the society has awarded him a premium.

We do not suppose that any praises of ours can add to the well-earned reputation of the Highland Society; but we should be at the same time unmindful of our duty, and negligent of our own feelings, if we were to dismiss, without our warmest approbation, a work which is equally valuable to the naturalist and practical cultivator, and which reflects the highest credit on the association whence it has originated.

## CHAPTER XVIII.

# MEDICINE, SURGERY, ANATOMY,

AND

## THE VETERINARY ART.

A VERY large increase has taken place in the number of publications on these branches of science which we have this year to present to our readers ; nor is the addition merely that of number ; for amidst much temporary and insignificant matter, we may select a portion which deserves a permanent place in our libraries.

The well-earned reputation of the late Dr. Fordyce will not be diminished by the last of his Essays on Fever ; Dr. Cheyne has given a useful treatise on a set of morbid symptoms in infants which bring thousands to an untimely grave, and among the practical works we may also distinguish Dr. Blackburne's description of scarlet fever. The extreme prevalence of the epidemic catarrh, or influenza last spring gave rise to several smaller publications of temporary interest, but derived from too partial observation to determine the very few questions of permanent importance connected with its rise and propagation. The most original of the publications of the year is unquestionably Dr. Beddoes's series of popular essays on the preservation of health, the work of no common observer, and characteristic both in its excellencies and defects. Two additions of considerable value have been made to the now familiar subject of Cow-Pox : Mr. Ring's marked by comprehensive diffuseness, that of Dr. Pearson and his colleagues distinguished by aphoristic condensation and perspicuity.

Surgery has received the accession of Mr. Hey's valuable practical remarks, the long experience of a *miles emeritus* ; the treatise on Hernia by the younger Monro, inaugural to the assumption of a professional chair, rich in hereditary reputation and deeply pledged to the world for pre-eminent abilities ; Mr. Home's further observations on stricture, and practical testimony to the importance of a particular mode of surgical treatment ; and Mr. Trye's remarks on a formidable and somewhat rare species of external injury.

Mr. Bell in completing his system of anatomy has supplied a deficiency long felt in our libraries. Professor Walter's beautiful plates of the abdominal and thoracic nerves, together with Mr. Bell's elegant system of neurology, and some other anatomical engravings, will materially assist the student of anatomy ; and the plan of nomenclature sketched by Dr. Barclay demands the attention of all who teach this admirable science. To these we may add Mr. Fox's treatise on the teeth, a valuable work on a subject hitherto somewhat neglected.

Elementary introductions to medical science and slight general treatises crowd upon us with profusion. It is not difficult for any one possessed of industry and educated in the midst of lectures on every science, and furnished with elementary

books of standing reputation, to compile a decent work of the kind; and there will never be any want of superficial students to become his readers.

In the class of Pharmacy and medical Chemistry the authorized reform of the Edinburgh Pharmacopeia, and the proposed improvement of the Paris codex by La Grange are both entitled to notice. They shew (especially the latter work), a very marked and almost exclusive attention to the chemical part of pharmacy. Dr. Lambe has thrown a very wide suspicion on the management of an essential part of domestic economy in his remarks on Spring Water; and Dr. Gibbes dwells on the mystic virtues of Bath-waters with the zeal of a devotee.

We have added Galvanism to the present chapter, as a subject of great and increasing importance to the study of Physiology. The origin 1 experiments of Professor Aldini of Bologna are marked with Italian ingenuity and acuteness.

Among the miscellaneous publications Dr. Percival's Medical Ethics will please by the amiable spirit which it exhibits, and the liberal conduct which it inculcates.

**ART. I.** *Annals of Medicine for the Year 1802; exhibiting a concise View of the latest and most important Discoveries in Medicine and Medical Philosophy.* By **ANDREW DUNCAN, sen. M. D.** and **ANDREW DUNCAN, jun. M. D.** Fellows of the Royal College of Physicians, Edinburgh.

THE analysis of books occupies, as usual, the first part of this work, which we pass over, in order to give an account of the original communications contained in the second.

1. "Observations on bilious disorders, extracted from a letter dated from the river Ganges, in 1770, to a friend. By John Sherwen, M. D. formerly surgeon in the service of the Honourable East India Company, now physician at Enfield. Continued from our last volume."

The proximate cause of bilious disorders, the author considers to be an excited state of the liver, produced by an effort of nature to throw off bile from the system. Bilious remittent fevers are trusted, by the natives of India, to nature and cold water, taken *ad libitum*. The author's experience led him to aim at the evacuation of bilious matter from the stomach and bowels, by emetics and purgatives, and at the removal of the fever by means of small doses of emetic tartar, large draughts of the saline mixture, anodynes, and the peruvian bark. At the same time, it was necessary to attend, during the disorder, to the more urgent symptoms. The propensity to the use of cold water, now so successfully employed in this country, in the early periods of fever, was often remarked by the author.

"During the febrile delirium, the patient had often a strong inclination to leap into the river. It was with much difficulty that I

prevented two of my patients from taking this fatal step; and I have a confused remembrance of a longing inclination, which I myself had when in this situation, to get into the river. Very fortunate for me, I was too weak to get out of my cot; but I can remember, I thought I should be perfectly easy if I could but leap from the cabin windows into the water."

The other remarks in this paper are on the subject of dysentery, enlarged liver, and prickly heat; but they contain nothing particularly worthy of notice.

2. "Observations on the duration and course of fever in Britain, and on the efficacy of medicine in interrupting its course, and in shortening its duration. By William Brown, M. D. one of the surgeons to the Royal Infirmary of Edinburgh."

To the interesting subjects of inquiry which the author has prosecuted in the present paper, he had an opportunity of attending, several years ago, by obtaining access to the records of a well-regulated hospital. The doctrine of critical days appeared to him an object worthy attention; and he therefore took some pains to enquire into the periods of the termination of fever. From a statement which is given, it appears, that out of 280 cases, 172 terminated on critical days; which is a proportion falling short of what is recorded by Hippocrates. But in some other respects, also, there is a difference between the two statements.

"Terminations on the 8th, 10th, 12th, 15th, 16th, 18th, and 19th, in the cases of Hippocrates, amount to no more than one-ninth of the whole; while our calculation makes the endings on these days to include almost all the instances of terminations of fever on days non-critical. We also have seventeen terminations on the thirteenth day, on which none were observed by Hippocrates. His terminations on the sixth are considerable in number; ours, on the contrary, are very few."

Recoveries, the author also had occasion to observe, were as speedy, after terminations on non-critical days, as any others.

From the examination of the records of 296 cases, which he has digested into the form of a table, the author considers it as probable

"—that fever is an affection that is not to be overcome but by the exertions of the system itself. If this be allowed, all that ought to be done toward its cure, is to remove or prevent any such derangement of the functions as are incompatible with the continuance of life. This done, we may trust what is farther to be performed to nature alone."

Though he denies that medicine has in general any power of terminating the febrile state, or shortening the duration of the disease, he deems it efficacious in the cure of fever, by frequently serving to protract the complaint. The author is silent on the effects of the cold affusion, lately employed in the early stages of fever, but mentions having seen the disease arrested in its course by a medicine, which operated by violently vomiting and purging, and afterwards produced profuse perspiration. It was used by a Mr. Warren, on board one of his majesty's ships, but the composition was unknown.

3. "History of the case of a man, who discharged by the anus a portion of the intestines full thirteen inches in length. By Mr. John Bower, of Doncaster. Communicated by Dr. George Pearson, of London."

The subject of this history, aged 40, had the misfortune, in the year 1796, to be rode over by a stage-coach. One of the wheels passed over his abdomen, between the navel and pubis, and left a mark of the injury. By proper means he was in a fortnight considerably recovered; but on the seventeenth day from the accident, he was seized with a great general debility, which continued ten minutes, and returned the following night. On the subsequent morning

"—he parted, *per anum*, with full fourteen inches of his intestines, apparently a portion of the ilium, with a part of the mesentery adhering to it; after which, he had a lax stool, more in quantity than he ever got quit of at one time since the accident. He continued in a lax state for two or three weeks (tho' he could retain his feces) when a tumour appeared below the navel, and in a few weeks broke, and discharged a large quantity of matter, having a yellowish tinct, and a faint smell of feces. At times, his body would be so much distended with wind, as to force out the discharge to the distance of a yard or two. He got strength gradually, and, in harvest time, was able to walk into the fields. When winter approached he was obliged to keep in the house, and frequently in bed, as three or four small tumours appeared at different times, and broke; so that now there are five orifices. The two first which broke, are a little above the pubis; the third, about one and a half inch below the navel, and the two last just above Poupart's ligament."

In the year 1801 he was living, and his general health was much improved. His stools were frequent, and he was much troubled with flatulence, but most of the latter was discharged through the orifices, two of which were open. The gut discharged was considered by Dr. Monro and Mr. Thomas, as an intussusceptio, which had sloughed off.

4. "The history of a recovery from a singular species of hiccup, which had subsisted for several months. By Dr. John Nelson Scott, physician in the Isle of Mann."

This complaint occurred in a young lady of a plethoric habit, and was only suspended during sleep. Various medicines were employed without advantage; in about six months after a change of residence, the complaint disappeared without any obvious cause. In three years it again returned, and the author, after trying sulphur without effect, at last succeeded in removing it, by the application of a blister, so large as to cover the whole of the cervical vertebræ.

5. "Communication on the good effects of the affusion of cold water in Typhus. By Dr. John Nelson Scott, physician in the Isle of Wight."

Dr. Scott's experience confirms that of Dr. Currie, on the good effects of cold affusion; but he suggests to the consideration of medical men the propriety of giving an emetic dose of tartrate of antimony some considerable time previous to the washing, by way of still further assisting in cutting short the 'morbid catenation of the system.' Attention is of course required by the author to the

state of the skin, previous to the affusion being employed, and hence the necessity of giving the emetic a considerable time previous to the washing, that the condition of the skin, from perspiration, &c. may not render it unfit for the application of the cold water.

6. "History of a remarkable case of diabetes, treated in the Royal Infirmary of Edinburgh, and extracted from the records of that hospital."

This is the detail of a case, mentioned in the last volume of the *Annals of Medicine*, as having been cured by the use of lime water and powder of galls.

7. "History of a considerable wound of the brain, attended with singular circumstances. By Mr. Edward Barlow, student of medicine at Edinburgh, from Westmeath, Ireland."

The patient, a boy of about 14 years of age, received a kick from a horse above the orbit, by which a large fracture was produced, and many of the broken pieces of the skull driven into the substance of the brain. Portions of the brain also escaped through the opening. The symptoms were very unfavourable during the first week, but in the second they began to improve. Early on the third, however, the suppuration, gradually increasing, became profuse, and as it was undiminished by the use of bark, an examination became necessary into the circumstances which kept it up. This examination discovered, that the discharge which wetted the bandages, night-cap, and even the pillow, 'was distinct from the purulent matter which the ulcerated surface afforded.'

"— That it came from the internal part of the wound, and was perfectly watery, as it now appeared distilling in quick successive pellucid drops from the eye-brow, unmixed with any purulent matter, which would naturally have impaired its transparency."

Various speculations on the source of this discharge were made; but the only probable one seemed to be, that a piece of the bone had penetrated the left ventricle of the brain, and that the fluid discharged was an increased secretion from its cavity. Calomel with opium, and afterwards peruvian bark were employed to remove it, and with success. The boy recovered his health, but his vision remained in a slight degree affected.

8. "Case of a gun-shot wound, with a division of the femoral artery. By Mr. David

Aitken, assistant-surgeon of his majesty's ship *Oberyn*."

The termination was fatal, and the circumstance chiefly remarkable in the case, was the state of the wounded artery.

"The artery, just about to enter the ham, was completely divided by the ball, its two ends fairly separated from each other, yet accompanied by no immediate hæmorrhagy, nor followed by that which was to be dreaded after the sloughs had been thrown off. There was not even any internal bleeding; there was no anæmism; but the divided artery was shrunk, and closed; the circulation was destroyed in the limb, and the leg perished before nature had forced open other channels for conveying blood to the parts below the wound."

9. "A Letter from Dr. G. D. Yeats, physician at Bedford, to Dr. Duncan, giving an account of the good effects obtained from a combination of calomel and opium in inflammatory diseases; with observations on effects arising from the acetite of copper, and on some other important subjects in the practice of medicine."

The author was led to the employment of calomel and opium conjoined, in inflammatory complaints, from the recommendation of Dr. Hamilton, of Lynn Regis, who wrote a paper upon the subject in the ninth volume of the *Medical Commentaries*. Acute rheumatism, enteritis, and pleurisies, were the complaints in which this combination was found most useful. A case is given in which bleeding, blistering, nitrous and antimonial medicines had all been employed without advantage, for very violent pneumonic symptoms, indicated by incessant cough, acute pain of the side, strong, full, and quick pulse, with violent exacerbations of fever. Repeated doses of calomel and opium were then had recourse to, which, in a short time, gave great relief, and as soon as the mouth became sore, produced a cessation of every bad symptom.

Another case is annexed, to shew the inefficacy of nitrous acid in syphilitic complaints, and of mercury without a due regard to diet.

Some very serious symptoms are mentioned, as having occurred in a family who had eaten pickled salmon, supposed to have had an impregnation of verdigris. They went off by the use of sulphur given in large doses. A case of diseased liver is also inserted, in which

hydatids were coughed up by an opening through the diaphragm, with some relief to the patient. The case was under the author's care at the time of this communication being made.

10. "Remarkable cases of convulsions, with some observations on the hæmorrhoids petechialis, or petechiæ sine febre. Communicated to Dr. Duncan, jun. By Dr. Albers, physician in Bremen."

In the first of those cases, the convulsions seem to be produced by the irritation of an abscess in the ear; in the second by an intussusceptio of the intestine. An intussusceptio was likewise observed in the dissection of a Mexican boy, which died of convulsions. The case of petechiæ sine febre is no way remarkable. The patient had a discharge of blood from the gums, and the body was covered with petechiæ. He was cured by decoction of bark acidulated.

11. "History of a singular case of an extra uterine fœtus, discharged by the rectum. By Mr. John Goodsir, surgeon at Largo."

About the seventh month of pregnancy the patient felt the child give a violent struggle, and at once its motion ceased. Symptoms of labour now came on, and continued six or seven weeks. The patient gradually recovered for as many months, and was then seized with a fever, during which she had frequent

symptoms of labour. She gradually lost ground, but in a short time observed a thick whitish substance to be discharged from the rectum, and on passing her finger upwards discovered something hard, which was found by the author to be the cranium of the child. With considerable difficulty, and after a good deal of time, the whole was brought away, and the mother did well.

12. "Observation sur la Cataracte. Par A. Mounot, professeur d'Anatomie & d'Accouchement à Besançon. Communicated by Dr. Inglis."

After giving a general history of this operation, the author mentions the usual mode of extracting a cataract; but as he has frequently found that the operation is unsuccessful, from inflammation attacking the capsule of the crystalline lens, he proposes, immediately after the extraction, "to direct to the posterior part of the capsule the same instrument by which it was divided anteriorly, and to cut it by a crucial incision. Thus the vitreous humour replaces the crystalline, the pupil is dilated, the eye is bright and without clouds, and the patient perceives all the objects which present themselves."

The remainder of this volume is occupied, as usual, with several articles of medical intelligence, and with a list of new books and inaugural dissertations published during the year 1802.

ART. II. *Medical Directions, for the Use of Navigators, and Settlers in Hot Climates.*  
By THOMAS M. WINTERBOTTOM, M. D. Physician to the Colony at Sierra Leone.  
pp. 144.

THE author's long official residence at Sierra Leone, gave him an opportunity of acquiring considerable experience in the diseases of hot climates; and the present work is intended to communicate the results of it, to such as may have occasion to be exposed to the warmth of the torrid zone. His observations are not entirely confined to his own experience; as it is his wish to provide general practical directions, for the management of health, and the treatment of diseases in tropical climates, for the use of such persons in particular, as may not have the advantages of medical advice. The directions given for the diagnosis and cure of diseases, will not, therefore, be expected to contain more than is already familiar to the practitioner who is at all acquainted with the complaints incidental to hot climates.

It may be observed of them, however, that they are concise and perspicuous, and, in proper hands, may be useful. The advice given to settlers, though it is that which will apply in a great degree to any climate, appears to be the result of personal observation, and we have no doubt, if it is attended to, will prove useful.

The principal circumstances to which their attention is required, are, sobriety in eating and drinking, early hours, moderate exercise in the cool of the day, flannel clothing, and the removal of costiveness. Bleeding immediately after arrival, bark and bitters, emetics, and cold bathing, appear to the author to be injurious. The unpleasant sensations frequently experienced in the mornings are more effectually removed by a light breakfast than any thing medicinal.

ART. III. *A Treatise on Tropical Diseases, on Military Operations, and on the Climate of the West Indies.* By BENJAMIN MOSLEY, M. D. Author of a *Treatise on Coffee, Medical Tracts, and Physician to Chelsea Hospital, Member of the College of Physicians of London, of the University of Leyden, of the American Philosophical Society at Philadelphia, &c. &c.* Fourth Edition, with considerable Additions. pp. 670.

AS it is a considerable time since this work first appeared, we conclude that it is sufficiently known to the public, not to require any particular examination in a fourth edition. The author has long been convinced, that the moon exercises considerable influence over the human body, and that certain diseases are much more likely to return during a few days before and after the full and change, than at any other periods. This, he remarked in a former edition, was peculiarly exemplified in hæmoptysis, of which he gave several cases in confirmation. In the present edition, he devotes a whole chapter to the influence of the moon, in which he gives a long history of the ideas entertained on this subject by ancient authors, and a great number of examples to prove its powerful agency, relative to diseases and death. The author's practice in the West Indies, has afforded him the greatest number of instances of the effects of the moon in the production of diseases; but in this country, he has also had occasion to see many examples of the same kind, as well in hæmoptysis, as in paralysis, apoplexy, and some other complaints. In Chelsea hospital, the author observes, that in the course of fifteen years, he has rarely known an instance of either apoplexy or palsy happening at any other time than the full or the change of the moon. The same extensive establishment afforded him an opportunity of determining, that almost all people in extreme age, are either attacked with their death illness, or die, at the new or at the full moon; and in consumption and chronical diseases, the same is commonly the case. In the hospital for French protestants and their descendants, in Old-street, the whole number of deaths of persons above the age of seventy, amounted to two hundred and one, and

"Of these, seventy-four died at the full moon, and sixty-one at the new moon. The remaining sixty-one, seven excepted, died at and within forty-eight hours of the quarters."

The author also observes,

"That in this asylum, where there are considerably more females than males—about

three to two—that the full moon has the superiority in influence. At Chelsea hospital, where there are none but males, the new moon has the superiority."

The same inferences are supported by various instances, which are adduced, of the most remarkably aged people, who have been known in the world. Births and conceptions are also said to be under the influence of this planet.

With regard to the utility of the observations which have been thus industriously collected by the author, he is of opinion, that by knowing the time when certain causes produce uniform effects in generating diseases, and the periods when relapses are apt to happen, many disorders may be palliated or prevented.

"The mischief," for instance, "of hæmorrhages from the lungs, a dreadful disorder in England, which, in the ordinary methods pursued, invariably end in consumption, may be effectually prevented at first; by taking proper measures, three days before every new and full moon; and continuing the regimen, and precautions, three days after each period, until all disposition to hæmorrhage ceases."

"By these means I have cured a great many people; and have long protracted, in incurable cases, the lives of others."

"Short-necked, comatose, plethoric, gross people, where any mischief is latent, are always affected near the new and full moon. Such habits should be carefully watched a few days previous to these periods; and if any symptom, indicative of apoplexy, be observed, how easily is the storm prevented,—by bleeding, cupping, purging, revulsion, abstinence;—or such prompt measures as the case may require."

"In paralytic disorders, so lamely defined by nosologists, the head is constantly confused and giddy for some time before the attack; and there is always a weakness in the knees. This sudden failure of the strength of the knees, has never been noticed in medicine before. But it is, if accompanied with any disturbance in the head, particularly near the new moon, the certain fore-warning of some great changes, which the habit is about to experience, and in extreme age, it presages death."

"In people disposed to palsy, or such as have already had some paralytic affection, this is the time to take alarm; and with vigilance the blow may be warded off."

Epilepsy and St. Vitus's dance are also

represented to be remarkably under the influence of the moon, and hence any attempts to cure should be made three days previous to every new or full moon. We are very much inclined to suspect, that the author speaks with too much confidence, on the facility with

which the former disease may always be cured in young people, and that bark, steel, oil of amber, mistletoe, and valerian, even when employed at the periods mentioned by him, will often be found inefficacious.

**ART. IV.** *Medical Ethics; or a Code of Institutes and Precepts adapted to the professional Conduct of Physicians and Surgeons. With an Appendix; containing a Discourse on Hospital Duties; also Notes and Illustrations.* By THOMAS PERCIVAL, M.D. F. R. S. and A. S. Lond. F. R. S. and R. M. S. Edinb. &c. &c. 8vo. pp. 246.

A VERY important part of the knowledge which a liberal practitioner in medicine ought to possess, relates to the conduct to be pursued in his intercourse with the world, and with his brethren in the profession. The medical art in this country has long maintained a very elevated rank, as well on account of its acknowledged utility, as the learning and abilities of its professors. The qualifications necessary to make a physician serviceable in his profession, are not of a nature to be duly estimated by the public. It is naturally however expected as a criterion, and in general not an unfair one, of his medical skill, that he should possess general learning and information, with a refinement of manner, and a liberality of conduct, which bespeak the well educated gentleman. A certain degree of acquaintance with the world is necessary to furnish that knowledge of mind and manners which are essential to a respectable advancement, and we doubt not that the work now before us, will prove extremely useful to the young and ingenuous practitioner, by furnishing him with the rules of professional conduct which have been laid down by a learned and liberal minded physician, after a long life of reputation and utility.

The present work originated in a code of laws which the author was requested to draw up in the year 1792, for the use of the infirmary of Manchester. He was afterwards induced to extend his plan, but various circumstances, for some years interrupted it, particularly the death of a very promising son for whose particular use his labours were intended.

The 1st chapter contains the code of laws above mentioned, and treats of professional conduct, relative to hospitals and other medical charities. It is not to be expected that much novelty should be here introduced. The author has given a summary of the mode of conducting public business, in a way the most satis-

factory and useful to the practitioner, and the most agreeable and beneficial to the patient. The principal objects which he inculcates are, tender and delicate attentions to the patient, and a liberal and unrestrained intercourse among the medical attendants. The advantage of the sick must necessarily be the first point of attention, but with this he always wishes to connect the improvement of the profession. Most of the injunctions which are laid down for the conduct of the practitioner to the patient, are highly proper, but feelings of delicacy may perhaps be carried too far, when it is said, that they should always be interrogated concerning their complaints in a tone of voice which cannot be overheard. Circumstances may certainly occur, particularly with females, when such an injunction is proper; but as a general rule, it seems to us very unnecessary, and will frequently deprive the attending pupils of very desirable information. Many important remarks occur in this chapter, on the utility and management of dispensaries, lunatic hospitals, and lock hospitals, which are equally creditable to the author's judgment as a physician, and to his feelings as a man. The two next chapters treat of professional conduct in private and general practice, and of the behaviour of physicians to apothecaries. The leading circumstances inculcated are, liberality of conduct to the patient, and medical brethren, and a strict regard to morality in general behaviour. Viewing medicine as a profession by which a man is to be supported, a certain attention to personal interest is necessarily required. The respectability of the profession should never, however, be sacrificed to motives of private interest, and it always becomes the practitioner to exercise a great liberality of conduct to those patients, whose situation in life may not make it convenient to obey their own feelings in the acknowledgment made. It is proper however to do our profes-

sion the justice to say, that, with a very few exceptions, there is every disposition to take into consideration the circumstances in which patients happen to be placed.

The following remarks are well worthy the serious attention of the candid physician.

“ At the close of every interesting and important case, especially when it hath terminated fatally, a physician should trace back in calm reflection, all the steps which he had taken in the treatment of it. This review of the origin, progress, and conclusion of the malady; of the whole curative plan pursued; and of the particular operation of the several remedies employed, as well as of the doses and periods of time in which they were administered, will furnish the most authentic documents, on which individual experience can be formed. But it is in a moral view that the practice is here recommended; and it should be performed with the most scrupulous impartiality. Let no self-deception be permitted in the retrospect; and if errors, either of omission or commission, are discovered, it behoves that they should be brought fairly and fully to the mental view. Regrets may follow, but criminality will thus be obviated. For good intentions, and the imperfection of human skill which cannot anticipate the knowledge that events alone disclose, will sufficiently justify what is past, provided the failure be made conscientiously subservient to future wisdom and rectitude in professional conduct.”

The commencement of that period of senescence when it is incumbent on a physician to decline the offices of his profession, it is not easy to ascertain, and the decision of so nice a point, the author justly observes, must be left to the moral discretion of the individual.

“ As age advances, therefore, a physician should, from time to time, scrutinise impartially the state of his faculties; that he may determine, *bona fide*, the precise degree in which he is qualified to execute the active

and multifarious offices of his profession. And whenever he becomes conscious that his memory presents to him, with faintness, those analogies, on which medical reasoning and the treatment of diseases are founded; that diffidence of the measures to be pursued perplexes his judgment; that, from a deficiency in the acuteness of his senses, he finds himself less able to distinguish signs, or to prognosticate events; he should at once resolve, though others perceive not the changes which have taken place, to sacrifice every consideration of fame or fortune, and to retire from the engagements of business.”

With regard to the behaviour of physicians to apothecaries, the author recommends every proper attention to that very useful class of men, who are generally the precursors of physicians, and with whom an amicable intercourse, and co-operation, if conducted with regard to decorum and etiquette, (which should always be steadily observed) will add to the authority of the one, the respectability of the other, and the usefulness of both.

The 4th chapter treats of professional duties in cases which require a knowledge of law. In many circumstances in which physicians and surgeons may be placed, it is desirable for them to have not only a certain acquaintance with the principles of jurisprudence, but of the forms and regulations adopted in courts of judicature. The necessity of such a knowledge, will evidently appear from the perusal of this chapter, in which much useful information is given on the subject. An extensive appendix is added to this valuable work, which contains a sermon on hospital duties preached by the author's son, in the year 1791, for the benefit of the infirmary at Liverpool, and a variety of notes and illustrations connected with the subjects of the preceding pages, and equally deserving a minute attention.

**ART. V.** *Observations on the Constitution of Women, and on some of the Diseases to which they are more especially liable.* By SAYER WALKER, M. D. of the Royal College of Physicians London, Physician to the City of London Lying-in-Hospital, and to the City Dispensary. 12mo. pp: 228.

THE diseases of women form a large and important branch of medical practice, and have received from the author, more than ordinary attention, during a long period in which he has acted as physician to an extensive lying-in charity. His work may be regarded as a useful compendium of the practice which is now most generally employed in female diseases, but we do not observe

that he has, by the observations which he had an opportunity of making, thrown any new light upon the subject. He studiously avoids entering into any discussion on disputed points in the pathology of female complaints, which we should have considered as natural objects of particular consideration; and contents himself with merely stating the opinions of other writers, where such subjects occur.

After some prefatory observations, Dr. Walker gives a general account of the constitution of women, and the peculiarities by which it is distinguished from that of males, which leads him to the consideration of the menses, chlorosis, amenorrhœa, menorrhagia and fluor albus. He then treats of the diseases of advanced life, which comprize various cutaneous complaints, uterine hæmorrhage, scirrhus and cancer, and the different morbid affections which accompany or follow the cessation of the menses. The diseases which occur during pregnancy, and those which present themselves after parturition, form the remaining subjects treated of in this volume. The former include nausea, sickness and loathing of food, heartburn, costiveness, urinary complaints, œdematous enlargements of the lower extremities, the cramp, spasmodic affections in the stomach and bowels, convulsions, hæmorrhagy and premature labour; the latter, after-pains, menorrhagia lochialis, affections of the breasts, milk fever, puerperal fever, mania and phlegmatia dolens. The author very properly takes much pains to guard against the use of stimulants and the heating regimen, in the puerperal state, and in the treatment of hæmorrhagies. A profuse lochial discharge is often considered as requiring the employment of wine and other cordials, to strengthen and comfort the patient; but this practice, the author observes, is not only

‘ — merely useless, as not at all adapted

to remove the cause of these symptoms; but is highly injurious, as it is calculated to increase and aggravate the mischief. By increasing the action of the heart and arteries, the circulation is accelerated, and the flow of blood from the open mouths of the vessels is proportionably increased. One of the first means to be employed is to keep the patient as cool as possible, and with a view to this, to lower the temperature of the air, by which she is surrounded. This regulation is found useful in other hæmorrhages, and is acknowledged to be necessary on other occasions, even when the uterus is the seat of the disease: but a prejudice against it, in the present circumstances, has been imbibed, and it has been thought necessary to keep a woman, whilst lying-in, particularly warm.— But, not to say any thing of the fallacy of the reasonings used on this occasion, if there were even some risk of future inconveniences, it would be necessary to obviate the dangerous symptom now referred to: but, by a prudent management, all danger of catching cold may be avoided, as constant experience proves. So necessary, indeed, is an attention to this direction, that it has been found that other means, employed with a view to check a flooding, have proved ineffectual, merely because counteracted by an excessive degree of heat, or the use of other stimuli.”

In the treatment of fluor albus, we observe, that the author does not mention the use of astringent injections, which have frequently an excellent effect as a topical tonic; nor does he say any thing of his experience of electricity in amenorrhœa, except to reprehend, among medicines which have been called forcing, its improper use.

#### ART. VI. *Practical Rules for the Treatment of Negro Slaves.* 8vo.

TO the inhabitants of the mid-land counties of England, this must appear a very curious performance; they have heard, no doubt, of several publications on the management of cattle, and on the breeding, rearing, and fattening of oxen and sheep. This book treats of a different species of live stock, not so well known in the markets of this country, described by naturalists as “*animal bipes implete*,” and commonly called *man*.— The author informs us, that he resided many years upon his own estate, and managed his own gangs of slaves; he may therefore be supposed to speak with confidence on different topics, because he speaks from actual experience. His work is divided into two parts: the first of which suggests rules for the management

of negroes, and the second includes directions for their treatment in sickness. He is an advocate for the slave trade, as might be expected. He says that slavery is only prohibited by philosophy, not by theology; and thinks that the arguments adduced against the existence of slavery, would apply with the same force to actions that are considered as moral, noble, and praise-worthy. Since no mortal has yet been found equal to so sublime an effort of virtue (we use our author’s own words), where the interest was large, and poverty the consequence, to surrender his right over his slaves, and restore them to their liberty, he infers that it is a fault of the whole human race, not of the individual; and he flatters himself and his friends, that

they will not be responsible in the next world for their cruel conduct in this. —He speaks, however, such is the omnipotence of truth, of the measures proposed for the abolition of this wicked traffic, with a sort of reluctant tendency to panegyric. It is stated, that many negroes die annually from want of food, hard labour, and improper treatment; and it is calculated that one fourth of the slaves imported die within three or four years after their arrival in the West Indies.—The treatment of the slaves has been much improved within these few years. This is not to be attributed to the more general diffusion of humane and tender feelings among the planters, but to the discovery of the advantages attached to such conduct. It has been found, that whatever ameliorates the health and condition of the slave, improves the fortune of his master. Every thing, in our author's opinion, is estimated by the way in which it may be turned to a good account; thus more food, better cloathing, religious instruction, &c. are recommended, not because they may be conducive to the happiness and comfort of the poor slaves, but because they will contribute to the interest of the proprietor, and diminish the expence in the manufactory of sugar. He denies that slavery is a state of misery; and remarks that the moral feelings of negroes are less exquisite than those of the whites, probably from the want of education. He asserts also, that "*the employment of a planter is a source of genuine delight*;" such delight as our eyes have not seen, it does not readily enter into our minds to conceive.

In page 39, we have met with some curious observations on the different breeds of negroes. Those from the Gold Coast are bad, because they are wild, and not easily tamed; those from Senegal are gentle and steady; the Congos are a good sort, they are of a very black colour, and are well limbed.—Page 42, the Mandingos are not adapted for strong work; the Ebbos and Ebboobees are a very hardy breed, especially the females—they are very little inferior to the males; the kingdom of Gaboon never sends good negroes, they are a sickly race; the Whidaws and Papaws are very good; the Aradas still better; the French speak highly of their qualities; we suppose they afford excellent meat!

The most frequent and fatal diseases

among negroes are fluxes and dropsies; they are less liable to fevers than white people, and this is attributed by the author to the absence of the fear of death. This privilege of exemption from fevers, may probably arise from some physical cause, perhaps it is owing to the state of their skin, which may render them less liable to be affected by any excess of heat, one of the most formidable and dangerous symptoms in all febrile diseases. The remarks on different diseases are short and common-place, they are only calculated to convey some few general notions to persons residing in the colonies, for whom this work is designed. One of the most singular diseases peculiar to hot countries is called the Guinea-worm, though it is not confined to this coast. This animal appears in different parts of the body, under the skin, and among the muscles; it manifests itself by a small tumour, resembling a boil, from the top of which the skin peels, and exposes a small white slender substance resembling thread. The method of extracting it is as follows:

"As soon as the worm appears, take hold of it with your fore-finger and thumb; or, if you find it impossible to be seized with the finger and thumb, employ a pair of surgeon's forceps for that purpose, and draw it forth until you find a resistance, when you should cease to draw, lest you break it, which is easily done. When you have got it out as far as it will come without violence, turn the part which you have extracted round a cotton thread, doubled up into the length of an inch and a half, to the thickness of the wick of a candle; then put a piece of diachylon, or any other sticking plaster, over the cotton, first observing to interpose a small piece of common rag between the worm and the plaster, just large enough to prevent them from adhering, and cover the whole with a bandage. These precautions are taken to prevent the worm from breaking; and you are to admonish the negro to be careful to prevent that. The next day you are to remove the bandage, and to renew your attempt to extract the worm as before, turning it round the cotton as it comes out, and discontinuing your endeavours as soon as you find it to resist; then replace the rag, the sticking plaster, and bandage.

"By this operation, repeated daily, and always with the same gentleness, you may expect to get the worm entire, which is much to be desired; but, should it happen otherwise, you need not be alarmed; for, though it seldom appears again at the same orifice, you may expect to meet with it at some other, not very distant; where, after occasioning a swelling and some pain, it pushes forth again.

Sometimes, indeed, the pain and inflammation are very considerable; and when it so happens, you should apply a fomentation and poultice. Should the worm perish, and, by

corrupting in the part, occasion an ulcer, it must be dressed with basilicon, spread on some lint."

**ART. VII.** *The Edinburgh Practice of Physic, Surgery, and Midwifery, preceded by an Abstract of the Theory of Medicine, and the Nosology of Dr. Cullen; and including upwards of six hundred Formulæ from the Books of St. Bartholomew's, St. George's, St. Thomas's, Guy's, and other Hospitals in London, and from the Lectures and Writings of the most eminent public Teachers, with Twenty Quarto Plates. A new Edition, in Five Volumes.*

THE plan of the present compilation is similar to that of the former edition of "The Edinburgh Practice," but much enlarged, and rendered more extensively useful. Of the present edition, the compiler thus speaks:

"That mere directions how to treat a disease, unaccompanied with any precise law by which that disease is governed, or any detail of the variations to which it is subject, are not merely useless but even pernicious, may be easily proved by the testimony of medical men, who have trusted to the fallacious guidance of those publications which pretend to teach the practice of the different branches of the medical art, without paying any material regard to theory. It is a conviction of this sort that has induced the editor of the following sheets to avail himself of a northern work, already and deservedly popular; and, in its present detached form, to place it within the reach of every medical student and practitioner, divested of many accidental errors, and enriched by materials drawn from the first sources of medical, chirurgical, and obstetrical information in South Britain.

"Thus to the excellent compilations of Dr. Monro and Mr. Fyfe, have been added every successive improvement in medicine and surgery; nor has less attention been paid to the necessary additions to the treatise on midwifery, originally the work of an eminent teacher at Edinburgh. Above all, it has been the editor's endeavour to bring together in these volumes a body of cases, truly valuable and authentic; and greatly to augment the formulæ, which stamped the former edition with a marked degree of superiority over other publications of the kind. Of these it may no less truly be said, that "none are the vague productions of obscure anonymous pharmacopologists, but stamped with the strongest possible characters of authenticity."

\* \* \*

"The plates, the number of which has been considerably augmented, it is hoped, will be found eminently useful, particularly to the young practitioner; and the tables and copious indexes capable of facilitating the reader's pursuits, in a manner that will en-

sure his decided approbation of the undertaking."

The work is strictly a compilation: the editor does not appear in any part as the adviser or instructor of his readers, his plan is to take a standard book as a text, and to add under each disease all that has been given on the same subject by the other writers, which he has chosen to select. The praise of industry, and some judgment in selecting is certainly his, the execution of the work is entirely that of the transcriber. The editor's recipe for composition is the simplest in the world; it is only to mark for publication the volume and page of Cullen, Lind, Fordyce, Zoonomia, Cleghorn, Medical Journal, &c. &c. and the printer will return you a compleat treatise on the disease in question.

In this manner, and on this plan, have five bulky volumes been put together, two on medicine, two on surgery, and one on midwifery; and as five large volumes, full of extracts from the most eminent writers, cannot but contain a great proportion of excellent matter, this selection is certainly a kind of arranged library, and must prove eminently serviceable to those who have not time or opportunity of perusing the originals. As we are not reviewing the medical classics, and standard books in our libraries, we shall pass over the contents of these volumes; but in justice to the compiler we must add, that he has fulfilled his promise in the preface, of bestowing considerable pains in the selection of formulæ, and the indexes and tables of contents: are full, and apparently accurate. The plates are pretty numerous: although an artist or connoisseur might not admire their execution, they give a very faithful view of what they are meant to represent, and correspond with the general character of utility, to which alone this compilation aspires.

ART. VIII. *The London Practice of Midwifery, or a Manual for Students, being a complete Course of practical Midwifery, in which are included the Treatment of Lying-in Women and the Diseases of Children.* 8vo. pp. 300.

THE *London Practice* is a specious title—it would imply to the uninformed that the greater part of the practitioners of this metropolis had adopted an uniform plan of treatment in those cases (in midwifery comparatively few) where the assistance of art was demanded, of which the book with the above title was an abstract.

Were this error, however, the only accusation against the anonymous editor of this volume, we should pass it over as one of the more venial artifices of book-making, considering the high and merited reputation of the *real* author: but common report, strengthened by the evidence of many who recollect, in another form, the observations contained in this volume, throws an imputation of fraud on the part of the editor as dis-

graceful to himself, as injurious to the person at whose expence it has been committed. Pirating for the press the lectures of a public teacher, is a fraud which, in morality, stands precisely in the same light as bribing a printer's journeyman for the unpublished sheets of a valuable work, with a view of underselling in the market: and in the former case, with the additional injury to the lecturer, of giving to the public his observations in an imperfect unfinished state, abounding with the errors of a piratical and often ignorant editor.

Whether the accusation of fraud be in this instance well founded, we do not pretend to judge; but the book would be more respectable if not anonymous, and infinitely more useful, if it bore the marks of correct attention.

ART. IX. *A Popular View of the Structure and Economy of the Human Body. Interspersed with Reflections, moral, practical, and miscellaneous; including modern Discoveries, and designed for general Information and Improvement. To which is annexed, an Explanation of difficult Terms.* By JOHN FELTHAM. 8vo. pp. 440.

THE compilers of the numerous elementary systems, familiar views, and other popular outlines, of different branches of human knowledge, do not always seem to be aware how difficult a task it is to render science easy and alluring to beginners, whilst cutting it down to the level of the lowest capacities. Men of real science sometimes disdain the task, sometimes are unable to enter into the limited views of the learner, and hence it falls into the hands of persons of information too narrow for selection, too meagre for condensation.

Physiology and anatomy, for they are inseparably connected, though infinitely interesting, can never be made *fashionable* (for this appears to be the author's design) till the disgust naturally felt, and prejudices long entertained, against dissection are overcome; till all the apprehensions of timorous delicacy are subsided, and till a mixed audience of genteel and respectable persons can look at the exhibition of human dissection with the same unrepressed curiosity with which they admire the brilliance of the electrical flash, or the dazzle of oxygen combustion.

Mr. Feltham seems to expect with some confidence the period when the

higher ranks of society may suffer the influence of reason to surmount minor considerations, and the legislature authorise more frequent **dissections** among the privileged orders as the most likely means of propagating the practice among the lower classes of the community."

Mr. Acerbi does indeed tell us, that the public pensioners and placemen in Sweden hold their situations on the tenure of bequeathing their bodies for public dissection; but in England no act of parliament has yet passed for authorising surgeons to anatomize the privileged orders for the benefit of their inferiors, and it is only two or three years since an attempt was made to increase the difficulty which now so much opposes the progress of anatomical knowledge.

Nevertheless we agree with the author, and with Dr. Beddoes, that much might be done (keeping within the strictest bounds of modern decorum) to make physiology a part of general education, and that even mere reading on this curious subject might attract the notice of youth, if put together by a master's hand; but it is not fulfilling this intention to give a dry, ill arranged detail of matter of fact, interspersed with scraps of poetry, gleanings from magazines and

books of various authority, and advertising notes.

Mr. Feltham shews himself, however, competently skilled in that part of anatomy which is taught by books; his descriptions are mostly accurate, and in a very few instances he exhibits some marks of that clearness of expression, and aptness of illustration, which are so much to be desired in an instructor of youth. We shall not detain our readers with any specimen of the patch-work sentiment from Lavater, St. Pierre, and Hervey's Meditations, which perpetually occur in these pages: the following will serve as an example of the anatomical description:

"Cartilages are solid, smooth, elastic, white substances, between the hardness of bones and ligaments, and covered with a membrane named perichondrium. Cartilages are the hardest parts of the body except bones, and seem to be kept from ossifying either by their motions of flexion and extension, or by being constantly moistened. Those of the ribs and larynx are often ossified. The cartilages are also part of the living system of the bones: and we see in the bones themselves how unphilosophical it must be, to deny organization and feeling to any part of the living body, however dead or insulated

it may appear; for every part has its degree of life; the eye, the skin, the flesh, the tendons, and the bones, have successive degrees of feeling and circulation. Where even the lowest of these, the bone, is deprived of its small portion of life, it becomes a foreign body, and is thrown off from the healthy parts, as a gangrened limb is separated from the sound body; and we speak as familiarly of the death of a bone, as of the gangrene of soft parts. Organization of life is given to the cartilages, though surely in respect of feeling, they must stand in the very last degree.

"Their uses, as far as they regard bones, are to allow them to slide easily, while by flexibility they accommodate themselves to the different motions, and by elasticity recover their natural figure and position as soon as the pressure is removed. This springy force may also assist the motion of the joint to be more expeditious, and may soften the shocks in running, jumping, &c. To these we owe the security of the moveable articulations, for without them the fibres of the bone would shoot out, and immediately coalesce with the additional bone."

We may add, that the author has entirely avoided all possible imputation of indecorum, by totally omitting those parts of anatomy to which these ideas could be attached.

ART. X. *A New Medical Dictionary, containing a concise Explanation of all the Terms used in Medicine, Surgery, Pharmacy, Botany, Natural History, and Chymistry. Compiled by JOSEPH FOX, M. D. late Physician to the London Hospital; revised and augmented by THOMAS BRADLEY, M. D. Physician to the Westminster Hospital. 12mo.*

BY help of a very small type, and extremely brief definitions, the compilers of this little work have contrived to include, as they profess to do, nearly all the terms that ever occur in the sciences mentioned in the title-page, and the volume is, in one sense, "an universal index on the subjects of medicine, surgery, and natural history, as far as it relates to medicine." It is, however, an index without references. Though the reader is promised, "that he may consult this dictionary with an assurance that he will

not be disappointed in finding the term he may want," we think that the authors might have spared a very great number of antiquated terms, the dreams of Van Helmont, and the mystic jargon of Paracelsus, without incurring the risk of failing in their engagement to any who are likely to employ such a help to knowledge as the present volume. In other respects it is fairly executed, and pains have been taken to render it copious in those parts which are likely to be most frequently consulted.

ART. XI. *Observations on the Opinions of ancient and modern Physicians, including those of the late Dr. Cullen, respecting the Nature and Cause of the Uterine Discharge. Also, Observations on the Opinions of Dr. Cullen on Amenorrhœa, or Green-sickness, of Dr. Saunders on Diseases of the Liver, of Dr. Thomas on Cachexia Africana, and of Dr. Bellacoe on Scrophula. And Remarks on the Method of Cure of what has been called Chlorosis, Amenorrhœa, or Green-sickness, as delivered to us by our late Preceptor, and other eminent Physicians: By A. FOGO, Surgeon. 8vo. pp. 103.*

THE object of this performance is to prove, that the medical world has long been mistaken in their ideas on the na-

ture of female obstructions; and that the symptoms which have hitherto been referred to this cause, originate, for the

most part, in an enlarged, obstructed; or scirrhus liver, and are to be cured by medicines of the alterative, aperient, attenuating kind. It would be little satisfaction, and no improvement to our readers, to accompany the author through the various pieces of bad reasoning, and the many coarse, awkward, and indelicate attempts at wit, which so often appear in the course of this little work. That he may have been right in occasionally finding an enlargement in the liver, in chlorosis, or amenorrhœa, we do not doubt; but that such is invariably the case, and that the remedies generally employed for the cure of those complaints, particularly chalybeates, never do good, is a position which he would find some difficulty in establishing, because he must previously remove an accumulation of unequivocal facts, afforded by the practice of every medical man of experience. The author expresses much surprise that so much pains have been taken, with so little success, to explain the cause and uses of menstruation. To him this appears perfectly analogous to many of the other functions of the body, and no more difficult to explain; for the

whole circumstance, says he, is nothing but a characteristic, which distinguishes the noblest from the inferior animals of the creation. But if he confess himself unable to explain the uses of this important function, in any other way than that now stated, and is dissatisfied with the attempts of other authors to account for it, we cannot admit his right to consider obstructed menstruation of itself as the mere retention of a certain quantity of blood, perfectly unconnected with a morbid state of the uterine system, and incapable of having any further influence upon the body, than what arises from an increased quantity of blood, which might readily be withdrawn in another way.

The author does not inform us what medicine he employs of the alterative, aperient, attenuating kind, to answer his indications of cure, but we suppose from a hint in one of his cases that it is calomel.

The *cahexia Africana*, described by Dr. Thomas, and the species of *scrofula* mentioned by Dr. Beddoes, are, from the symptoms, conceived by the author to be affections of the liver.

**ART. XII.** *Three Letters on medical Subjects: addressed to the Reverend Gilbert Ford, Ormskirk, Lancashire. Containing, 1. An Account of the Effects of an aloetic Medicine in the Gout and other chronic Complaints. 2. A Practice which has been successful in the individual Prevention of the late Epidemics. 3. An Account of the sedative Properties of the granulated Preparation of Tin, in some Affections of the Mind.* By JOHN FORD, M. D. Chester. 12mo.

THE object of the two first letters, is to recommend an aloetic medicine (the particular composition of which the author withholds) as highly beneficial in gouty complaints and influenza. Its obvious action is as a purgative, but the author connects with it some particular operation upon the liver, and other organs. The third letter is upon the effects of granulated tin as a vermifuge, and as removing without difficulty, indurated feces, and viscid mucus from various parts of the alimentary canal, both which have a powerful tendency to produce, or keep up, various mental affections.

Empiricism cannot be concealed in this publication, under the thin mask of candour, philanthropy, and erudition. But as a newspaper is generally considered as the best means of diffusing the knowledge of such preparations as the authors are convinced cannot be too universally known by the public, we should not be surprised if Dr. Ford at some future period adopt the plan so successfully pursued by the Brodums and the Solomons of the present day, in order more extensively to disseminate the knowledge of a valuable medicine, prepared only by himself.

**ART. XIII.** *Medicina Nautica, an Essay on the Diseases of Seamen, comprehending the History of Health in the Channel Fleet for the Years 1799, 1800, and 1801.* By THOMAS TROTTER, M. D. Member of the Royal Medical Society, and honorary Member of the Royal Physical Society of Edinburgh, late Physician to his Majesty's Fleet under the Command of Admiral Earl Howe, K. G. and to the Squadrons commanded by Admiral Lord Bridport, K. B. Admiral Earl St. Vincent, K. B. and the Hon. Admiral Cornwallis. 8vo. 507 pages.

THE present volume is the conclusion of the author's work on nautical medicine, and consists, like the former ones, of a general history of the health

of the fleet to which he was physician, and of various strictures and observations relating to the diseases of seamen, both by himself and numerous correspondents. The enthusiastic zeal with which Dr. Trotter has prosecuted his labours, for the improvement of that department of naval discipline which relates to health, is highly creditable, and in some important particulars has led to very beneficial changes. He laments, however, that his suggestions have not always received that degree of attention which, in his estimation, their importance demanded, and with others, who have aimed at material innovations, has had occasion sometimes to complain of the disinclination of public offices, to listen to any deviations from established usage. In order, however, to prevent such hints as he deems worthy consideration from being entirely lost to the world, he has thought it advisable to insert them in the present volume.

With an honourable zeal in the cause of a numerous and deserving body of the profession, the author has used every endeavour in his power, to ameliorate the condition of navy medical men, who, he thinks, have been hitherto very much and very impolitically neglected. His observations on this subject, which are interspersed through various parts of his book, are more particularly stated in a letter to the present first lord of the admiralty, in which the merits of this class of men are spiritedly pointed out, their hardships noticed, and such a plan of encouragement recommended, as appears to him expedient. The author considers it to be absolutely necessary, that the services of medical men, in public situations, should be uninterrupted by private practice. But in order to withdraw any kind of apology, which the narrowness of pecuniary circumstances may give, for such a combination of public and private duties, it is necessary that their emoluments should be increased. He gives some striking examples of the disadvantages which have arisen, from the interference of the one with the other.

In the history which is given, in this volume, of the health of the fleet, we find a very creditable and humane interposition, on the part of the author, to check the great increase of dissipation at Plymouth, occasioned by the imprudent augmentation of public houses, which, in the town of Dock alone, had

an increase of one hundred and forty.—The board of admiralty attended to his suggestions on this subject, and very wisely ordered the number to be reduced to the old establishment.

Dr. Trotter, it is well known, has always been a violent opposer of nitrous fumigation, which, like every other process of a similar kind, he is convinced, does nothing more than overpower, or neutralize a disagreeable odour, and divert the attention from the use of a free ventilation, a safe and efficacious means of destroying the contagion. The exertions made by him with a view to procure a more perfect ventilation to the decks of ships, are very meritorious, and tend materially to remove the causes, or arrest the progress of disease, while the separation of febrile cases, which he has practised with so much success, has frequently stopt the course of a contagion, which threatened to commit the most formidable ravages. The propriety of the means recommended by him, are thus fully demonstrated; and if he were satisfied with stating his conviction, that those means were sufficient for the purposes in view, without having recourse to any other, he would do no more than is completely warranted. Dr. Trotter, however, goes much further; and, from what appears to us a very imperfect experience, takes every opportunity of vilifying the use of nitrous fumigation, as a destroyer of contagion. This, indeed, seems to be a favourite topic with him; for the slightest occasion is invariably embraced, to make some ill-humoured reflection on its use. If Dr. Trotter spoke from a fair, impartial, and candid trial, his tone might, with reason, be decided; but it is apparent, that the feelings with which he was actuated when the subject first came under his discussion, and those which still remain with him, are by no means favourable to philosophical examination. Dr. Trotter's reasoning on this subject, has always been weak, and is by no means improved in the present volume; for, whatever may be the merits of the nitrous or muriatic fumigation, they can only be known by fair experiments, instituted by men accustomed to inquiry, and who have not prejudged the practice which they are to examine. Various trials, it is true, are mentioned in the present volume, by the author's correspondents, in which the practice is said to have been ineffectual; but the im-

perfect evidence in general to be deduced from them, is very materially weakened by the great appearance of a want of candour, with which they are for the most part accompanied, and the evident disposition which they so frequently discover to flatter the particular opinions of the person to whom they are addressed.

The author, under the term fumigation, very improperly confounds every species of this process, and thus from the ill-success which attended the smoking of clothes and rooms formerly, and now occasionally practised, adduces a specious, though an uncandid and fallacious argument, against the use of the plan lately brought forward.

His tone may be judged of from the following remarks, which occur at the beginning of the chapter on contagion and typhus :

“The spirit of fumigation had arrived at its full height, on the introduction of the nitrous vapour, published by a court physician, countenanced by the admiralty, and directed by the *codex officialis* of the sick and hurt board. But not one of its supporters have yet ventured or deigned to go one step into the inquiry concerning the nature of contagion, or its chemical attraction for this vapour. The naval department, they were led to believe, would eagerly embrace the practice, on the authorities which accompanied it; but fortunately for the service of the country, it came at a time when the subject of health was beginning a new era; and when both officers and surgeons doubted the validity of what came in so questionable a shape.

“The world has now seen a second edition of Dr. Smyth's work; in which he has published some reports of naval surgeons to the commissioners of sick and hurt, on the supposed efficacy of this anti-pestilential fume. I do not mean at this stage of the discussion, to criticise those select reports; but I feel most unfeignedly for the reputation of the medical officers, when I behold official documents laid before the public eye in defence of the grossest delusion. Yet these are all that the board have produced from seven hundred surgeons, after seven years war! There is one thing for which I give the reporters due credit; attention to cleanliness is a part of their operations. But at the same time I cannot help remarking the passive spirit of these gentlemen, with the fuming pipkins in their hands, that they never asked themselves, what is the chemical nature of this contagion? Does it possess form or substance? How does this vapour act in destroying it? These questions arose so naturally from the employment of fumigation, that it shows as much a want of

common curiosity, as it was unphilosophic, not to interest themselves in the business. A disease disappearing, during the time any article of the *materia medica* is used, may receive the credit of the cure from an ignorant bystander, or a shallow observer; but the man who notes the history of cases; the mind enquiring after truth must weigh causes and effects; draw conclusions from reasonable premises; and appeal to principles confirmed by experiment and matter of fact only. To say that the nitrous vapour subdues contagion, without explaining the manner, is like the fly on the chariot wheel in the fable. It reminds me of a story told to children, that the great mogul orders a bell to be rung when he goes to dinner, and conceits that the whole world dines at the same time. In like manner, these gentlemen trim their pipkins, and conceit, while the fumes ascend, that whatever is contagious within their reach, is annihilated and destroyed.”

We are not a little surprised, that Dr. Trotter, who is not a Tyro in medicine, should bring forward a piece of declamation so much at variance with the information which practical experience furnishes, as that which we have now quoted. Is it necessary to know the proximate cause of a disease, and the exact operation of a medicine, in order to effect its cure?

And must we regard the cure of every complaint as hopeless, when we are ignorant of its precise nature; and throw aside the use of every remedy which experience has demonstrated to be serviceable, merely because its mode of operation is unknown? Surely Dr. Trotter will not assert, that because we are ignorant of the nature of syphilitic poison, and of the mode in which mercury operates in destroying it, that we are to cast off the use of this remedy, and leave the disease to itself, until our knowledge of it is more complete. And yet his reasoning with regard to a destroyer of contagion, will go, on examination, precisely to that length. The author admits, that the stench of bilge water may be destroyed by the nitrous fumigation, as was stated to him by a captain of the navy, in a letter which is inserted in this work; and he accounts for the effect, by supposing, that the vapour employed, underwent certain chemical changes by coming in contact with the offensive exhalation of bilge water: but if this is admitted in the present instance, there does not appear to be any thing unphilosophical in supposing, that the same may take place when contagious matter comes in con-

tact with the nitrous vapour. The result of the latter combination is certainly unknown; but there is nothing so absurd in the supposition of its taking place, as to interrupt an examination into the real merits of nitric vapour in destroying contagion. The author seems to entertain an idea of its being a part of the doctrine of the advocates for nitrous fumigation to suppose, that the oxygene contained in the acid, is afforded to the atmosphere, and thus assists in purifying it. He therefore asks, with much self-complacency, what becomes of the azote with which it was previously combined? It must be observed, however, that the idea thus attributed to the advocates for nitrous fumigation, forms no part of their doctrine, which goes no further than to point out a mode by which the power of contagion is destroyed, without attempting to determine by what means this effect is produced. The author's extensive experience confirms the observations of Dr. Currie, with regard to the use of cold affusion in typhus. The large and indiscriminate use of bark is condemned, and the employment of antimonials in the advanced stages of this disease considered improper.

Quarantines, he is of opinion, have hitherto been conducted on very erroneous principles. By way of speedily and effectually purifying any contaminated goods, he thinks there should be proper establishments, where they might be exposed for a certain time to moderate heat, and a free current of air. To these institutions, he would add a small medical establishment, where affected persons, or those suspected of being so, might be detained, with the advantages of proper medical aid.

The author has not been able to determine, how far contagion may be carried by the air, but he supposes that a few yards may be sufficient for perfect safety.

The chapter on ventilation is principally directed to officers, and contains many useful directions, on the mode of procuring a free supply of air to the lower decks, and removing from them what has been vitiated. As an instance of the great necessity of such a supply, the author states, that in the summer season and warm climates, the Orlop deck comes very near, in some corners, to a vacuum, as he frequently ascertained by the sweat bursting out as soon as he

entered it. What the doctor's ideas of a vacuum may be, we know not, but we confess it to be greatly beyond our powers of conception, to imagine such a state to occur, where the communication with the surrounding air is uninterrupted. His own feelings may be very good evidence with himself, but we must own that though we run the risk of having reflections thrown upon us for dullness, they do not, to our minds, in this instance, completely prove his position.

We suspect that the author's information is incorrect, when he states, "that experiments have lately been made, that prove the proportion of the oxygene to be greater in the island of Martinique than in Great-Britain." The most accurate observations which have come to our notice, shew no difference in the proportions of the component parts of atmospheric air in any part of the world.—Dr. Trotter considers dry rubbing with sand, as a much better method of cleaning decks, than the continual use of water, which, besides keeping up a constant dampness that is very inimical to health, disposes the wood to rot, and, by leaving saline particles on the iron, nails, &c. rusts them and thus weakens the ship.

Two short chapters are devoted to observations on the small and cow-pox, and to pneumonia, catarrh, and ophthalmia, (ophthalmia); after which the author goes on to phthisis pulmonalis, a disease, which he informs us has been particularly frequent among seamen since the year 1800. The very long cruises made in blocking up the enemy's fleets; the severe duty required of the men sometimes at sea, but more particularly in the short periods of equipment; and the constant use of lemon juice, served, in the author's opinion, to dispose very much to attacks of this complaint. His idea of its proximate cause is, that it consists in an exhausted excitability, in which the arteries have an increased irritability, while the lymphatic system is torpid. He is inclined to agree with Dr. Beddoes on the good effects of a lowered atmosphere, in the cure of this complaint; and considers it highly improper to employ the debilitating plan. The author very humanely and very properly recommends, that whenever a seaman is at all indisposed, he should be kept from duty for some time, in order to prevent the occurrence of a serious indisposition.

In a chapter upon spasmodic complaints, he takes occasion to point out, as a very singular circumstance connected with the constitution of seamen, that they are particularly subject to such complaints as are called nervous.

"That a body of men," says the author, "by education and habit accustomed to adventure, braving danger in every hideous form, and surpassing hardship, famine, and fatigue, in every shape, (the very relation of which appals the puny imagination of timid minds, enfeebled by luxury and delicacy in the fashionable or retired walks of life) should be subject to complaints more nearly allied to the tender female, than the robust masculine constitution, would appear a paradox, did not daily experience confirm the fact."

"There is a something in the atmosphere of a ship, perhaps deficiency of oxygene, and the local confinement on board, that, to particular persons, are a never-failing cause of vapours and dyspeptic feelings. The motions and actions of the stomach and intestinal canal are retarded and become irregular, and habitual costiveness at sea is common in many constitutions. I do not think that this depends so much on the sea diet as has been generally imagined. The situation itself affords less variety than most other conditions of life; day after day you go through the same kind of routine, the same objects are presented to the eyes, the same smells to the nose, and the same sounds to the organs of hearing. As all stimuli lose their effect by repetition, and as a peculiar train of ideas so naturally follows external impressions on the organs of sense, that condition of mind is generated which is usually styled nervous. But the effect appears to fall chiefly by sympathy or association on the stomach and bowels. This complaint, therefore, belongs with more propriety to the catalogue of the sea diseases than has been either suspected or believed; and, if we may judge from the multitude of cases which have come under our observation, it ought to be considered as a very common one. I have seen in a sick-birth, at one time, no less than five or six strongly-marked instances of violent hysteric. Long cruises in bad weather, joined to severe and irksome duty in the foggy and variable climate of the channel, will, at all times, produce these complaints; such is the duty of a blockade. On the contrary, I believe the disease is little known in the southern latitudes, for I have seen both officers and surgeons prefer a West-India station, solely with a view to escape it, which they could not do in the home cruises."

Independent, however, of the causes now enumerated, the author considers the disease as being particularly favoured by a gouty constitution, fevers and fluxes, the too liberal use of spices, but

particularly hard drinking and frequent mercurial courses. Change of scene, and moderate exercise on shore, particularly on horseback, readily effect a cure.

Dr. Trotter's earliest labours were on the subject of scurvy, and the retrospect of them justly affords him considerable satisfaction. In the present volume, he slightly notices this disease, in order to express his disapprobation of the plan now in use in the navy for preventing it, that of continually giving an allowance of lemon juice to seamen. This he considers as unnatural in winter, and unnecessary, except when the disease has actually appeared. Vegetables, (which may always be carried out to sea,) and fresh meat, (when it can be procured), will effectually prevent it, but at the same time there should never fail to be a sufficient stock of lemon juice, or rather of the concrete acid of lemons, in hand, for the purpose of administering, whenever symptoms of scurvy appear.

The volume is concluded by an account of Capt. Markham's sick birth, and sick diet; a few observations on sea-sickness; and some communications from various navy surgeons on the malignant ulcer, so common and so obstinate among seamen.

The sea diet is very well worthy of observation, and the plan of it should be universally adopted through the navy, as affording to the sick sailor various comforts, which could not be furnished by the public, but at a very great expence.

"The plan," as is mentioned by the author in a letter to Sir Evan Nepean, "is to establish a mess for the sick, by the consent of each ship's company, which is to be done from the salted provisions, &c. which the sick are unable to eat when indisposed, and confined to the sick birth. There are numerous diseases, when it is either improper for the patient to use the ship's diet, or when, from want of appetite, he dislikes it. A large allowance, therefore, goes to his messmates, which if not devoured by them, has often been sold on shore to disadvantage. Now, instead of this superabundant allowance being given to a man whose appetite rejects it, or to his messmates, who may sell it for bad purposes, Captain Markham, of the Centaur, has been long in the habit of directing the purser to keep a book of credit for all such provisions, from a list daily furnished by the surgeon, which credit goes to the use of the sick, and is converted into a fund for supplying live stock, whether sheep or poultry, porter, vegetables, fruit, &c. when the ship goes to sea; from this also, new bread is daily baked for the use of the whole."

The present, we are informed, is the last volume of *Medicina Nautica* which will appear. Any communications on

the subjects of the work, which may afterwards be received by the author, will be inserted in another edition.

ART. XIV. *Attempt to investigate the Cause of the Egyptian Ophthalmia, with Observations on its Nature and different Modes of Cure.* By GEORGE POWER, Assistant Surgeon to the 23d Regiment of Foot, or Royal Welsh Fusiliers. pp. 72.

THE author of this essay had an opportunity, by being attached to the English army in Egypt, of seeing very numerous instances of the Egyptian ophthalmia, a disease which is peculiarly serious and obstinate. To this field of extensive observation, which enabled him to become acquainted with every form of the complaint, was added a severe attack of it in his own person, which gave him occasion to try the effects of opium, in order to relieve the excruciating pain with which it was attended.

“The first dose produced a very sensible cessation from pain, without inducing the least disposition to somnolency, but rather a degree of exhilaration, heightened of course by this pleasing change in my health. As those effects disappeared the pain returned, so that a repetition of the dose was found necessary during the night, and twice or thrice the next day, applying at the same time the vegetable poultice, and removing the discharge occasionally by syringing.

“Having persevered in this mode of cure for two days, on the third I was enabled to perform my duty.”

A medical friend was soon after induced to employ the same remedy, which he did with so much success, that from that time it formed a part of the plan of cure in the military hospitals appropriated to ophthalmic patients; and it is affirmed as a fact, that, in the space of a month from its general use, every one of them was restored to the army, in a state either of convalescence, or of perfect health. The author considers the disease as one of debility, and in this manner accounts for the great advantage which opium produced in its cure; but whatever might be thought of the rationale of the practice, its success was perfectly sufficient to recommend it. In the early stage of the disease a collyrium of rose water, distilled vinegar, and a small quantity of opium or cerussa acetata, with a few doses of bark, were found to be sufficient to remove it. But when the high inflammatory stage had come on, which was generally the case before an application was made for relief, it became necessary to employ more vigorous measures. Besides the frequent

injection of a stream of clear water into the eye by a syringe, a gentle laxative was generally administered;

“—after the operation of which, if not contra-indicated by a general phlogistic diathesis or pleihora, a quarter of a grain or more opium was ordered every four or six hours, according to circumstances, on the first and second day; but diminishing the frequency as well as the quantity of the dose on the succeeding days, until the cure was accomplished, which a course of bark effectually confirmed.”

When the inflammation appeared likely to advance, or had arrived at an alarming height, it was necessary to use general and local bleeding, blisters, and cold applications to the eye. We feel it difficult, however, to reconcile some parts of this practice, particularly the use of blood-letting, to the author's idea that the disease arises from a debility, which it is necessary to counteract. The œdema, or spasm of the eyelids, which sometimes remained after the inflammation had abated, were relieved by warm fomentations, or a blister, applied over the eyelids. If, on getting the eyelids opened, the cornea was found to be red, a solution of cerussa acetata was employed as a collyrium, or a blister applied behind the ear. When there were spots or specks upon the cornea, which were not particles of indurated matter, separable by aqueous injection, an active dry collyrium frequently removed them, though it is admitted that this was often unsuccessful. By first mentioning the plan of treatment recommended by the author, for the cure of the Egyptian ophthalmia, as we have inverted the order adopted in his work, it remains that we should state the result of his observations with regard to various circumstances connected with this disease. He is dissatisfied with all the causes which have been assigned for its production, and considers the absence of it among the Bedouin Arabs who inhabit the deserts, and its being scarcely observed in General Baird's army, which had a very long and perilous march through the deserts, to be proofs that the effects of

sand are not sufficient for its production. The author considers it as having a common origin with the plague and dysentery, and as arising with them from a putrid virus, diffused in the atmosphere, and produced by the union of putrid exhalations from animal and vegetable matter, with the various earthy and saline substances with which the air abounds. These circumstances are favoured by that state of corporeal debility which is so commonly observed among the inhabitants of Egypt, and so soon appears in Europeans in some degree. When they operate upon a system peculiarly debilitated and unable to resist them, they produce, according to the author,

“—that highly putrid fever called plague In a patient less relaxed, as the habit of body determines the disease either to the surface of the skin, or to the intestines, an eruptive fever or dysentery is produced. And when the putrid virus is but partially applied, to the eyes for instance, or to the mouth, or even on the surface of the body, ophthalmia,

ulcerated fauces, or ichorous blotches on the skin ensue.”

The hypothetical view of the subject which the author here communicates, is not very likely to prejudice the reader in favour of his philosophical powers. The circumstances stated as producing so long a train of diseases must be supposed to exist in an equal degree wherever the plague originates; and yet the ophthalmia, so prevalent in Egypt, does not appear as an epidemic in any other country. Much of this reasoning is upon data which are assumed, and we have yet to be informed of any experiments which justify him in his conclusion, that argillaceous and calcareous earths abound in the atmosphere, either in a separate state, or combined with sulphuric or carbonic acid.

The author gives an accurate account of the symptoms of the Egyptian ophthalmia, and mentions the practice which is usually, though, as he informs us, unsuccessfully adopted in its treatment.

**ART. XV.** *Observations on Diarrhœa and Dysentery, as those Diseases appeared in the British Army during the Campaign in Egypt, 1801. To which are prefixed a Description of the Climate of Egypt, and a Sketch of the Medical History of the Campaign.* By HENRY DEWAR, late Assistant Surgeon to the Cambridgeshire Regiment of Foot. pp. 161.

THE introduction to this work is occupied with a general account of the climate of Egypt, and various particulars relating to the medical history of the late campaign. To the many circumstances which were capable of affecting the health of the army in that country, the author thinks may with great propriety be added, the particular kind of tent employed, which universally consisted of a single covering, and was therefore a very ineffectual defence from the rays of the sun.

A few general remarks on bowel complaints precede the account which is given of diarrhœa. The author divides them into diarrhœa, dysentery, cholera, colica, and enteritis, and considers all of them, but particularly the two former, as demanding the peculiar attention of the army medical practitioner.

The symptoms of diarrhœa often went so imperceptibly into dysentery, that it was not easy to draw a proper line of distinction between them. The predisposing causes of this disease were the debility which follows acute diseases, hard drinking, fatigue, and change of diet from salt to fresh meat; but more

particularly the high temperature of the atmosphere. The exciting causes were cold, eating and drinking acrimonious and putrid substances; inhalation of putrid effluvia, intemperance in eating, and drinking cold water in immoderate quantities. The author had occasion to observe a remarkable connexion between all the diseases which were produced by cold.

“A rheumatism in the arm or back, often alternates with diarrhœa and pain in the bowels. It is also very common for pains in the bowels sensibly to move backwards, and settle in the muscles of the loins, in the form of lumbago. These facts evince that a resemblance exists betwixt the two diseases; or rather, that they differ only in the part affected. This is more particularly to be remarked in such forms of these diseases as owe their origin to cold. When rheumatism is the effect of overstrained muscular exertion, or when diarrhœa is the effect of acrimonious or spoiled food, they do not alternate in the same manner. The disease is not then connected with a general diathesis in the animal system. It is more properly local in its nature, and therefore less easily shifted to different parts of the body. I have observed in some cases a similar connexion betwixt bowel

complaints and pneumonia, especially where the constitution has been impaired by a former dysentery. When the system has been exposed in a susceptible state to the effects of cold, symptoms of an incipient inflammation in the lungs were accompanied with uneasiness in the bowels; and where the disease was not stopped, it terminated sometimes in pneumonia, sometimes in diarrhœa. In Egypt, bowel complaints were observed by the medical gentlemen, both in the French service and ours, to alternate remarkably with ophthalmia. This last disease, though it did not in general yield to the administration of purgatives, often disappeared on the patient being attacked with diarrhœa. And, on the other hand, it frequently attacked a patient when a diarrhœa or a dysentery was cured. Diseases of the bowels are well known to alternate with the different species of lichen, and other cutaneous diseases."

The author does not consider the effects of obstructed perspiration in producing diarrhœa to arise from those humours which would have been thrown out by the skin being forced inwards on the bowels, but to the action of cold upon the sensible fibres of the skin, and to the sympathy of those fibres with those of the alimentary canal. In the cure of diarrhœa he principally trusts to opium, conjoined with some one or other of the various astringents in use. When they have assumed a chronic form, camphor and opium are often found to be the best remedies.

In his description of dysentery, the author is not disposed to consider fever as always forming a constituent part of this disease; he is rather of opinion that it is an independent disease, with which the intestinal affection is accidentally combined; and hence observes, that dysentery often appears as a collateral epidemic, during the prevalence of remittent fevers. Diarrhœa and dysentery, he is of opinion, are much more nearly connected than is generally allowed, and has had frequent occasion to remark, that dysentery either begins, or, in the course of some of its stages, has had a mixture of diarrhœal symptoms combined with it. The causes of dysentery are the same as those of diarrhœa, and, whatever may have been its origin, it generally is in course capable of being propagated by contagion. This the author also considers as applicable, though

in a smaller degree, to diarrhœa. The cause of dysentery he attributes to irritations, which are attended with slight specific sensations in the parts affected, and which at first produce almost imperceptible changes in the alimentary canal, but by being in time accumulated, give rise to a train of diseased motions and painful feelings, which all at once force themselves upon the attention.

As preventives of this disease, the author recommends caution with regard to exercise, particularly in the heat of the day, flannel clothing, attention to diet and the state of the alimentary canal, and the use of aromatics, as cinnamon or ginger, on finding the least pain of the bowels. In the beginning of the complaint, the alimentary canal is to be cleared by purgatives of neutral salts, or castor oil; but during their operation it is strongly recommended to keep the bowels very warm by thick folds of flannel, secured by a flannel roller applied tight, and in a uniform manner, nearly to the arm pits, and to wear this until the complaint disappears. Emetics are necessary when there is much nausea and heaviness about the stomach, but they are to be given in divided doses, so as to operate by vomiting and stool. After the operation is over, opiates are to be exhibited to quiet the bowels, and after twenty-four or thirty-six hours the purgatives must be again had recourse to; and thus, by alternately exciting the bowels and allowing them to rest, the greater number of dysenteries gradually yielded. When the flannel bandage was employed, the author remarks, that opiates were very seldom necessary, as the support which it gave to the bowels, together with the warmth kept up by it, were generally sufficient of themselves to produce considerable relief. The author speaks with great confidence of the use of this application, which he was first induced to employ from the recommendation of the late Dr. Whyte. He adverts to various other means of cure which have been employed by different authors, and concludes with some observations on the diet proper for dysenteric patients, and the treatment of some complaints consequent upon this serious disease.

ART. XVI. *An Account of the Epidemical Catarrhal Fever commonly called the Influenza, as it appeared at Bath in the Winter and Spring of the Year 1803. By W. FALCONER, M. D. F. R. S.* pp. 46.

THE epidemic which prevailed so universally in the beginning of last year, has given rise to several publications on its nature and treatment. The ample opportunities which have been so universally afforded, of witnessing every part of its phenomena, might reasonably be supposed to have elucidated every circumstance concerning it. We still however find, that there is considerable difference of opinion, not only with regard to some particulars of its treatment, but on its mode of propagation; many conceiving it to be of a contagious nature, and therefore capable of being communicated from an individual to another, while others consider it as arising from an epidemic constitution of the air to which all are equally exposed. The question is one of considerable difficulty, and we are not yet in possession of evidence sufficient to determine it. The mere statement of an opinion, with which authors for the most part content themselves, cannot be admitted as having much weight in an inquiry, which is only to be successfully prosecuted by a minute attention to facts, in the examination of which there are numerous sources of error. Some observations of Dr. Haygarth's, on the nature of the epidemics, of the years 1775 and 1782, which are published for the first time in an appendix to the account of the influenza now before us, seem to afford an example of the only proper way, by which the contagious nature of so universal a disease can be clearly ascertained: Information was carefully sought for and obtained, from various respectable persons, whether in the profession or not, of the particular periods at which the epidemic made its appearance, both in Chester, and the different towns and villages in its neighbourhood, and of the sources from whence it was supposed to have arisen. In the year 1775, the first person afflicted with the influenza in Chester, was the landlady of a principal inn, to whom it was supposed to have been communicated by some travellers from London; in a short time, it spread through the whole town. In the year 1782, a gentleman ill of the influenza, went from London to the same place, and communicated the disease to a lady into whose family he came; in about a fortnight the complaint was

general. In villages and scattered houses in the country, the disease always appeared later than in neighbouring towns, and its introduction could frequently be traced, without difficulty, to a particular individual. The following was the result of the information which Dr. Haygarth received on the rise of the epidemic in several towns in the neighbourhood of Chester.

"1. That the first patient who had the disease in Frodsham, was seized with it as he was returning from Manchester.—2. That at Malpas, the first patient was the landlady of the inn and her family, a week sooner than any other patient in the town.—3. That the first person who had the distemper in Middlewich brought it from Liverpool.—4. That the first person affected with the influenza at Mold, had been at Chester a few days before, in a family ill of that distemper.—5. That a gentleman arrived at Oswestry, ill of the influenza before the inhabitants were attacked.—6. That at Tarporley, the first person seized was a postilion who had driven a chaise thither from Warrington, where the distemper had previously appeared.—7. That at Wrexham, the first patient came from Chester, and the second from Shrewsbury. But my correspondents at Holywell and Ruthin did not recollect by whom it was brought into these towns."

Reasoning from the analogy of the former epidemics, and comparing their progress with what has happened in 1803, Dr. Haygarth has no doubt of the late influenza having been contagious, but in order to ascertain the fact by the most correct evidence, he advises practitioners to institute enquiries similar to those which he made, in order to discover the very individuals by whom the disease was transported from one place to another. This kind of evidence is certainly necessary to set the question at rest; and it is to be lamented, that the enquiries of Dr. Haygarth have not been equally directed to the investigation of the nature of the late influenza, as to that of the former one; or that other medical men of experience and observation, have not prosecuted the subject on a similar plan.

The principal circumstances which characterize the account given in this pamphlet, of the influenza as it appeared in Bath, and its neighbourhood, are the disposition which frequently shewed it-

self to peripneumony, and the consequent necessity there was, in such cases, for general blood-letting. The complaint came on with symptoms of general fever, which were soon followed by headach, cough, and difficult respiration; pain and throbbing of the temples, vertigo, and hot and dry skin. The pulse was variable, in some very quick, even to 150 in a minute; in others not exceeding 80 or 90. In one of the worst cases which Dr. Falconer saw, it did not exceed 70, and in upwards of 100 cases which appeared in the general hospital, it did not rise above 100. Six only of the cases which occurred in the hospital had peripneumonic symptoms, but they were much more frequent in private practice. Only four persons died in the author's practice, and all of them peripneumonic; he had not an opportunity of inspecting the appearances on dissection, but received the particulars of a case, in every respect similar to them, from Dr. Broderip, in which there was much inflammation in the substance of the lungs, with large adhesions, and considerable extravasations of coagulable lymph.

When the peripneumonic symptoms were at all urgent, bleeding was absolutely necessary; but they were frequently checked in their progress, by the early employment of an emetic. Neither leeches nor blisters were adequate to the relief of the pectoral complaints. Ammoniacum and squills seemed to do harm, volatile alkali appeared to be serviceable, but most advantage was derived from opiates, given so as to abate the cough. The author considers the complaint as decidedly contagious, and remarks, that it was always followed by a great and characteristic debility, which remained for some time after the complaint had gone off. After giving the results of his own experience in this complaint, the author annexes an account, translated from the *Moniteur*, of the same disease as it appeared in Paris. He subjoins an abstract from the bills of mortality of Bath, in order to shew that the number was very materially increased, during the existence of the epidemic, but as far as his own practice extended, the disease was by no means a fatal one.

**ART. XVII.** *Observations on the Epidemic Catarrhal Fever, or Influenza of 1803; to which are subjoined Historical Abstracts concerning the Catarrhal Fevers of 1762, 1775, and 1782, and Communications from various Correspondents. Second Edition.* By RICHARD PEARSON, M. D. pp. 49.

THE late epidemic is here represented as having differed from a common cold, in the degree and kind of fever with which it was accompanied, and in the fever, not the catarrhal symptoms, constituting the essence of the disease. From these circumstances, the author is of opinion, that it should be termed epidemic catarrhal fever, or synochus catarrhalis, and not simply epidemic catarrh. The following are mentioned as its most frequent symptoms.

“After some alternations of chilliness and heat, the patient is seized with a heaviness or pain of the head, with sneezing, wateriness of the eyes, hoarseness and cough. These symptoms come on in the order here stated. In the course of a few hours the headach increases, the skin becomes hot, with pains in the back and limbs, or transitory stitches across the chest. The tongue is white; the pulse quick or frequent, and for the most part soft. There is more or less of sickness at the stomach, and sometimes vomiting. The bowels are generally costive; and considerable uneasiness, or even a distressing pain, is felt in some part of the abdomen in many instances. But the second or third night,

the cough and fever become greatly aggravated. The former, viz. the cough, is strong and incessant, sometimes dry, but often accompanied (even at its first coming on) with an expectoration of thin, sharp mucus: the latter, viz. the fever, is attended with increased heat, and with extreme restlessness and anxiety. There is also some confusion of the head. At this time the pulse is often from 110 to 120. In the morning there is a considerable remission of the febrile symptoms; but the cough (with more or less dyspnoea) still continues urgent, and the patient complains of excessive languor and dejection of spirits.

“After the third or fifth day, where early perspirations have come on, or sufficient evacuations have been procured by the stomach and bowels, the fever declines: and although the cough continues, the expectoration is more free, the sputum being of a thicker consistence, and milder quality. The urine, which before was high-coloured and clear, now becomes turbid, or throws down a sediment. In other instances the cough continues very troublesome for many days, or even some weeks, after the abatement or cessation of the fever, and goes off very tediously without any remarkable degree of expectoration.

"The lassitude and depression of spirits, with restless nights, harass the patients for many days after the decline of the fever; which indeed, in several instances, does not go off after the fifth day, but becomes intermittent, the patient feeling himself worse every other day."

These symptoms were modified in various ways; in some there appearing a violent headach, and in others a sore throat, a peripneumonic disposition, or a disorder of the stomach and bowels. As the author considers the fever to be the essence of the complaint, his plan of cure is principally directed to the use of such remedies, as are capable of acting upon the system at large. Hence he recommends, at first, emetics, cathartics, and diaphoretics, and afterwards gentle opiates and the squill. Blisters were beneficial for the relief of the cough and dyspnoea, and when pneumonic symptoms appeared early, blood-letting was necessary. Great debility had remained after the symptoms had gone off, which was rather to be removed by bitters or myrrh, than bark or mineral acids.

The infectious nature of this disease, the author thinks is hardly to be doubted; but his opinion on this point appears to be rather derived from general reasoning, than the consideration of particular facts. Nothing but facts can justify a decided conclusion upon this subject; for though the origin of the complaint may not be referable to any perceptible change in the state of the air, yet it by

no means follows from hence, that it is necessarily propagated by personal communication. It must still be admitted to have arisen from an unknown cause, the operation of which differs exceedingly from that of any contagion with which we are acquainted, and until it is unequivocally shewn that it has been conveyed only by personal intercourse, and has been confined within the limits to which this has extended, many doubts must still remain on this subject. In the communications from which the author gives abstracts, there is considerable difference of opinion with regard to the contagious nature of the complaint. Most of the correspondents consider it as an infectious disease, but one of them who is of this opinion, Mr. Du Gard, of Shrewsbury, mentions an instance of a boy, who was seized with it at a grammar school, on the 20th of February, was ill a week, and did not communicate the complaint to his bedfellow, nor any of the boys in the same room, who amounted to 20:

"—nor did any one in the house become attacked with the disease till this boy had been well eleven days, at which time, five or six were taken ill, and the same number daily till four fifths of the school were affected."

In general, the observations and practice of the author's correspondents pretty much agreed with his own. The disease very seldom assumed an inflammatory disposition, and bleeding was rarely necessary.

ART. XVIII. *A Plain Discourse on the Causes, Symptoms, Nature, and Cure of the prevailing Epidemical Disease, termed Influenza.* By JOHN HERDMAN, M. D. Fellow of the Royal College of Surgeons of Edinburgh. pp. 76.

THE author has entered upon the consideration of influenza, with hypothetical ideas on the general nature of diseases, unsupported by, and frequently repugnant to the inductions of the most cautious and attentive observation. He is a Brunonian, but his principles do not always accord with those of his master; for while the latter admitted the existence of diseases of excitement, requiring blood-letting and other evacuants, the former denies that such a morbid state of the system can ever occur; and hence concludes, that the debilitating plan of cure must, in every circumstance, be improper. The extent to which Dr. Herdman carries his speculative notions on the practice of medicine, which, it may however be remarked, are not novel, may be appreciated, from his determined

reprobation of blood-letting in the most violent pneumonia. The more violent the inflammatory symptoms are, the greater, in his opinion, is the degree of debility which has occasioned them, and the less, therefore, are the usual means for removing inflammation, adapted to the cure. A doctrine so extremely repugnant to the universal experience of medical practitioners, might do a great deal of harm, if it were not so evidently in contempt of every well established fact, and so clearly the result of a narrow and unphilosophical view of the subject. The author possesses, however, a great deal of self-complacency, and entertains no doubt of the firmness of the basis on which his reasoning and practice are built.

His doctrine and treatment of influen-

za (which has given rise to a long exposition of the principles which guide him in the practice of medicine) are simple; he considers it a disease of debility, produced by debilitating powers existing in the atmosphere, and to be cured by keeping the patient quiet, and by warmth;

but should nature require more to relieve the complaint; you may then, says he, administer "your stimulant medicines and your warm cordial-drinks, your opium, your warm wine, and your warm spirits and water."

ART. XIX. *On the Influenza, as it appeared in Bristol and its Vicinity during Part of February, March, and Part of April 1803.* By JOHN NOTT, M.D. pp. 25.

THE symptoms here described, and the method of cure recommended, do not materially differ from those which are mentioned in the other accounts of the epidemic already given. Bleeding was never necessary when the complaint appeared in its simple form; but when it was combined with peripneumonic symptoms, as was frequently the case, a corresponding mode of treatment became necessary. A full dose of opium has sometimes suspended the disease, but in general this medicine was found to be improper, for in such cases the complaint afterwards returned with increased violence. Syrup of poppies was a good anodyne; but opium itself, contrary to the experience of Dr. Falconer, seemed to do harm, by checking the expectoration. The author's experience of blisters differed from that of most other medical men: he found them to be of little or doubtful efficacy.

With regard to the nature of this com-

plaint, the author is adverse to the opinion of its being contagious, and thinks it ascribable to some peculiarities in the air, which elude all medical research. The reasons which he adduces against its contagious nature, are the following, viz.—That two or three persons of a numerous family have had the disease, without any others being affected by it, till a fortnight after their recovery; that its propagation in public seminaries has been unfrequent and uncertain; that people who slept together frequently did not take it from each other; that it often attacked all the individuals of a large family at almost the same instant, which could hardly argue the progression of the contagion from one to another; and that remote villages, and solitary houses, have been affected at the precise time of its appearance in large cities. The last stated fact, it may be observed, is at variance with those which Dr. Falconer mentions on the same subject.

ART. XX. *Observations on the Epidemical Diseases now prevailing in London, with their Divisions, Mode of Treatment, &c.* By ROBERT HOOPER, M.D. resident Physician to the St. Mary-le-Bone Infirmary, &c. pp. 43.

DR. Hooper describes the late epidemic as assuming a considerable diversity of forms, and as having its origin in causes which exist in the atmosphere. The forms under which the epidemic appeared, were peripneumonia vera, peripneumonia notha, catarrh and acute rheumatism. The symptoms of each of those species of the complaint, and the treatment required by them, are given under particular heads; but previous to their being thus separately considered, the author gives the remote causes, which seemed to him to dispose to their attack; and the general symptoms by which they were accompanied, together with the treatment which each of them seemed more especially to require. These symptoms are particularly referred to the head, chest, limbs, skin, pulse, tongue, bowels, and stomach, and the nature and

degree of them a good deal depended upon the form of the epidemic with which the patient was attacked. The author describes the appearance of the tongue as having been very uniform.

"From the beginning of the disease," says he, "to the termination, it is white in the centre, and its edges are red, and studded with very florid papillæ."

"In some instances, the line which separates the red edges from the white centre is very distinctly marked, and frothy; while in others the whiteness is gradually lost towards the sides."

"The whiteness of the tongue appears to arise from change of colour in the papillæ of the tongue, and not from inspissated mucus covering that organ, though in some this has taken place."

"In many instances several of the papillæ are of a florid red colour, and distinct in the midst of the white papillæ. This appearance

resembles somewhat the strawberry seed elevated upon the strawberry, with this difference only, that the seeds of the strawberry are yellow, and not red. The strawberry tongue is sometimes observed in other diseases besides the prevalent epidemics, but in these it has been very common.

“The removal of the diseased states of the

tongue depends on the removal of the other phenomena of the disease.”

The treatment adopted by the author, did not differ from that usually employed in the cure of the complaints to which he referred the different forms of the epidemic.

ART. XXI. *Hygeia: or, Essays Moral and Medical, on the Causes affecting the Personal State of the middling and affluent Classes.* By THOMAS BEDDOES, M. D. 8vo. Three vols.

AMONG the multitude of writers on the ‘art of preserving health,’ there are few who merit any particular attention. They have in general copied from each other, and detailed the common notions and prejudices of the age in which they lived, apparently with no object in view but to announce themselves to the world, as the proper guardians and dispensers of the blessings of health and longevity. Catalogues serve to record the books which they have written, but posterity is not in possession of any proofs of the good which they have done, or the benefits which they designed. When an author appears endowed with superior abilities to lay before the public a body of popular information on health, his writings have many claims to be studied with all the care and consideration required for so difficult and delicate a subject. Such is the author of the work now before us. The name of Dr. Beddoes must be familiar to all readers. The number and variety of his publications, the novelty and boldness of his views, and the peculiar originality of many of his speculations, have contributed to raise and to sink his fame in the scientific and literary world. For conveying instruction from the shrine of Hygeia, he has shewn himself possessed of talents of no common and ordinary cast. One of his most striking characteristics as a writer, is the power of drawing fine pictures of diseases; he delineates the most trivial complaints in the strongest colours, which fix the attention and captivate the imagination. He has proved himself a great enthusiast in whatever he undertakes, though in the present instance his ardour and zeal may by some persons be considered as misplaced.

This work is divided into eleven essays, which were published separately. These essays are written in a bold energetic style, yet there is too much frothy declamation, and frequently a careless or wanton forgetfulness of the subject. It

is to be regretted, that they did not receive the form as they contain the substance of a general treatise. Much obscurity and useless prolixity would have been avoided, if the trifling and temporary topics had been placed in a subordinate digression or wholly omitted, instead of being interweaved with more interesting and general inquiries. This work, however, is only a prelude to a more comprehensive one; it is selected from a general treatise of physiology, which the author promises soon to bring forward, for the use of all to whom their own nature is interesting. We shall attempt to give an abstract view of the principal contents of these volumes.

The first essay, on personal prudence, and on prejudices respecting health, contains the greater part of the author's opinions on the means of avoiding habitual sickness and premature mortality. He tells us his intention, with regard to preventive medicine, in the following passage:

“What I could wish then, and what every one, who has taken serious pains to follow up the most irreparable and most regretted of human sufferings to their origin, will agree with me in wishing, is, that reasonable care should be taken to provide each individual with a set of ideas, exhibiting the precise relation in which his system, and the several organs of which it is compounded, stand to external agents, particularly to those with which he is likely to come most in contact; that these sets of ideas be so placed in his head, that he may refer to them with as little difficulty as to the watch he wears in his pocket; and that as by the one he adjusts his business to his time, so by the other he may be always able to accommodate his actions to his powers.

“The distance at which we at present stand from such a consummation is no reason why future generations should, like the past, be abandoned to their fate. The relation of the animated machine to the powers by which it is put in motion, is unhappily not enough understood for the purposes of minute medical philosophy; but so far as it

is understood, it constitutes, as I hope to shew in the sequel, a doctrine rich in lessons for common life."

Personal prudence is only to be acquired by an acquaintance with the structure and functions of the human body. For this purpose, Dr. Beddoes proposes, that lectures on select subjects of *anatomy*, adapted for a *mixed* audience, should be established in all our large towns; that one of the medical profession in each place should undertake the office of lecturer, or that travelling professors should engage in such an employment. The deep interest excited by a teacher of chemistry, when he treats of respiration, is adduced as an example to enforce the importance of this proposal. And precedents are produced from the success of a popular course of anatomical lectures at Bristol, and the lectures on *anthropology*, which are given in some foreign countries. To supply the want of lectures, books and engravings are recommended, and clinical lectures, to teach the method of applying physiological knowledge to domestic use.

Many objections present themselves to this general diffusion of medical knowledge. The arguments adduced in its favour by our ingenious author are not very consistent or convincing. There can be little doubt, that the ascertainment of causes has scarcely been more beneficial in preventing real danger, than in banishing false alarms; but it is the difficulty of ascertaining the causes of diseases, which renders a superficial knowledge of medicine or physiology more likely to induce, than to banish false fears. Medicine at present is imperfect, whether considered as an art or a science; it requires to be deeply studied, to be well practised and understood. Since it ought to be our first concern in the art of living, to ensure a continued succession of agreeable feelings, this general acquaintance with the human body and its complicated disorders, may be productive of more harm than good. It will render persons alive to sensations, trifling in themselves, that would otherwise escape attention, and imaginary and exaggerated complaints will form a more conspicuous part of the evils of life. We shall see people constantly swallowing pills to clear the *primæ viæ*, supposed to be deranged; and nobody will travel without a tourniquet to stop hæmorrhage, or caustic and a scalpel to prevent the mischief from the bite of a mad dog!

This consideration will be better illustrated by an example than by any general assertion. Let us then refer to our universities; let us enquire, whether hypochondriasis be not very common among medical students? According to Dr. Beddoes it ought not, but we will venture to assert, that among no class of men is it more frequent. Every student almost in the beginning of his studies is harassed by groundless apprehensions; through his want of more extensive knowledge and experience, he often has every disease in succession as he reads *Cullen's First Lines*, and where a constitutional tendency to low spirits has existed, some young men have appeared to die, not from any one particular disease, but from *Cullen's Nosology*! If such be the case with those who must be supposed to have acquired more information than can be derived from a few popular lectures, what must be the condition of a large portion of the community, when every person shall be taught in his youth a smattering of anatomy, and physiology, and diseases?

The aim and object of this popular instruction is highly laudable, if it could be attained within certain limits. It would lead men to avoid those things which gradually undermine the constitution, and might enable them to check diseases in the first stages; it would teach them when to call in medical assistance, and enable them to select rational and judicious practitioners. These good effects seem more likely to be counterbalanced by the bad, which have been already stated, and of which Dr. Beddoes seems fully aware. For he deprecates the custom of living by rule, and condemns very justly the *methodists* in meat and drink. His plan, however, seems calculated to increase the number of fanatics in physic, though in his *second essay* on the prevention of mischief he very properly sets forth the folly and absurdity of making private practitioners. The *lady and gentlemen doctors*, the hoarders of single infallible cures, the pedlars and hucksters in medicine are very ably and judiciously exposed. Alluding to the absurdity and evil tendency of books on domestic medicine, he expresses himself thus:

"Here let me beg the reader to consider the power and province of mere rules in practical affairs of the easiest kind. No one has, I suppose, yet come forward with pretensions to teach the coarsest handicraft by a book.

But in the tumult of literary projects, amid which we live, scarce any absurdity being impossible, let us imagine some adventurer, sufficiently intoxicated to undertake to communicate the capacity for exercising one of our humblest, and most useful trades, without apprenticeship, by a tract on *domestic shoe-making*. Should any one, after studying this tract, conceit himself qualified to handle the awl and the paring knife, I leave it to be imagined by the reader, how unmercifully the leather would be pricked and slashed, and what would be the condition of the poor toes, condemned to be lodged in the receptacle, prepared by these learned hands. Does common sense spurn at the idea of efficacious instruction in such an art by such means? Are the qualities, then, of leather more complicated than those of the living body? Does the art of managing the former, to most advantage require a long apprenticeship, and not that of managing the latter? Are the tools that lie within the compass of the shoemaker's bench, more easy to employ properly, than the articles of the *materia medica*? I see, indeed, one essential difference: the incompetent mechanic will soon be marked; no clumsy workmanship of his can pass: whereas, in medicine, bunglers may go on, I know not how long, without disgrace. This chance of escaping detection is, no doubt, an encouragement for *private practitioners*, such as nothing can countervail, if they be agitated by the same restless demon that possessed Lord Chesterfield's blood-letting peer. But I have no hope of effecting any thing, except with active, but misguided benevolence. Insanity must be differently dealt with, and wrong-headedness, is scarce to be reclaimed by plain dictates of prudence. Otherwise, a consideration, yet untouched, would be decisive! For the defect of the artisan, who leaves his work imperfect, can be afterwards supplied. But an amending hand may be vainly applied in case of omission during sickness, where it is often just as fatal to leave undone what is right, as to do what is wrong. What then shall we think of the defence, which conscious incapacity is so apt to set up by anticipation: very simple my advice is: you may be sure if it does no good, it can do no harm? Oh, yes, but if does no good, it can do harm—all possible harm, provided in killing there be harm. It can arrest the rescuing hand, till the silent, but progressive finger of fate move from *time is*, to *time is no more*. There are plenty of occasions on which water-gruel, upon the harmless principle, will do a man's business just as effectually as laurel-water. And what, I pray, does it signify to the killed, whether they come to their end by the saucepan or the still? To the killer, the difference, we know, is all in all. Yet he who simply thrusts his ignorance between the sick, and the means of recovery, will really have done more mischief, inas-

much as he will have more largely accumulated pain upon death. And surely, where law cannot interfere, the call is so much louder for public censure. It is by far too unequal a game to be allowed in society, where one party stakes empty professions of good-will against the other's existence."

To many persons the study of physiology must be well suited, as an interesting branch of natural philosophy. An inquiry into the structure of animal bodies, an investigation of the beautiful adaptation of different parts, and of the most wonderful effects produced by the simplest means, will be deemed far more interesting than the history of butterflies and cockle-shells. But the latter of these pursuits is less liable to abuse, and therefore better adapted for general readers; inasmuch as medical reading excites groundless anxieties, especially on hypochondriacs, which have so often been exhibited with exquisite humour. Some acquaintance with the general principles of medicine might be useful to the clergy, especially those residing in the country, as they may be called upon to judge of the propriety of sending for medical aid, and can enforce the regulations necessary for the preservation of health.

The third and fourth essays include a variety of curious and important observations on schools. Many of the instances of errors, mentioned in the fourth essay, might have been omitted with great propriety. Common decency and decorum require such omissions. The remarks on girls' schools appear just and well-founded; the lady abbesses of our temporary nunneries will blush at such a public declaration of the truth. It is to be hoped, that the faults are not so general or so enormous as detailed. The condition of children, with respect to food, is said to be improved, and there was room for improvement, as a curious fact is stated in another part of this work, *of forty girls at a school who fed for two successive days upon a single leg of mutton!*

The second volume commences with a series of useful details relating to animal temperature. Then follow two essays on *scrophula* and *consumption*, which include many excellent remarks, well deserving an attentive perusal. Did our limits permit, several interesting passages might be selected from these two important dissertations.

In the last volume, our author comes to treat of what is generally understood by the appellation of *nervous disorders*;

an appellation which pathological writers have never been able to form a distinct conception of, and nosologists have in vain attempted satisfactorily to define. To describe them, as Dr. Beddoes has done, is equally inconsistent with the spirit of analysis, and the true history of those diseases. His description would include all automatic motions, and the state of fatigue, arising from the occasional exercise of our perceptive and intellectual faculties, although these states of the system have never been considered as related to nervous affections. From the little we know of the origin and progress of this extensive tribe of fashionable complaints, it does not appear judicious to exclude from this class all those irregular actions of the nerves, in which some other part of the system is at all concerned, as cause and effect. Our author indeed seems convinced of the truth of this remark, for he enumerates various cautions against the derangement of organs closely connected with the functions of the brain. That an over-loaded stomach may give rise to frightful dreams and delirium; that hysteria, hypochondriasis, and epilepsy, are frequently connected with disorders of the bowels; that mania and melancholia are often brought on by intemperance or by fever, &c. are facts sufficiently ascertained for disclaiming any ground of distinction, originating in the remoteness or the different nature of the immediate cause of nervous disorders. Small-pox, our author observes, is sometimes accompanied with convulsions; is it for that reason to be classed among nervous diseases? No; but nervous affections, considered as a particular class of complaints, are sometimes induced by small-pox and other eruptive fevers, and they do not lose their specific character, because the exciting causes may indeterminately vary in different as well as in the same subject. When we object to Dr. Beddoes' definition of nervous disorders, we are far from intending to substitute another in its place. In order to be consistent, we do not feel disposed to exclaim against nosological histories, and then make a feeble attempt to delineate an outline of fanciful characters. It is better to acquiesce in the general notion of the vulgar, looking upon these diseases as related more particularly to a certain mobility of the nervous system, assuming in its effects all possible gradations, from simple frivolity to actual convulsions.

Farther than this we conceive ourselves unable to penetrate through the medium of language. The department of the practical physician extends to the various associations of morbid phenomena, which he can discover as causes or effects of each other, and which he can frequently destroy, though unable to comprehend distinctly the nature of their necessary connexion. We are more disposed to insist on this point, because we are persuaded, that this part of pathology has suffered much from artificially separating diseases which nature has indissolubly united, by considering the diseases of the mind as diseases *sui generis*, and therefore out of the reach of the physical experimentalist. Groundless apprehensions of the consequences of materialism have operated as a check to the natural connexion of these two essential elements of rational physiology. When dispassionate reasoning has shewn the possibility of separating the useful application of a salutary doctrine from its adventitious abuses, no apology can be offered for supporting a view of natural phenomena, inconsistent with all the rules of inductive philosophy.

After premising these general remarks, on the plan which medical inquirers ought to follow in such intricate objects of investigation, we feel great pleasure in stating, that Dr. Beddoes has presented his readers with an excellent specimen of what may be done by a method apparently so tedious and unpromising. The case is that of an intelligent foreigner, who was afflicted seven years with epileptic fits, and kept an accurate journal of all the circumstances connected with the accession of different paroxysms, as they fell under his own observation or that of his attendants. This account furnishes a number of data concerning the occasional state of the organs of intellect, which in ordinary practice could hardly be obtained in any manner adapted for any useful application. There are numerous difficulties in the way of increasing the number of such historical reports. A patient sends for a physician as to the regulator of his disturbed nerves and broken spirits, when the doctor perhaps is hurried from house to house, from one case to another, unwilling to listen to long stories about dreams, reveries, stupors, &c. and chills his patient in the warmth of his narrative zeal. Allowing the possibility, that mankind and medical science might

be benefited by his patience, the fashionable physician has learnt, that a call at an apothecary's shop, or some jocose remark on the news of the day, conduces more to increase his fortune and professional reputation, than the most profound speculations on the tremors and interesting sensibility of delicate females. The ingenious author of these essays must be applauded for his laudable courage, in upbraiding the leaders of fashion for their senseless course of routes, balls, and other such sickly joys. "It is a notorious fact, that at the close of the season in London women appear worn out, haggard, and spent. During their stay in the country, their shrunk countenances regain a degree of plumpness, their muscles recover their tone, and they really feel somewhat of that flow of spirits, which they often afterwards so miserably affect." But as if Dr. B. apprehended some danger from this bold and disinterested remark, he courts favour again, upon the happy recollection of the rules of good breeding, that have confined to the pulpit the privilege of declaiming with safety against the vices and follies of the age.

"Persons, it is commonly seen, who are governed by different habits, conceive towards each other a species of antipathy, so quick and inveterate, that it may almost pass for instinctive; and many a fine lady, on hearing the economy of her time arraigned by the sedate, has persuaded herself that the censure proceeds from this feeling, and not from any foundation in reason. But it is only necessary for her to revert to the influence of her days upon her nights, to be convinced that the sober part of mankind do not vine. arrogate to themselves a superiority, barely as any day or cast may arbitrarily such as a some insignificant distinctions, found upon her need acknowledge. On the contrary, the advantage they enjoy is no less solid and permanent than the laws, according to which nature has ordained that the human frame shall be affected. The throngs, by which the followers of high life are perpetually pressed; the dazzling scenes which they frequent in quick succession; their unceasing hurry of body and mind; the anxiety (to say nothing of the mortification) which every candidate for admiration must undergo; all contribute to stir up a correspondent tumult of imagination as soon as they are sunk into slumber. When they have tossed themselves awake, how can they help feeling more weary by half than on going to bed? Without spirit to raise their head from the pillow, even if they have suspected this to be the best measure they could adopt, and in spite of constant disappointments,

they still hope to find refreshment in an additional nap. But another and another leave them but in more languid plight. We cannot, therefore, be at a loss to comprehend the tendency of that mode of existence, to which we see our countrywomen so enthusiastically devoting themselves. The night is the season in which the vulture of fashion flies abroad for prey. Many of the primrose cheeks and aspen constitutions, which are to be met with so abundantly in the great world, exhibit the consequences of his secret depredations."

In the ninth essay Dr. Beddoes wanders through all the roads, lanes, and alleys, of the nervous labyrinth, in the least connected with a derangement of the intellectual faculties. Not one is omitted; epilepsy, hysteria, catalepsy, convulsions and spasms, have long been known as belonging to this old tribe; but giddiness, chills, shiverings, heats, tremors, and starting form a new addition to the list, not the less formidable, we believe, from their apparent insignificance. It is one of the merits of this part of the work, to extend our views of those baneful disorders, to shew with more than common accuracy the relations that these deviations from the healthy state bear to each other. The perusal of this and the following essay may be amusing and instructive to medical inquirers, but in spite of the benevolence and good intentions of the author, we cannot recommend them to that particular set of persons whom they equally concern, and for whom they were designed. Even our tried spirits have been more than once almost smothered under the heavy load of predisposition to these horrible maladies, attendant upon human nature; and we still tremble and shake at the idea of impending danger. Nothing but a laudable confidence in the *vis medicatrix nature* could have preserved the author himself from sinking under the workings of his vigorous imagination. How dreadful must be the situation of those who read these essays, and have no experience or knowledge of such friendly aid!

In the tenth essay, Dr. Beddoes proceeds in the same strain to the consideration of those disorders, more strictly called *mental*, known by the names of *mania* and *melancholia*. This is not the place for enlarging upon these important topics of human miseries. Our author is less original here than in other parts of this work, for with the exception of some witty remarks on public characters, who boast of understanding human nature, when they

can hardly attend to the perceptions of their own senses, we find nothing but what might as well be extracted from Mr. Haslam's and Dr. Pinel's excellent books on insanity.

Upon the whole, we believe that the end held in view by Dr. Beddoes, when he published this *Hygeia*, has never been seriously submitted to the controul of his judgment. It is a work undoubtedly which comes from the hand of genius, of a man whose conceptions are always grand, whose style is bold and fascinating. It is much to be regretted, that he

has ever misconceived the application of his talents. This last performance is unworthy of his pen; it will be censured as too superficial by his brethren, and it will be considered as too abstruse and splenetic by other classes of readers.—The principle of *popular medicine* is fundamentally wrong; and all attempts to revive, under a new garb, the spirit of universal quackery, ought to be deprecated and shunned, as prejudicial to the advancement of science, and to the happiness and comfort of our fellow-creatures.

ART. XXII. *The Report on the Cow-pock Inoculation, from the Practice at the Vaccine Pock Institution, during the Years 1801 and 1802, &c. Written by the Physicians to the Institution.* 8vo. pp. 150.

TOGETHER with the History of the Vaccine Institution, this publication contains the results of the practice carried on within its walls, up to the end of 1802. The number inoculated to this time is stated to be 1202, a number comparatively small, but amply sufficient for the basis of the valuable pathological observations here laid before the public by the physicians to the institution, Drs. Pearson, Nihell, and Nelson.

These observations are given as commentaries upon the *principia* of vaccination, which are drawn up in the aphoristic form with eminent skill, perspicuity, and accuracy. These aphorisms or propositions are twenty-three in number, and they briefly discuss both the acknowledged points, and those that are still controverted. A few of these we shall notice:

Proposition 2.—“No one has died from the inoculation of the cow-pox.” The authors are aware that this assertion requires some modification; and the following is given:

“Here however, perhaps, we ought to except a few instances, which have been published, of deaths of very young children, apparently occasioned by ulcerations of the inoculated part. These ulcerations were, in all probability, occasioned by exposure to cold, scratching, pressure, adhering of the linen to the ruptured vesicle, or sore from the torn off scab, together with the application of dirt, or other extraneous matter among very poor people, whose children were half starved and half naked. It has been too commonly the practice to blame the inoculator in these instances, by imputing the mischief to using matter from a pock older than the ninth day; and also, on equally unjustifiable grounds, to refer these bad consequences to using some other matter different from the vaccine, or to

the mode of inoculation. We have heard of no death from the ulceration or inflammation among children duly nursed.”

We agree with the author, that there has often been too much readiness to throw blame on the inoculator or the matter; but such cases of excessive inflammation are certainly not always to be imputed to carelessness in nursing and external injury, as indeed is allowed in the very next page, in speaking of the extent of local inflammation.

“We do not, however, mean to allege, that in no instance do such sore arms occur, independent of mechanical injury, from the irritation of the vaccine vesicle or scab itself; for, in truth, we have seen such cases in private practice, particularly in scrofulous patients.”

The next proposition contains several most important points, which will admit of some discussion.—The proposition states the general uniformity in the progress and appearance of the vesicle during its growth and maturation. The following exceptions require some notice: “The red areola generally took place, but when it was absent, in other respects the pock was the usual one; and the susceptibility of the small-pox was equally destroyed, as when the most extensive erythema appeared on the inoculated part.”

“In some cases a large pimple, or gnat bite-like eruption only was excited, but permanent for the usual time, yet, on reinoculation with the vaccine and variolous matter, the susceptibility of the small-pox appeared to have been destroyed.

“By scratching, the common appearance of the vaccine pock was altered, but the effect of unsusceptibility of the small-pox was produced.

"In some cases the progress of the affection was so slow; that the pock on the eighth day had the common appearance of that of the fourth; and that of the sixteenth was like the usual one on the eighth or tenth. We have been shewn a case in which no signs appeared of the infection having taken place for five weeks; but in six days, after a second inoculation, a pock appeared, and alike from both inoculations.

"In two or three rare instances, an irregular figured pock, followed by a yellow rough large irregular figured scab, was produced on repeated inoculation; yet the subject could not take the small-pox subsequently.

"In one case a large mulberry-like pock only was excited, yet the susceptibility of the small-pox was destroyed by it.

"In no case was the susceptibility of the cow-pock, and of course of the small-pox, destroyed, when the pimple or pock excited, disappeared within ten or twelve days; although the inflammation was seen on the day after inoculation, and when also no cicatrix was left behind.

"The areola is neither essential in the same, nor different constitutions; nor connected with the fever; nor with the age of the matter; nor with the quantity of it; nor with the mode of inoculation; but with apparently the state of the skin, in even different arms of the same person, one arm had borne a pock with a large red areola, and the other had a pock with none at all; some have had no areola, and yet a fever; and others no observable fever, yet there was a considerable areola."

The reader will see from the above passage, that the authors make the test of sufficient vaccination to be, not the presence of the areola, nor even the form of the vesicle, but simply the time of its duration. This opinion indeed is not expressed absolutely, and refers chiefly to the individual cases on which it is founded; but experience would have justified a caution, not to rely implicitly on this test alone, as positive evidence might be brought of its insecurity.

The intervention of many of the diseases in every stage of vaccination, and of the small-pox in its earlier progress, is explained and illustrated in a very satisfactory manner.

We shall transcribe the whole of the twelfth proposition, with the subjoined remarks, as they relate to a point of practice which has been more controverted than any other:

"No difference could be perceived in the agency of the vaccine matter, according to the age of the pock, or to the presence or absence of areola, except in certain early ages of it, being more efficacious than others.

"It was the usage of the institution almost always to inoculate with matters of the eighth, or eleventh and twelfth days; and from our ample experience we affirm, that if the pock of the eleventh or twelfth day was not yet in the scabbing stage, or was but just beginning, the matter was equally efficacious with that of the eighth day; yet, if the pock had begun to scab, or was advanced to that state, this old matter oftener failed than younger matter; but when the matter of such old pocks failed to excite the vaccina, considerable inflammation or phlegmonous eruption or pimple (which is improperly called spurious cow-pock), did not more frequently occur than from younger matter of the distinct cow-pock, when it failed, and the bad consequences did not ensue more frequently from such old matter, than from matter of the eighth day, or earlier.

"Whether the matter was taken from a pock which had an areola or not, the effect was not on that account different. We have used matter when it could be had, as early as the fifth day, but it excited the vaccina with the usual appearances; and certainly it was not on account of the age of the matter more mild.

"Matter from a pock still containing lymph, though as late as the fifteenth day; and even pus, when the vesicle had become a pustule, generally produced no effect at all except like that of a common scratch; but sometimes it took effect, and then it produced the genuine distinct vaccina.

"In the same arms, matter of the eighth day and of the twelfth has been employed, and the event was, that each sort excited the genuine and similar vaccine pocks; and the same effects were seen from matter, so inoculated, of the eleventh and fifteenth days."

It is a curious question to determine the effect of diluting the virus. The reporters mixed the matter of a single pustule with a quarter of an ounce measure of warm water, and produced the perfect disease by subsequent inoculation with this diluted virus. We should think the proportion of dilution might be full an hundred fold in this instance.

An appendix is added to these elementary propositions, containing further illustrations derived from the practice of the institution, and abounding with acute observation; and the whole concludes with documents on the mortality of small-pox, and miscellaneous papers relative to the plan of the institution. Two beautiful coloured plates are prefixed, containing several views of the vaccine pustule, of some of its anomalies, and of the genuine small-pox pustule.

This publication merits every attention; though concise, it abounds with instruction, and the observations are often

original, always weighty. When such use is made of the opportunities of observation, afforded by an institution of limited means and moderate patronage, we have

additional reason to join in the author's concluding sentence, that "*so much good has rarely, if ever, been done at so small an expence.*"

ART. XXIII. *A Treatise on the Cow-Pox, containing the History of the Vaccine Inoculation, and an Account of the various Publications which have appeared on that Subject in Great Britain, and other Parts of the World.* By JOHN RING, Member of the Royal College of Surgeons. 8vo. pp. 1038.

THE aspect of the work before us is truly a phenomenon in book-making; two full-sized octavo volumes without a single break or division into chapters, heads, or sections; without a table of contents or any of the common helps (a good index excepted) to assist the reader in cultivating an acquaintance with his author!

The first volume of this collection was published 1801, and begins the history of vaccine inoculation, with Dr Jenner's first experiments: the second volume carries down the history to May 1803, and the establishment of the Royal Jennerian Society in London. So much has now been written on this infinitely important subject, so many questions more or less intimately connected with it have been agitated, and above all, so many thousands have partaken of the benefit of vaccine inoculation, that, though the subject is by no means exhausted, it has become a very useful undertaking to exhibit under one comprehensive point of view, a full, clear, and impartial representation of all that has hitherto been done to establish cow-pock inoculation.

Mr. Ring in the preface to the first volume thus announces his plan.

"Boerhaave, speaking of the small-pox, says, 'there is reason to hope a specific may be found to correct this malady; and we are impelled to seek for such a specific, by the vast advantage that would thence accrue to mankind.'

"His words are prophetic; his hope is realized; a specific is discovered for that disease, which has been the scourge of Europe for a thousand years, and committed the most dreadful ravages in every quarter of the world.

"May the author of that discovery, which so eminently distinguishes him as the benefactor of the human race, live to reap the fruits of his labours! and to receive every possible demonstration of private and public gratitude and esteem!

"The vast number of remarks published on vaccine inoculation, both at home and abroad, having swollen this treatise far beyond the bulk at first intended, it was deem-

ed expedient to divide it into two parts. The continual occurrence of new facts, and publication of new treatises on the subject, rendered it impracticable to preserve a strict and methodical arrangement. The intention of the author was, to collect and combine the substance of all that has hitherto been ascertained on this interesting subject; and rather to incur the censure of prolixity, than to deserve the charge of omitting any thing of importance, on an occasion where the welfare and happiness of the whole human race are so immediately concerned."

Mr. Ring's name stands eminently conspicuous as one of the earliest, most indefatigable, and most zealous promoters of the new inoculation, and we therefore give him full credit for the importance which he attaches to every iota that has ever been done or said on the subject: but as he professes in the present publication to *combine* as well as *collect*, we must suggest to him that combination, in a case like the present, implies an assortment or arrangement of heterogeneous materials, and not a mere republication of the original documents in the order in which they happened to be inserted in the Medical Journal or appeared in the booksellers' shops. We believe too that most of his readers would have wished for a little more *selection* as well as arrangement.

Let not our readers suppose, however, that the present is a mere compilation. The author enters into the subject so heartily, and is so much at home in every question of controversy that has ever been started on these topics, that his pages abound with remarks which agreeably, and generally usefully, break the tedious uniformity of narrative: nor are wanting to enliven the reader, the satirical touch and the apt classical quotation.

We shall not attempt a description of a work that defies analysis; nor would the task, if performed, be interesting to our readers, as it would chiefly present to them in another form what must be already quite familiar to them. We turn with much more satisfaction to the

part where the author speaks of his own efforts in this important cause:

"I come now to the last part of the task I have undertaken; which is, to state the result of my own practice. Deeply impressed with the magnitude and importance of this discovery, and of the benefits that would accrue to society from its adoption, I considered it as a duty incumbent on me to promote it to the utmost of my power. In consequence of this opinion, I laboured to overcome the prejudices which prevailed; and not altogether without success.

"Much experience has convinced me, that the prejudice of the public in general is not insurmountable; and that the prejudice of certain individuals would not be insurmountable, nor rise to such a height, were not a little of the leaven of self-interest blended with that prejudice. The annihilation of the small-pox is the annihilation of one of the principal branches of the medical revenue.

"Having overcome the first difficulty, by prevailing on a few families to submit to the new inoculation, having also ascertained the mildness of the disease, and its efficacy in protecting the patient from the small-pox, I resolved never to inoculate with variolous matter again, unless the vaccine fluid should prove less capable of superseding a previous infection of the small-pox.

"Nor should I deem it a perfect discharge of duty, in any professional man, on an occasion like this, did he not exert every faculty of his mind to remove the obstacles that retard the progress of this improvement; did he not explain the advantage of the practice to *all ranks of people*; did he not exhort and encourage, and *enable all ranks of people* to avail themselves of that advantage.

"Impressed with these sentiments, I have held out every encouragement in my power to all persons; but especially to that order of society, of which a very great majority have hitherto tasted only the bitter fruits of inoculation. To the rich it has proved a blessing; but to the poor in general, at least in this metropolis, it has proved a bane.

"Favourable as the opinion was, which I first entertained of the new practice, the success which has attended it has exceeded my most sanguine expectations. For a while it had some difficulties to encounter, like every other innovation; but when a few in any neighbourhood were inoculated, and its mild nature was ascertained, the tide of popularity turned in its favour; and instead of 800, which is about the number that I have now inoculated, if time and other avocations had permitted, I might have inoculated at least as many thousands.

"In the populous villages of Lambeth, Walworth, Newington, Bermondsey, and Rotherhithe, and in the Borough itself, there is no vaccine institution, nor inoculation hospital; nor was this practice scarcely known

to any of the labouring poor; who constitute the bulk of society every where, but there in particular.

"In these parts in general, the houses and apartments are small and crowded; the streets narrow, the accommodations very scanty, the air in many places unhealthy; the people in general, from their situation in life, are ill-informed, and unable to procure good medical advice; and from a combination of these causes, the small-pox in that district is very fatal.

"Anxious to extend the blessings of this happy discovery, to acquire and communicate all the knowledge I possibly could of the subject, to dispel the mist of prejudice which was excited by certain malignant persons, and to establish the practice on a solid foundation, I devoted every moment which I could spare, and more than I could well spare, to these important objects. This is the reason why the present treatise has been so long delayed; and, I trust, will plead some apology for those imperfections which it now contains.

"In pursuance of this plan, I have assiduously sought for patients, whom I might inoculate with the vaccine virus; and laboured to remove every obstacle that opposed my progress. With the multitude, I have reason to believe, the expence of inoculation at home, and the trouble of having it performed at a distant place, are the principal objections to the practice: objections which, I sincerely hope, will soon be removed.

"It is now unnecessary to exhibit a tabular statement of cases, or to detail those which are regular; I shall therefore confine my observations to those which tend to some practical inference, or serve to confirm, in a striking degree, the principal axioms laid down by the great advocates for this invention."

Of the great success which is likely to crown the endeavours of those who have zeal enough to give; not merely their money, but their time, and *personal* attention to this object, the author speaks in the following very satisfactory terms; and from all that we can collect, *he* has a good right so to speak.

"About the same time I inoculated a child of a wet nurse, who was suckling the child of Mr. Bourne, whose case is before mentioned. Anxious to propagate the practice, and to render it popular; anxious also to acquire all the knowledge I possibly could, of the nature and treatment of a disease on which I proposed to write, I embraced every opportunity of recommending this inoculation, and spared no pains in persuading the parents of children, who had not had the small-pox, to comply with my advice. This child was at nurse in York-street, Newington-causeway; and the woman who had the care of her neglecting to bring her to me, I

went to that place, and inoculated the infant. Observing a number of poor people in the neighbourhood, I determined to inform them of the advantages of this new practice, to which they were perfect strangers; and, by various arguments, especially by an offer of gratuitous inoculation at their own houses, found it not very difficult to prevail.

"Every proselyte which I gained facilitated the conversion of others; and my efforts were powerfully seconded by the encomiums lavished on this practice by those who experienced its good effects; but above all, by the benign appearance of the disease. Hence, instead of seeking for subjects to be inoculated, in a short time I had numerous applications; and was earnestly solicited to diffuse the benefits of this happy discovery in every direction.

"Could I have employed my whole time in the prosecution of this pleasing task, by which so much good may be done with so little trouble, and at so little expence, the number which I might have inoculated is incalculable. But many impediments lay in my way. The places were distant from my residence, and from each other; and, in addition to unavoidable avocations, a considerable part of the day was occupied in explaining the nature of the practice to those who requested information, and collecting matter to supply the increasing demand."

Mr. Ring, in his zeal to preserve the immaculate purity of the vaccine virus, speaks of some of the original experiments with more asperity than we ought to expect from a reformer.

"The virus generated by similar mal-practice has already been attended with ill consequences; already spread consternation in Great Britain and other parts of the world; and proved fatal in more places than one. It has disseminated a destructive pestilence far and wide under a fictitious name, and attacked unawares those who were totally unprepared for its reception. This ought to have been a warning to all men; and particularly to the parties immediately concerned in its dissemination.

"Such a practice, equally repugnant to every principle of reason, justice, and humanity, is a monster which ought to be strangled in the birth. It contains, however, within itself the seeds of its own dissolution.—By lessening public confidence, lessening the number of patients, and lessening the demand for a lucrative commodity, it will at length work its own downfall.

"If those who ask for the small-pox at one house, receive the cow-pox, and those who ask for the cow-pox at the other receive the small-pox, they will in time lose all patience; and exclaim with Mercurio, 'A pox on both your houses.'

"How accurately is this rage of making idle, useless, and wanton experiments, de-

lineated by the masterly pen of Dr. Gregory, in his Address to the Manager of the Royal Infirmary at Edinburgh!"

The experiments here alluded to were neither idle, useless, nor wanton; they established some very important points which at that time were disputed, and the very reason for avoiding a repetition of them, is derived from the decisive information which they then afforded, and which could only have been acquired by such means.

Mr. Ring scorns to compliment the *good sense and liberality of the British public* at the expence of truth: he speaks his opinion plainly and forcibly with regard to the reception which the new inoculation has met with in this island.

"I lately received from Dr. Moore, who left England last year, a pamphlet published by Dr. Anderson, Physician-General at Madras, from which it appears that vaccination is welcomed there with the warmest enthusiasm; and that the governors, and medical officers of the British establishments in India, vie with each other in their zealous exertions to promote the practice.

"This is very different from the reception it met with in our frigid climate, where it first occasioned a *very long and general cold fit*; then a *very short and partial hot fit*, which terminated in a *critical sweat of a few guineas*.

"How unlike the profuse and salutary perspiration of certain individuals, on the rumour of an invasion! and the sacrifices they offer at the *shrine of patriotism*, and on the *altar of humanity*, when their own dear persons and property are in danger!

"Parliament, which gave its mite to one of the greatest benefactors of mankind, in consequence of his *humble petition*, and acknowledged the importance of the practice in the most unqualified terms, has done nothing to put that practice into execution.—But parliament has nothing to fear from the small-pox."

In this disheartening sentiment, we entirely concur with this zealous friend of vaccination; we agree with him that the reception of this discovery has been marked with a singular degree of coldness and indifference; that barren patronage has taken the place of active efficient co-operation; and that the examples of a contrary line of conduct, though individually numerous and respectable, include so small a proportion of the leading and influencing part of the community, as to shew that the mere preservation of human life is not regarded as an object of public concern. Abundance of praise has been lavished on the *liberality*,

*discernment, and public spirit* of parents who have satisfied themselves with procuring for their own offspring the advantages of a practice, which interests the sordid equally with the benevolent feelings. That parental affection must be ardent which will not shrink at the harassing duty of tending a child through a painful and loathsome pestilence; and cool economy will calculate the cost of present sickness, the wear and tear of con-

stitution, and the damage to future prospects in life, when the smooth harmony of the female features is ploughed up by the seams of a merciless distemper.

A coloured plate is added to the second volume, which gives a most faithful and perfect resemblance of the vaccine pustule in its several stages, and is executed in a manner very creditable to the artist.

ART. XXIV. *Five Common Sense Arguments to evince the Efficacy, and enforce the Duty of Inoculation with the Cow-Pox.* By JOSEPH SIMMONS. 8vo. pp. 42.

A PERSUASIVE to cow-pox inoculation, principally taken from Mr. Ad-dington's neat comparative view of the

two diseases, and from the circumstances attending the establishment of the Royal Jennerian society.

ART. XXV. *A Fifth Dissertation on Fever, containing the History of, and Remedies to be employed in, irregular continued Fevers; together with a general Conclusion of the four preceding and present Dissertations.* By the late GEORGE FORDYCE, M. D. F. R. S. Fellow of the Royal College of Physicians, Senior Physician to St. Thomas's Hospital, and Reader on the Practice of Physic in London. Edited by CHARLES WELLS, M. D. F. R. S. and Physician to St. Thomas's Hospital. pp. 70.

THE present dissertation, which completes the view of fever originally proposed, is very nearly in the state in which it was left by its learned and venerable author, who, a short time before his death, desired that Dr. Wells might be requested to superintend its publication. Its design is to point out the diseases which may be complicated with, and the irregularities and accidents which may occur in continued fevers. General inflammation is the first disease which the author treats of, as sometimes forming a part of such combination, and its particular nature he has described at some length in a former dissertation. The union of this complaint with continued fever, he tells us, often takes place in the beginning of the latter disease, in men of strong constitutions, but very seldom shews itself in great towns, where the habits of life are unfavourable to general vigour. Cold climates and seasons are much more favourable to the occurrence of general inflammation than the reverse, and this the author endeavours principally to account for by reasons dependent upon the nature of muscular contraction.—Blood vessels are tubes, which, however they may change their capacity from the different quantities of blood contained in them, are always cylindrical. This circumstance arises from a constant contraction of their parietes round the blood; which, in proportion to its diminution in quantity, re-

quires a greater exertion of the powers of the vessel to accommodate it to the change, and to keep up the same form. This the author conceives, requires an exertion of the vital power, which, as the contraction is permanent, and not casual as in muscular contraction, must be a continued source of expenditure to the vital power. When the diminution of blood proceeds to a certain degree, the vital power thus necessary for contracting the vessels may be withdrawn in such quantity as to produce death.

In order to apply this reasoning to the production of a disposition to general inflammation, the author states, that as the external vessels are much more distended with blood in warm than cold climates, the internal, in such circumstances, must have a smaller than usual quantity contained in them. Hence they must be more contracted; and as this contraction supposes the abstraction of a greater quantity of vital power, than happens when they are of a larger size, the general strength of the body must be more diminished, and therefore a smaller tendency exist to general inflammation. The same reasoning is applied by the author to different circumstances of the body in cold and warm weather.

On this theory we would only remark, that it is by no means proved that a constant exertion of such a contraction as requires vital power to support it, is necessary in proportion to the diminution

of the size of vessels. There is a certain extent, beyond which vessels cannot be emptied, and as we know that they possess an elastic force, it is not improbable that this may be sufficient for producing a change of dimensions. When general inflammation occurs in intermittent fevers, the author conceives that there can be no doubt of the propriety of blood-letting, because the system has time to recover, and the vessels are enabled to fill themselves before the next paroxysm; but in continued fevers, the practitioner ought to satisfy himself well on the propriety of the measure, from the existence of some urgent symptoms, such as determination to the head, before he have recourse to it. But when it is once resolved upon, he thinks that as much should be taken at once as is necessary to remove the symptoms of general inflammation. The propriety of general bleeding, in the continued fevers of this country, is at all times extremely problematical, if not decidedly improper, on account of reasons stated by the author; and it is much to be doubted, whether the symptoms of general inflammation, indicated particularly by hardness of the pulse and a buffy coat to the blood, even in such cases shew themselves, without any degree of local inflammation. Several irregularities are particularized by the author as occasionally shewing themselves in continued fevers. The first of them is the want of some particular symptom which is usually present, or a disproportion between the violence of some one symptom and the others. This circumstance is frequently regarded as a favourable one, but Dr. Fordyce is of opinion that in general it is not so, and enumerates the cases in which he has had occasion to make this remark.

“ Sometimes a fever does not attack a patient all at once, and he cannot exactly ascertain the time at which the first attack took place. In this case most commonly the system is not equally affected. In the next place, it sometimes happens, that although the fever came on in such a manner, that the patient can perfectly ascertain the time of the attack, yet at that time he felt no sense of coldness, or, as he generally expresses himself, chilliness. If this should happen, the fever is often irregular; but not so frequently as in the former case. In the third place, when the attack comes on, the depression of strength is sometimes in a much greater degree than the appearances of the contraction of the small vessels, and sometimes the reverse. If the depression of strength be greater

than in proportion to the contraction of the small vessels, there is greater danger of delirium, such as has already been described, at the beginning of the second week of fever. If the appearances of contraction of the small vessels be greater in proportion than the depression of strength, there is less chance of a crisis, and a greater probability of the disease running out to a great length. In the fourth place, the symptoms not found in particular parts of the body are the patient's being either totally free from head-ach, or very slightly affected with it; the tongue's not being covered with a crust, not only at the beginning, but likewise through the first week of the disease; there being no costiveness, but rather too great evacuations from the intestines. This last symptom sometimes increases to a diarrhoea, which, besides the irregularity it shows in a want of equal affection in the disease, tends also very much to weaken the patient. The appetite not being totally lost is a very deceitful symptom, because it would give an inexperienced practitioner the idea, that food might be easily digested, and so the strength be prevented from being exhausted during the progress of the disease. The skin's being soft and moist, and the sleep not being at the beginning of the fever very much disturbed, are also to be regarded as irregularities. If one, or two, or three of these mild appearances should take place, and all the other symptoms should not be equally mild, the fever is likely to run out for a great length of time, and has a much less chance of being terminated by a crisis.

“ This is not only the case, but every attempt to carry off the fever by any remedy is frustrated. Every medicine, such as preparations of antimony, ipecacuanha, &c. which tends to produce symptoms similar to those which take place in the crisis of fever, has its whole force exhausted upon those parts, in which the appearances of fever are slight, and does not at all affect those parts which are most afflicted by the disease. For example, if there should be considerable pain in the forehead, and the skin should be soft and moist, preparations of antimony being exhibited, the patient will fall into a profuse sweat, without the least relief of the pain in the forehead.

“ It is further to be observed, that not only if there should be a want of febrile symptoms in any one particular part of the body, but if even those appearances should arise, which take place in a crisis, in some particular part of the body, and not in the whole at the same time, the mischief is much greater, and the patient in such a case rarely recovers. If, for example, there be a lateritious sediment in the urine from the beginning of the disease, or if it take place before the middle of the second week, and neither the head-ach nor delirium is any way diminished; if the skin should remain hot, contracted, and dry, the tongue covered with a mucous crust, and the pulse continue of

equal frequency; it hardly ever happens that the patient recovers from the disease. In like manner, the skin having been dry and contracted at the beginning, if a profuse sweat afterward takes place, and continue for some time without any diminution of the other symptoms of the disease; that is, if there should be no lateritious sediment in the urine; if the costiveness and the head-ach should continue; instead of being favourable appearances of the disease, we are to expect that it will prove fatal. Independently of the mischief arising from inequality of the disease, any evacuation will weaken the patient, and render him incapable of supporting the further progress of it, if there be not at the same time an alleviation of the other appearances of the disease."

When such irregularities as have now been described exist, the author knows of no means by which we are able to increase the appearances of fever in those cases where they are wanting. Another irregularity mentioned in this work is, when the fever instead of going on to its acme, and then gradually declining, has alternate exacerbations and remissions of two or three days duration, which in time wear out the patient. In those cases we should employ such means as tend to produce an artificial crisis; but if those are ineffectual before the tenth day, they should not be persisted in, but the disease left to wear

itself out; the practitioner taking care to keep up the strength of the patient, to bear him through the complaint. Cinchona has sometimes had a good effect when given in large doses during the remissions.

Hysteric symptoms, and an imperfect crisis, are mentioned by the author as forming irregularities which are occasionally observed in continued fevers. The first are very alarming to the patient and his friends; but are no otherwise prejudicial, than as they often prevent the disease from subsiding in its ordinary course. An imperfect crisis, such as occurs when the delirium does not subside, or the pulse remains very frequent, the sleep continues unrefreshing, and the appetite is bad, though there is in other respects a concurrence of critical symptoms, generally indicates an unfavourable termination. Where hysteric symptoms make their appearance, the patient should be supported by nourishing food, and should have occasional doses of laudanum, with some antispasmodic, as Russian castor.

To the present dissertation is annexed a general summary of the opinions which the author has advanced in his essays on fever, and a reply to some objections which have been made against them.

ART. XXVI. *Essays on the Diseases of Children, with Cases and Dissections. Essay 2d. On the Bowel Complaints more immediately connected with the Biliary Secretion, and particularly of Atrophia Ablactatorum, or Weaning Brash.* By JOHN CHEYNE, M. D. Fellow of the Royal College of Surgeons of Edinburgh. pp. 80.

IN our last volume we gave an account of the first of the author's essays on the diseases of children, that on the subject of cynanche trachealis or croup. The second essay, which we are now to notice, is prefaced by a few observations on the importance of the hepatic system in the animal œconomy, and by a statement of the change which takes place in the circulation connected with the liver, after birth. During the fœtal state nature seems to have prepared for the functions which were afterwards to be exercised, by the large size and maturity to which the liver was brought. Whether, however, the secretion of bile, immediately after birth, is established in the way in which it is intended by nature that it should continue, may admit of doubt; for though the author considers the évacuation of the meconium as the natural consequence of the stimulus applied to the intestines, yet nature seems

to have aimed at more effectually securing this in another way, by the purgative effects of the milk first secreted by the mother.

The first of the complaints connected with the biliary secretion, which the author takes into consideration, is the jaundice, which occasionally attacks children a few days after birth. This disease has been supposed to arise from the ducts being obstructed by meconium, mucus, or viscid matter; or from pressure on the common duct by milk coagulated in the stomach or duodenum. Such causes, the author is of opinion, may give rise to these slighter species of the complaint, which disappear in a few days, but are insufficient to produce the jaundice, which sometimes terminates fatally. This species is attended 'with languor, flatulence, and bilious urine,' and continues many days, or even weeks, sometimes going away gradually, but generally

terminating in a fatal marasmus. It is not to be removed by emetics, purgatives, or the warm bath, the usual remedies for obstructions in the ducts; and hence it is conceived by the author to arise from

“—*atrophia ab lactatorum*; in the first place it will be found superabundant; and eventually it will appear to be possessed of unusual acrimony. In the *icterus infantum* there is often a complete obstruction to the passage of the bile.

“Taking these diseases in the order of time in which they occur, I shall first mention that species of jaundice which attacks infants a few days after birth. This is always an alarming disease, for when infants do recover it is with great difficulty. It generally comes on about the third day after birth; for it is necessary that this time should elapse before the complete absorption and subsequent deposition of the bile into the blood can take place. It is attended with languor, flatulence, and bilious urine, and continues many days or even weeks. Sometimes it goes gradually away, but generally ends in a fatal marasmus.

“When this disease is fatal, it in all probability is so from an original malconformation in the liver; for we do not find, upon dissection, that it is a disease of the hepatic or of the common ducts, which, though somewhat contracted, from the thickening of their coats, are always pervious. The malconformation is probably an impermeable thickening of the beginnings of the hepatic duct, or, as they are called, the *pori bilarii*.”

Gentle laxatives, frictions of the abdomen, and emetics, are the only medicines which promise advantage.

Another derangement of the function to which the liver is subject in early infancy, is a discharge of bile by vomiting or purging, which is often accompanied with convulsions, fever, gripings, &c. The complaint originates from improper food or cold, and is cured by vomits and cathartics,

“—especially cathartic glysters; and should the disease, or any symptom of it denoting great irritation, continue after the full operation of these medicines, we must have recourse to opiates and testaceous powders; but we must be cautious in giving opiates until the purgative medicines have operated.”

When there is merely a purging, it is called by nurses the green scour.

The principal object of this essay is the description of a disease, which is known in Scotland by the name of *weaning brash*, and which the author thinks may properly be designated *atrophia ab*

*lactatorum*. The purging which accompanies this complaint has generally, by practitioners, been supposed to originate from teething, or from a mesenteric enlargement in scrophulous children; and for some time the author was himself induced to adopt the latter opinion. The indispositions which sometimes accompany teething may occasionally meet in the same child with the weaning brash, but that there is no necessary connexion between them, he considers as proved, by the latter frequently existing where no affection of the gums, or appearance of pain in the mouth, are to be observed, and where the teeth have frequently been cut easily; but more particularly by its frequently coming on in children long before the teething period.

The weaning brash is an atrophy, says the author,

“—the consequence of weaning children too suddenly at an unfavourable season of the year.

“This disease sometimes comes on two or three days after weaning; frequently not for three or four weeks; sometimes not before five or six weeks have elapsed.

“The first symptom is a purging, with griping pain, in which the dejections are usually of a green colour. When this purging is neglected, and after continuing for some time, there is added a retching, with or without vomiting; when accompanied by vomiting, the matter brought up is frequently covered with bile.

“These increased and painful actions of the alimentary canal produce a loathing of every kind of food, and naturally are attended with emaciation and softness of the flesh, with restlessness, thirst, and fever.

“After some weeks I have often observed a hectic blush on the cheek; but the most characteristic symptom of this disease is a constant peevishness, the effect of unceasing griping pain, expressed by the whine of the child, but especially by the settled discontent of his features; and this expression of discontent is strengthened towards the conclusion of the disease, when the countenance has shared in the emaciation of the body.

“In the progress of the disease, the evacuations from the belly show very different actions of the intestines, and great changes in the biliary secretion; for they are sometimes of a natural colour, at other times slimy and ash-coloured, and sometimes lienteric.

“Towards the end of the disease the extremities swell, and the child becomes exceedingly drowsy; but these I rather conceive to arise from debility than to be pathognomonic (pathognomonic) symptoms. It is remarkable, in the advanced stages of the disease, that the purging sometimes ceases for a day or two, but without any amelioration of

the bad symptoms; nay, I think that children decay even faster than when the purging is most violent.

"The disease seldom proves fatal before the sixth or seventh week; and in this short time I have seen the finest children miserably wasted. I have seen, though rarely, a child recovered after the disease had continued three or four months; and again, I have seen the disease cut short by death in the second, third, or fourth week, before it had reached the acme; the sudden termination having been occasioned by an incessant vomiting and purging, or by convulsions from the immense irritation in the bowels.

"The disease is more frequent in children who have been weaned before the eighth or ninth month, and in particular in those who, in consequence of some accident happening to the nurse, have been weaned abruptly."

It is a disease of the autumnal months, and is most likely to occur in delicate constitutions, such as might be supposed to be, in future, liable to scrophula.

The peculiar nature of this disease the author thinks he has detected by dissection, which, instead of confirming his first opinion, has given him reason to conclude, that it originates in an increased secretion of acrid bile, or rather in the morbid state of the liver, which occasions it. He observed,

"—in every instance, that the intestinal canal, from the stomach downward, abounded with singular contractions, and had in its course one or more intus-susceptions; that the liver was exceedingly firm, larger than natural, and of a bright red colour, and that the enlarged gall bladder contained a dark green bile. In some dissections the mesenteric glands were swelled and inflamed; in others, however, they were scarcely enlarged, and had no appearance of inflammation.

"These contractions and intus-susceptions were entirely of a spasmodic nature, as in the latter the contained part of the gut was easily disengaged from that which formed its sac; and in no part of the entanglement was there adhesion, or even the mark of inflammation; and the contracted portions of the intestine were again permanently dilated by pushing the finger into them."

The connexion which the author presumes to exist between these appearances, and an increased secretion of acrid bile, he infers from some positions which may be regarded as rather hypothetical. When a child is weaned abruptly, and at an improper period, the food on which it is put becomes too violent a stimulus to the intestines. The liver is connected with the intestines by a very close sympathy, and is hence excited to unusual action, which produces a large and vi-

tiated secretion of bile, to which the long-continued purging, and the various phenomena observed by dissection, are supposed to be owing. The green stools, which are observed at an early period of this complaint, discover an increased secretion from the liver; and though, at some stages of it, the fæces are clay-coloured, and therefore seem to indicate a defect of bile, yet this circumstance seems to the author accountable, upon the supposition that when the gall bladder is distended with bile, it presses so much upon the cystic duct, and so much increases its natural curvature, as to prevent it from flowing out freely; hence it becomes concentrated and more acrid, and when by some action of the stomach and duodenum the enlarged gall bladder is compressed, the intestines are inundated with bile. This supposition, however, requires the necessity of an interruption to the passage of the secreted bile, which could be poured into the intestine by the hepatic and common ducts, notwithstanding any obstacle to its flow from the gall bladder.

With regard to the cure of this complaint, the author, after trying without success various means of relief, was at last induced to employ calomel, and from the use of this medicine has had many very satisfactory results. He gives it generally in doses of half a grain every morning and evening, and until its operation on the liver has taken place, moderates the griping, purging, or vomiting, by opiate glysters. The same plan has been found efficacious in the diarrhœas of children. Whatever opinion may be formed of the author's theory of this disease, the practice which he recommends, of giving calomel for its removal, is certainly a very proper one, but at the same time it is too general to admit of its being received as a new idea. The author annexes several cases to exemplify the effects of his practice, and to illustrate the appearance observable on dissection. Two well executed and coloured plates exhibit the morbid appearances in two cases which terminated fatally.

A few pages at the conclusion of this essay, which are intended to be placed with that part of his work to which they refer, are devoted to the defence of some of the author's ideas on croup. He entertains an extreme aversion to the operation of bronchotomy, which he is of opinion no circumstances can ever justify, and now gives some observations

with a view to strengthen his former arguments. He does not, however, appear to have placed the question in a new light, or to make it necessary to add any thing to what we have remarked upon this subject in our last volume.

We approve of the author's plan in

thus publishing, in separate parts, the results of his experience in a numerous and important class of diseases; but at the same time we cannot forbear observing, that the style of publication is very unnecessarily expensive.

**ART. XXVII.** *Observations on the Origin and Treatment of internal and external Diseases and Management of Children.* By Mr. HUME, one of his Majesty's State Surgeons, and Senior Attendant of Mercer's Hospital. 8vo. pp. 290.

THE author informs us, that the work which we are now to notice is the result of an extensive practice and long experience in medicine and surgery. Whatever, therefore, may be the opinions entertained of its merit, the medical world must feel itself obliged to an individual, who, at a late period of life, conquers his disinclination to appear before the public, from the hope of rendering some

degree of service to his profession. We are sorry that we have not been able to discover, either in the theoretical or practical discussions of this work, much that is likely to improve the medical practitioner, and likewise regret that we are obliged to notice the very great inaccuracy of the composition, which is every where apparent.

**ART. XXVIII.** *An Account of the Discovery and Operation of a new Medicine for the Gout.* 8vo. pp. 194.

THE annunciation, by an anonymous writer, of a concealed remedy for a disease which has hitherto been an opprobrium to the regular practitioner, and has long afforded numberless opportunities to the empiric, of imposing upon credulity, comes with so suspicious an aspect, as to require all the care and precautions of the author, to give it any claim to professional consideration. Various circumstances, we are informed, prevent it from being thought proper, either to publish the name of the author, or of the medicine here recommended; but in order to ascertain fully its particular effects, before an ultimate decision is made upon the best means of communicating it to the world, it has been placed at the disposal of Drs. Beddoes and Bradley, whose reports, contained in the present work, afford a confirmation of its efficacy, and a sanction to its employment. If the trials of this medicine still continue, we may soon expect to have additional evidence on the subject from various professional quarters; but we cannot help expressing our fears, that, as has been by no means unusual in similar cases, experience will not be found to warrant the flattering expectations at present formed of it. It is hardly necessary to give any particulars of its success from the cases given, either by the author or his friends. It will be suffi-

cient to state the circumstances which led to its employment. The author informs us, that he had a very early aptitude at determining by the eye the qualities of vegetable substances, as whether such or such a tree bore sweet or sour apples by the configuration of the leaf or the twig. Hence he frequently felt a very urgent desire to taste the fruit, the leaf, or the bark, of any new untried plant that he chanced to meet with. About fourteen years ago, during the affliction of an acute rheumatism, he first tasted the fruit, whose juice affords the medicine afterwards applied to the use of gout. He found relief by it, and was induced to repeat it until a cure was effected. Some time afterwards, on a return of the same complaint, the same medicine was resorted to, and with similar good effects. The author has been for some years subject to the gout, but in 1798 he had a fit of extreme severity, which recalled to his mind the good effects which he experienced by the use of the fruit abovementioned when affected with rheumatism. He was hence induced to try it, and was agreeably surprised to find the first dose followed by the production of sleep, and the permanent removal of pain. The use of the medicine produced a gradual recession of the swelling, in a few days enabled him to ride and walk, and in

a short time completely restored his health.

"The medicine seemed to effect as much

in so many days, as nature or rather the passive plan would have done in so many weeks; and the constitution remained quite unimpaired by the attack."

ART. XXIX. *Advice to Mothers on the Subject of their own Health, and on the Means of promoting the Health, Strength, and Beauty of their Offspring.* By W. BUCHAN, M. D. Fellow of the Royal College of Physicians, and Author of *Domestic Medicine*. pp. 419.

THE author of this publication deserves great credit for his strenuous endeavours to remove the prejudices which so much tend to affect the health of females and their offspring; and which it is to be lamented still too generally prevail. The careful observation of a long life has pointed out in strong terms the various disadvantages which arise from the common mode of managing children, and the facility with which those disadvantages might be avoided, by attending more closely to the plan which nature and common sense dictate in so important an object. The physician and the philosopher seem to consider it as beneath them to turn their attention to the cares which are proper in the nursery, and thus unfortunately leave to the management of ignorance and self-conceit, a very important period in the life of the rising generation.

The circumstances to which it is necessary to attend, for the purpose of procuring to females that permanent state of robust health, which is necessary to fit them for the proper performance of the maternal office, is the first object of consideration with the author in the present work. He possesses an elevated idea of the dignity of the maternal character, which he justly considers as capable of materially influencing the future destiny of the offspring, and he views with a well merited veneration the exertions of a female who faithfully discharges her parental duties.

The education and conduct of females of the present day, are justly considered as worthy of severe reprehension, and the author strenuously endeavours to bring them back to the mode of life which nature has intended them to pursue, as that which is best fitted for making them good wives and good mothers. A weak, languid, nervous, or deformed woman may become a wife, but she is wholly unfit to become a mother.

"She risks her own life—she disappoints the natural wishes of a husband—and should

she have children, her puny, sickly offspring, as I before observed, will have little cause to thank her for their wretched existence. The evil is not confined to her own family; society at large is materially injured; its well-being depends on the vigour of the members that compose it; and universal experience has fully proved, that the frame of a husbandman or a hero is not to be moulded or cherished in the womb of debility, and that the bold eagle will never be brought forth by the timid dove."

The observations made in the chapters which relate to the conduct proper to be observed during pregnancy and child-birth, are very judicious and worthy of attention, but we should hope that the author has deviated far from accuracy, when he represents it as no uncommon thing for a married woman to endeavour to procure abortion, merely from an apprehension of a large family, or to avoid the trouble of bearing and bringing up children.

The second and greater part of this treatise relates to the nursing and rearing of children. Very little medicine the author considers as necessary for infants, and this he had an opportunity of determining, upon a large scale, many years ago, at an extensive establishment at Ackworth, in Yorkshire where the consumption of drugs was by his means greatly diminished, and the health of the children materially increased. The indiscriminate use of cold water, for the purpose of daily washing infants, he is of opinion does a great deal of harm, and is at best a very unnecessary severity, which ought to be laid aside. When the mother is able to suckle her child, nothing more than her milk need be given for some months, but this may then be gradually diminished, and other food substituted, that the change in weaning may not be sudden.

In this as in the other parts of the work, the observations are in general creditable to the author's good sense, knowledge of the world, and philanthropy; and if attended to, will, we have no

doubt, prove eminently serviceable. In an appendix the author has transcribed a considerable part of Dr. Cadogan's treatise on the nursing and management of children.

ART. XXX. *The Elements of Physiology, &c. Translated from the French of A. RICHERAND, by Robert Kerrison, Member of the Royal College of Surgeons, London. 8vo. pp. 500.*

IT has been remarked by a French writer, that there is no subject on which any one can come to think right, till he has exhausted all the folly and absurdity into which it may lead him. If this observation be just, every reader, as well as every author, will have reason to be satisfied with it, because it always inspires the hopes of acquiring some new truth, or making some discovery. Should these hopes be disappointed, it must be pleasing and consolatory to reflect, that the quantum of error is diminished, although no addition has been made to our knowledge. Hence authors might be divided into two classes—1st, into those who improve science directly by their genius and exertions; and 2dly, into those who benefit science indirectly, by exhausting some of the nonsense and absurdity with which it is encumbered. Physiology has been chiefly cultivated unfortunately by the latter species; and even to the present time, few have studied it, that belong to the first distinguished order.

Within these few years, however, in consequence of the rapid progress of physical science, the animal economy has been investigated with more accuracy and success. Our knowledge of several functions, though still imperfect, has been greatly increased; and what we do know, does not rest on plausible reasoning, or hypothetical conjecture, but on the solid basis of observation and experiment. An explanation or a theory addressed to the imagination is not now sufficient to satisfy our inquiries, we must have numerous facts and legitimate theories formed by induction, and these only can result from following the plan that Bacon pointed out, and Newton exemplified. To collect and arrange the elements of physiology, becomes therefore a very difficult task. The facts connected with the structure and functions of different parts are so numerous, in consequence of a more general acquaintance with the chemical characters of the solids and fluids of the body, that extensive research and considerable powers of mind are required to select and condense them into a systematic and elementary

form. Whoever executes such a desirable work, would confer a lasting benefit on science. M. Richerand does not seem to possess the qualifications necessary for such an undertaking. In the preface to this work, he informs us, that he has followed the model of Haller's smaller treatise on physiology (*Primæ Linæ Physiologiæ*, 8vo.). It is only in the title-page that these publications bear any resemblance, for we have in vain looked in the book before us for that valuable selection of curious and interesting facts, that order and lucid arrangement, which distinguished every page of Haller's immortal work. Many important facts are collected together from various authors by M. Richerand, but on the most interesting subjects there is the greatest deficiency, and the arrangement of the whole work is calculated rather to confuse and mislead than to instruct. We shall endeavour to lay before our readers some general account of what the author has done, though it would be almost as easy to state what he has omitted to do.

In the 'introduction,' which occupies fifty pages, M. Richerand has given some general remarks on the vital powers, on sensibility, contractility, on the differences between organized and inorganic bodies, and has offered a theory of inflammation. Most of these remarks are so superficial and vague, that it is difficult to discover any meaning in them. We find ourselves quite at a loss to know what the author means, when he talks of the *vital principle*, *vital power*, &c.; for in one place he says, that it is only used as an abridged formula, to signify the aggregation of those powers which animate living bodies, and distinguish them from inert matter—and in another page, he considers the vital principle as a single agent, that presides over all the phenomena, and influences and directs them. Some of these expressions are borrowed from Cuvier, and others from Chaussier and Dumas; but M. Richerand does not seem decided which opinion to adopt, so he has confounded them both, and has not clearly stated either the one or the other. There is the same want of accu-

racy in his theory of inflammation. "Inflammation (says he) in my opinion may be defined, *an augmentation of the vital powers of that part which is the seat of it.* Sensibility there becomes more lively, mobility greater; and from this increase of sensibility and motion arise all the symptoms that denote the inflammatory state," p. 16.—Now this definition is bad, because it expresses none of the phenomena of inflammation, and still more, because it involves an hypothesis, which is contradicted by experience. Those morbid actions which constitute inflammation take place in different degrees, and in very opposite states of the system, and of the part. In some cases there is increased action of the vascular system, increased sensibility, &c. and in others the healthy actions are diminished, and an evident loss of power exists.

The observations in the second section on the relation of physiology to the other sciences are just, and the author with great propriety has insisted on the utility and importance of comparative anatomy. So much cannot be said in praise of his account of the "system of the great sympathetic nerves." Let us hear what the author has thought worthy of republication on this subject:

"The great sympathetic nerves should be considered as a medium destined to unite the organs that are animated by the assimilating powers, and by means of which man grows, develops himself, and constantly repairs the continual loss from vital motion. They form a nervous system, very distinct from the system of the cerebral nerves; and as the latter are instruments of the functions by which we have a relation to external objects, so the great sympathetic nerves give motion and validity to the internal, assimilating, or digestive functions.

"Is not the nervous system of animals without vertebræ, that floats in the cavities with the viscera they supply, entirely confined to the great sympathetic nerves? It distributes itself chiefly on the organs of internal life, the activity of which seems to increase in animals, in proportion to the weakness of their external senses, and power of locomotion. If the great sympathetic nerves exist in all animals that have a distinct nervous system, do they not peculiarly contain the principle of this vegetative life, essential to the existence of every organized being, and to which belong the phenomena of digestion, absorption, the circulation, secretion, and of nutrition? Is it not, in fact, probable, that in man, the system of the great sympathetic nerves has the most important influence in a

great number of complaints; and that it is to its numerous ganglions that its affecting impressions have a relation, whilst the brain is, exclusively, the seat of intelligence and reflection?"

We must confess that we are so dull of comprehension, or so fastidious, as to hesitate in coinciding with our author's sentiments upon this point. He appears to have formed this general conclusion in a hasty manner: it does not seem so clear, that because the sympathetic nerves are numerous, and perform very important purposes in the animal economy, that they form a separate and distinct system. The different parts of the whole body, and especially the nervous system, are so connected together, that no part can be said to be independent of the others. Some of the branches of the sympathetic nerves only serve as media of communication, and they have all an intimate relation to one centre, the brain. Like most theorists, M. Richerand has magnified the importance of these nerves, and makes them the seat of all our pleasures and pains. In answer to the question about the use of these nerves in some animals, it may be remarked, first, that in animals without vertebræ, there is no great sympathetic nerve. And 2dly, that the heart, stomach, and intestines, whose actions are involuntary in animals possessing sympathetic nerves, are immediately and powerfully influenced by the communication with the brain being interrupted or cut off.

Chapter Ist, on Digestion.—Many things are here said, but to little purpose. The author adopts the opinion, that this function is performed by a solution of aliment in the gastric juice: he takes no notice of the different explanations which have been proposed, he mentions no interesting experiments, and refers to no sources for farther information. This whole chapter might be read by any student, without his having an idea that Spallanzani ever lived, or that Stevens, Hunter, and Fordyce ever wrote. When speaking of the organs which secrete bile, M. Richerand has adopted the common error, in supposing that the hepatic artery only supplies blood necessary for the nourishment of the liver. He ought to have known that this artery contributes to the secretion of bile, as has been established by an accidental discovery of a singular termination of the vena portæ in the vena cava. Under the article digestion many subjects are

included, such as hunger and thirst, mastication of the food, action of the intestines, excretion of the fæces, secretion of urine, physical and chemical properties of this fluid, and a few short remarks on the differences in the digestive organs in different animals.

The second chapter treats of *absorption*, in which there is nothing new or interesting to arrest attention. This account is chiefly taken from the valuable and splendid work of Mascagni. The doctrine of cutaneous absorption is cursorily noticed, but none of the objections to it are stated. The author is an advocate for absorption by the skin; his arguments, however, are not very convincing, nor indeed can any reasoning determine this matter, till we have more numerous experiments.

The third chapter on the *circulation of the blood* is more full and complete than any other: it contains the principal facts, and gives the most general views relating to this subject. Among these there is a mixture of some absurdities, as in the following passage:

“From the time of Galen, the pulse has offered to physicians one of the principal means of distinguishing diseases. The force, regularity, equality of its motions, contrasted with its weakness, inequality, irregularity, and intermission, enable us to form a judgment of the kind and magnitude of a disease, of the powers of nature to effect a cure, of the organ particularly affected, of the time or period of the complaint, &c. No person has employed himself more successfully than Borden, on the doctrine of the pulse, considered in these points of view; his modifications indicative of the periods of disease, establish, in the opinion of this celebrated physician, as may be seen in his *Recherches sur le Pouls par Rapport aux Crises*, the pulse of crudity, of irritation, and of coction. Certain general characters indicate whether the affection occupy a part situated above or below the diaphragm; and from this is formed the distinction of superior and inferior pulses; and, lastly, peculiar characters denote the injury of each individual organ which constitutes the nasal, guttural, pectoral, stomachic, hepatic, intestinal, renal, uterine pulses, &c.”

These distinctions are frivolous and nugatory, and in many there is no difference. It is impossible from the pulse alone to determine the seat of the disease, or the violence of the symptoms: in some cases the pulse is our best and surest guide, but in other instances of masked disease we learn nothing from attending exclusively to it. It was for-

merly the custom to lay great stress on the number and frequency of pulsations; the Chinese physicians regulate their practice by attending to indications derived from this source alone; but amongst us, though the state of the vascular system deservedly engages considerable attention, many opinions relating to it have been wisely laid aside, with the self-sufficiency of the gold-headed cane and full-bottom wig.

*Respiration* forms the subject of the fourth chapter, and this leads to the consideration of animal heat, pulmonary transpiration, asphyxia, and certain phenomena connected with the action of the lungs. The quantity of air inhaled into the lungs of an adult, is stated generally to be from thirty to forty cubic inches, but it is said that some physiologists believe the volume of air inspired to be much less, and that Professor Gregory, of Edinburgh, teaches in his public lectures, that hardly two inches enter at each inspiration. No reference is made to the source of this information, which we are strongly disposed to consider incorrect, because such a calculation is refuted by all the experiments made by Jurin, Menzies, Lavoisier, and Davy. The quantity of air inspired will vary in different persons, according to the size, age, sex, &c. and even in the same person at different times; but the average capacity of the lungs may be stated at forty cubic inches. M. Richerand adopts the theory of Dr. Crawford; he has wholly omitted to mention the interesting experiments made by Lavoisier, Seguin, and Davy, and seems never to have heard of the speculations of Hassenfratz and La Grange.

The fifth and sixth chapters contain a short history of secretion and nutrition. The chemical analysis of the blood is very imperfectly given, and the author attributes properties to the halitus or vapour, to which it has no claim. It is stated also, that the red colour of the blood is occasioned by the presence of *phosphate of lime*; we suppose this to be a typographical error, or some false translation, although the same phrase is repeated. Probably the author means *phosphate of iron*.

The actions of the nervous system are considered at great length in the seventh chapter, under the title of *sensations*. The author has adduced some experiments made by himself (and they appear conclusive), to prove that the motions of

the brain, when exposed, are exclusively communicated to it by the pulsations of the arteries situated at its basis.

The eighth chapter is occupied with an account of muscular motion; and we here meet with some ingenious remarks on the preponderance of the flexor over the extensor muscles. The merit of this theory is claimed by M. Richerand, and he is certainly entitled to some praise for his ingenuity.

“The flexor muscles, therefore, have longer and more numerous fibres than the extensors; their insertion into bones is farther from the centre of their motions, under an angle more open, and which increases in proportion as the limbs are in a state of flexion: it is to these causes united that the flexors are indebted for the superiority they possess; and the disposition of articular surfaces, which are mostly inclined towards the side of flexure, is to be attributed to the great extent of motion effected by these muscles.

“This preponderance of the flexor muscles varies according to the periods of age. In the foetus all parts are reflected on themselves without proportion. This convolution of the new individual on itself may be perceived from the time of early gestation, when it resembles a French bean, suspended by the umbilical chord in the midst of the liquor of the amnion; the embryo floats in a cavity, where it becomes progressively more confined as it advances towards the time of birth. This extraordinary flexion of parts, necessary for the product of conception, accommodates itself to the elliptical form of the uterus, and concurs to afford the muscles that effect it, the superiority which they maintain during the remainder of life.

“The new-born infant preserves in a remarkable manner the habits of gestation, but as it advances in growth it becomes less curved: frequent pandiculations or stretchings denote the endeavour to establish a just proportion between the muscular powers. When the infant is able to stand erect, and left to itself, all its parts are in a state of semi-flexion, its walk tottering, continually pressing towards the point of support. But in middle life the preponderance of the flexors over the extensors become less apparent; man possesses the full and entire exercise of his loco-motive faculties, but as he advances

in age this vigour abandons him; the extensor muscles gradually return to that state of relative debility, in which they were during infancy, and become incapable of completing the action of standing in a firm and durable manner.

“The state of our limbs during sleep resembles that of the foetus, which, according to Baffon’s remarks, may be considered in a sound sleep: its cessation in man, as well as the generality of animals, is followed by frequent pandiculations. We stretch the limbs to restore to the extensors a degree of tone necessary for the functions that they are to perform when awake. Barthez refers the crowing and fluttering of wings, by which the cock announces his waking, to a similar purpose.”

The three remaining chapters are on the voice and speech, on generation, on ages, temperaments, the varieties of the human species, &c. and these, with some observations on old age, the probabilities of human life, on death, and putrefaction, conclude the volume.

In composing these elements of physiology, M. Richerand has made ample use of the labours of others, and has added very little of his own. Except in two instances, we have not found an original observation relative to the animal economy: the author seldom rises above the quotation of a surgical case, and these are not much to the point. An elementary work ought to contain the principal and most striking facts arranged in a proper manner, and detailed in plain and simple language. In these respects the present work is very deficient; it may be found useful, however, to those who are desirous of becoming acquainted with some of the general doctrines of physiology, and it may serve as a work of reference to those who may want to refresh their memory with the rudiments of this science. We cannot say how faithful the translation may be, as we have not had an opportunity of comparing it with the original. Very little can be said in praise of its elegance and perspicuity. Many words occur like the following: *musculosity, quiesce, cherubims*, p. 29, &c.

**ART. XXXI.** *A Course of Medical Studies: containing a comparative View of the anatomical Structure of Man, and of Animals; a History of Diseases; and an Account of the Knowledge hitherto acquired with regard to the regular Action of the different Organs. A Work chiefly designed for the Use of medical Students. By J. BURDIN, M. D. Translated from the French. 3 vols. 8vo.*

THE object of this work is to convey popular instruction on the physical nature

of man, by giving a comparative view of the anatomical structure of animal bo-

dies, and of the phenomena exhibited by the different organs in health and disease. This is a mode of communicating knowledge, which the French seem very fond of; there is scarcely any subject which has not furnished them with *un cours & un dictionnaire*. Such collections have their use; they afford information and entertainment to most readers, and may give general notions to many, who have not opportunities to acquire all that knowledge which can only be obtained by more profound research and extensive enquiry. Dr. Burdin has executed his design with great diligence, he has collected together a variety of interesting and important facts, and condensed a vast body of information within the limits of three volumes. Although this work is said to be chiefly designed for medical students, the author, in a preliminary discourse, enlarges his ideas of its utility, and flatters himself that every intelligent person, by reading his book, will render himself master of the subjects on which it treats. He hopes to banish quackery by a more general diffusion of medical knowledge, and in this opinion he is not singular. The grounds of such expectations may reasonably be doubted. Instead of its being the means of putting an end to quackery, a superficial knowledge of diseases, a smattering of medical science, seems most likely to encourage it. To say that a person who has learnt that the body is composed of bones, muscles, and nerves, &c. is best qualified to take care of his own health, and restore it when deranged, is like saying that every soldier is duly qualified to repair his own firelock, if he happens to know that the barrel is made of iron, and the bullet is discharged by the sudden extrication of an elastic gas. Who purchase quack medicines? Who take these medicines unnecessarily? Who are most frequently indisposed from imaginary complaints? Who neglect the precious moments for arresting the progress of acute and dangerous diseases? The readers of *Buchan's Domestic Medicine*, the family prescribers, and nostrum mongers. Quackery will continue as long as knaves and fools remain to dupe and be duped, and this probably as long as men continue "to wag their beards." One advantage of these popular views of medical subjects may be, to prevent sensible persons from being imposed upon by the grimace and affected sapience of ignorant

practitioners, in the same way as a general knowledge of the principles of law and justice, assisted by common sense, may prevent imposition by crafty and pettifogging attornies. Many persons consider themselves the best qualified to judge of their disorders by their sensations, which is a very equivocal test, because at the beginning of any disease the nervous system is generally affected, and false conceptions are produced in the mind. "Every man his own physician," is an unfortunate adage for many hypochondriacs, and besides it is a satire upon the medical profession.

This course of medical studies is divided into three parts:—the first comprehends the organic structure of the body, the osteology, the muscular and nervous system, the senses, the function of digestion, circulation, and generation. The second part includes the history of diseases; and the third part is occupied with physiological disquisitions on the vital functions, the action of the brain and nerves, &c. In a work so very general as that of Dr. Burdin, which includes such a variety of topics, some faults and imperfections are to be expected. It would be tedious to enumerate all those which have attracted our notice; a few remarks may be sufficient to convey some notion of its defects, as well as its merits. The first volume contains many curious facts with regard to the anatomical structure of the lower animals, selected from the valuable lectures on comparative anatomy, by Cuvier and Dumeril. In describing the muscles, the author has employed the nomenclature of Chaussier and Dumas. Many objections may be started to the adoption of these terms; they are difficult to be understood, and still more so to be remembered. Winslow long ago showed the propriety of distinguishing muscles by names which marked their origin and insertion. But Chaussier and Dumas, in adopting this principle, have carried it too far. In framing their new nomenclature, they seem to have forgotten one of the great purposes of language, that of dispatch. Their compound names in general are bad descriptions, they are with difficulty pronounced or remembered, and what is worse, they do not apply to other animals besides man; for many muscles that have similar situations and functions, have not the same origin and insertion in all animals. In

the context, the new names alone are employed; but at the end of each chapter, tables of the bones, muscles, nerves, and blood-vessels are given, and both the old and new names are mentioned.

The account of diseases is chiefly confined to a detail of the principal symptoms; the causes, diagnosis, prognosis, and method of cure is seldom noticed, and only in a superficial manner. This diminishes the value of the work to medical students; for no information is given on those points on which they are most desirous of acquiring some instruction. It does not appear well judged to consider the functions of parts separate from a description of their anatomical structure; the third volume should have been the continuation of the first.

Dr. Burdin would certainly have appeared to greater advantage, if he had written in a more simple and unaffected style, and if he had fallen into the hands of a better translator. The French idiom is so closely adhered to in the translation that some passages are almost unintelligible, and many absurd and bombast expressions have been servilely copied.

**ART. XXXII.** *The Natural History of the Human Teeth; including a particular Elucidation of the Changes which take place during the second Dentition, and describing a proper Mode of Treatment to prevent Irregularities of the Teeth: To which is added, an Account of the Diseases which affect Children during the first Dentition. Illustrated by Copper-plates. By Jos. Fox, Member of the Royal College of Surgeons, London, and of the Society of Medicine, Paris. 4to.*

IN our last volume, we had occasion to notice a very valuable work on the subject of the teeth, by Dr. Blake. The present, which is like that, the production of a man of observation, and practical experience, affords an interesting view of the various phenomena of dentition, which in most particulars agree with those which we had occasion to notice in the article to which we have referred. Mr. Fox does not seem to admit the adhesion of the membrane to the neck of the tooth, after the ossification is completed, and therefore describes the membrane and gum as being equally subject to pressure by the rising of the tooth; a circumstance which, according to Dr. Blake, only applies to the gum. The descriptions of the author are perspicuous, and the plates by which they are illustrated are numerous, well executed, and accurate. Ulceration and absorption he frequently uses as synonymous terms, and therefore in describing the

For instance: "the lungs become hard as if *carnified*," p. 89. vol. 2. "the urine becomes *spumous*," and in another place "*sanguinolent*." We are told of the *osteocope pains* in syphilis, and the *vulvouterine conduit*," &c. &c. It is to be regretted that persons who undertake to translate from one language into another, appear so often ignorant of both, especially of their own mother tongue. Notwithstanding these defects, the work upon the whole is entitled to commendation. It labours, however, under the general fault of all French publications, the want of reference to any author, or to the sources for farther information.

There is one assertion made by our author, which, as it is quite erroneous, ought not to be passed unnoticed. He states the temperature of arterial blood to be  $40^{\circ}$  of the centigrade thermometer, which is equal to  $104^{\circ}$  Fahrenheit's scale. Now it is well known, that the average temperature of the blood in health is  $96^{\circ}$  or  $98^{\circ}$ , and that the animal heat seldom exceeds  $102^{\circ}$ , even in violent and acute febrile disorders.

removal of the fangs of the temporary teeth, and the rise of the teeth through the gums, refers to the agency of the one process, what he should have attributed to the other. An analysis of human teeth is annexed to this work, by Mr. W. H. Pepys, jun. By this it appears that the enamel consists in 100 parts, of

ART. XXXIII. *A new Anatomical Nomenclature.* By DR. BARCLAY.

SO much of the best spirit of a moderate, sagacious and truly philosophical reformer appears in this essay, as immediately to lay to rest all that hostility to mere innovation which naturally arises when reform is *dictated* and not advised; and to ensure, at least, a respectful attention, if not to enforce conviction.

The subject of scientific nomenclature is curious, important and entertaining, and involves many interesting enquiries relative to the origin, progress, and capacity of language. The author but slightly touches on these topics, confining himself principally to the precise object expressed in the title page, that of anatomical nomenclature.

Dr. Barclay judiciously begins by shewing the faults of the present system; the most unpardonable of which, where it occurs, is ambiguity. Many of the common terms of relative situation lie under this censure; *superior, inferior, anterior, posterior, within, without, &c. &c.* are all occasionally used in more than one sense, and therefore must frequently mislead the learner. Our continental neighbours, the French, stimulated doubtless by the deserved success of their chemical nomenclature, have attempted a reform in that of anatomy; but though undertaken by such able men as Vicq d'Azyr and Chaussier, Dr. Barclay has shewn that these attempts have not answered expectation, owing to a preference (now so fashionable) of cumbersome minuteness to useful condensation.

The author proceeds to enquire which is the best language to furnish the radicals of a scientific nomenclature. The scholar will at once decide in favour of Greek or Latin; and, with justice we apprehend, because they are the only languages common to science, over the greater part of the philosophical world, because they are the least liable to change being fixed by indelible standards, which will endure as long as learning and taste

are valued, and because they possess a modulating harmony which admits of extensive variety and useful combination. Dr. Barclay comes to the same result by a different mode of reasoning, and proceeds to demonstrate anatomically (and we must add a little whimsically) the 1,125,899,906,842,623 possible combinations of the muscles that contribute to the human voice, whence he infers that no living vocal language can preserve its stability against such an array of millions of chances of variation; and hence that the classic languages, now nearly extinct as living tongues, and resting on the solid basis of written record, are to be preferred as the basis of philosophical nomenclature.

Dr. Barclay allows, however, a large latitude in the combination of these languages, "notwithstanding the opprobrium attached by some to certain connections and intermarriages among harmless vocables," and where utility would be much consulted, he would not refuse the union of the two languages in the same compound. In this he is supported by some authority; for though the classic ears of our continental name-reforming neighbours might be shocked at *diventer* or *bigastric*, they have judiciously tolerated *centilitre, milligramme, &c.* for the convenience of their metrical system.

With some remarks on the present system of chemical nomenclature, Dr. Barclay proceeds to point out the imperfections of the anatomical:

"Many of the present terms of anatomy have been condemned for not expressing some quality or circumstance of the objects which they signify, and others, containing a kind of a short definition or description, have been substituted for them. As it may be both wished and expected that the new terms brought into anatomy were all of this sort, a previous inquiry into their nature, uses, and peculiar advantages, will not be improper. The French have lately adopted such terms in their modern calendar; the words *nirose,*

*pluviose*, and *thermidor*, are intended to shew the species of weather which prevails at certain periods of the year. Let us see the improvement: the weather being variable even in France; and the rain and snow not happening to fall always at the time foretold in the calendar, these terms become so many lying predictions; and in countries where the seasons and climate are different, are an absurd unintelligible jargon. But what are the descriptive terms in anatomy? Not a great deal better. Many of these, as *sphenoides*, *ethmoides*, *astragalus*, *cuboides*, which are founded on vague and remote analogies, scarcely convey the most distant idea of the forms which they were meant to express:—many which contain allusions to functions, and seem to communicate something of importance, deceive thousands of the indolent and credulous, who trust to their lame and imperfect information;—some, again, as *levator scapulae*, and *supinator radii longus*, are almost unavoidable sources of error, from directly insinuating what is not true;—and some, as it were taking advantage of a partial and erroneous classification, pretend to inform us of what belongs to this or that function, excluding, by a kind of secret reservation, some of the principal organs employed. This is evident in our distinction and arrangement of muscles into *flexors*, *extensors*, *pronators*, and *supinators*. But by no means the least numerous class are those which allude to frivolous circumstances; some of which, like *sella turcica*, and the word *hippocampus*, seem intended to illustrate the things which we see, and which we may handle, by comparing them to objects which we either have not seen, or have seldom an opportunity of observing. Much discernment, therefore, and caution, are highly requisite in the use and application of such terms; for wherever their descriptions are frivolous or vague, or wherever they are false, whether founded on ignorance, error, or hypothesis, they can hardly fail, if used in their primary and original sense, to be hurtful to science; nay, even when true and accurately just they cannot be admitted unless when concise; for be their powers what they will, they become ridiculous when they run out to the length of sentences.

“Are all such terms then to be rejected from the language of anatomy? And ought there to be a complete revolution in its nomenclature? To answer these questions it may be observed, that no where perhaps is prudence more necessary than in our attempts to innovate on habits and established customs. Those terms may surely be retained which are just and accurate, and not too long; those which assist us in discriminating objects; and those likewise, however absurd their general allusions, that, in course of time, have laid aside their primary sense, and begun to be used as arbitrary names.”

Let us pursue this subject a little farther

than our author, and give some of the leading features of the present system of anatomical nomenclature, if system it may be called. A very large class of names is that which expresses the *form* of the organ, either absolutely as *biceps*, *triceps*, *serratus*, or from a resemblance more or less accurate with other visible objects, as *lamdoid*, *styliform*, *stapes*, *malleus*, *incus*, &c. Another class shews the real or supposed use of the part, as *adductor*, *accelerator urine*, *sartorius*; another class, though small and constantly diminishing, commemorates the name of the inventor, as *Cooper's glands*, *Eustachian tube*, *Schneider's membrane*, and a few terms are derived from an erroneous or whimsical origin, such as *artery*, *pia mater*, *ponium Adami*, or, like the *os innominatum*, are absurd appellations; but the larger class of names is expressive of relative situation, either in the form of a definition, like the compound term *occipito-frontalis*, denoting both the origin and insertion of a muscle; or, more generally, as implying connection with a particular organ, as *hepatic artery*.

Dr. Barclay appears to be most exclusively attached to the latter class, which, when well contrived, answers the purpose of topographical description, and on that account is highly estimable; but we cannot entirely agree with him in the objection, qualified as it is, which he urges against many of the terms of our first-mentioned class. However far-fetched and distant be the resemblance to other objects, though not one out of ten thousand students should ever have seen a Turkish saddle in his travels, or a hippocampus in his books of natural history, though the *os scaphoides* should not put them in mind of a boat, or the corner of a ploughshare; yet when the resemblance is once pointed out, the mind catches at the association, and it soon becomes indelible. The tax on the memory in anatomy is so heavy, and, as far as nomenclature is concerned, is so much greater than in chemistry, that every artificial means of lessening its burthen should be studiously encouraged; and we appeal to the experience of every learner, whether the terms that express resemblance in shape to known objects, however remote, are not precisely those which the soonest lay hold of the memory, and cling to it the most tenaciously.

Of the singularly happy names, perhaps none is superior to that of the first vertebra. The classical allusion con-

tained in the *Atlas*, implies a firm elevated support to an organ of commanding importance, and ingeniously describes in a single word the circumstance both of use and relative situation; but such fortunate combinations are very rare, and it has been a real labour to the most prolific imagination to devise terms sufficiently distinct and appropriate to follow the ever ramifying search of the anatomist; therefore, though Highmore has surrendered his exclusive claim to the maxillary antrum, and of late the crural arch has been refused to Poupert; and though we should be glad to see a name substituted to a definition, when speaking of the *iter a tertio ad quartum ventriculum*, or the *additamentum suturæ lambdoidalis*, we are not sanguine enough to entertain the hope of seeing the entire system of anatomical nomenclature simplified to a single principle, without encreasing the difficulty of the learner by the excessive recurrence of the same leading terms, and overloading the mechanical part of memory by depriving it of the assistance of the imagination.

The system proposed by Dr. Barclay does not, however, go to a total change of the present nomenclature, nor can we entirely infer from what is said, that it is the author's intention so to extend it. The present plan only proposes a reformation in all the terms relative to position and aspect, to be substituted for *upper*, *lower*, *internal*, *external*, *right*, *left*, and others of the same class.

The human anatomy has been the prototype of the comparative; all the terms of relative situation are therefore derived from it, and the anatomist has generally chosen the erect posture as the most convenient for the delineation of his subject. But it requires a great stretch of the imagination to transfer this position, the *os homini sublime*, to the brute creation; and in so doing, all the natural distinctions of situation in the inferior animals are distorted, whence infinite perplexity ensues. To remedy this evil, the author, extending his views to every branch of anatomy, has with great judgment, and, in our opinion, with equal success, devised a system of relative terms, founded on those features of universal anatomy which are invariable, and capable of general application. The former plan resembles the *right* and *left* of a map, which gives correct ideas only on one projection; the latter is the *east* and *west*, always accurate.

As our limits will not allow us to explain this system with sufficient minuteness to do it justice, we shall only enumerate a few of the terms, as a specimen of the author's talent for philosophical nomenclature. Three sets of names are separately devoted to imply relative situation in the trunk, the extremities and the head. For the trunk, a line drawn from the atlas to the sacrum furnishes the well contrived terms of *ATLANTAL* and *SACRAL*, to correspond with *upper* and *lower*; another line, from the sternum to the back, expresses *anterior* and *posterior* by the denominations *STERNAL* and *DORSAL*. A plane passing along the neck, mediastinum and linea alba, is called the *MESION*, whence *MESIAL* and *LATERAL* will be equivalent to *internal* and *external*, in one of the senses in which these two terms are employed; whilst *DERMAL* and *CENTRAL* is substituted for the same terms, when they imply *superficial* and *deep*.

The anatomy of the head requires a greater variety of combinations, and the author distinctly makes out ten different aspects, to be described by appropriate names. This provision affords a facility for comparative anatomy, superior to any thing that has yet been devised, and it is in every way worthy of attention.

The greatest stretch of system that we have observed, occurs in the extension of the terms atlantal and sacral to the head. These, as we have before observed, imply relatively, superior, and inferior, and are derived from the extreme points (in the trunk the opposite *poles*) of the atlas and sacrum. "Continue this line," says the author, "perpendicular to the plane of the foramen magnum occipitale, till it fall on some bone of the cranium or face, and let this bone, whatever it be, be called the *atlantal*. In man the line will terminate on the sagittal, a little behind the coronal suture;" now "if the term *sacral* be applied to the head, it must always denote that side which is opposed to the atlantal, and may easily be found from observing the place of the foramen magnum."

According to this plan it will follow, that the parts of the head the most *remote* from the atlas, will be termed atlantal, and those the most *contiguous* to it, will be called sacral; nor can it be otherwise, consistently with the general system. It may indeed be argued, and not without reason, that these terms so applied have here only a relative signification, like

north and south, and wherever one is employed absolutely, the other must be used relatively as its opponent; but till by long habit we come to sink the etymology of these terms altogether, such a stretch of nomenclature must appear as strange as if, in a reformed geography of this island, Tweed and Thames were assumed as synonymous with north and south, and the traveller was directed to turn his horse's head *Tweedwards*, to find his way from Stirling to Inverness.

Dr. Barclay has not thrown his system before the public in the state of an unfinished sketch, but has filled up many of the minuter parts with care, and obviated some objections which would naturally occur. One that he suggests is the following:—The terms denoting *aspect* are uniformly derived by the author from the names of certain organs, whose relative position is sufficiently invariable for his purpose; so that all the common appellations of situation, upper, outer, &c. are totally discarded; but the derivatives

from these selected terms would also naturally imply something belonging to, or proceeding from the part itself; thus a *fibular* artery (which is one of the new terms) would imply both an artery situated on the fibular or *external* side of the lower extremity, and an artery belonging to the bone called the fibula. The author has no other way of avoiding this difficulty, than by changing the termination, giving to the former meaning *fibular*, and to the latter *fibulen*. This distinction stands on a par with the *sulphate* and *sulphite* of the chemists; that is to say, sufficient where due stress is laid on the terminating syllable, but far inferior to the antient terms of *vitriolic* and *sulphureous*.

The author has given some good outline plates in explanation of his system; a system which has convinced us, of the practicability, as we long have been of the utility, of effecting a thorough reform in all the erroneous or defective parts of anatomical nomenclature.

ART. XXXIV. *Cases of the successful Practice of Vesicae Lotura, for the Cure of diseased Bladders. Parts I. and II. By JESSE FOOT, Esq. 8vo. pp. 139.*

THE idea of injecting liquids into the bladder has been occasionally adopted in different diseases of this organ. As the readiest and directest means of applying any supposed solvent liquid to calculus when contained within this cavity, it has been employed experimentally by several eminent men; but the success has not corresponded with expectation. One great reason of failure has been the difficulty of ascertaining previously the nature of the calculus (except Colonel Martin's celebrated filing or scooping plan were adopted), and analysis has shewn such a vast variety in the composition of calculi that no single solvent could be applied with a certainty of success. But the chief reason for laying it aside appears to have been the pain, trouble, and difficulty of persevering in it for a sufficient time to give it a fair trial, considering that a bladder, even in its healthy state, and still more irritated by a painful disease, is not quite the properest vessel for chemical experiments.

But there is another kind of disease in this organ in which the injection of liquids may often prove of essential service; it is where the bladder has been exposed to great and habitual irritation, unconnected with calculus, and attended

with the most distressing symptom of incontinence of urine, owing to an actual thickening of the coats and diminution of its cavity. Dissection fully shews that this is a frequent state of disease.

It is in both the above cases, but principally the latter, that the author recommends the injection, and in this he revives a practice mentioned by Le Dran, who has given a very good case in point which is quoted in the present publication. Mr. F. attempts to establish the following diagnostic rule.

“In the fifth edition of my “Critical Enquiry into Diseases of the Urethra and Bladder” I have particularly noticed this observation; and I have there pointed out, for the first time, I believe, that it has ever been observed, a leading principle, by which a diseased bladder is always to be detected, and distinguished from any other cause with which it might be otherwise confounded. It is this: that at no time the bladder can hold more than a certain portion of urine, and of course that at no time, more than that portion, if so much, can be ever discharged at once. For example thus: suppose that a patient, for a series of time, has not been able to evacuate more than two spoonfuls of urine, upon any effort: and suppose that such has been the habit without any exception, for two or three months; suppose that

mucus comes away with the urine, and at the same time the urethra has been carefully distended by bougies; in that case I should have no hesitation in declaring, that the capacity of the bladder was contracted, and that its contraction was just in proportion to the diminished quantity it would contain, from a comparative view formed with a sound bladder. Whereas in all other possible affections of the bladder, there will be times when it is not contracted, that the full contents of a capacious bladder can be evacuated. This is a distinction *a priori*; but injecting the bladder will readily decide the question *a posteriori*, for just so much as the bladder will possibly hold, can be injected; and by the fluid being measured when it is evacuated, any further doubt about the nature of the case is completely removed."

Several cases are given in which the injection was used with success. A part of the first we shall quote, it is given in the patient's own words.

"To afford as clear an idea of my case as I possibly can, I conceive I should detail it, by stating what my symptoms were before the injection was applied to the bladder, and what they were after.

"My symptoms before, were an almost continual inclination to urine, in the day time, and in the night rising for that purpose from the bed seven, eight, and nine times, with seldom any thing like a continued stream of urine, the volume small, and the quantity from two to three spoonful; and that with great uneasiness. From the first of my finding the difficulty of urining abovementioned, my urine was accompanied with mucus; and it generally was of a strong red colour, mostly turbid, sometimes ropy, and it hath continued thus for many years. Another formidable symptom was growing on me apace, a constant state of irritability, and which the most trivial incident, notwithstanding my own mental precautions, would frequently provoke; feeling at these times great irritation and uneasiness in the region of my bladder. Walking on wet grass, and being in damp rooms, would bring on a stranguary.

"Such, Sir, was my state as nearly as I can recollect, previous to the operation of injecting my bladder. Time by neglect, and the want of proper treatment, of course gradually reducing me to a worse and worse condition.

"The account of my subsequent condition will, happily for me, be more comfortable and pleasing. My urine has been no way perturbed or mucus discharged, since March last. I retain it much longer in the day time, and I rise upon an average three times in the night only. The quantity of urine discharged in the night at those three times, is generally about three half pints. The quantity my bladder would hold when you first began to inject it, could not possibly ever amount

to three ounces, with mucus included. You increased the capacity of my bladder, so much by the operation of injection, as when you left off this time twelve month, it would contain nearly fourteen ounces. And I have by injecting myself occasionally since, rather gained upon that quantity, although I have purposely discontinued it for more than a fortnight at times, without finding that I lost ground. The irritation of the bladder, I have greatly though not entirely subdued, by a rigid adherence to your directions of lessening my quantity of animal food; and I have experienced, that if at any time I forget myself and indulge myself, I am punished."

The term *capacity of the bladder* is however liable to some misconception. A bladder may be so diminished in size from the thickening of its coats, or from a condensation of mucus into membrane lining its cavity, that it actually will not contain more than three or four ounces of liquid; or it may become so habitually irritable as not to allow of being filled to more than three or four ounces, without bringing on the natural efforts to expel its contents. The cases given by the author may be of a mixed kind, partaking of the nature of both these morbid states; and it appears very largely of the latter; since by use of the injection, the irritability of the bladder seems to have declined in proportion as its capacity for liquid has enlarged. This is proved by the circumstance that the time in which the injected liquid or the natural secretion could be retained, has lengthened, as its quantity has increased. It does not however detract from the importance which may attach to this practice.

The second part contains several additional cases of irritability of the bladder and incontinence of urine, arising from abscess in the kidnies, some of them fatal. The injection in some of them appears to have done what could rationally have been expected, that is, it proved a useful palliative for one of the most distressing symptoms of a dangerous and commonly fatal disease.

The author in relating them takes an opportunity of throwing extreme censure on the use of the caustic in strictures; and he does not scruple to affirm that in two thirds of the cases for which caustic is applied, no other obstruction is present than what arises from the irritation of a diseased kidney.

The author considers phymosis as a cause of disease of the whole urinary organs, and thus explains it.

"The cause of this affection is shewn by the stream of urine being obstructed in its passage from the bladder; from its not having that equal and proportionate egress out of the urethra as it is poured into the urethra from the bladder. The contracted prepuce makes a pressure upon the glans penis, by which the urine recoils upon the neck of the bladder, irritating and inflaming it more and more, till the bladder, and in process of time, the kidneys, become as much diseased from this cause, (as the following cases will demonstrate) as they possibly can be, from any other cause whatsoever."

The cases do not appear to us perfectly conclusive. In the operation for phymosis, which the author recommends, he only divides the inner duplicature of the prepuce. He employs a small bill-hook knife, a plate of which is given; we shall give his description of the operation.

"About the sixth of an inch of the outer cutis, is to be divided from within outward; so that the point of the knife shall be seen passing out, and dividing about one-sixth of an inch of the outer cutis; and this is all of the outer cutis that needs to be divided. This will naturally enable as much of the cutis as is divided, to be slid back; when only the duplicature will present itself; as much as

does present itself must be divided in the same manner. This will allow fresh undivided duplicature to present itself, which is also to be divided after the same manner; and so on, till the whole is thus divided, and till the whole can be slid back behind the glans penis, leaving it completely denudated.

"The treatment of the part is to be according to the principles of common surgery; to be dependent upon the degree of inflammation, and the previous habit and age of the patient. One point must be always attended to; the prepuce must never be suffered to remain, for any time, slid back, as in one instance, where that was the case, it was with the utmost difficulty, that I could again bring it forward. The strangulated glans had hydatids upon it, and in the shortest time must have sloughed away. When the consequent inflammation will permit it, the prepuce should be slid backward and forward two or three times in a day, and whilst that was doing, the glans should be smeared over with oil of almonds. This will be sufficient in the simplest cases, and the whole will be well in a fortnight."

A plate is given with the second part, shewing the instrument for injecting the bladder. It is simply an elastic gum bottle, to the neck of which is fixed a flexible catheter.

ART. XXXV. *Anatomical Plates of the Thoracic and Abdominal Viscera, for the Use of Students in Anatomy, and Artists; accompanied by explanatory Maps.* By ROBERT HOOPER, M. D. Fellow of the Linnean and London Medical Societies, resident Physician to the St. Mary-le-bone Infirmary, &c. &c.

THE title of this little work sufficiently explains its contents. The size of the plates is the same as that of the author's reduced Albinus, and as the parts here represented are larger and not so much involved as the muscles, the stu-

dent may obtain from them a very good general idea of the situation of the thoracic and abdominal viscera. They have every claim to be as well received as the former fasciculus.

ART. XXXVI. *A Diagram of the Human Eye.*

A Single-coloured plate giving a very accurate transverse section of the eye much magnified, accompanied with a short explanation.

The exact ratio of enlargement is not mentioned; the length of the figure is nine inches, which well adapts it for demonstration in a lecture room.

ART. XXXVII. *A Map of the Human Ear.*

AN enlarged coloured view of the external and internal ear. The explanation is not so full as that of the eye, and Dr. Hooper has equally omitted to men-

tion the natural dimensions. From this plate the operation of puncturing the tympanum may be seen with great correctness.

ART. XXXVIII. *The Anatomy of the Human Body, Vol. III: containing the Nervous System; with Plates. Part I. The Anatomy of the Brain and Description of the Course of the Nerves. Part II. The Anatomy of the Eye and Ear.* By CHARLES BELL, Fellow of the Royal College of Surgeons of Edinburgh. 8vo.

THOUGH nominally a third volume, this work may with propriety be considered separately, the two former volumes being written by a different

author, and the present being only connected with them as it completes the joint design of the two authors, in giving a comprehensive system of human anatomy.

A writer, himself an accurate and practised anatomist, and in a situation to avail himself of the best published authorities, will find a greater treasure of curious, beautiful, and recondite anatomy on the subject of the nervous system, than on any other part of anatomical science. Who is unacquainted, by report at least, with the admirable works of Scarpa, Vicq d'Azyr, Zinn, Sæmerring, Monro, Walter, and many other men of eminence, whose lives have been devoted to anatomy, and who have made the nervous system their peculiar care?

But, even to follow the demonstrations of these excellent anatomists requires a very considerable share of previous knowledge, both of that substantial kind which is gained by long and dexterous use of the knife, and of that familiarity with artificial distinctions and points of controversy which is acquired by consulting books.

It is but justice to Mr. Charles Bell to say, that he appears well qualified for the task he has undertaken; his drawings, some of them original, in the particular point of view in which they are represented, and his general mode of description, shew that he does not teach merely by rote, but from personal experience, and the authorities which furnish the basis of his work are of the best kind, and well selected.

The work before us is chiefly anatomical; with small admixture of physiological discussion, or any other of the many interesting enquiries connected with the functions of the noblest organ of the human body; and as simple anatomical description of intricate parts is of all things the most intolerable to read without plates or preparations, or dissected subjects, we shall content ourselves with giving a cursory view of the contents of this volume.

The author begins with a very slight introductory view of the nervous system, chiefly relating to the structure of the brain and nerves, of ganglions and plexus. The mutual dependency of the nervous and circulating systems is thus described.

expansions in the organs of the senses, are dependent for the perpetual renewal and support of their function upon the circulation of the blood. We should be tempted to imagine, that the nervous system were a nobler part of the economy, did we not frequently see the powers of the mind as well as the functions of the nerves disturbed, or altogether overthrown by the irregularities of the bodily system; were we not thus reminded of that circle of connexions and mutual dependency which support the whole. If the tide of blood flow too rapidly upon the brain, the intellect is disordered, the ideas come in rapid and irregular succession. If the exit of the blood from the head be obstructed, there is an obstruction to the circulation of the blood in the extremity of the vessels of the brain; the function of the brain is suddenly suppressed, because, though its attributes seem so peculiar, it requires the perpetual circulation of the blood through it to renovate its powers.

"The effect of the circulation of the blood through the nerves of the limb is not less remarkable. If the nerve of a limb be cut or tied, the animal can no longer move the limb, having lost the power of the will over it. But if the great artery of a limb be tied, the function of the nerve is, in a short time, equally destroyed; because the circulation of the blood through the nerve being obstructed, it loses its powers, and is no longer a living part."

"Thus, whilst the moving powers of the circulation of the blood are dependent on the state of the nervous system, the nervous system is as immediately dependent on the healthy state of the blood, and the velocity of the circulation."

Though the interruption of the functions of the nervous system, by a derangement in the other parts of the animal economy, does not absolutely invalidate the term *nobler part* of the system, it is very proper to point out the dependence of the nervous, on the arterial functions.

The anatomical description of the membranes of the brain, and the texture of the brain itself forms the subject of the first chapter.

The veins and sinusses follow, and are described with care.

The author is willing to attach considerable importance to the *glandula Pachioni*, or small tubercles appearing like silk-worms' eggs, as the inventor describes, and studding the inside of the longitudinal sinus. Mr. Bell conceives, that they act as valves to the veins that open into this sinus.

The use of the sinusses of the brain is an important speculation. Mr. Bell

gives the following observations on this subject.

“The importance of the sinuses in the circulation of the blood in the brain, is either vaguely described, or imperfectly understood by authors. We find it said, that the sinuses support the blood against compression, and protect its free circulation. This to me seems an erroneous idea. The lesser veins are as in other parts of the body, and have no such provision; and since, within the head, there can be no such partial compression as in the limbs, any cause which would compress the greater veins, were they not supported, must fall upon their extremities with worse effect. The circulation is the only power which can act mechanically upon the brain; but this can never cause a compression of its veins, because the increased action of the arteries must tend more to the distention of the veins than it will be the occasion of the brain compressing them.

“The more general idea conceived of the use of the sinuses is nearer the truth; viz. to prevent the sudden and violent action of the muscles of respiration, or of the muscles of the head and neck, from repelling the blood into the vena cava, or internal jugular veins; and consequently preventing the impulse from being communicated to the blood in the small and tender veins of the brain, which might endanger a rupture of them. Yet this is not exactly the manner in which the sinuses preserve the lesser veins; they do not suffocate nor take off the force of the impulse from the regurgitating blood, so much as they would do if they were like the trunks of veins in other parts; because, being incapable of distention, they throw the undulation of the blood, when it is thus checked in its exit, backwards upon the extremities of the veins. But then the effect is, that no particular vein or trunk receives the shock; all suffer in a lesser degree, and equally, which is their safety. All the veins in the base of the brain, which would be liable to rupture, or distention, from receiving, in their sudden turns, the shock of the blood, checked by the muscles of respiration, or otherwise, are preserved by being inclosed in sinuses, and covered by the strong lamellæ of the dura mater. The lesser vessels again are removed from the shock: its force is spent, because it has spread among many branches; and it has become a general impulse upon the brain, which the brain resists, because it is incompressible.”

Monro's explanation of the use of the sinusses, to which the author refers, in a note, is not given quite correctly. Dr. Monro does not say that the sinusses prevent the repulsion of blood, by the sudden action of the muscles of respiration into the vena cava and internal jugular, but that when the blood is so re-

pelled “the impulse may not be communicated to the blood in the small and tender veins of the brain, which would endanger a rupture of these,” and in confirmation of this opinion, he adds, that “generally a very small quantity only of any liquor injected into the sinusses enters the small veins of the brain and cerebellum.”

The ventricles of the brain and origin of the nerves are described in the following chapter. Mr. Bell takes Willis's arrangement of the nerves, allowing only nine of the encephalon; whence the facial and auditory is included in the seventh pair, the glosso-pharyngeum, the vagum, and accessorium in the eighth, and the sub-occipital or tenth of Willis forms the first cervical pair, as Haller has proposed.

We shall give a single specimen of the author's talents for anatomical description, that our readers may form some opinion of the execution of the work. Let us take part of the description of the par vagum, as being one of superior importance.

“The par vagum is the great and important division of the eighth pair. It is the middle fasciculus of the three nerves as they lie within the skull. In its exit, it is separated from the internal jugular vein by a thin bony plate; and sometimes two or three fibres of the nerve pass the bone distinct from the others, and afterwards unite into the proper trunk of the par vagum. Deep under the lower jaw and the mastoid process, the glosso-pharyngeal nerve, the par vagum, the spinal accessory, the sympathetic nerve, the portio dura of the seventh, and the upper cervical nerves, are entangled in a way which will fatigue the dissector, and may account for every degree of sympathy of parts. The par vagum, lying behind the internal carotid artery, and as it were escaping from the confusion of the ninth accessory and glosso-pharyngeal nerves, descends and swells out into a kind of ganglion. We now observe three branches to be sent off: the first and second pharyngeal nerves, which pass to the constrictor pharyngis muscle, and the internal laryngeal nerve. This last mentioned nerve is even larger than the glosso-pharyngeal nerve. It is behind the carotid artery, and passes obliquely downward and forward. In its progress the principal branch passes under the hyo-thyroides muscle, and betwixt the os hyoides and the thyroid cartilage; while others, more superficial, pass down and are connected with the external laryngeal, or pharyngo-laryngeus; which is a nerve formed by the sympathetic, and par vagum conjointly. The principal branch of the internal laryngeal nerve, which runs

under the hyo-thyroideus, is distributed to the small muscles moving the cartilages. The minute extremities of this nerve pass also to the apex of the epiglottis, and the glandular membrane covering the glottis. We have, at the same time, to remark a very particular communicating nerve betwixt this internal laryngeal nerve, and the recurrent branch of the par vagum. This branch is described by Galen. The par vagum continues its uninterrupted course betwixt the carotid artery and jugular vein, and is involved in the same sheath with these vessels. In this course down the neck, it sometimes sends back a twig which unites with the ninth pair, and when near the lower part of the neck, it sends forward twigs to unite with those from the sympathetic nerve, which pass down to the great vessels of the heart, to form the superior cardiac plexus. On the right side, these nerves to the great vessels are in general given off by the recurrent nerve.

"The par vagum now penetrates into the thorax by passing before the subclavian artery; it then splits into two. The main nerve passes on by the side of the trachea, and behind the root of the lungs; while the branch, on the right side, turns round under the subclavian artery; on the left, under the arch of the aorta, and ascends behind the trachea to the larynx.

"This ascending branch of the par vagum is the recurrent nerve. On the right side it is sometimes double. It ascends behind the carotid artery, and sometimes is thrown round the root of the thyroid artery. On the left side, which, from its turning round the arch of the aorta, is much lower than on the right, it gives off filaments which go to the lower cardiac plexus, after having united with the branches of the sympathetic. Under the subclavian of the right side, also, there are sent branches from the recurrent to the cardiac plexus; and on both sides there pass branches of communication betwixt the sympathetic nerve and the recurrent. When the recurrent nerve has turned round the artery, it ascends in a direction to get behind the trachea, and it lies betwixt the trachea and œsophagus. It here sends off many branches to the back and membranous part of the trachea, which pierce this posterior part, to supply the internal membrane. It gives also branches to the œsophagus and thyroid gland. The final distribution of this nerve is to the larynx. It pierces betwixt the thyroid and cricoid cartilages, and separates into many filaments, which terminate in the crico-arytenoideus lateralis and posticus, and thyro-arytenoideus, and in the membrane of the larynx. We have already mentioned the branch of communication betwixt the recurrent and internal laryngeal nerves, and Sabatier describes a branch of the recurrent, which sometimes ascends and joins the sympathetic high in the neck.

"Two cases, mentioned by Galen, of scrophulous tumours in the neck opened, where the consequence was loss of voice, have tempted many anatomists to institute experiments on the recurrent and internal laryngeal nerves. Notwithstanding the deep situation of those recurrent nerves, Galen says, they were cut in these cases, and he believed that the branch of communication betwixt the laryngeal and recurrent restored the voice after some time had elapsed. Both the internal laryngeal and recurrent nerves are necessary to the formation of the voice. Experiments have been made, upon them in dogs, and the result is curious; although the lesser changes of the strength, acuteness, and modulation of the voice could not be well observed in the lower animals. When the laryngeal nerve is cut, the voice is feeble but acute; when the recurrent nerve is cut, there is a relaxation of those muscles moving the arytenoid cartilages which command the opening of the glottis, and in consequence the voice is flatter or graver, or more raucous."

"Thus we see that the par vagum has a most appropriate name, and that it is nearly as extensive in its connections as the sympathetic itself. It is distributed to the œsophagus, pharynx, and larynx; to the thyroid gland, vessels of the neck and heart, to the lungs, liver, and spleen, stomach, duodenum, and sometimes to the diaphragm. The recollection of this distribution will explain to us many sympathies; for example, the hysterical affection of the throat when the stomach is distended with flatus, the exciting of vomiting by tickling the throat, the effect which vomiting has in diminishing the sense of suffocation, that state of the stomach which is found upon dissection to accompany hydrophobia, whether spontaneous, or from the bite of a dog."

The second part is devoted to the organs of the senses, of which the eye and the phenomena of vision, occupy (as from their importance they well deserve to do) a large portion of the volume. The ear, both of man and of other animals, is also considered much at large.

The chapter on vision begins with a short abstract of the most essential propositions in optics, perhaps rather too brief for the very minute description of parts which follows.

We shall not analyze this chapter, as the matter is too copious for condensation. A few observations may be made on particular parts. The following is a favourable instance of the author's accuracy of remark.

"There is a circumstance in the operation of extracting the cataract, which I have seen

but little attended to, and yet it is sufficiently evident. When the cornea has been cut, operators, disappointed in not finding the cataract protruded, keep the eye staring in the light, and press the ball of the eye; but while the eye is thus exposed to the excitement of the light, the pupil is contracted, and the lens propelled by the action of the muscles; and, still more, by the pressure made on the eye-ball, is in danger of bursting through and tearing the iris. The best operators have been in the custom of shutting the eye-lids the instant the incision was made in the cornea; by this means, the eye is for a time supported in some degree during the violent spasm of the recti muscles, and the iris being allowed to dilate, the lens is protruded into the anterior chamber of the aqueous humour through the pupils, and is ready to slip from under the cut cornea, when the eye-lids are again opened. By this means, if the incision of the cornea is of the proper extent, the lens is not extracted, but is protruded, by the action of the muscles of the eye."

In describing the effects of light on the retina, we rather expected to have found some notice of Buffon's experiments on ocular spectra, and of Dr. R. Darwin's close imitation of them. They certainly deserved a place, on account of the important physiological observations deducible from them.

On the *membrana pupillaris* the author, after describing its structure, gives the following original explanation of its use.

"To explain the effect of this membrane, then, we have only to consider that it is of the nature of the iris to contract its circular fibres during the operation of light, so as to close or nearly close the pupil; that, on the other hand, the pupil is completely dilated through the operation of the radiated fibres of the iris in darkness. To the question, then, why it is not dilated during the foetal state? the answer, I think, is decidedly this: The iris is not loose in the foetal state, it is connected and stretched to the middle degree of contraction and dilatation by the *membrana pupillaris*. Were the iris in a full state of contraction, during the life of the foetus, it could not receive its full nourishment, proper degree of extension, and due powers; but being preserved stationary and extended, the disposition to contraction, which it must have when the retina is without excitement, is counteracted, until it is about to receive, by the birth of the child, that degree of excitement which is to keep up the preponderance towards the contracted state of the pupil."

The much agitated controversy concerning the method by which the eye

adapts itself to different focal distances, the imagined encrease of convexity in the cornea, the supposed muscularity of the crystalline, and the other questions relating to this subject, are collected with industry, and detailed with fairness. It is a little surprising, however, that the author, in giving an abstract of Dr. Young's most ingenious paper (the Bakerian Lecture, in the Transactions for 1801) should have overlooked the most important experiment of all (we mean that of enclosing the eye in water behind a convex lens, and ascertaining the same change of focal distance) and one on which the inventor himself justly lays the greatest stress.

Mr. Bell appears equally deficient in the conclusions which he draws from all the experiments on this subject. After acknowledging himself entirely undetermined which hypothesis to adopt, he thinks proper to reject all, and from the following reasoning.

"I have often doubted, whether these experimenters were not in search of the explanation of an effect which has no existence. I have never been able to determine, why a very slight degree of convexity in the cornea of a short-sighted eye should be so permanent during a whole life-time, notwithstanding the perfect elasticity of the cornea, and its being so adapted as to alter its convexity by the action of the muscles. Again, a near-sighted person, with the assistance of a concave glass, can command the objects to the distance of some miles, and with the glass still held to the eye, can see minute objects within three inches of the eye. Now, I cannot conceive how the concave glass should give so great a range to the sight; as there can be no change in the glass, it must be the eye which adapts itself to the variety of distances; yet, without the glass it cannot command the perfect vision of objects for a few feet. Again, a short-sighted person sees an object distinctly at three inches from his eye; at twelve feet, less distinctly; and when he looks upon the object at twelve feet, the objects beyond it are confused, just as in other men's eyes; but when he directs his attention to the more remote objects, those nearer become indistinct. Now this indistinctness of the object, seen when he examines narrowly the object beyond them, would argue (did we admit this muscular power in the eye of adapting itself to objects), that the cornea or the lens has become less convex, were we not previously convinced that the utmost powers of the eye could not bring the object at the distance of twelve feet, or any other intermediate distance, to be more distinctly seen than the fixed and permanent constitution of the eye admits."

We do not understand why the excessive convexity of a short-sighted eye should not be as permanent as the natural convexity of a perfect eye; the same cause that preserves this figure to the latter will equally apply to the former if owing to original conformation. Mr. B. seems also to confound the proper focal distance of the eye, with the distance at which objects can be seen; and to suppose that a concave glass gives to a short-sighted person a range of focal distance, or sphere of *distinct* vision of some miles. By the description of Dr. Young's simple optometer he would find that a concave glass to a short-sighted person does no more than put him on a par with an unassisted perfect eye, and in both the power of accommodation to distinct vision only extends a few inches.

The chapter concludes with observations on squinting and defective vision, taken chiefly from Reid's Enquiry and Jurin's Essay.

The chapter on the ear is finished with much care, and all the latter observations of anatomists are included. With regard to the external ear of fishes, asserted by Monro and denied by Scarpa, Mr. B. inclines to the latter opinion from the probable inconvenience to which an external ear would expose an animal living in so dense an element as water.

"We have seen that water conveys the sound of vibrating bodies with a shock almost intolerable to the ear, and with a particular and distinct sensation over the whole body. We see also that, in the greater number of fishes, there is confessedly no external opening, the whole organ is placed under the squamous bones of the head. Yet the cartilaginous fishes, which are supposed to have an external ear, swim in the same element, and are in no essential point peculiar in their habits. And we should receive with caution the account of any peculiarity in the organ of hearing of one class of fishes, which is not common to all inhabiting the same fluid.

"Such animals as occasionally pass from the water into the air, must have a membrane capable of vibrating in the air; but, even in them, it is expanded under the common integuments, and protected by them. Were it otherwise, when the creature plunged into the water, it would be assailed with that

noise (confounding all regular sounds), of which man is sensible when he plunges under water. It appears opposite to the general law of nature, to suppose any species of fish having that simple and more delicate membrane, which is evidently intended to convey atmospheric sounds only, while, on the other hand, creatures living in the water alone, should have an organization fit to endure the stronger vibrations of the denser fluid, and which would be useless and absurd in those existing in our atmosphere."

A short account of the other organs of sense concludes the volume.

A considerable number of small plates and sketches are given to assist the reader; they are executed, some rather coarsely, others with great elegance, but all of them with clearness and accuracy. It would have been a great addition to the utility of the work, if the author had given the directions to which he is so thoroughly competent, for demonstrating the particular parts of the brain in the order of dissection, in the manner of the excellent system of dissections formerly published by the same partnership. As it is impossible for the pupil to have a just idea of these parts without the actual use of the knife, a work so full and accurate as the present will be resorted to as the guide in private dissection; and therefore we should have been glad to see the steps of the demonstration more fully pointed out, as for example, the way of inflating the veins of the pia mater, of exhibiting the septum lucidum, the communication between the ventricles, and the other niceties in the manual operations, on which so much of the clearness of demonstration depends. The style is plain and easy, free from acrimonious personalities, and from the affectation of recondite learning, introduced under the guise of entertaining the reader with obsolete follies. The printing is not very correct.

On the whole we have no hesitation in recommending it as an excellent elementary book, that bears the marks of much industry on the part of the author, who also shews that he thoroughly understands the subject which he describes, a point not always attended to by the numerous writers of elementary treatises.

ART. XXXIX. *A Series of Engravings, explaining the Course of the Nerves.* By CHARLES BELL, *Fellow of the Royal College of Surgeons.*

THIS collection, together with the plates on the brain, formerly published by the same author, properly accompany

the last mentioned article, and together will give the student a very tolerable idea of the nervous system, as far as books

and engravings will teach him. The execution of the present series is in the same style of soft engraving as the former, a style favourable to effect as a picture, and to the imitations of real dissection. However the plates, when very comprehensive, though finished with much care, have the defect of not being sufficiently distinct: the eye is pained to pursue even important branches in the intricacies of the thoracic and abdominal viscera, and for the sake of the picturesque effect the references are so minute, that it is with extreme difficulty that they can all

be followed when the dotted lines proceeding from them lead to the inner parts of the plate. These defects could hardly have been remedied but by separate unshaded sketches for the references, or by using a larger scale. The latter was not in the author's plan; the former might have been introduced, at least to the most intricate.

Still they are an elegant and useful series of plates, and will be received, we doubt not, with the same approbation which has distinguished the former publications of this able anatomist.

ART. XL. JOHN GOTTLIEB WALTER's *Plates of the thoracic and abdominal Nerves, reduced from the Original, and published by Order of the Royal Academy of Sciences at Berlin; accompanied by Explanations and a Description of the Par Vagus, great Sympathetic, and Phrenic Nerves.*

PROFESSOR WALTER's incomparable plates are well known by anatomists to be one of the most accurate, most complete, and altogether most perfect specimens of Neurology ever published, and fully to merit the encomium of Sæmmerring of being "opus consummatissimum, maximâ curâ, diligentia, et perspicuitate difficillimam doctrinæ nervorum partem exhibens."

They were first published in the Memoirs of the Berlin Academy for the year 1780, and are there executed in the most masterly style of engraving. Being now not easily procurable, Dr. Hooper has done a great service to anatomy in republishing them in a reduced form,

accompanied with the original explanations, to which he has added a short account of the par vagum, great sympathetic and phrenic nerve.

Dr. Hooper has also adopted the very useful plan of some of his former anatomical selections, of accompanying the finished plate with a variously-coloured outline sketch, to which all letters of reference are transferred, a plan which preserves the unity and clearness of the engraving, and is of most material assistance to the reader. The plates of this collection are executed in a remarkably distinct and elegant manner, and do great credit to the artist, Mr. Kirtland.

ART. XLI. *Practical Observations on the Management of Ruptures, in two Parts. Part I. New Inventions and Directions for ruptured Persons. Part II. A familiar Account of the Nature of Ruptures in both Sexes. By WILLIAM HALL TIMMER, Esq. To which are prefixed two recommendatory Letters, by William Blair, A. M. Member of the Royal College of Surgeons; Fellow of the Medical Societies of London, Paris, and Brussels; Surgeon of the Lock Hospital and Asylum, and of the Bloomsbury Dispensary, &c. The third Edition, with Additions, illustrated by three Engravings.*

THE author, a gentleman not in the profession, and long a sufferer under this complaint, has obtained the honourable distinction of the gold medal of the Society of Arts for his improvement in the construction of trusses. The most material point in the construction of this truss is a calico cushion to be worn under the pad. For this we shall give the author's words:

"I will now add the description and uses of the cushions of coarse calico, and the instructions how to form one; first observing, that calico has elastic and adhesive properties which do not exist in linen or flannel.

"Cut or tear a slip of coarse calico, about twelve inches in length, and for adults three inches in breadth; fold it into a square of a size that will project a quarter of an inch round the edges of the pad of the truss, except that end next the thigh, which should have no projection beyond the neck of the pad. The rough edges of the cushion are worn upwards and downwards. Over the first slip many others are folded, or doubled on each other, to the thickness of about three quarters of an inch, but the thickness must be regulated by the size of the patient. When the hollow in the groin is completely filled up, and the cushion quite immoveable, it is properly formed.

"This calico cushion is to be worn under

the pad or pads of the truss; and from time to time an outer slip or two may be changed at pleasure, for the purposes of cleanliness, or restoring the cushion to a proper degree of thickness.

"This cushion, when judiciously made, even with a bad truss, if it be in a line with the aperture, will materially assist in keeping upon a reducible rupture.

"The properties of the calico cushion are,  
"First, That it protects the spermatic cord from being injured by the hard pad of the truss; which injury, in common trusses, often produces hydrocele, inflammation of the spermatic vessels, hernia humoralis, &c. &c.

"Secondly, By protecting the spermatic vessels from the injuries of pressure, it fulfils a desideratum never before obtained. It enables the patient to girt the truss round the body with such an effective degree of tightness, that the rupture cannot descend.

"Thirdly, By uniting the properties of softness and solidity, it yields to the form of the abdomen, and thus completely fills up the aperture or ring in the external oblique

abdominal muscle through which the rupture descends.

"Fourthly, It affords an additional column of pressure; and the truss being tightly fastened keeps the omentum and intestines, all round and above the aperture, in a state of quietude; preventing any internal or partial descent of the bowels, &c.

"It is necessary to repeat, that this cushion, to obtain all its advantages, must be formed of separate slips folded over each other, and not of one piece of calico."

Familiar directions are given for the use of the ruptured. Beyond the precise object of this little treatise, the author's improvement, they are but trifling. He takes upon him to forbid the use of dumb bells to children, because he once saw a rupture produced by using them! He might with equal propriety forbid a boy ever to mount a horse, since many ruptures have come down when on horseback.

**ART. XLII.** *Observations on Crural Hernia; to which is prefixed a general Account of the other Varieties of Hernia. Illustrated by Engravings. By ALEXANDER MONRO, jun. M.D. F.R.S. E. and Professor of Anatomy and Surgery in the University of Edinburgh. 8vo. pp. 120.*

THE title page of this work excited our particular attention. It professes to contain a series of observations (we supposed practical as well as speculative) on one of the most delicate and important points in surgical pathology; it is the first production of the professor of anatomy and surgery in the first medical school in Europe; and we are informed, by an advertisement, that it has been read before the Royal Society of Edinburgh. In looking at the table of contents our expectations were raised still higher, for we found twenty-five different subjects enumerated, some of them on difficult and controverted points, and all of them very interesting to practitioners. This delusion began to vanish on referring to the size of the book, as we saw all these subjects, which have filled volumes, discussed and determined in ninety-two octavo pages, with the assistance of large type, frequent spaces, and abundance of margin!! Perhaps our expectations were raised too high, for certain it is, that all our hopes of instruction and improvement have been followed by disappointment and regret. The following analysis of this work will, probably, be sufficient to satisfy our readers. To the observations on crural hernia,

which is the professed object of the book, a general account of all the varieties of hernia is prefixed. Here are strange and wonderful cases, some related at full length, others only hinted at, none of which serve to illustrate any theory, or to furnish any practical conclusion. Next follows a dull enumeration of the causes of hernia, and some general remarks on the nature of the hernial sac, on the diagnosis, prognosis, &c. At page 44, the observations on crural hernia begin; and first, an anatomical description of the crural arch is given. Mr. Gimbernat, a Spanish surgeon, first pointed out the peculiar termination of the oblique muscles, and described the formation of what he called the crural arch. He showed the propriety of attending to this structure in performing the operation for crural hernia, though his description is not very accurate or easily understood. Dr. Monro has not been more successful in his description, but he has excelled Mr. Gimbernat in his representation of the crural arch, in a drawing. The situation of the blood vessels, in respect to the hernial sac, then engages our author's attention, and some acute and pertinent remarks are made on the course of the epigastric artery.

Camper's opinion on the impossibility of dividing this artery is ably controverted, and a long passage is quoted from Rougemont's translation of Richter's treatise. We remembered to have read these sensible criticisms, which were published without a name in a northern periodical journal. There can be no doubt of the author, as, on comparing the passages, we find the remarks precisely the same, and expressed in the same clear and decided language. No allusion, however, is made to that publication. After describing Gimbernat's mode of operating, our author quotes the operation proposed by his father so far back as many years ago, which has always been recommended in his surgical lectures. With this quotation the volume terminates; but an appendix, consisting of sixteen pages, is added, which is wholly occupied with an extract from Dr. Monro's treatise on the *bursæ mucosæ*. The use of this appendix is not very evident, except it was to serve as stuffing, to make something like a book; for the practice there recommended of not dividing the hernial sac is dangerous, and often impracticable.

The merits of this first essay cannot be rated very high: it will not entitle the author to the smallest niche in the tem-

ple of fame. If we consider it as an inaugural dissertation, and it resembles the generality of these first flights, it is entitled to some praise, and may be read "*haud sine fructu*." There is great industry and assiduity displayed in collecting materials; almost every sentence can boast of its derivation from some writer or some respectable practitioner. Books and conversation appear to have furnished Dr. Monro with all the substance of his work—"ore trahit quodcumque potest, atque addit acervo." We are unable to guess his reasons for choosing such a subject. The faults in his manner of treating it may be ascribed more to his situation, as an operator on the dead body, than to any want of abilities for such pursuits. We should therefore caution him not to venture again before the public on such a practical subject, where he has such slender opportunity for displaying his acquirements, and where so many things contribute to expose and aggravate his defects.

The plates connected with this work are six in number; they are very neatly engraved, apparently from very accurate drawings. The names of the artists are not mentioned, although they contribute so large a share to the merit and price of the publication: "*sic vos non vobis, &c.*"

ART. XLIII. *The Soldier's Friend; containing familiar Instructions to the Loyal Volunteers, Yeomanry Corps, and Military Men in general, on the Preservation and Recovery of their Health.* By WILLIAM BLAIR, A.M. Member of the Royal College of Surgeons, Fellow of the Medical Societies of London, Paris, and Brussels, &c.

AMONG the many publications of temporary interest, which the general arming of the nation has given rise to, the present compilation will be favourably distinguished, as containing much useful matter, selected from good and various authorities, on all the functions of the hospital surgeon, and that important part of the duties of the officer which relates to the preservation of the health of his men.

An abstract of this little compilation would be useless; the whole forms a very useful manual of health for the camp and military hospital. The chapter on diet and cookery is perhaps the best.

A few wooden cuts are added, on the tourniquet and its application, the camp-ventilator, and a spring waggon for conveying the wounded.

ART. XLIV. *Anthropology, or the Natural History of Man; with a comparative View of the Structure and Functions of animated Beings in general.* By WILLIAM BLAIR, A.M. Member of the Royal College of Surgeons, Surgeon of the Lock Hospital, &c. pp. 163. 8vo.

A COPIOUS syllabus of the author's lectures on physiology, which, if well filled up, would grow into a system nearly as complete as the present state of knowledge would allow of. To conclude with *eclat*, Mr. Blair magnanimously attacks the renowned system of

craniognomy, devised by Dr. Gall, of Vienna, and congratulates us on our escape from a "general contamination" of materialism, a system in which there is "too little of sound philosophy for thinking men, and too little of common sense for the vulgar."

ART. XLV. *Illustrations of some of the Injuries to which the lower Limbs are exposed.*  
By CHARLES BRANDON TRYE, Member of the late Corporation of Surgeons in London,  
of the Royal Medical Society in Edinburgh, of the Medical Society in London, and Surgeon  
of the Gloucester Infirmary. 4to. pp. 37.

OBSERVATIONS of this kind made from cases actually occurring are always valuable. The author has had the opportunity of examining, in two instances, after death, the state of parts deranged by violent, but not of itself fatal, external injury: the one a dislocation of the femur, the other a fracture of the neck of the upper articulating head of the same bone, without complete dislocation. These cases are the basis of the present short publication, and have furnished seven plates of the appearances after dissection.

It is well known to surgeons that, of these two accidents, dislocation without fracture, though generally caused by terrible violence, producing immediate deformity, and requiring often excessive exertion to be reduced, is less formidable than a fracture of the neck of the femur; which last is incurable, no instance being well authenticated, we believe, of a perfect cure of this calamitous injury. The diagnosis of the two is therefore important, but sometimes difficult, especially in stout, corpulent, and muscular subjects.

In the present case, the dislocation was upwards and outwards; and on account of the other injuries, which soon proved mortal, no reduction was attempted.

In two other cases which occurred to the author, the attempts at reduction were successful; and the following remarks upon this operation may interest our readers.

"The taxis or reduction of the dislocated thigh bone is often a difficult operation. I know of no mode which invariably promises success. Much must be left to the ingenuity of the surgeon, who will vary the posture of the patient, and the application of his own effort, to reduce the bone, as his judgment shall direct him in the instance before him.

"One principle, however, I think may be laid down, viz. to fix the pelvis firmly whenever extension of the limb is to be made. In a strong muscular man, whose thigh had been dislocated upwards and outwards, after fruitlessly trying other methods, the following process succeeded. He was laid prone upon a bed; a sheet was passed between his thigh, and held firmly by two assistants. I then knelt upon the pelvis, in order to keep it steady, and resist its being raised up when the extension should be made. Three men then pulled at a towel, fastened round

the thigh above the knee, and drew it in such a direction as to carry the thigh upwards; that is, in relation to the trunk, backwards. I then rested my two hands on the head of the bone, and pushed it downwards and forwards with all my strength; and after a short exertion of our powers in this manner, I directed a gentleman who held the leg to twist the toes suddenly outwards, upon which the head rushed into the acetabulum with a loud noise.

"I tried the same, and a variety of other methods, in a very muscular middle-aged woman, unsuccessfully, within six hours after her accident. She took half a drachm of Dover's powders at bed-time the succeeding night, and the next morning used the warm bath, and was well sweated for two hours before the intended time of repeating the taxis. She was laid upon a bed, on the sound side. I then pressed my left hand against the head of the bone, one of my knees against its body, a little higher than the middle, and with the other hand I drew her knee outwards. The leg was supported by an assistant, the knee bent to a right angle. Three persons made steady the pelvis by holding a sheet passed between the thighs, and three others made the extension. In this manner our strength was exerted for some time, and I plainly felt the head of the bone move, but the reduction was not completed. We renewed our attempts in the same manner, except that a gentleman, who became one of the extenders, placed his foot firmly against the arch of the pubis (properly defended) and thereby both increased his power of extension, and, at the same time, rendered the pelvis more steady and fixed. The force being continued for some time, and my hands and knee being applied in the manner already described, I directed the assistant, who supported the bent leg, suddenly to carry the internal ancle towards the other leg, and to twist the toes outwards, and then the head slipped into the acetabulum. The day on which the accident took place there was uncommon rigidity and hardness of the muscles; but after the operation of the sudorific and the bath, the tension and resistance were greatly diminished."

A good case is added of compound luxation of the tarsus, in which, as the bones could not be returned, and there was no alternative but amputation, or removing the protruded bone; the latter was adopted, and the astragalus was entirely taken out.

The patient recovered, and was able to walk, in six months, with the assistance, however, of a stick, a jointed iron from the hip, and a high shoe. The

case shews the powers of nature in recovery from such serious injury, but we question whether amputation would not have been preferable.

The plates are executed in an extremely coarse style. The work is very handsomely dedicated to the governors of the Gloucester Infirmary.

ART. XLVI. *Practical Observations on the Treatment of Strictures in the Urethra and in the Œsophagus.* By EVERARD HOME, Esq. F. R. S. Surgeon, to St. George's Hospital. Vol. II. 8vo.

OUR readers are too well acquainted with the former volume of this work to require to be informed of its contents, any further than to remind them, that in it the author treats very fully of the method of removing stricture by caustic first proposed by John Hunter, explains the structure of the parts, gives very full directions for the application of the caustic, and relates a variety of cases, both of the more frequent kind, and where other morbid symptoms accompanied the stricture, and often interfered with the proposed mode of cure. The stricture of the œsophagus is also noticed briefly in the first volume.

In the present volume Mr. H. takes a much wider range; he first endeavours to point out a sufficient diagnosis between temporary spasm of the urethra and permanent stricture; after which he assumes the position, that stricture is in itself a primary cause of a great variety of diseases, chiefly of the organs connected with its seat, or contiguous to it, often unsuspected, and often going on to a fatal termination after severe and protracted misery.

The general complexion of the work, therefore, is to direct the attention of the practitioner more particularly to this disease than has hitherto been done, to induce him to bear constantly in mind the possibility of its existence, where any morbid affection of the organs exist; and to lead him to have recourse to the Hunterian method of cure with caution and perseverance.

The propriety of use of the caustic in the extensive manner in which Mr. H. recommends, and very largely practises, has been, and still is, the subject of much controversy. We do not think it incumbent upon us to enter into it in this place, our present object being briefly to state the arguments for the practice here brought by its ablest defender.

The author in the preface relates the particulars of a successful case where the caustic was condemned by Mr. Benjamin Bell, the only one of his opposers whom he personally notices.

The first chapter contains general observations upon strictures, from which, as it is in some degree the summary of the opinions afterwards maintained, and unembarrassed by cases, we shall extract several passages.

First, of the symptoms of constitutional diseases, induced by stricture, the author thus speaks.

“The constitutional symptoms, which belong to a stricture in the urethra, have been more frequently mistaken for an original disease than those of any other local complaint; and it is only within these few years that this error has been detected. I have been enabled to determine, that the following constitutional affections, which I shall soon mention, occasionally belong to strictures in the urethra, by three different modes. The first is, that patients are liable to them when labouring under that disease; the second, that they very often are brought on in the course of a few hours after an armed bougie has been applied to the stricture; and whenever they follow such an application, it has been found that the symptom then produced has, at a former period, been met with in the same patient. The third is, that after the removal of the stricture the symptoms disappear, although the patient had been liable to them for a number of years. Such evidence, when collected upon a large scale by a person of extensive experience, can admit of little if any fallacy.”

The particular symptoms are paroxysms resembling that of a regular intermittent, (also often brought on by the application of caustic,) feverish indisposition, extreme irritability both of mind and body, derangement in the digestive organs, sometimes erysipelas, and eruptions of the skin.

The stricture, when of long duration, often changes from being only a membranous band to a hard cartilaginous body, requiring all the skill of the surgeon, and we imagine that degree of resolute patience in the sufferer, which would only be endured, generally speaking, in diseases of the part here affected. The inference, from much experience, Mr. H. lays down with confidence.

“This mode of treating strictures having

been in use now for eight years, a sufficient time is elapsed to admit of some conclusion being drawn respecting the consequences which are produced by it, and the permanency of its effects; and so great has been the number of those who have submitted to it, that, notwithstanding the many difficulties which still attend the subject, the following conclusions are given as formed upon a very extensive series of observations.

"That it does not dispose the parts to take on any other disease is sufficiently established, as there is no one instance within my observation in which that has been the case.

"That the parts recover themselves after the use of caustic, and acquire the natural smooth surface they originally possessed in common with the rest of the urethra, is also completely ascertained.

"That removing the strictures restores the parts to all their natural functions has been proved by the effect on patients in a married state, who had for years palliated the symptoms by means of bougies, and during that period had not begot children; but who were afterwards capable of doing so during the same marriage.

"These are the essential points which could not be determined by any reasoning, and were therefore only to be ascertained by experience."

Several causes of what may be called spurious stricture, or temporary obstruction of the urethra, are related, all of which have been mistaken for true stricture, and occasionally have exposed the sufferers to the use of the caustic, whereby extreme mischief has been produced and the practice itself brought into discredit. A most calamitous case is related of inflammation of the bladder producing permanent obstruction of urine and constant pain, which had so much the appearance of stricture as to induce the surgeon to apply caustic several times, and with temporary relief to the strangury. The latter part of the case is so instructive, that we must relate it in the author's words.

"In this state he came to town, and put himself under my care. He was now very much emaciated, and appeared to be in a state beyond recovery, independently of the state of the complaint in his bladder. Upon examining the urethra by a bougie, this could not be passed beyond the bulb of the urethra; I could not, however, procure any impression upon the point of it, so as to satisfy my mind of the real state of the part. He requested me to use the caustic, as the only means of giving him ease, from the distressing pain he had at the glans penis; and upon applying it, he found himself next day easier. I made several attempts to get an impression

of the stricture upon the bougie, but in vain; and always applied the caustic, to give my patient a temporary relief. After using the bougie four or five times, I passed a silver catheter, of a size larger than the bougie I had used, and found it went with perfect ease into the bladder. This explained to me the present state of the case; and I informed the patient, that there was now no stricture, the passage was perfectly open, and the whole of the remaining disease was in the internal membrane of the bladder, and therefore the only object was to enable the parts to recover themselves by soothing them, and to strengthen the constitution by nourishment. He became, however, weaker and weaker, and in the course of three months died.

"During this period he had frequent rigors and cold sweats, which are common attendants upon diseases of the bladder; but the symptoms of which he died were wasting of flesh, loathing of food, occasional sickness, without his being aware of his gradual decay. At last he was so weak as scarcely to bear being moved. He had his faculties perfectly clear, and his recollection complete, till within a few hours of his death.

"Upon inspecting the parts after death, it appeared that there had been no stricture in any part of the urethra. The internal membrane of the bladder was in a state of ulceration, particularly the lower part, where the ureters enter into it, except a line not broader than the eighth of an inch, extending from each ureter to the middle line, where the two streams would unite. The orifices of the ureters were in a state of ulceration, and inflammation had extended itself along the internal surface of the left ureter to the kidney, the pelvis and infundibula of which were in a state of ulceration.

"The use of the caustic had made five different holes through the membrane of the urethra, of the size of the end of a common bougie, at a small distance from each other; a large abscess had formed between the perinæum and buttock, into which the urine escaped by these orifices. The immediate cause of his death, I should believe, was the state of the kidney, having seen two other cases in which a diseased state of the pelvis of the kidney produced similar symptoms."

A more instructive warning against the rash application of the caustic could hardly have been found; and notwithstanding the original disease of the bladder and kidney, we can hardly refuse to attribute a very large share of the fatal event to the caustic itself, the dreadful effects of which Mr. H. has so candidly related.

In such cases as these it does not appear that the author has any other criterion of the existence of stricture than

the impression made on the point of the bougie.

The author next relates several very interesting cases of strictures requiring an unusual number of applications of the caustic for their removal. He attributes this to a change in the texture of the original stricture, and a supposed complication of action and re-action between old and new strictures. In one of the cases the caustic had been applied during six years no less than 486 times. The final success was considerable and probably would be complete, and a just observation is added which will apply to many of these excessively tedious cases.

"In 1803 this patient continued free from any relapse, but was under the necessity of passing a bougie daily, and leaving it in the urethra for half an hour, to keep the canal in a state of tranquillity; for he found that when he omitted to do so, occasional symptoms of irritation came on.

"On contemplating the sufferings of the patient during so long a period as six years, it may be observed, that few men would have had the same degree of perseverance, and that a cure was hardly worth so dear a price. This, however, is not by any means a just view of the case, since the whole time he was under this treatment he suffered less, both in body and mind, from the effects of the caustic, than he had done from the symptoms of the disease previous to its being adopted, and the degree of relief he received from the immediate effect of the applications upon the parts irritated, was more than sufficient to counterbalance the local pain it produced."

A very long and very prolix but highly valuable case is given by the patient himself, a general officer, past the middle age, who had long suffered under severe stricture, that had baffled Daran, Hunter, and many of the men of peculiar eminence in diseases of this organ. The case is a daily register for five months of incessant application of caustic at as short intervals as could possibly be allowed of, and attended with the final success of making a complete passage through a great variety of strictures into the bladder.

After this point was secured, the patient recovered to so great a degree as to enjoy life very considerably, though the power of retaining urine was so much impaired as to prevent him from mixing freely in society, and a mucous discharge from the bladder remained. It is flattering to the practitioner, after so long and assiduous attendance, to have his

patient thus describe his feelings and his sentiments.

"Now for the bright side of the picture; my general health is so much improved, that I am congratulated by all my acquaintance upon my appearance. I can ride ten miles with much satisfaction, and whenever I have a call to make water, it passes without difficulty. I feel no pain of any kind; in short, could I surmount the frequency of making water, there would be very few men of my age (sixty-five) more robust. This amazing change from a life of pain and misery I attribute entirely to the operation of the caustic. This copy of the journal, which I kept during the operation, I give to Mr. Home, and hope he will be pleased to consider it as an acknowledgment of his professional abilities, and of my grateful remembrance of their exertion."

Four years afterwards this patient died. The irritability of the bladder, which had never left him, increased, calculous concretions formed, and his complicated sufferings put an end to his existence. On dissection the cause of death was traced to the bladder, but the urethra remained sound and uniform through its whole extent.

Our limits will not allow us to examine the other cases of disease occasioned by and accompanying stricture.

A valuable chapter, already published in the second volume of the transactions of a society for promoting medical and chirurgical knowledge, is here very properly inserted, containing cases in which suppression of urine, in consequence of stricture, has required puncturing the bladder.

Some cases are given of strictures in the œsophagus, cured by the bougie simple, or armed with caustic. The following valuable diagnostic remarks we shall transcribe. Besides the stricture, the œsophagus is liable to two other diseases, both of which produce difficulty of swallowing.

"One of these is a thickening of the coats of the œsophagus, which extends to the surrounding parts, and in the end generally becomes cancerous, or, in other words, an incurable disease: the other is an ulcer on the lining of the œsophagus; this last is commonly a little below the seat of the stricture, and is upon the posterior part which lies on the vertebræ of the neck. Both of these produce a difficulty in swallowing, and in their early stages are only to be distinguished from stricture by an examination with the bougie; when the disease is more advanced, the other

symptoms which arise sufficiently explain the nature of the disease.

"Strictures appear to be a disease belonging to the earlier periods of life, while the other two are more commonly met with at an advanced age.

"Passing a bougie in cases of stricture in the œsophagus requires considerable dexterity as well as in those of the urethra, and I have found that it is more easily done while the tongue is brought forwards out of the mouth, than in any other state of the parts."

\* \* \* \*

"When a bougie is passed with a view to determine the nature of the complaint, and it passes down to the distance of eight inches, measuring from the cutting edge of the front teeth in the upper jaw, the surgeon may be satisfied that it is beyond the usual seat of the stricture; and if it is brought back without any resistance, he may conclude, that the aperture of the œsophagus considerably exceeds the size of the bougie which had been used. But if the bougie stops at the distance of six and a-half inches, or even lower, he is to retain it there with an uniform steady pressure for half a minute, so as to receive on its point an impression of the surface to which it was opposed. If the end of the bougie retains its natural form, or nearly so, and there is an indentation like the mark of a cord on its side, whether all round, or only partially, he may decide that the disease is a stricture; but if, on the other

hand, the bougie passes without any difficulty to the distance of seven and a half inches, and when brought back the point has an irregular jagged surface, it is equally clear that the disease is an ulcer on the posterior surface of the œsophagus."

A successful case of strictured rectum, cured by caustic, concludes the work.

Such are the general contents of this volume. The whole subject is highly important to surgeons, as embracing a very interesting part of surgical practice, one which is much controverted, and which is of too serious a nature to be taken up or rejected lightly. Mr. Home is fully aware that he is wielding a most active and hazardous weapon, and a statement like the present was demanded of one who stood a conspicuous advocate for its use. We do not think he has altogether made out so satisfactorily, (and perhaps the thing is in its nature impossible) the extent of *injury* which the caustic is capable of committing, as the *benefit* which may attend its use, but we are convinced, that no one can peruse the volume before us without participating in some of the advantages which the author himself has acquired by very successful and very extensive practice.

ART. XLVII. *Facts and Observations respecting the Air-Pump Vapour-Bath in Gout, Rheumatism, Palsy, and other Diseases.* By RALPH BLEGBOROUGH, M. D. Member of the Royal College of Surgeons, London. 8vo.

IT is necessary to inform our readers what this air-pump vapour-bath is. It is, as its name imports, an air-pump; what answers to the receiver is an oblong truncated wooden box, made very strong and tight, somewhat in the form of a fracture-box for the leg, but perfectly close, excepting an opening at one end, just wide enough to admit the limb, and with a broad border of oil-silk, which, when the limb is in the box, draws round it, and the opening where it entered, so as to exclude the external air. At the other end of the box, is a common piston for exhausting the air, and also a tube through which steam may be thrown into the box, and foment the part within it.

It was invented, we are told, by a Mr. Smith of Brighton, who took it from the old idea of sucking out poison from wounds, and supposed that gout, rheumatism, and other morbid causes might, in like manner, be sucked out from a limb. It is, in fact, a machine for dry-cupping,

united to one for fomenting; and both the idea and the execution deserve some attention, as we are convinced there are many cases in which such a powerful derivative topical application might prove of material service.

The author gives some cases of its utility, and many speculations as to the extent to which the practice might be carried. The practitioner will readily conceive the cases where it might be advisable, rheumatic indolent tumours, paralysis, perhaps gout, &c. &c. Dr. Blegborough also proposes it for ulcers.—Here, however, much discrimination is required, for such a powerful topic is equally capable of doing great mischief. His proposal for using it to chilblains is promising. The machine is the property of a patentee, who disposes of the privilege of using it both personally and professionally.

The machine is illustrated by a very neat plate.

ART. XLVIII. *Practical Observations in Surgery, illustrated with Cases.* By WILLIAM HEY, Esq. F. R. S. Member of the Royal College of Surgeons in London; honorary Member of the Royal Medical Society of Edinburgh, and of the Literary and Philosophical Society of Manchester; and senior Surgeon of the General Infirmary at Leeds. 8vo. pp. 537.

THE abilities and experience of the ingenious author of this work have already gained him considerable celebrity, and the publication now before us will be found to possess those claims to attentive consideration, which are derived from accurate observation, sound judgment, and a perspicuous detail of interesting facts.

The first chapter is on fractures of the skull. In this, the author combats the practice pursued by Mr. Pott, that of taking away part of the integuments, to give room for examining the state of the skull. It is always sufficient to make an incision for this purpose, and to have the integuments held back while the examination is pursued. The author is of opinion that there are various inconveniences attending the employment of the trephine, for the purpose of removing such parts of the skull as may be injured, and therefore recommends the use of a saw, which may be worked gently in a straight or curvilinear direction. Saws of this kind he has used for a great number of years, and finds that much less of the cranium is obliged to be removed when they are employed, than must be done in the usual manner of operation.

In a case of caries in the tibia, the vitiated bone was successfully removed by the saw now mentioned, and in another case, when the posterior tibial artery was wounded, the removal of a portion of the fibula allowed the artery to be got at, and taken up.

Chapter 2d. On the Cataract.—The author informs us, that he cannot enter into a fair comparison between the operation of couching and that of extraction, because he has only performed the latter operation once, and then, though he did it with a great deal of care, the inferior half of the cornea became opaque, so as to deprive his patient of the benefit of the operation. Couching he has been in the habit of performing for thirty-three years, and with so extensive an experience of its merits has not been able to find it liable to any of the objections made against it by Baron Wenzel. He prefers a round needle flattened near the point to the spear-pointed

one generally in use. Several cases are given in which this operation was performed, and one is mentioned, where, from the unsteadiness of the patient, and the power which was possessed of drawing in the eye, he could not succeed in depressing the cataract; but the mere passing a needle through it, answered the purpose of producing its gradual absorption, and of thus restoring the sight of the patient.

Chap. 3d. On the strangulated Hernia.—Much difference of opinion has taken place on the propriety of blood-letting in this disease. The author is inclined to conclude, that there are cases in which this remedy may be useful, and others in which it will prove pernicious. Bleeding has generally failed in producing a reduction of the gut, but it has never (as Mr. Wilmer supposes), within the author's knowledge, rendered the subsequent operation more dangerous. Purgative medicines by the mouth are condemned, glysters have been of little service, the warm bath has not uniformly done good.

“Gentle efforts with the hand to reduce the prolapsed part are perhaps attended with less danger, and with greater prospect of success, while the patient lies in the bath, than in any other position. The free use of opiates coincides with that of warm bathing, and, under some circumstances, these means deserve to be tried in conjunction.”

Opiates are not in general successful in producing a reduction of the intestines, but they are useful in mitigating the symptoms, when it is necessary to remove the patient to a considerable distance. Cold stupes, and the cold bath, have oftener failed than been serviceable. Injections, a decoction of tobacco (made by boiling a drachm of the cut leaves for ten minutes in a pint of water), are, upon the whole, considered as the most efficacious remedies in the strangulated hernia, previous to the operation.

The author is decidedly of opinion, that the operation should be performed early, to give it a chance of success. When he first began business, he lost three patients in five, on whom the operation was performed, from delaying it too long.

" Having more experience of the urgency of the disease, I made it my custom, when called to a patient who had laboured two or three days under the disease, to wait only about two hours, that I might try the effect of bleeding (if this evacuation was not forbidden by some peculiar circumstances of the case) and the tobacco glyster. In this mode of practice I lost about two patients in nine upon whom I operated. This comparison is drawn from cases nearly similar, leaving out of the account those cases in which a gangrene of the intestine had taken place.

" I have now, at the time of writing this, performed the operation thirty-five times; and have often had occasion to lament that I had performed it too late, but never that I had performed it too soon. There are some cases so urgent, that it is not advisable to lose any time in the trial of means to produce a reduction. The delay of a few hours may cut off all hope of success, when a speedy operation might have saved the life of the patient."

The author particularly describes the mode of operation to be pursued in strangulated scrotal hernia, and annexes many remarks, which are well worthy of attention. The strangulation of the femoral hernia, he is of opinion, does not arise from Poupart's ligament, but agrees with M. Gimbernat in thinking that it is from a ligament existing in the aponeurotic sheath, which envelops the great vessels of the thigh, and is strongly attached at its superior part to the ossa pubis.

This ligament " runs transversely, but does not descend obliquely, as that ligament does. On the contrary, it rather ascends as it approaches the symphysis of the ossa pubis, passing behind, and decussating, the extremity of Poupart's ligament."

The author denominates it femoral ligament, and it is by the division of this that the return is effected.

Several useful practical observations are made on the proper treatment of the omentum, which may be included in the herniary sac.

A new species of scrotal hernia is described by the author, as having occurred in an infant of fifteen months old.

" This hernia differed both from the common scrotal rupture, in which the hernial sac lies on the outside of the tunica vaginalis; and also from the hernia congenita, where the prolapsed part comes into contact with the testicle, having no other hernial sac besides the tunica vaginalis."

In this case the hernial sac was in

contact with the testicle, and therefore within the tunica vaginalis. The author terms it hernia infantilis. He thus enumerates the species of scrotal hernia :

" 1. If the abdominal aperture of this process is open when the intestine or omentum is protruded, the rupture is then called hernia congenita. 2. If the upper part of the process remains open, but the abdominal aperture is closed, and is capable of resisting the force of the protruding part, the hernia then becomes of that species which I have now described, the hernia infantilis. 3. If the cavity of the upper part of the process is obliterated, and the septum is formed a little above the testicle, as in the adult state, the hernial sac then descends on the outside of the tunica vaginalis, and forms the most common species of scrotal rupture, which may with propriety be called hernia virilis."

The following description is given of a new truss for the exomphalos, invented by an ingenious mechanic of Leeds :

" It consists of two pieces of thin elastic steel, which surround the sides of the abdomen, and nearly meet behind. At their anterior extremity they form conjointly an oval ring, to one side of which is fastened a spring of steel of the form represented. At the end of this spring is placed the pad or bolster that presses upon the hernia. By the elasticity of this spring the hernia is repressed in every position of the body, and is thereby retained constantly within the abdomen. A piece of calico or jean is fastened to each side of the oval ring, having a continued loop at its edge, through which a piece of tape is put that may be tied behind the body. This contrivance helps to preserve the instrument steady in its proper situation."

Chapter 4th. Of the Fungus Hæmatodes.—This disease has not been noticed by any author, whose works have come under the knowledge of Mr. Hey, previous to the completion of this paper. But a species of it he has since found, described by Mr. Burns, of Glasgow, under the name of Spongoid inflammation.

The following case will give a view of the origin and progress of this singular and serious disease.

" August 20th, 1801, James Richardson, a stout man, aged fifty years, consulted me on account of a large tumour on the posterior part of his left shoulder. Upon a careful examination I could not doubt of its being a tumour of that intractable species, to which I have given the name of Fungus Hæmatodes.

"As the knowledge of this disease in its incipient state may be of importance, I will give a description of this case; which I apprehend will not be found inapplicable to the general appearance of the disease, when it arises spontaneously, without any previous operation, upon a part not endued with great sensibility.

"The tumour was not painful. It had arisen to a considerable size before the patient was aware of its existence; and it was first pointed out to him by his friends, who observed, that the posterior part of one shoulder was become larger than the other.

"It did not interrupt the motion of the muscles upon which it was situated; the patient being able, as he informed me, to follow his laborious employment of a blacksmith as well as usual.

"Its situation seemed to be between the integuments and external muscles, a little below the joint of the shoulder, covering a great part of the scapula.

"Its form and size may be understood by the following measurement, which I took with a marked tape: from the base on one side to that on the opposite side, where the breadth was the greatest, carrying the measure over the summit of the tumour, it measured 12 inches. The measure taken across the tumour, in the same way, at its smallest breadth, was 8 inches. Its base measured 23 inches.

"When examined by gentle pressure in various ways, it seemed to be of an uneven density. In some parts an alternate pressure gave the sensation of a deep seated fluid. When grasped by the fingers in other parts, one might perceive an irregular hardness. This examination gave no pain.

"It was moveable, but in a slight degree: not so much as a wen formed by an enlargement of the adipose membrane.

"The cutaneous veins, which ran over its surface, were enlarged.

"Some idea of its growth may be obtained from the following particulars. It was first examined in July 1800, and it was then judged to be about half the size at which I found it. The patient had been lately at Harrogate, and had used a hot bath there, which he apprehended had much increased the size of the tumour.

"The integuments did not seem to be rendered thinner by the distention of the fungus, which I conceived to be lodged beneath and within them.

"The skin had been irritated by some stimulating applications which had been made to it. I directed the application of the cerat. lap. calam. to remove this superficial inflammation; and advised the poor man to do nothing else, as I conceived the disease to be incurable.

"I saw this patient again in February 1802, and was informed by him, that he had been under the care of some irregular practitioners, supposed to be skilful in the cure of cancers. The tumour was much enlarged,

and beginning to ulcerate. His countenance was fallen and his strength seemed to be declining."

The author has now seen 16 or 17 cases of this complaint, but has not been able to effect a cure in any of them, except by amputation of the limb, where the seat of the disease was in the extremities. Several instances are mentioned in which the mammæ were affected with enlargements of this kind. Extirpation was had recourse to but did not succeed.

"When the disease occupies merely the adipose or cellular membrane lying upon the surface of the muscles, the tumour is not usually painful in its beginning, nor does it impede the motion of the muscles on which it is seated. But when deep seated in the limbs, it causes pain and weakness of the part affected.

"The fungus, as it increases in bulk, does not render the integuments uniformly thin, as in the case of an abscess. In one part the tumour, when pressed with the hands, will afford the sensation of a deep seated fluid, while another part feels hard and uneven.

"In an advanced stage of the disease, the integuments, and aponeuroses of the muscles, (if the fungus is situated beneath this part) are burst open, and the fungus which rises through the aperture sometimes appears black, like a mass of coagulated blood. At other times the appearance more resembles an excoriation. Under both these circumstances hæmorrhages ensue.

"In this process, the integuments do not become uniformly thin, and of a red colour, as when purulent matter is making its way; but they continue to feel thick as usual round the fungus that has burst through them.

"This fungus is an organised mass, and bleeds wherever it is broken.

"When the parts containing the fungus are divided, they are found to be in a morbid state. The adipose membrane forms a great number of pouches, filled with the fungus, upon the removal of which the pouches bleed copiously, from every part of their internal surface.

"Wherever the fungus comes into contact with the muscles, they lose their natural redness, and become brown. They also lose their fibrous appearance, and cannot in every part be distinguished from the adipose membrane, though a distinction is in general evident.

"The growth of this fungus cannot always be repressed by the strongest escharotics. Neither the hydrargyrus nitratus ruber, the hydrar. muriatus, the antimon. muriatum, nor the undiluted vitriolic acid, have been sufficient for this purpose."

A plate is annexed from a drawing of one of those cases.

Chap. 5th. On dislocations.—Various useful remarks are made in this chapter, on the nature of luxations or the mode of reducing them; but they are too much connected with description to admit of abridgment.

Chap. 6th. On internal derangement of the knee joint.—This sometimes happens in consequence of trifling injuries, and if it is not attended to, will in time produce a considerable degree of permanent lameness. The nature of this complaint may be judged of from one of the cases given by the author.

“In 1784, the honourable Miss Harriet Ingram (now Mrs. Aston), as she was playing with a child, and making a considerable exertion, in stretching herself forwards, and stooping to take hold of the child, while she rested upon one leg, brought on an immediate lameness in the knee joint of that leg on which she stood. The disorder was considered as a simple sprain; and a plaster was applied round the joint. As the lameness did not diminish in the course of five or six days, I was desired to visit her.

“Upon comparing the knees, I could perceive no difference, except that, when the limbs were placed in a state of complete extension, the ligament of the patella of the injured joint seemed to be rather more relaxed than in that joint which had received no injury. When I moved the affected knee by a gentle flexion and extension, my patient complained of no pain; yet she could not perfectly extend the leg in walking, nor bend it in raising the foot from the floor; but moved as if the joint had been stiff, limping very much, and walking with pain.

“I thought it probable, that the sudden exertion might in some degree have altered the situation of the cross ligaments, or otherwise have displaced the condyles of the os femoris with respect to the semilunar cartilages; so that the condyles might meet with some resistance when the flexor or extensor muscles were put into action, and thereby the free motion of the joint might be hindered, when the incumbent weight of the body pressed the thigh bone closely against the tibia; though this derangement was not so great as to prevent the joint, when relaxed, from being moved with ease.

“To remedy this derangement, I placed my patient upon an elevated seat, which had nothing underneath it that could prevent the leg from being pushed backward towards the posterior part of the thigh. I then extended the joint by the assistance of one hand placed just above the knee, while with the other hand I grasped the leg. During the continuance of the extension I suddenly moved the leg backwards, that it might make as acute an angle with the thigh as possible. This operation I repeated once, and then desired the young lady to try how she could

walk. Whatever may be thought of my theory, my practice proved successful; for she was immediately able to walk without lameness, and on the third day after this reduction she danced at a private ball without inconvenience, or receiving any injury from the exercise.”

Chap. 7th. On loose cartilaginous substances in the joints.—These substances, it has generally been thought necessary to remove, by an incision made into the joint. But as this operation is a very dangerous one, the author was induced to make use of a well adapted laced knee cap, or a quilted knee piece, which answered the purpose of retaining the substance within the interior parts of the joint, and allowed a free motion without inconvenience. The substances were in time absorbed.

Chap. 8th. Of wounds of the joints.—The author has had considerable success in the treatment of such cases, by taking due care to prevent inflammation.

Chap. 9th. Compound luxation of the ankle joint.—In those cases he agrees with Mr. Gooch, on the propriety of sawing off the head of the tibia or fibula, if either of them protrude through the integuments.

Chap. 10th. Of retention of urine.—Many useful remarks are contained in this chapter, on the different modes of introducing the catheter, an operation which is often attended with considerable difficulty. The necessity of early having recourse to this remedy, when symptoms of retention appear, is strongly indicated by several cases, and the author was particularly led to remark, that an involuntary discharge or even the power of expelling a small quantity of urine, frequently succeeded to retention, but never had the effect of emptying the contents of the bladder. The use of the catheter was therefore as strongly required in such cases, as where the retention was complete. To preserve the flow of urine, an elastic catheter was sometimes left in the bladder for a continuance; but the best plan appeared to the author, to be that of introducing it at certain short intervals. By the latter means, the patient sooner regains the power of emptying the bladder by natural efforts, than when it is suffered to remain constantly in the urethra.

Chap. 11th. Cure of the procidentia ani in adults.

“The relaxed state of the part which came down at every evacuation, and the want of

sufficient stricture in the sphincter ani, satisfied me, says the author, that it was impossible to afford any effectual relief to my patient, unless I could bring about a more firm adhesion to the surrounding cellular membrane, and increase the proper action of the sphincter. Nothing seemed to me so likely to effect these purposes, as the removal of the pendulous flap, and the other protuberances which surrounded the anus. I hoped that the inflammation caused by this operation would produce a more firm adhesion of the rectum to the surrounding cellular substance; and I could not doubt that the circular wound would bring on a greater stricture in the sphincter ani. I explained my ideas to my patient, and he thought it right to submit to the operation which I proposed."

His expectations on this ground were not deceived, as we learn from five cases which he succeeded in curing.

A tumor in the rectum is cured by ligature.

Chap. 12th. Of the cancer of the penis.—Several cases are given of this disease. When the body of the penis was affected, amputation was necessary, but where the disease was confined to the prepuce it was sufficient to remove so much of it as was diseased.

Chap. 13th. Convulsions after strangulation.—In this case convulsions came on, after a copious bleeding, which was employed in order to restore a man who had attempted to hang himself. They were considered as arising from debility, brought on by the suspension, and probably increased by the loss of blood, and they were removed by volatile stimulants given internally.

Chap. 14th. Of a tumour in the neck.—This tumour was supposed to originate from a varicose distension of the veins of the neck, but was afterwards found to have arisen from a rupture of a small blood-vessel.—The author examined it, by passing a couching-needle into it, a mode which he recommends for this purpose. On finding that it contained blood, a cure was attempted, by a gradual evacuation of the contents, which was effected by repeated punctures with a couching-needle.

Chap. 15th. Of the empyema.—The deposition of matter was on the left side, and the opening for evacuating it, was made close to the upper part of the 6th rib. The integuments on the left side of the thorax were œdematous. The case terminated favourably.

Chap. 16th. Of an enlargement of the mamma.—Soon after a sudden ces-

sation of the menses, the mamma, which had from infancy been larger than usual, began to increase in size, and at the age of fourteen were so enormous, as to prevent the patient from being able to walk upright.

"The constant bending forwards had brought on a permanent curvature in the spine. The dragging sensation, arising from the weight of her breasts, was so troublesome, that she was never easy unless when lying in bed, or sitting with the breasts resting upon her knees.

"There appeared to be no disease in the breasts except that of simple enlargement; and their weight had separated them so far from the subjacent pectoral muscles, that I could push my finger, along with the integuments, some way behind each mamma, which felt like a bundle of enlarged glands connected together."

Amputation seemed to be the only mode of relief, and it was therefore determined to remove the left breast, which was the larger, and to wait the event of the operation. This was done, and the breast, after amputation, weighed eleven pounds four ounces avoirdupois. Menstrua then soon returned after the removal, and became regular. The right mamma decreased in size, though it never fell to its natural dimensions, and the health was in a little time perfectly restored. The curvature of the spine continued, though in some degree diminished.

Chap. 17th. Of collections of pus in the vagina.—Two cases of this kind are given, in both of which the matter was in a cyst. In one of them, the cyst was taken out; in the other it was laid open, and filled with lint. A cure was in both of them soon effected.

Chap. 18th. On alvine concretions. Two cases are related of a ball of light pliable matter being formed in the intestines. In one of them the magnitude of the concretion seemed to be the cause of death. A third case is given in which very alarming symptoms were produced in a female by hardened excrement, which was, with very great difficulty, removed.

Chap. 19th. Of the atheroma.—In this chapter, a few observations are made on the best mode of removing the little atheromatous tumours which occasionally appear in the eyelids.

Chap. 22d. On deep-seated abscesses in the mamma, which abscesses are not confined to women in the puerperal state, or to such as give suck. They are only

to be cured by opening all the sinews, however tortuous or deep-seated they may be, through their whole extent.

Chap. 21. On amputation. It is always desirable to procure an union of parts by the first intention, and this is an object which the author constantly bears in view in performing this operation. In amputation of the thigh and arm, the author operates with a triple incision, in the following way.

“ He first makes an incision through the integuments alone; secondly, an incision through all the muscles made somewhat higher than that through the integuments; and thirdly, another incision through that part of the muscular flesh which adheres to the bone, made round that part of the bone where the saw is to be applied. When these incisions are made in their proper places, the integuments and muscles on the opposite sides of the stump will meet each other conveniently, and may be preserved in contact so as to produce a speedy healing of the wound, and a convenient covering for the extremity of the bone.

“ The proper distances of these incisions from each other must be determined by the thickness of the limb upon which the operation is to be performed, making allowance for the retraction of the integuments, and of those muscles which are not attached to the bone.

“ I will suppose the operation to be performed upon the thigh, and the circumference of the limb to be twelve inches, at that part where the division of the bone is intended to be made. The diameter of the limb, in this case being four inches, if no retraction of the integuments were to take place, a sufficient covering of the stump would be afforded by making the first incision at the distance of two inches from the place where the bone is to be sawn, that is, at the distance of the semi-diameter of the limb on each side. But as the integuments, when in a sound state, always recede after they are divided, it is useful to make some allowance for this recession; and to make the first incision half an inch below the semi-diameter of the limb.

“ Supposing the thickness of the integuments to be half an inch, the diameter of the limb after the first incision would be reduc-

ed to three inches; the second incision might, therefore, be made at the distance of an inch and half below the place where the bone is to be divided: but it is useful to make some allowance for the retraction of the muscles, particularly the posterior muscles of the thigh, which takes place in them to a considerable degree in the process of healing. These should be divided somewhat lower than the rest of the muscles, if it is wished that the muscular flesh should retract equally on all sides of the stump. The division of the posterior muscles may be begun at half an inch, and that of the anterior at three quarters, above the place where the integuments were divided. The integuments will retract a little both above and below the place where they were divided; but the distance from that place must be computed from the mark left upon the surface of the muscles in dividing the integuments. The edge of the knife should be directed somewhat obliquely upwards in dividing the muscles, and the division should be made through the posterior muscles at one stroke, and through the anterior at another.

“ In order to make the third incision, the divided integuments and muscles must be drawn upwards by an assistant, who will generally do this the most conveniently with the aid of a retractor, and who should be cautious to avoid pulling the periosteum from the bone, when the muscles which adhere to it are divided.

“ The most perfect union of the soft parts would be produced by making an incision through them all in a conical direction; the apex of the cone being that part of the bone where the saw is to be applied. But such an incision is impracticable in the ordinary mode of operating; nor is it necessary for the formation of a good stump.”

In amputating below the knee, the author employs the flap operation, and manages so as to saw the bone about midway between the knee and ankle. Some observations are made in this chapter on the excision of the metatarsal bones, with which the author concludes his work, which has afforded us a great degree of satisfaction, and will prove a valuable acquisition to the practitioner.

ART. XLIX. *Remarks on the Constitution of the Medical Department of the British Army, with a Detail of Hospital Management; and an Appendix attempting to explain the Action of Causes in producing Fever, and the Operation of Remedies in effecting Cure.* By ROBERT JACKSON, M. D. 8vo. p. 351.

THE medical department of the army enjoys very extensive and valuable opportunities of practical observation, and it is with much satisfaction that we now have occasion to advert to the work of a physician, who has spent his whole

life in the public service, and has been distinguished, as well for the attachment which he bears to his profession, as his unremitting zeal in the prosecution of it.

A military hospital, under proper regulations, is one of the best schools of

medical experience, and one in which there are not the same difficulties to contend with, which frequently present themselves in private practice. The patient and his attendants are equally under military discipline, which enforces, as a duty, whatever mode of treatment may be considered as proper. It is much to be lamented, that the greater number of army medical practitioners do not possess a portion of that ardour for which Dr. Jackson is so much distinguished. The habits of life, it is true, which they are apt to acquire are by no means favourable to observation and enquiry; and, though this may be considered as affording an apology for the want of energy in the improvement of their profession, which is so often observed, yet it is to be regretted that the necessity for it so much exists.

The first part of this work is on the constitution of the medical department of the army.

Dr. Jackson laments that the army medical officer has in general little to say on the means necessary to be pursued for the preservation of health.—This, he informs us, generally rests with commanding officers, who are little disposed to consult the medical department, except on the immediate subject of disease. We have known, however, many examples, in which a spirited but decorous interference has been respectfully attended to, and have no doubt, that in the greater number of examples the mind of a commanding officer is open to the suggestions of good sense and philanthropy.

The author represents the elements of the British medical department as extremely heterogeneous, and as therefore by no means adapted to produce an arrangement, and union of exertion, throughout the whole service. Much practical experience is required in the heads of departments to appreciate adequately the wants of the service, and the qualifications of those to be employed in it. This experience can only be obtained by actual observation, in the stations which they are to superintend, where they will learn the practical difficulties which often present themselves in the arrangements for the sick, and the means to be adopted for obviating them. The medical board, we are informed, has not one member composing it whose education or habits had at all given him an opportunity of being acquainted with

the details of military medical service; and besides this circumstance, it is objected, that the more lucrative engagements of private practice, from which it is not attempted to debar them, necessarily withdraws much of that attention which ought to be exclusively devoted to the regulation of an important branch of the service.

The author considers it as a material disadvantage that the education of army surgeons is not uniform, and is of opinion that an examination, as it is usually practised, can by no means be regarded as a proper test of medical ability. He would, therefore, recommend an establishment, such as that of the hospital at the military depôt in the Isle of Wight, to be fixed upon as a medical seminary, where lectures might be given, and every candidate for admission into the army in a medical capacity obliged to study for a certain period.

According to the practice in use, when Mr. Hunter was surgeon-general, army physicians were generally promoted to that rank after many years service as surgeons. This plan is considered by the author as a very proper one, and as infinitely better than that which has been adopted since his time, in which surgeons are precluded from the chance of being physicians, and the latter rank confined to such as are graduates of the English universities, or licentiates of the London College. He conceives that the whole number employed in the various medical departments of the army is far greater than necessary, and goes so far as to entertain no doubt that the number thus employed is adequate to the care of the whole army establishment, even if all the individuals composing it were actually sick.

The second part contains the detail of management of the hospital of the army depôt in the Isle of Wight, in the year 1801.

In this chapter the author informs us that the hospital was new, slight, and by no means commodious; and that the troops at the depôt were for the most part recruits destined for foreign service, who were very liable to sickness, and frequently brought with them dangerous fevers, generated during their passage from Ireland. In the details which are given us of the management of the hospital, great vigilance seems to have prevailed in every department, and at the same time a careful obser-

vance of economy in the various heads of expenditure. Forty-eight attendants were found to be sufficient for 400 sick, and this diminution, (from above 100, the number formerly employed) united to the disuse of the purveyor department altogether, produced a saving of 2500l. per annum to government.

The author's exertions in the public service do not, however, appear to have met with the approbation of his superiors; and the third part of his work is devoted to an examination of the management of the hospital of the army depôt, in consequence of some reflections thrown against it in an official letter from the army board to the Secretary at War. In this letter Dr. Jackson is charged with having carried a regard to economy too far, and with having employed too debilitating a plan of regimen and medicine, which gave rise to great mortality, frequent relapses, and tedious recoveries, with a debilitated state of the patients. A board of army physicians acquitted him of those charges, and considerable pains are taken by the author to shew,

“— that the hospital of the army depôt, while under his management, stands on advantageous ground, in point of mortality in similar diseases with the same hospital at other periods, or with other hospitals in other places. The cure also appears, by good testimony, to have been equally perfect as in the periods preceding or following. The time required for cure not more than half of what it was in the period which immediately succeeded his suspension from medical duty, or which preceded his appointment.”

An appendix, as large as the body of the work, is occupied with an account of the principles which the author has adopted in explaining the action of causes in the production of fevers, and the action of remedies employed in their cure. From this part of his work we shall make a few abstracts, in order to shew his principal peculiarities of opinion and practice; but it may be observed, that his doctrines on this subject do not now appear for the first time before the public.

Health, or the proper performance of the various functions of the body, depends upon a certain harmony, or as the author chuses to call it *rhythm* (*ῥυθμός*) of movement in animal bodies. On the phenomena of life, and in many other parts of his reasoning, he adopts, in some

measure, the principles of Brown, though with a modified language.

“The expression of life, or animal action, may be considered as a forced condition.—The nature of the radical quality in which it consists is not known; but the expression of it is visibly called forth by the application of peculiar and appropriate causes. Its manifestation is thus the effect of stimulation. A pause of rest is the cause of action; for it is a fundamental law of nature, that whatever is moved to action by stimulation tends to rest when the action, the effect of the stimulation, is produced. Thus, as action is the consequence of stimulation, and a tendency to rest the consequence of an action completed, alternate action and rest, however varied in period, necessarily follow each other, while the cause and condition of organization preserve their relations. A certain rhythm of movement is, consequently, a condition inseparable from a living animal body; as the integrity of the order and force of that rhythm is the index of health. But as movement is an expression of the presence of life, and rhythmical movement an expression of health, so the mode of health is liable to be perverted, the motions of the machine to be even finally arrested or annulled. The scale of the deranged modes is extensive; and as the modes are various, though errors, they have their train of errors, and their productive effects variously multiplied and combined.”

“A change in the rhythm of movement is the first visible, even supposable step of action, arising from the operation of the causes of fever. Such derangement seems to proceed either from the application of powers, which are in their own nature stimulant of the ordinary movements of health, erring by excess or defect of just quantity, or from the application of new and extraneous matter, stimulant in their nature, but subversive of natural movement—both in time and force, productive of new and artificial action in the minutest circle of organization, communicated to combined organs, and manifested in the operations of functions. This new action originates in the application of a new material; the effect corresponds with quantity and quality, and condition of subject to which the application is made. This last requires a minute consideration in forming an estimate of effect, for it seems to be the principal circumstance which modifies the expression of symptoms. Action is supposed, in all cases, to be in proportion to the force of the stimulating power, and the capacity of the excitable organ. This has different conditions or capacities,—different degrees of facility or difficulty in manifesting action.—The facility in excess may be termed irritability, the difficulty torpor. The constitution varies radically, that is, constitutionally in different subjects; and it varies in the

same subject, according to differences of accidental circumstances."

Atmospherical air is stated to be the common stimulant to animal bodies, and various alterations of action, in producing disease, are supposed by the author to arise from "inexplicable deviations in the proportions and conditions of the elements of the atmosphere, and from various extraneous matters enveloped or suspended in it."

Irritation seems to be the derangement which accompanies fever, and this appears to be the effect of a variety of causes possessing an irritative power, supposed to offend from excess in quantity, or from nature of quality." The author admits, however, that where contagion is generated in close confined places, though it is calculated "to produce irritated motions," and possesses "the quality of irritating as a cause," that the condition of the subject, as affected by the vitiated air, "seems not to obey the impulse."—As the natural harmony which exists in health is interrupted in fever, or as fever consists in a rhythm of movement, irregular in time and force, the restoration of this rhythm is necessarily the restoration of health. But previously to attempting to restore the harmony of movement, by the application of causes calculated to excite motions analogous to those of health, the author considers it as often necessary to arrest the irregu-

lar course of the existing motions.—Bleeding and emetics are two of the most powerful means in use for this purpose, and when by them the diseased motions have been arrested, the pure air of the atmosphere is often sufficient to solicit the organic structure to resume its natural action. But when this fails, he attempts to give origin to an action, similar to that of health, by alternate warm and cold bathing, which, preceded by bleeding, furnishes, he asserts,

"— a safe and effectual cure for a form of fever, which destroys life occasionally in every country; but which has committed dreadful ravages among Europeans, particularly among European soldiers in tropical climates. The remedy is comprehended in the means now mentioned; but the effect depends on the management. A scanty bleeding rarely prepares the condition prescribed for the application of the means; and, unless the condition be duly prepared, the effect is looked for in vain."

Very ample observations are made on the mode of employing blood-letting, the cold bath, and some other remedies of smaller importance, but for those we must refer to the work itself, only observing, that though we pay great deference both to the experience and the abilities of the author, we have occasionally some difficulty in admitting the correctness of his reasoning, and have much hesitation in assenting to the very liberal use which he makes of the lancet.

ART. II. *Facts and Observations concerning the Prevention and Cure of Scarlet Fever, with some Remarks on the Origin of acute Contagions in general.* By W. BLACKBURNE, M. D. 8vo. pp. 166.

FEW of the inquiries of modern times have led to more interesting, or more beneficial results, than those which relate to contagion. The nature of this agent, which is so much and so deservedly the object of alarm, has hitherto eluded the most zealous, and the most careful research; but though we are not enabled to discover what it is, or even to demonstrate by chemical analysis its existence, much less the parts of which it is composed, yet the industry of some modern philosophers has been able to discover many of the laws by which it is regulated. We have read, with much satisfaction, the observations contained in the treatise now before us, and regard them, as not only confirming some of the valuable remarks which have

been made by other writers on the subject of contagion, but as enlarging considerably our knowledge of the operation of this agent, particularly as it relates to scarlet fever. This disease has long been a particular object of attention with the author, but within these two or three years he has had more frequent opportunities of observing collectively its nature and progress, than at any previous period. It has hitherto been generally the custom, where scarlet fever has shewed itself in a public seminary, to break it up; and if, on the other hand, one child of a family was attacked by this disease, it has been usual to send off the others to school, in order that they might be removed from the influence of the contagion; both those

measures, the author has clearly proved to be extremely injurious. When a school is broken up, the individuals composing it have a chance of carrying the infection to their respective homes, and of thus widely disseminating a subtle and insidious poison. When a family is separated, an equal risk occurs of its being transported far beyond its first limits, and of its thus extending the scene of its ravages. To prevent those direful effects, the author strongly recommends, that whenever the disease shews itself in a school, those affected with it should be kept perfectly separated from the others, in apartments appropriated to their reception, and not allowed to mix with their companions till a considerable period after their convalescence. In a private family the same plan should be adopted. Intercourse with the other branches of it should be strictly prohibited, until the disease has not only gone off, but till the danger of its being propagated from the convalescent subject has ceased. How soon there is no risk of such propagation has not yet been accurately determined; but the author is convinced that the danger exists long after it has been supposed to cease, and has known instances of infection taking place after the 10th day. The dispersion of individuals, who are not apparently affected with the disease, is always done at some risk to those with whom they may afterwards associate, if sufficient time does not intervene between their exposure to the contagion and the period of their mixing with healthy subjects, to determine whether there may not be some latent seeds of it existing in them. The author, therefore, conceives it a duty which parents and the heads of seminaries owe to the public, to do their utmost to prevent the propagation of this serious complaint, which can only be effectually done by excluding the infected till they cease to be capable of disseminating contagion, and by taking care not to send out children who may have been exposed to its influence till there is a perfect assurance that they have been able to resist it.

The occurrence of scarlatina in a large family, and in a numerous school, afforded the author very favourable opportunities of ascertaining several important circumstances relating to this disease.—In the former case, he ascertained, that convalescents from scarlet fever are capable of communicating it for ten days, or a

further period, not yet precisely defined, after their perfect recovery; and that it may be suppressed in its commencement by an emetic, or the affusion of cold water, but that the person who thus escapes its full formation is liable to be reinfected. The success which attended the complete separation of the affected or suspected cases, in the public school, convinces the author that measures of prevention are always practicable, and should at all times be carried into effect. At this school there were sixty-four scholars, of whom only twenty took the complaint, and none of the family, the assistants, or servants. On the other hand, out of forty ladies at a boarding-school at Chester, as mentioned by Dr. Haygarth, where similar precautions were not taken, only four escaped the complaint, twelve had it very severely, and two most dangerously.

With regard to the identity of the origin of scarlatina and malignant sore throat, a point which has been very much the subject of discussion, the author ascertained satisfactorily, from the histories of both the sets of cases above-mentioned, that the primary sources of contagion were the same in each, and that

“ Every form of angina contagiosa, or scarlatina, was exhibited in them, some with angina alone, others with angina and eruption combined, others with eruption only.”

The contrary doctrine has, in the author's opinion, produced disadvantages in two ways.

“ 1st. Common cases of scarlatina, having been supposed to belong to a mild and safe class of diseases, have been treated with too little attention in ordinary practice. It is true, that a very great majority of patients recover from scarlet fever, yet it must be allowed, on the other hand, that general anasarca, tumid glands, hectic fever, cough, and sometimes dysenteric symptoms, are the too frequent consequences of the imperfect cure of scarlatina. 2dly. It being generally presumed, that the same contagion does not in one instance produce eruption, and in another ulcerated throat only, among the members of the same family where scarlet fever is present, the state of the throat is too often not adverted to in proper time.”

The general treatment of scarlatina, Dr. Blackburne conceives, should

“ — be grounded upon the knowledge of its source, and its debilitating propensity.— But at the same time that this is acknowledged to be the true complexion of it in an enlarged and general sense, yet where such

various degrees of morbid affection take place, general rules cannot be laid down with propriety, or carried into effect with success in every instance. The practitioner is therefore bound to exercise his own discrimination in individual cases, and proportion his mode of prescription to the degree and the form in which the disease individually appears. The too early exhibition of tonics and cordials is equally pernicious with profuse and excessive evacuations. For this reason I object to the indiscriminate use of strong antimonial emetics, which commonly induce too great a degree of debility, where the tendency to it is inherent in the disease itself, and the inflammatory symptoms extremely transient, even in the robust and adult subject. There are two indications to be answered by emetics in this disease, corresponding with the different stages in which they are administered. In the first stage, the great good effect of an emetic is to restore obstructed perspiration, which is of the greatest consequence in mitigating and shortening the febrile period in this particular disease. In more advanced periods, where this has not been done, an emetic, if not too long deferred, will excite perspiration, and will also act mechanically in cleansing the throat, discharging the sloughs, and inducing a more active and healthy secretion in the glands and neighbouring secreting surfaces. In neither of these instances are violent emetics required. Mercurial or drastic purges are liable to the same objection. The plan, which I adopted with general success in Mr. E.'s school, will be found equally safe and efficient in a great majority of mild incipient cases. My general intention was to diminish the violence of fever by gentle evacuations, by relaxing the skin, inducing moisture, and after this, by an early assumption of moderate tonics and nutritives, to prevent the access of great weakness during the actual presence of the disease, and by protracting the use of more powerful tonics and a full diet over the convalescent state, to guard against the approach of the ordinary consequences of scarlatina, viz. anasarca, &c. This mode of practice, like every other, must be appropriated to the peculiar habit and circumstances of the patient—those of robust and plethoric constitutions require a shorter continuance of, and less powerful tonics, than those of a contrary frame; but no constitution ought to be allowed to struggle unassisted through the disease itself, or through the convalescent state. If the milder instances of scarlatina demand the physician's vigilant eye, to prevent future ills, where no immediate danger threatens, the severer instances of this pestilence, where affection of the throat constitutes most urgent degrees

of hazard, require his utmost solicitude and skill. The insidious progress of ulceration in the organs of deglutition has been permitted too often to rob an afflicted family of a valuable parent, or the tender parent of a much-beloved child, even where the full manifestation of scarlet efflorescence has given, though too late, undoubted proof of the existence of the nature of the malady."

"It will be a good rule, therefore, to proportionate early and seasonable medical exertions to the seat of ulceration in angina contagiosa, remembering, that the most hazardous situations, and which require the most prompt and uninterrupted assistance, are those immediately concerned in the act of deglutition, and are so near to the larynx and trachea, as to afford a ready path of communication to those organs, which are essential to life."

In such cases the author has found it necessary to recommend

"The exhibition of wine or negus\*, with bark and the mineral acids, to be taken alternately with strong soup, every hour or two, in proportion to the advancement of the ulcer, the debility of the patient, &c. for eight and forty hours in succession, or three days and nights without intermission, if occasion requires. Life has been saved by these extraordinary efforts, which otherwise must have been lost."

The author disapproves of the method recommended by Dr. Withering, of treating this complaint by the frequent administration of strong antimonial emetics, which have too great a tendency to weaken the patient.

Towards the conclusion of the first part of this treatise, the author inquires into the modes by which infection is generally introduced into the human body, which must be either by simple contact, inoculation, or inhalation. The first is considered by him, from a multiplicity of facts, as insufficient for the purpose. The second is voluntary, and on that account not applicable to the question. The third is therefore the only way in which contagion can be propagated; and consequently to guard against its communication, by the respiratory organs, is the most simple, intelligible, and practical means of prevention which can be adopted.

The second part of this work is on the subject of contagion in general. Since it has been discovered that the progress

\* "Negus, of the following composition, forms a very pleasant and grateful beverage for the patient. Wine, eight parts; water, four parts; lemon juice, one part; sugar, a sufficient quantity, or none, according to the taste of the sick."

of contagion may be interrupted by the interdiction of intercourse with the infected, it becomes an object of personal and public policy, that this easy mode of effectually subduing a source of disease, should be completely carried into effect.—The author, therefore, with much philanthropy, views the subject in the most enlarged scale, and considers this information as capable of being applied most extensively to every contagious disease. The more varied and extensive application of the laws of quarantine, is all that is required to subdue with as much effect the contagion of scarlatina, as that of plague.

“Be it well imprinted on every one's mind,” says he, “that all infectious diseases are pests, only inferior in the rapidity, the degree, and the urgency of their consequences, to that surnamed the plague, from its supposed pre-eminent fatality. Patience, firmness, and perseverance, as in all other instances of evidently promoting public advantage, will gradually overcome prejudice, unreasonable fears, and selfish opposition\*. In proportion as plans of prevention become more known and more practised, the great ends of their adoption will be more easily attained, and their beneficial tendency more fully comprehended. The contagion of typhus, small-pox, and scarlet-fever, being known to be capable of complete intervention and local extinction, the transition from controlling these forms of contagion to that of repressing others, as hooping cough, measles, &c. will appear easy and practicable.”

It may be said, however, that every species of infection must have had its origin, and that the same causes which originally gave it birth may reproduce it under similar circumstances. But even in this point of view it appears to the author, that immediate measures of prevention will always be productive of great advantage, compared with the consequences which ensue, where no precautions are used. The argument in favour of universal prevention would, however, be irrefragable, if the principal sources of contagion could be discovered, and be then capable of being obviated or removed. With the hopes of throwing some light upon a subject which has

hitherto been considered as too obscure to admit of elucidation, the author employs considerable pains, and some ingenuity, in attempting to discover the origin, and trace the rise of contagious diseases. Of his ideas on this part of his subject, we shall, therefore, proceed to give a general abstract.

Certain exhalations, or marsh miasmata, as they are usually termed, have the peculiar effect of inducing fever on human bodies, exposed in certain circumstances to their influence, and hence these exhalations should, in the author's opinion, more properly be called, paludal febrilizing gases. The effluvia from febrile animal bodies, and the exhalations from marshes, swamps, and mud, are considered by him as gases of a peculiar composition, of which hydrogen or the principle of humidity, forms an essential part. But the opinion entertained by him on this subject does not appear to be supported by adequate evidence. He admits that the precise composition of pyrexial gases, whether contagious, limose, or pallidous, has not been discovered, but from a great number of facts, considers it evident, “that an aqueous constituent is essential to the composition of both.”

“In the citations,” he continues, “already extracted to prove the effect of marsh miasmata, it has been amply demonstrated, that dampness, moisture, or humidity, is always an indispensable ingredient in the exhalations which induce fever. But another very important truth is also now, I believe, for the first time, brought to light, that, by depriving the pyrexial gases of their aqueous or hydrogenous principle, they are, for the time, annihilated. That, upon this sole principle, we are enabled to account for the well-known fact, that extreme additions or abstractions of caloric or heat, arrest the progress, or destroy the existence of all epidemic and contagious diseases.”

It seems difficult to determine whether the author applies his reasoning to hydrogen in a separate or combined state. If in a combined state, in the form of aqueous vapour, it can only be supposed to be the medicum in which the contagion is carried; if in a separate, the

\* “A business of this kind will go on but slowly, and sometimes seem to have a final stop put to it, not only from its magnitude, but from indolence, prejudice, interest, envy, and wrongheadedness. This common fate of all great and new undertakings should never discourage the adviser from persevering; for every useful truth, fairly laid before the world, however it may seem, at first, to be slighted, will gradually undermine the old errors, and, in time, prevail over all opposition.”

“See the late Dr. Heberden's letter, annexed to the second edition of the Enquiry how to prevent Small-pox.”

addition or abstraction of heat from a permanently elastic vapour does not seem to be capable of annihilating it.—No facts have been brought forward to prove, that hydrogen gas possesses any such deleterious properties as those which the author ascribes to it, and if it is only supposed to be a *part* of a poisonous compound, we are still in the dark with regard to the other, and perhaps the most necessary ingredients.

The exhalations or gases above-mentioned, seem to be capable of producing simple fever, which, by exposure to “accumulated febrilized animal effluvia,” are supposed to be converted into contagious fever, and thus rendered adequate

to propagate each other. All contagious diseases are thus supposed to arise originally from similar causes, and the peculiar differences by which the various species of contagious diseases are distinguished, are conjectured to proceed from accidental circumstances, as eruptions of various kinds, with which the original simple disease may have been combined.

Specific contagions are thus supposed to be transmitted *propria forma*,

“—from one subject to another, on similar principles with which hereditary diseases, peculiar constitution, similitude of temper and person, are conveyed from parents to children. The process of previous animalization is equally inexplicable in both.”

ART. LI. *An Introduction to Electricity and Galvanism; with Cases, shewing their Effects in the Cure of Diseases. To which is added, a Description of Mr. Cuthbertson's electrical Machine. By J. C. CARPUE, Surgeon; being the Substance of Lectures delivered to his anatomical Class.*

IT is seldom that outlines of lectures can do more than give the reader an idea what the lectures themselves would be, or afford some instruction to him who would wish to repeat the experiments exhibited in the lecture-room. In this point of view the small volume before us, and the plates that accompany it, may assist the student. The cases to which the author has applied electricity as a cure of disease, are detailed more at large, and with apparent accuracy and candour. We shall give two of them.

“*Deafness.*”

“A young lady of scrophulous habit had been deaf three years: she could not hear, so as to hold a conversation. I threw sparks on the mastoid process, and round the meatus auditorius externus, and drew them from the same parts of the opposite side with my fingers, twenty times a day for three weeks, when she could hear perfectly well.

“A gentleman, aged fifty, had been deaf nine months; I electrified him eight times, when he recovered.

“A gentleman had been deaf six months; could not hear me speak at a yard distance. I electrified him the first day twenty minutes (as in the first case); he could now hear me at twenty yards distance. I continued to electrify him every day for three weeks, and he gradually recovered.

“*Opacity of the Cornea.*”

“A girl, aged six years, had an opacity of the cornea of both eyes, in consequence of the small pox, which was so considerable that you could not observe the pupil; she could tell when a candle was brought into the room, but could not distinguish objects; she had been in this state two years; the usual applications had been tried. I drew the aura with a wooden point from the parts affected ten minutes a day for fourteen days, continuing the applications without any visible effect; during this time the electricity did not give any pain, but on continuing it the parts became very irritable, much pain being occasioned by the fluid. I now observed a visible alteration; the girl began to distinguish objects, and by the end of three months a cure was nearly effected. I now electrified the eyes occasionally, and at the end of six months she was perfectly recovered. I have had other successful cases of opaque cornea, though I have been unsuccessful in many. I have observed that those opacities occasioned by the small-pox yield more readily to electricity than those occasioned by other causes.”

We have preferred these cases, as the benefit received was palpable, and not liable to be exaggerated by any influence of the patient's imagination.

ART. LII. *An Essay on the Medical Application of Electricity. By JOHN BIRCH, Esq. Surgeon Extraordinary to his Royal Highness the Prince of Wales, and one of the Surgeons to St. Thomas's Hospital. 8vo.*

THIS decided testimony to the importance of electricity in the cure of diseases, was inserted many years ago in

Mr. Adams's treatise on electricity, and is now published separately. We therefore only notice it to introduce an obser-

vation which the author makes in the preface: "I am sorry to be under the necessity of saying that, though I have with great pains endeavoured to establish a regular practice of this useful branch of surgery at St. Thomas's hospital, I could never prevail. This may be owing to the many objects of study which present themselves to the pupils during the short time of their residence in London, and which prevent them from attending so much to this part of surgery, as I earnestly wish they would. An operation is more often admired, than a cure by any other means, as it is at once splendid and lucrative. I am therefore obliged to limit the hospital practice to particular cases, which I attend

to myself, because I can so seldom prevail on a young student to take the necessary pains which are required to become an able electrician."

If it is a real fact, that not a single young man can be found in this school of medical art, sufficiently skilled in the easiest part of electricity, to be trusted with applying it medically, we need not wonder at the apathy and reluctance to try the most promising experiments, which we so often find to stand in the way of improvement. When the age for education is passed, the most frequent resource of ignorance is then an affected contempt for the branch of knowledge where the deficiency is felt, or an equally affected dread of all innovation.

ART. LIII. *A Dissertation on the Bit Noben, or Fatid Salt of the Hindoos, the Sal Indus Antiquorum, commonly known in Hindostan by the Name of Khalla Neemuck; with Remarks on the Cherayta of the Hindoos, the Kusseb Uzzereereh of the Arabians, the Calamus Aromaticus Antiquorum.* By JOHN HENDERSON, of the Bengal Medical Establishment.

WITH a great display of oriental erudition, and a long motto in the Persian character on the title page, which we are not able to translate, this pamphlet gives but little real information on the two articles of pharmacy which the author professes to describe.

The Bit Noben appears to be one of the commonest salts in India, and has been employed from time immemorial by the natives, as a sovereign remedy for a vast number of complaints. Its external appearance is in brown irregular lumps; to the taste it is salt and sulphureous. All that the author knows, or chooses to tell about its chemical properties, is included in the following imperfect account:

"When dry, the salt has scarcely any perceptible smell, but when moistened, it emits a strong sulphureous foetid odour. It dissolves readily in a small proportion of water, forming a solution of a greenish colour, which has been found, by experiments, to possess all the properties of the Harrowgate or Aix-la-Chapelle waters. The solution emits a strong sulphureous smell, resembling bilge water, rotten eggs, or the foulest gun-scurings, which goes off by exposure to the air. The solution soon deposits a little black sediment, which has been found by the application of the magnet to be oxid of iron. On the addition of a little vitriolic, muriatic, or nitric acid, the greenish colour is instantly destroyed. The vitriolic acid causes a slight effervescence, while the nitric acid produces a milky appearance without any effervescence whatever. Caustic potash restored the colour which had been destroyed by the muri-

atic and nitric acids; but, on adding it to the solution which contained the vitriolic acid, instead of a green it caused a brownish appearance, with an evident precipitation. A small quantity of extract of lead, poured into a fresh solution of the salt, caused a very copious precipitate. A silver spoon, laid over it, became discoloured in a short time. By exposure to the air, the greenish tint and foetid smell gradually disappear, and the liquor becomes as clear as the purest water; and when this has taken place, on pouring out the liquor, the inside of the vessel is found to be lined with a film of sulphur.—A quantity of clear solution was evaporated in a china plate, by the heat of the sun, which left a number of cubical crystals, which, from the taste and other circumstances, appeared to be very pure muriate of soda, the neutral salt that predominates in the mineral waters of Aix-la-Chapelle, Harrowgate, Moffat, and indeed of almost all sulphurated springs."

After this the author concludes that the Bit Noben dissolved in water, would be a valuable and cheap substitute for these celebrated waters.

"Here, then, we have the neutral salt that impregnates these waters, and the sulphur in union with hydrogen, on which the efficacy of both the hot and cold sulphurated waters are in a great measure allowed to depend; and, what surprises the chemist, is the sulphurated hydrogen mostly uncombined. From the easy solution of the salt in water, and the sulphurated hydrogen being in such abundance, a water of any degree of strength, either of the gaseous or saline impregnation, may be prepared; the super sulphurated hot

waters of Aix-la-Chapelle may be imitated with equal facility as those of Harrowgate and Moffat, by merely heating the water before the salt is added to it."

Mr. Henderson may indeed make a foetid saline sulphureous liquor by means of this salt, but he ought to have known a little more of chemistry before he ventured to pronounce that "it really affords the means of imitating the sulphurated mineral waters, to much greater perfection than any process we are yet acquainted with."

The Bit Noben appears, by our author's account, to be an artificial preparation, or rather perhaps a native salt, which has undergone some preparation. It purges in moderate doses, and it seems to have the medicinal virtues which one would expect from a sulphureous saline purgative.

With regard to the Calamus Aromaticus, we are informed that it is a very pure bitter, without any aromatic flavour, and sold in the Indian markets for a trifle; but that Dr. Bruce, though he

offered an hundred guineas for a fresh plant of it, could not obtain one, and was obliged to describe it from a dried specimen. After a long quotation from Prosper Alpinus, and one or two other writers, the author professes to put the controversy about it out of dispute, by giving Pomer's drawing of a bundle of the calamus, together with the plant that furnishes it; so that it does appear that Mr. Henderson himself never saw the fresh Calamus plant, any more than Dr. Bruce.

As the Indian Calamus is a pure bitter without aroma, we can hardly agree with the author that it would be a very valuable addition to our materia medica, so long as we can procure gentian or quassia.

It appears that a quantity of Bit Noben has been imported into this country, but has attracted very little notice. It certainly more deserves a trial than many new medicines, even than the boasted Lichen Islandicus.

ART. LIV. *An Account of the Discovery of the Power of Mineral and Acid Vapours, to destroy Contagion.* By JOHN JOHNSTONE, M.D. 8vo.

IN the review of M. Guyton Moreau's treatise, in our former volume (page 813), we gave a short history of the discovery and application of the vapours of mineral acids to destroy contagion, and we there mentioned that the merit of being the first discoverer was undoubtedly due to the late Dr. James Johnstone of Worcester. The pamphlet before us is a short and satisfactory statement of the claims of Dr. Johnstone, given by his son Dr. John Johnstone; and as the value of the discovery must be felt by every impartial observer, and has been sanctioned by a national reward to a *supposed* inventor, we think it right to state it in the author's own words:

"In 1802, the report of the committee of the house of commons on Dr. C. Smyth's petition, states another sentence of Dr. Lind, 'that a certain method of destroying infection in places whence persons cannot be removed, is a desideratum not yet obtained in physic. Many things had been proposed and tried, but without effect.'"

"Nearly fifty years before the framing of this report of the committee of the house of commons, a country physician had acquired eminence by the discovery of a certain method of destroying infection, which could be used with perfect convenience in the apartments

of the sick. In 1758, Dr. James Johnstone published his 'Historical Dissertation concerning the malignant epidemical Fever of 1756, with some Account of the malignant Diseases prevailing since the year 1752, in Kidderminster.' In that dissertation, adopting the theory of the day, he proposes to keep the air free from putrefaction by the steams of vinegar; or, as a more effectual method, 'the marine acid may be raised very easily, by putting a certain quantity of common salt into a vessel, kept heated upon a chaffing dish of coals; if to this a small quantity of oil of vitriol is from time to time added, the air will be filled with a thick white acid stream.' It is fortunate for the fame of Dr. Johnstone, that this discovery was published at that time. He had used the mineral acid vapour to correct the contagion of putrid fever in his earliest practice. The advantage derived from it became so well known in Kidderminster, that the manufacturers, during the prevalence of fevers in that town, spontaneously placed the fuming vessels in their shops; and Dr. Johnstone continued to use the muriatic vapour in his extensive practice, to the last hour of his life; yet all this would have availed little, had it remained a mere matter of prescription. It would have been neglected or undervalued, and perhaps the practice and discovery altogether denied. I shall not dwell on these possibilities. It was published in 1758, as having been practised in 1756; and the book attracted so much notice, that the whole edition was quickly sold."

The truth of this statement is corroborated by further evidence.

“ Mr. Crane, the present eminent and respectable surgeon in Kidderminster, is prepared to give the fullest testimony, that the muriatic acid vapour was so commonly used, when he settled in business, more than thirty years ago, that the manufacturers placed it spontaneously in their shops, when fever was apprehended; and that in malignant cases it was always ordered by my father. He remembers Mr. Cooper and Mr. Symonds, two old and eminent surgeons of Kidderminster, who were employed with my father in his earliest practice, to have frequently mentioned the discovery of muriatic vapour; and the use of it in the fever of 1756; and its continual use, when occasion called for it, from that period.”

Nor had the confidence in the muriatic fumigation at all diminished in the county of Worcester during the time of Dr. Smyth's supposed original experiments, on which he founded his claim to national remuneration. Dr. Smyth, according to the evidence brought before the House of Commons, first used it in 1780. In 1779, Dr. James Johnstone, jun. in his *Treatise on Sore Throat*, expressly recommended the muriatic fumigation discovered by his father. In 1783, a malignant fever, which had broken out in Worcester gaol, was subdued by acid fumigation; and in 1784, it became the subject of public enquiry.

“ In consequence of the alarm of the gaol fever, and a report that it had spread into several parts of Worcestershire, Sir Francis Buller wrote to my father in the beginning of 1784, desiring information of the state of Worcester gaol; and if there were any fever, or risque of infection, he would adjourn the ensuing Lent assize to Bromsgrove, or some other town in the county. There had been solitary instances of fever in the county gaol, and in the neighbourhood of Droitwich, towards the close of 1783; but there had been no peculiar symptoms of malignity in these cases; the judge was therefore encouraged not to adjourn the assize from the city of

Worcester. My father was, however, desirous to recommend measures of precaution; and in consequence the gaol was fumigated, the prisoners fresh clothed, and the county hall was also fumigated during the whole of the assize. The event was favourable, no fever appeared.

“ Shortly after, a malignant fever broke out in the workhouse of Kidderminster, and upwards of twenty persons were infected.— Upon this occasion my father was called in by the magistrate of that borough; he ordered the whole house to be fumigated with muriatic vapour, the patients to be washed with vinegar and water, and nice attention to be paid to cleanliness. By these means contagion was soon stopped, and my father received a vote of thanks from the inhabitants of that populous town.”

The remainder of this pamphlet is occupied with the fullest and most irrefragable evidence, that not only the power of the muriatic acid is to all appearance fully equal to the nitrous, but that it can be employed with equal convenience to the patient, without producing cough, sense of suffocation, or any other uneasiness, provided it is managed with prudence and caution. The testimony given by M. Guyton Morveau, corroborates this fact; and we fully agree with Dr. Johnstone, that no valid evidence appears for giving the preference to the nitric acid. The superior diffusibility of the muriatic vapour, at a low temperature, will amply explain the reason why its effects should be more sudden, and should require a somewhat different management; but where the quantity of vapour is equal in a given space, both acids appear equally to destroy contagion, and to be equally safe to the patient.

Dr. Smyth cannot even claim the merit of *reviving*, but simply of extending with a trifling variation, a practice already well established in the centre of the kingdom by the most weighty and respectable authority: the reward has been his, let the honour, now posthumous, be paid to the memory of the real inventor.

**ART. LV.** *A second Treatise on the Bath Waters; comprehending their medical Powers in general, and particularly as they relate to the Cure of Dyspepsia, Gout, Rheumatism, Jaundice, and Liver Complaints, Chlorosis, Cutaneous Eruptions, Palsy, &c.* By GEORGE SMITH GIBBES, M. D. F. R. S. late Fellow of Magdalene College, Oxford, Fellow of the Royal Medical Society, Edinburgh, &c. 8vo. pp. 120.

DR. Gibbes has already distinguished himself as a chemist in the analysis of these celebrated waters. In the present treatise he describes all the medicinal powers that are attributed to them, and gives directions for their use.

We do not find that Dr. Gibbes has thrown any real light on the *modus operandi* of these waters, or has made any other practical observations than have been already given by the different advocates for Bath. The whole is in the

style of eulogy, but the concurring testimony of numerous invalids who might hang up their votive crutches in the

pump-room, in token of ameliorated health, will justify a considerable degree of zeal in such a cause.

ART. LVI. *A Treatise on Cheltenham Waters and Bilious Diseases. To which are prefixed, Observations on Fluidity, Mineral Waters, and Watering Places. By THOMAS JAMESON, M. D. Member of the Royal College of Physicians of London and Edinburgh, now resident Physician at Cheltenham.*

IT appears an established custom for a physician, on settling in any popular watering-place, to write a treatise on the spring, a chemical analysis of its water, general observations on bathing, air, exercise, and on all the diseases for which the spring is employed. Fortunately the materials for making a book of this kind are very abundant, and it requires no great exertion of talents or ingenuity to

compose from them a treatise like the present.

One piece of information however will, we suppose, prove agreeable to the visitors of Cheltenham, which is, that Dr. Jameson has discovered a new spring similar in properties to the old well, and able to furnish more water than can possibly be used by any probable number of visitors.

ART. LVII. *Experiments and Observations on the Cortex Salicis Latifoliae, or Broad Leaved Willow-Bark; illustrated by a coloured Plate. Interspersed with general Observations and Remarks on the different Species of the Cinchona, &c.; General History and progressive Introduction of the Salix Latifolia; with a Variety of Experiments, tending to elucidate its Properties; illustrated by Cases, demonstrating its superior Efficacy above the Cinchona in various Diseases, more particularly that Branch of the healing Art termed medical Surgery. By G. WILKINSON, Corresponding Member of the Medical Society of London, Licentiate of the Royal College of Surgeons, and Honorary Member of the Chirurgo-Physical Society of Edinburgh, and of the Literary Society of Newcastle-upon-Tyne.*

EVERY attempt to introduce into our materia medica any valuable indigenous vegetable is highly meritorious.—The salix alba, though already strongly recommended, has not met with the notice which it merits. Mr. James of Hoddesden, and Mr. White of Bath, have both published treatises on its virtues, and the present author adds an useful testimony to its febrifuge properties. He gives the following direction for gathering and preserving it.

“The most proper time of gathering the bark is in May, June, and until the middle of July, as after this period it is found to adhere so firmly to the tree, as not easily to be peeled off; neither does it appear so vigorous or juicy as I have found from experience. It should be cut into pieces not more than five inches in length, and the large thick bark to be one or two inches in breadth. This must be done when green, and then it should be dried in the house, in a place where no sun or fire comes. This renders it convenient and neat for stowage, or packing for carriage, dries it more regularly, and fits it for the mortar, either for decoction or infusion. That of a finer sort to be exhibited in substance, should it not be sufficiently dry for pulverising, may be exposed to a very gradual

and moderate heat in an oven, which will facilitate its reduction into a very fine powder.”

Decoction is the best mode of exhibition. Mr. Wilkinson's prescription is the following.

#### “FORMULA.

“R. corticis salicis latifoliae siccati ℥ss; in pulverem crassum redige, et macera in aquæ fontanæ libris duabus per horas sex; deinde coque leni igne per quartam vel tertiam partem horæ, et cola pro usu. Capiat æger cochlearia duo vel tria larga decocti ter vel quater de die: sed febre intermittente, dare oportet unciam unam aut duas secundâ vel tertiâ quaque horâ absente paroxysmo.

“Of late I have in some cases of dyspepsia, combined with this decoction, a small portion of the *lignum quassia*, by boiling it with the bark. It may be tinctured more or less strongly with it, according to the intention of the prescriber, and I sometimes add to it a few drops of the *tinct. lavend. comp.* When thus tinged, it strongly resembles in taste the decoction of *cort. peruv.* This method has also been used by Mr. White. From various experiments, which will hereafter be detailed, I find that the decoction, above all other preparations, whether tincture, cold, or warm infusion, is much stronger, and more fit for medical purposes. I cannot speak from ex-

perience on its effects in powder, spirituous, or watery extract; but I strongly suspect it will be found much less efficacious and more uncertain in these last forms, exclusive of their being more expensive than the decoction."

It is to be observed, that the salix is simply astringent, and scarcely if at all bitter: the author endeavours to shew the superiority of the astringent or tanning principle in the cure of fever over that of bitterness; he gives a few comparative experiments, on the antiseptic power of the salix in the manner of Pringle, compared with the cinchona and some other substances, and endeavours to ascertain the quantity of tannin in this

bark by the sure test of animal jelly. In this last respect the willow stands very high in power, as indeed had before been proved by Mr. Biggins, in his experiments at Woburn, published about two years ago. It is evident, however, that bitterness is a most important auxiliary to astringency in the cure of diseases, which appears to have very little in common with the power of preserving dead animal fibre, and the salix is really defective, as a medicine, in not possessing any sensible bitterness. It is, however, easily remedied, by adding quassia or gentian, and this new formula deserves a place in every pharmacopœia pauperum.

ART. LVIII. *Manuel du Pharmacien*, par E. J. B. BOUILLON LA GRANGE, Professeur aux Ecoles Centrales de Paris, & au Collège de Pharmacie, &c. &c. 8vo. pp. 439.

WHILST other countries in Europe, in which medicine is the most cultivated, produce their own pharmacopœias every ten or twenty years, it is rather singular that in France a reform, confessedly so much wanted, is so tardy. The last edition of the Paris Codex was printed in 1758, and a great proportion of it, to judge by the nature of its contents, appears at least two centuries older.

The author, one of the most enlightened cultivators of pharmacy in Paris, has here attempted a plan of reform in some essential particulars, though encumbered with a heap of antiquated rubbish which he knows not how to get off his shoulders. His preface is modest, and remarkably conciliating to the practitioners in medicine, who in Paris are totally distinct from the pharmacians: "It is well known," he says, "that many prescriptions are antiquated, that new ones have been adopted, and that many which are retained are encumbered with useless substances. But who will pretend from his own authority to subtract an iota out of the articles of a compound? Has any one been yet able to apply any theory exactly suited to the action of a great number of preparations? Does any one know what is the result of the enormous mixture of substances which compose the Theriac, for example? Let us therefore respect them as long as they are retained in practice, and whilst we daily see the success with which they are attended."

However, as other nations have ventured to lay hands on these reliques of

antiquity, and have actually reformed their pharmacopœias, the author, rather than acknowledge that his countrymen are a little behind-hand in this salutary work, explains it by saying that the foreign practice must needs differ from the French, as neither the climate nor constitution of his countrymen will admit the drastics of Germany, nor the over-active remedies of the English.

The work before us, though bulky, contains in fact but a small portion of original matter, full five-sixths of it being a transcript of Beaumé, and the recipes of the Paris Codex. The most original part is (as may be supposed from the fashion of the times, and the well-known labours of M. La Grange) that which describes the pharmaceutico-chemical processes, and these are mostly very good and accurate. In fact, they are not original in this place, being taken from the most valuable (French) chemical works, and the former publications of the author. We shall, therefore, slightly run over the contents.

The first part of the volume is a pretty full materia medica, which requires no description.

The preparations themselves are next described in a useful order, taking first the simple substances, acids, alkalies, and those of the mineral kingdom; the vegetable kingdom follows, and engrosses the greater part of the work, for under *decoctions* are given all the individual prescriptions in Beaumé for ptisans and drinks of this kind; under *alcohols* are given all the tinctures, spirituous wa-

ters, &c.; and the like of the rest. The animal kingdom is described in the same way.

The last part is a catalogue of all the medicines, simple and compound, with a short character affixed to each. There is here what we should not have expected to find in a respectable book, the bill of some quack proprietor of a certain American elixir, printed at full length, which seems to rival Dr. Solomon's Balm of Gilead, or Dr. Sibly's Solar Tincture.

As a whole, M. La Grange's manual would hardly excite much interest in this country, but some of the observations on certain parts of pharmacy shew considerable skill and practice, and it is

greatly to be attributed to the multiplicity of articles, and extreme variety of preparations in the French pharmacopœia, that the apothecaries in Paris have been some of the ablest chemists that have ever adorned the science, and have reflected honour on the whole country.

Among the more uncommon but useful articles in this collection, we find a description (with a plate) of a *sparadrapier*, or machine to spread sticking-plasters; and a simple machine to roll and cut pills, which appears to have all the requisite qualifications for success, and we believe is actually used in London in some of the larger apothecaries or druggists' shops.

#### ART. LIX. *Pharmacopœia Collegii Regii Medicorum Edinburgensis.*

WHEN the eighth edition of the Edinburgh Pharmacopœia was published in 1792, it was received with the respectful attention due to the learned body who promulgated it; and as a rational, elegant, and simple code of pharmacy, it has for ten years maintained a distinguished rank over Europe.

The public will naturally enquire why, at so short an interval, it has now been thought necessary to introduce a new code, which, in its external aspect at least, differs so materially from that which is already established. A closer examination, however, will shew that the greater part of this difference is only in appearance; the real acquisitions to pharmacy have been but few during this period; and it is chiefly in nomenclature that the present edition requires our attention. However, as the "*denuo limatam auctamque*" is something more than a mere form of speech, we shall first very briefly point out the omissions and additions that strike us, and the improvements in the pharmaceutical processes.

The materia medica has undergone a further expurgation, and many articles of doubtful value or difficult to be proved, are expunged. When a pharmacopœia is considered, as it ought to be, simply as a direction to the apothecary what articles he is to keep in his shop, and how he is to compound them, a very great simplicity may be allowed of, and nothing should be admitted but what the physician may reasonably expect to meet with, not in every country village indeed, but in all towns where pharmacy is on a respectable footing. The

college seem to have acted on this principle, otherwise we might think that they were sifting too close and throwing away good grain with the chaff, when they rejected such articles as the *abrynthium*, *arum*, *asarum*, *curcuma*, *ginseng*, *oxalis acetosella*, *Rhynus-serpyllum*, and a few others of equal claims. The fate of the *lichen islandicus* is a little singular; in the edition of 1792 it was retained, in the present it is expunged; and, if it continues in fashion so long, in some future edition ten years hence, it must petition for readmittance, on the testimony of one or two entire pamphlets that have been written in its favour.

Unless we have looked over the catalogue too hastily, we find no additions to the materia medica; nor are any mentioned in the preface.

The pharmaceutical part remains nearly the same, except with some small variations in the chemical processes.

Among the sales and salina, the radical vinegar is very properly introduced, the process is that of (we believe) a M. Badolier, a French chemist, distilling the sulphate of iron with the acetite of lead: the nitrous acid is made with a greater portion of sulphuric acid, which prevents the fusion of the glass retort; the nitric acid is new, the super-carbonated potash and soda, and the hydro-sulphuret of ammonia are very important additions, the muriats of barytes and of lime less so, but certainly deserve their place.

The only addition that we can find to the metallic preparations is, the precipitated carbonate of iron: some varia-

tions occur in the preparation of one or two of the mercurials, the tartar emetic, &c. but none of any great importance.

For the sake of uniformity, we suppose, the indications of the perfect causticity of potash have been omitted; it would have been equally uniform, and a very valuable addition, if a few directions had been added to each recipe to ascertain the purity of the preparation by chemical tests.

As we do not pretend to give an accurate comparison of the old and new editions, many smaller alterations and improvements may have escaped our notice; but, on the whole, they are certainly few, and from the specimen before us, we may fairly conclude that they are real improvements.

From the great and increasing consumption of the artificial mineral waters, these valuable preparations, which are strictly pharmaceutical, and in no degree concealed by empiricism, might perhaps have deserved some notice.

Was it an oversight to omit prescribing the use of Woulfe's apparatus, in making the caustic ammonia, or is the distillation of the water from the alkaline materials the method actually employed?

The change of nomenclature, as we have before mentioned, is very extensive, for, besides smaller corrections, all the terms of the chemical preparations have been reformed from the new nomenclature, latinized, as in Dr. Pearson's tables; and all the appellations of the vegetable materia medica have received the Linnæan or approved systematic names. On the former class the following very candid and temperate observations are given in the preface. "Gravior autem labor, nos haud parum moratus est, in describendis variis præparatis & compositis quæ inter medicamenta recensentur. Hæc omnia propositum fuit iis solis nominibus definire quæ jam apud optimos hujus sæculi chemicos invaluerunt. Horum sermo novus & quasi proprius, etsi nondum omnibus suis numeris & partibus absolutus, tamen ad scientiæ usus videtur accommodatissimus, et adeo necessarius, ut non dubitemus eum, ut jam a junioribus receptus est, ita ab omnibus medicis & medicamentariis brevi receptum iri. Horum sermo in re medicamentaria olim receptus, non alius erat quam vetus chemicus: igitur, ut nobis videtur, æquum est

eum medicinâ exulare qui jam in chemiâ prorsus obsolevit."

The merits and defects of the modern chemical nomenclature have long been before the public, its value is generally acknowledged, and the elegant simplicity and facility of acquirement have deservedly rendered it the vernacular tongue of chemists in every part of Europe. The principle of including a definition in every term, has however made it, in many parts, cumbersome and verbose, and we must say, that in the present instance, examples of this defect are occasionally occurring, notwithstanding the pains which, we are told in the preface, are taken to avoid it. Was there no other way of informing the physician or apothecary how the crocus of antimony is made, than by compelling him to call it, the *oxidum antimonii cum sulphure per nitratem potassæ*: or litharge, the *oxidum plumbi semivitreum*?

We have however another, and, we think, a weightier objection to urge against the unlimited use of the present nomenclature. As long as medicines are prepared from the written prescriptions of physicians, the errors that attend various, and often hasty writings, must be taken into account; and the consequence of these errors will be, not a failure in some chemical experiment, the waste of a few ounces of acid or alkali, and a few hours or days' labour; but perhaps a violent disease produced on a fellow-creature already suffering; perhaps, even a sudden and painful death; and to the prescriber, an unmerited loss of reputation, and incalculable anxiety. Therefore it is, that the names given to powerful medicines should be as clear, precise, and distinct as possible, similar to no other, and religiously preserved to that and to no other preparation. These dangers are not imaginary; we know a valuable life nearly sacrificed to the unfortunate resemblance between *nitrum* and *natron*; we know an only child destroyed by an unhappy error of the sign for ounce instead of that for dram; we could procure well authenticated instances of calamitous accidents arising from the similarity between *tinctura opii* and *tinctura opii campharata*; *hydrargyrus muriatus*, and *hydrargyrus*; *muriatus mitis acidum vitriolicum*, and *acidum vitriolicum dilutum*, and other such unfortunate specimens of ill-judging adherence to systematic reform. Could not the same prudent caution which

prescribed an uniformity in weighing and measuring medicines, have made the written signs of those measures somewhat less liable to mistake? How could the superintending care of the college expunge the familiar term calomel, and allow it to differ only by a small particle from the equally unpractised name given to corrosive sublimate? What practitioner will not tremble to order for an infant two grains of the *sub-murias*

*hydrargyri*, when the same quantity of the *urias hydrargyri* will produce inevitable destruction in the severest agonies.

We therefore still think a reform is wanting in a few essential points; and we should hope that the system of *security* will in time come to be considered as the leading principle in an art in which the preservation of human life is so deeply interested.

ART. LX. *Researches into the Properties of Spring Water; with Medical Cautions (illustrated by Cases), against the Use of Lead in the Construction of Pumps, Water-Pipes, Cisterns, &c.* By WILLIAM LAMBE, M. D. late Fellow of St. John's College, Cambridge. 8vo. pp. 204.

THIS treatise is dedicated with peculiar propriety to Sir G. Baker, whose valuable paper on the same subject long ago directed the public attention to the baneful effects of the poison of lead, introduced slowly and insidiously into the system, by forming a part of a common daily beverage.

Dr. Lambe pursues the subject much farther, and his assertions, if well founded, would lead us to suspect almost every liquid article of diet which has been prepared by water that has ever been in contact with lead in any form. Two points therefore are to be made out, the one the existence of lead in all common waters, as generally employed; the other, a just discrimination of the symptoms which may fairly be supposed to arise from this poison. The author first considers the latter of these.

It is evident that the proof required of a very extensive use of poisoned water will be, to discover some disease equally extensive, the progress of which bears an exact ratio with the prevalence of the morbid cause. Individual cases will not suffice, nor will it be enough to alledge peculiar susceptibility of constitution, if the supposed morbid symptoms can only be very partially detected; the analogy of all other metallic poisons or medicines, points out so great an uniformity in their operation on the human body; that there is no reason to suppose it would fail in this instance. The following is a case in point.

"However minute may be the quantity of noxious matter taken up by most waters, I am persuaded, that in most cases it is enough to have a sensible influence on tender and delicate habits. As far as I can conjecture by the appearance with precipitants; there are very few waters more pure in themselves, than those of the Priory pools, which

supply the water-works of the town of Warwick; and few which are less tainted by passing through the leaden pipes. The distance from the town is not a quarter of a mile, and many of the pipes are still of wood. I cannot attribute any serious illness to the use of these waters alone; though I must confess that my attention, till within this last year and half, not having been directed to this point, many facts illustrative of the question may have escaped me. But in one family, which has now used no other than these waters for four years, three young ladies may be suspected to have received injury from them. One has, during the last two years, become much thinner, and has frequently slight pains of the bowels: all have lost their colour and the healthiness of their complexion; and one has repeatedly regained the freshness of health, by occasional absence from the town. How soon it vanishes on her return home has been already mentioned. All this would not be called disease, strictly speaking; but it would probably terminate in disease of the most serious nature, if the cause were neglected or misunderstood.

"The great minuteness of the dose is in part compensated by the very abundant use which is made of the vehicle of the poison. Besides drinking it pure, we use it hourly in our tea and coffee, in our beer and our domestic wines. It enters into our bread, and many of the preparations used at our tables. It were idle to enumerate all the ways in which we are constantly receiving it. When we employ water in our kitchens for boiling our food, a portion adheres to, and is probably absorbed by the meat, and by the vegetables, in abundance."

If the whole town of Warwick had for many years been receiving this slow poison, could the author have found only three young ladies as sufferers from its ravages?

The application of the author's hypothesis to this metropolis is still more vague.

"The metropolis of the kingdom is, I apprehend as much, if not more interested in the object of this inquiry, than any other town in Europe. The Thames and New River are the principal sources from which this great city is supplied with water. Neither of these waters are conducted through lead, except from a short distance through the small collateral branches, which convey it from the main pipes to the separate houses. In these the fluid stagnates, and I have found that small quantities of metallic matter are dissolved. There are other water-works for the convenience of particular parts of the town, but of what materials the pipes are formed I have not as yet learned.

"These pipes cannot be entirely harmless, though they convey water through such short distances. But the cisterns with which, I am told, almost every house is furnished, and also the apparatus for conveying it to separate apartments, which are very common in the better kind of houses, are what I suspect to be productive of infinitely greater mischief. These, I suppose, have been gradually extending and increasing in number, and the use of common pumps diminishing in the same proportion. Besides the scanty supply from pumps in so populous a place, and particularly in dry seasons, to keep them in repair, and renew them when decayed is attended with much expence, and with still greater trouble and inconvenience. On this account it may be expected that, where water can be procured by other means, common pumps will be gradually neglected, and fall into disuse. I ask then whether, through the whole of the last century, the use of the Thames, and particularly of the New River water, has not been increasing; and in consequence, whether there are not at present a greater number of cisterns, and fewer common pumps in the same proportion, than there were a hundred years ago?

"It appears that certain diseases have been increasing in London, through the last century, which, there is reason to think, would have diminished, if no new exciting cause had been introduced. The number of deaths classed under consumption, which in the beginning of the last century amounted annually to 3000, on an average of ten years, in the middle of the century amounted to 4000, and in the end to 5000. To obtain this average, those years were selected, in which the whole number of deaths were nearly equal. Now it must be acknowledged, that the most powerful exciting cause of this class of diseases, (for the meaning of the term must not be confined to the *phthisis pulmonalis*) in populous and profligate towns, is syphilitic disorders and their consequences. If these disorders have not been less frequent, still the treatment of them has been made much less severe than formerly, and the constitutions of great numbers are now preserved, which would have severely suffered under the harsh

method of cure that was formerly universally practised."

Dr. Lambe goes on to make the same remark with regard to dropsy, palsy, and apoplexy; and the inference which he deduces is, that since we have a better mode of curing syphilis than formerly, which is one great cause of consumption, and since drunkenness, the great cause of dropsy, is decreased among the higher classes, and yet the diseases of consumption and dropsy continue to increase on the bills of mortality, some other cause must be assigned for these disorders; and this cause may possibly be the habitual introduction of minute quantities of lead into the system.

This hypothetical reasoning is carried still further.

"There is a disease, endemial in northern countries, which the Scotch call vulgarly the *water-brash*: it is the *pyrosis succica* of Sauvages, or simple *pyrosis* of Cullen. Linnæus asserts, that one half of the inhabitants, male and female, of the Lapland mountains are afflicted with it. English physicians meet with it so seldom, that we scarcely hear its name mentioned; nor have I ever observed it, except it be in this and one other case, which I believe to be saturnine. The description given of it by Cullen so perfectly resembles the case I have just related, and the general course of the pains excited by lead, that I cannot but suspect that its origin must be sought for in the action of this poison. It is described by him as a pain at the pit of the stomach with a sense of constriction, as if the stomach were drawn towards the back, it brings on an eructation of a thin watery fluid. It is often very severe, and more usually comes on when the stomach is empty; when it has once taken place, it is ready to recur occasionally for a long time after; finally, no treatment has been found serviceable, except relieving the pain by opium. In all these points, the analogy between this and saturnine disease is striking and obvious.

"That, in the *pyrosis* the action of the poison is peculiarly determined to the stomach is perhaps owing to the qualities of the vehicle, in which it is applied. What then is this vehicle? I can conjecture no other than the spirits distilled from oats, which is called whisky, in the use of which the inhabitants of the northern countries are known greatly to indulge. This spirit, most probably, is frequently distilled through worms, of which lead is an ingredient. I apprehend, that if these impure spirits are used undiluted, the stomach will be affected with pain, which the intestines may escape.

"The Laplanders are likewise subject to colic pains of extreme severity. These they ascribe to certain worms, which are found

in the stagnant water, which they are obliged to drink in the summer months, when they quit the mountains, and inhabit the woody parts of their country. This disease terminates in a flow of saliva. It is known that lead occasionally excites a salivation like mercury. It is much more probable, that the colic is caused by the spirits used to correct the water than by these worms, or any bad quality of the water itself. The Laplanders, it is true, distil no spirits, their country hardly producing grain of any kind. But they are abundantly supplied by their neighbours, and so much attached to the use of strong liquors, that a bottle of brandy is the customary present, exacted daily from the young men by the fathers of their intended brides. The spirits that are used among this rude people, cannot be supposed to be prepared with the smallest attention to nicety."

It is not easy to find an example of hypothesis carried to a more extravagant length. An ordinary observer would suppose that the vehicles of the lead, the brandy and whisky, might have full as much share in disordering the stomach of these jovial Laplanders as the metallic poison, the very existence of which is purely hypothetical.

The following is one of the author's strongest cases; let our readers judge of its validity.

"In December, 1802, I visited Mrs. B—, the wife of a farmer, a person advanced in life. She had suffered pains of the bowels about eight years. The pain was of extreme severity, affecting the whole canal, and attacking in paroxysms. It was relieved by pressure on the abdomen. During the intervals there was always an uneasiness of the bowels. She was better after food than when the stomach was empty. There was no fever; the urine was pale, as in hysterical women.

"These paroxysms came on with such a violent tremor that three people were necessary to hold her. The attacks also left a tremor on her for some time. At my second visit I perceived a shaking of the head, which she had not when I first saw her. She had also in the beginning of the paroxysms an ejection of a watery fluid from the stomach, as in the disease called *pyrosis*.

"This disease I have no hesitation in pro-

nouncing to be purely saturnine. The only way in which I can discover the poison to be introduced is by meat salted in a leaden trough. I shall prove in the sequel, that common salt dissolves lead very abundantly. Indeed I believe that there is a pretty general suspicion of the noxious qualities of these troughs, on which account they are much less used than formerly. This is one of the cases, where common observation has anticipated scientific enquiries, or, to speak more properly, is in contradiction to the deductions which have been hitherto formed from them."

The second part of this treatise contains the proofs of the existence of lead, derived from chemical analysis. The common mode of detecting it by sulphurated hydrogen, the author finds to be insufficient for the purpose, where the quantity is very minute; and he describes some improved methods, the chief of which is to make a more concentrated solution, by previously obtaining by an alkali, all the precipitable contents of any water, redissolving this in nitric acid, and then applying the test of hydro-sulphurated water. As we have considerable confidence in Dr. Lambe's chemical knowledge, we think that this method may fully answer the purpose, and many other chemical observations are added, which will be perused with pleasure.

Though we cannot agree with the author in the general obloquy which he would throw on a valuable metal, we acknowledge with pleasure the many useful hints that he gives on the varieties of the saturnine disease, and the means of additional security which he has furnished us. As this metal has already enough to answer for in the destruction of the human species, we should be sorry to be debarred from using it for so many important and domestic purposes to our daily convenience; but if our author's accusation were well founded, we could never regard it in any other light than that of a most insidious enemy, and could not think ourselves secure till we had entirely banished it from our houses.

ART. LXI. *The Edinburgh New Dispensatory; containing I. the Elements of Pharmaceutical Chemistry; II. the Materia Medica; or, the natural, pharmaceutical, and medical History of the different Substances employed in Medicine; III. the pharmaceutical Preparations and Compositions, including complete and accurate Translations of the octavo Edition of the London Pharmacopœia, published in 1791; Dublin Pharmacopœia, published in 1794; and of the new Edition of the Edinburgh Pharmacopœia, published in 1803. Illustrated and explained in the Language, and according to the Principles of modern Chemistry. With many new and useful Tables; and several Copper Plates, ex-*

*plaining the New System of Chemical Characters, and representing the most useful pharmaceutical Apparatus.* By ANDREW DUNCAN, jun. M.D. Fellow of the Royal College of Physicians, and Royal Society of Edinburgh, and Associate of the Linnean Society of London.

The object of the present work is thus explained:

"Dr. Lewis published the first edition of his New Dispensatory in 1758. The principal part of the work was a commentary upon the London and Edinburgh Pharmacopœias, of both of which it contained a complete and accurate translation. A concise system of the theory and practice of pharmacy was prefixed as an introduction, and directions for extemporaneous prescription, with many elegant examples, and a collection of efficacious but cheap remedies for the use of the poor, were added as an appendix.

"The manner in which the whole was executed placed Dr. Lewis at the head of the reformers of chemical pharmacy; for he contributed more than any of his predecessors to improve that science, both by the judicious criticism with which he combated the erroneous opinions prevalent in his time, and by the actual and important additions he made to that branch of our knowledge. He was justly rewarded by the decided approbation of the public. During the author's lifetime many editions were published, each succeeding one being improved as the advancement of the sciences connected with pharmacy suggested improvements. After the death of Dr. Lewis, Drs. Webster, Duncan, and Rotherham, successively contributed to maintain the reputation of the work by taking advantage of the discoveries made in natural history and chemistry, and by making those alterations which new editions of the Pharmacopœia, on which it was founded, rendered necessary. From the place of their publication, and to distinguish them from the original work of Dr. Lewis, which was still reprinted in London, these improved editions were entitled the Edinburgh New Dispensatory. When the Edinburgh College some time ago determined to publish a new edition of their Pharmacopœia, the booksellers who purchased the copyright of that work, being desirous that it should be accompanied by a corresponding edition of the Edinburgh New Dispensatory, applied to the present editor to make the necessary alterations. This he readily undertook, and the number of alterations made will shew, that if he has not fulfilled what was expected from him, it has been owing to want of ability and not to want of exertion."

The purchasers of this every way valuable work will discover no want either of ability or exertion in the author; the whole is a complete well-executed system of pharmacy, excellently calculated both for practical use, and for the improvement of the learner. It ought to

be kept in a drawer of every apothecary's shop.

The chemical part of pharmacy is that which has received the greatest additions, and a short sketch of general chemistry is prefixed.

Many smaller additions are inserted, which are real improvements. One of them is a list of those articles of materia medica excluded from the British colleges, but retained in some of the pharmacopœias of the continent.

The following short specimen will shew the manner in which the most important part of the work is executed.

"DIGITALIS PURPUREA. *Folia.* (Edin.)

"*Digitalis Folium.* (Lond. Dub.)

"Foxglove. The leaves.

"Willd. g. 1155. sp. 1. *Didynamia Angiospermia.* Nat. ord. *Solanacæ.*

"This is an indigenous biennial plant, very common on hedge banks and sides of hills, in dry, gravelly, or sandy soils; and the beauty of its appearance has gained it a place in our gardens and shrubberies. The leaves are large, oblong, egg-shaped, soft, covered with hairs, and serrated. They have a bitter, very nauseous taste, with some acrimony.

"Its effects when swallowed are,

"1. To diminish the frequency of the pulse.

"2. To diminish the irritability of the system.

"3. To increase the action of the absorbents.

"4. To increase the discharge by urine.

"In excessive doses it produces vomiting, purging, dimness of sight, vertigo, delirium, hiccough, convulsions, collapse, death. For these symptoms, the best remedies are cordials and stimulants.

"Internally, digitalis has been recommended,

"1. In inflammatory diseases, from its very remarkable power of diminishing the velocity of the circulation.

"2. In active hæmorrhages, in phthisis.

"3. In some spasmodic affections, as in spasmodic asthma, palpitation, &c.

"4. In mania from effusion on the brain.

"5. In anasarca and dropsical effusions.

"6. In scrofulous tumours.

"7. In aneurism of the aorta, we have seen it alleviate the most distressing symptoms.

"Externally, it has been applied to scrofulous tumours. It may be exhibited,

"1. In substance, either by itself, or conjoined with some aromatic, or made into pills with soap or gumm ammoniac. Withering directs the leaves to be gathered after the flow-

ering stem has shot up, and about the time when the blossoms are coming forth. He rejects the leaf-stalk and middle rib of the leaves, and dries the remaining part either in sunshine or before the fire. In this state they are easily reduced to a beautiful green powder, of which we may give at first one grain twice a day, and gradually increase the dose until it act upon the kidneys, stomach, pulse, and bowels, when its use must be laid aside or suspended.

"2. In infusion. The same author directs a drachm of the dried leaves to be infused for four hours in eight ounces of boiling water, and that there be added to the strained liquor an ounce of any spirituous water for its preservation. Half an ounce or an ounce of this infusion may be given twice a day.

"3. In decoction. Darwin directs that four ounces of the fresh-leaves be boiled from two pounds of water to one, and half an ounce of the strained decoction to be taken every two hours, for four or more doses.

"4. In tincture. Put one ounce of the dried leaves, coarsely powdered, into four

ounces of diluted alcohol; let the mixture stand by the fire-side twenty-four hours, frequently shaking the bottle; and the saturated tincture, as Darwin calls it, must then be separated from the residuum by straining or decantation. Twenty drops of this tincture may be taken twice or thrice a day. The Edinburgh college use eight ounces of diluted alcohol to one of the powder, but let it digest seven days.

"5. The expressed juice and extract are not proper forms of exhibiting this very active remedy.

"When the digitalis is disposed to excite looseness, opium may be advantageously conjoined with it; and when the bowels are tardy, jalap may be given at the same time, without interfering with its diuretic effects. During its operation in this way, the patient should drink very freely."

A few outline plates of chemical apparatus are added, which are very decently executed.

**ART. LXII.** *The Veterinarian's Pocket Manual: containing brief Directions for the Prevention and Cure of Diseases in Horses; including important Observations on the Glanders; together with a Table of different Degrees of Running commonly denominated Glanders; and a Treatise on some of the most common Operations.* By M. LA FOSSE, Member of the National Institute, of the Medical Society, and principal Farrier to the Army in France. pp. 128 12mo.

THE authority of M. La Fosse, in matters relating to veterinary medicine, is considerable; but some of the opinions entertained by him, as they differ materially from those of many of the best informed practitioners in this country, must be received with caution. In shoeing, he recommends, as is the practice of the Veterinary College, that the frog should not be cut away, but be allowed to touch the ground; and adduces, as an argument for the safety of this practice, that the horses of the Low Countries and Germany, go without shoes, and suffer no inconvenience from the pressure of the frog against the ground. On the subject of glanders, the author holds some peculiar opinions. He conceives that this disease may be divided into three species, the first of which is the glanders properly so called; the second, '*nothing more than some disorder circulating in the mass of blood*;' the third, the farcy glanders.

"Glanders of the first kind is not infectious; except it be complicated with other disorders, but this is seldom the case, and we may daily witness horses thus attacked, abandoned as incurable, or with more humanity put to death. On the contrary, glanders of the second species is communicable, because

the horse, besides, running at the nose, and becoming glanderous, has likewise chancres, and these chancres appear to be the only proximate cause of contagion.

"The third species of glanders is in like manner contagious, because it not only occasions a running of the nose, but the tumefied glands, and the cartilage, of the nose are chancred, and likewise certain parts of the body are covered with lumps and chancres, which latter characterize the farcy glanders, the most dangerous disorder of the three, but not the most common. These two latter species of glanders are infectious, because the disease resides principally in the blood; but the glanders of the first species, the real glanders, the glanders properly so called, is not in any wise contagious although it most frequently occurs.

"The second and third species are incurable, but the last only is mortal. But as to glanders of the first sort, it is neither incurable nor mortal. In the first place, we repeat, this disease is not mortal in any case, and a horse attacked by it is in the same situation as a man who has lost the sense of smelling; it is the loss of a sense, and the loss of a sense prevents neither the man nor the horse from fulfilling all the animal functions; for as we daily observe men affected with ulcerated noses preserve an otherwise sound constitution, and even look jolly, so we may observe a glandered horse preserve his strength and health.

"Secondly; it is incurable only when inveterately confirmed; but when taken in an early stage, its progress may be stopped with very little trouble: by frequent bleedings, and inhalation of the steam of boiled marshmallows, hung round the neck in a bag."

A table is annexed, to point out at one view, the diagnostics of the different species of glanders; how far the author is accurate in his divisions of this disease, and in the opinions which he entertains of the nature of its different species, we do not feel ourselves qualified to determine. We should be inclined however to receive them with much hesitation, from their being at variance with the practical deductions of some of our most judicious veterinarians, who regard glanders,

properly so called, as having no remedy, but are of opinion, that farcy is capable of being cured, and that it is only a peculiar modification of the former disease affecting the skin.

The author's account of particular diseases, seems, in general, to be rather too slight. His pathology is not unexceptionable; as when he speaks of fever being often a thickening of the blood caused by indigestion; staggers a superabundance of nervous fluid producing dropsy in the anterior ventricle of the brain, &c. Two ounces of aloës, which he orders at one time as a purgative, seems to be by much too large a quantity, from half an ounce to an ounce being generally found to be sufficient.

ART. LXIII. *A Domestic Treatise on the Diseases of Horses and Dogs, so conducted, as to enable Persons to practise with Ease and Success on their own Animals, without the Assistance of a Farrier; including likewise the natural Management, as Stabling, Feeding, Exercise, &c.; together with the Outlines of a Plan for the Establishment of genuine Medicines for these Animals throughout the Kingdom. By DELABERE BLAINE, Professor of Animal Medicine; Author of the Anatomy of the Horse; a System of Veterinary Medicine; a Treatise on the Distempers in Dogs, &c. &c. 2nd Edition, pp. 204.*

IN our last volume, we had occasion to notice a very extensive work by the same author, on veterinary medicine, and subjects introductory to it. The present little treatise contains many of the practical observations contained in that work, on the management of horses, both in health and disease; but in order that the plan of cure recommended in it may not be misunderstood, the author refers to an arrangement, with the prices annexed, of ready prepared medicines, which may be had, of the best quality, and compounded with the utmost regard to chemical principles, of every medicine vender in the united kingdom. The author is at much pains to prove, that his

'medicine arrangement holds out very superior utility,' but that it is 'completely removed from any empirical attempt to dupe the public.' At the same time, however, he candidly admits 'that he does not pretend to any superior disinterestedness,' but on the contrary, having served 'for many years,' he conceives that 'he merits his reward.' We are very far from attempting to dispute the author's claim to a reward, whether from the sale of his books or his medicines, for his long and faithful services, but, at the same time, we cannot forbear remarking our surprise, that his feelings with regard to the use of the term empiricism, should still continue so acute.

ART. LXIV. *A new System of Farriery, including a systematic Arrangement of the external Structure of the Horse. Illustrated with Copper Plates, representing the exact Proportions of a Blood Horse, with a Description of all the Defects that tend to impede Velocity. Likewise Directions for ascertaining with Exactness the Age of a Horse, from his being foaled, till fourteen Years old. To which are added, the improved Mode of Treatment, and Prescriptions recommended by the Veterinary College, in every Disease of difficult Management. Interspersed with occasional References to the dangerous Practice of country Farriers, Grooms, &c. And the Method of curing the principal epidemic Diseases to which Cows, Sheep, &c. are subject. 4to. pp. 272.*

THE author informs us, that he has been above 30 years in the study and practice of his profession, and, in addition to the various opportunities of improvement which he has enjoyed during

that period, has availed himself of the veterinary establishment in this country, to become acquainted with the principles and practice inculcated in that valuable institution. The ample title-page of th

work is sufficiently descriptive of the general objects which it embraces. The details are for the most part judiciously conducted, and appear to be in general deduced from observation and experience. We are often, however, inclined to disagree with the author in matters relating to general physiology and pathology, subjects to which he does not seem to have paid great attention. Neither do his methods of cure always appear to be founded upon philosophical principles, or to be perfectly consistent with each other; but this is a remark which we make with some hesitation, knowing how frequently mere analogical reasoning (which we confess ourselves on this subject only able to employ) is apt to lead to conclusions which are not completely warranted.

On the necessity of pressure, to preserve the frog in a healthy state, and to prevent the foot from contracting, and thus producing lameness, the author is fully convinced; and by the success with which attention to this circumstance was accompanied, in the ample opportunities of observation which he has enjoyed, the system pursued in the Veterinary College, and detailed at considerable length in our last volume, has received a desirable confirmation. The author has frequently occasion to advert to the absurd and injurious practices, which are still so very generally in use among farriers, both in the management of the regimen of horses, and the treatment of their diseases. Purging is a practice which he properly represents as having done a great deal of harm, both by the frequency of its employment, and the quantity of the medicine used to produce the effect. The greatest prudence he considers as necessary in the exhibition of cathartics, which appear to him to be requisite in but very few cases. To purge a horse for the purpose of bringing down his belly, is completely unnecessary; for this he observes may either be prevented or removed by

proportion of his corn, mixed with a few split beans, must be increased in proportion to the deficiency in the other aliment; this single diet, uniformly administered, will be sufficient to reduce the bulk of too large a belly, without having recourse to that pernicious and whimsical idea, of giving three doses of physic; by which intolerable practice great numbers of good and valuable horses have lost their lives, or been rendered useless."

The employment of cathartics, with a view to purge a horse from ill humours, and to enable him to run faster, is equally deprecated by the author. The system of a race-horse should be strengthened instead of being weakened by improper physicking; for

"If the organs of digestion and chylication are continually disturbed by physicking or any other improper treatment equally dangerous, the food will be ill digested, and the chyle and nutrition imperfect: hence will result a debility and weakness of the system; profuse sweatings will take place on the least exercise, and of course, the animal will be incapable of sustaining any violent exertions in such a languid state. This defect may be also the consequence of a natural weak constitution of the horse; but in either case he must be rejected, as incapable of being a racer, or a hunter."

The authority of Mr. Coleman is adduced with his own, against the heatiness of close and heated stables, such as are too frequently in use. Their temperature should never exceed from 60° to 70° of Fahrenheit, and though cold blasts must necessarily be avoided, care must be taken to provide a free circulation of air, as being eminently conducive to the support of health and vigour.

The observations on the diseases of cattle and sheep are very short, but the author promises, in a future publication, to give a full comparative description, with the proper mode of treatment of every disease that affects domestic animals.

The plates which accompany this work are extremely well executed, and afford good illustrations, of the circumstances of formation which either tend to increase or diminish the speed of horses.

"—a proper management in his diet, such as reducing the quantity of his hay, and particularly his water, which should be administered with a very sparing hand: but the

## CHAPTER XIX.

## L A W.

ALTHOUGH the law publications of last year contain little new or interesting matter to a general reader, the lawyer's library has obtained by one, at least, of them, an important acquisition. Mr. East's *Pleas of the Crown* is a work of much consequence to the profession, not only as it is a revision of the penal law of the country, executed by a barrister of great experience and learning, but, in an especial degree, as that revision has been completed with the use of all those private collections of cases and determinations, of which it was known the judges had long availed themselves, without their being communicated to the public. Our system of penal law, notwithstanding its dreadful catalogue of statutable offences, has always been our pride, as it has been the protector and guardian of that precious liberty, which Englishmen do not boast of more in the theory of their government than they enjoy it in its administration. To have the whole system of that law, which establishes his personal security, presented to him in a shape of easy reference, and clear analytical statement, must prove grateful to every one of our countrymen; and it is much to the honour of our learned men in high stations, that they have so generously aided in its execution.

The various periodical reports of Messrs. East, Puller, and Bosanquet, Vezey, jun. Robertson, Forrest, and Espinasse, are continued as usual; and as the public have long recognized their obligations to these gentlemen, and are already sufficiently acquainted with their merits, it is not necessary to do more at present than merely to notice the continuance of these labours, which are so highly useful to the profession.

Amongst the reporters is a posthumous work of Mr. Dickens, the late senior-register of the court of chancery. The cases of which his notes are given extend through a period of many years, and were chiefly taken by himself during his long attendance in that court; but we fear their value is lessened by the very circumstance of the great delay in their publication.

A new edition of Swinburne's celebrated book upon *Last Wills* is the most important of that kind of performance, and is calculated to bring it into more general use.

In short, we may congratulate the profession to which these publications peculiarly belong, that in spite of their limited circulation and sale superior minds continue to be engaged in them, and most honourably strive to advance its utility and renown.

ART. I. *A Treatise of Testaments and last Wills, by Henry Swinburne, 9th Edition, with Annotations of the late J. J. Powell, Esq. Barrister. Prepared for the Press by JAMES WAKE, Esq. Barrister.* 8vo. 3 vols. pp. 1236.

THE very great facility which the late Mr. Powell possessed in composing treatises upon legal subjects kept his pen ever engaged, and hardly any lawyer has contributed so much to the shelves of his profession. Amongst other valuable books, that of Swinburne had, it seems, for some years been chosen by him for illustrative notes; but dying before they were ready for the press, the proprietors of the present publication purchased them of his widow, and they now make their appearance from the revision and arrangement of Mr. Wake.

The text is very judiciously printed,

in the old language of the edition of 1640, and not according to the sixth edition, in which the style had been attempted to be modernized; and the two indexes are incorporated into one. The notes are explanatory of doubtful passages, and collect subsequent decisions and authorities, where the positions of the author have undergone discussion or received alteration. They are very numerous and elaborate, and with the addition of the late statutes certainly, in a great degree, increase the value of this sterling work.

ART. II. *A Practical Treatise on Copyhold Tenure. By RICHARD BARNARD FISHER.* 8vo. pp. 423. Second Edition.

IT is nearly ten years since the first edition of this treatise was given to the public; and having been sometime out of print, the author, in bringing forward

this new edition, has corrected and considerably enlarged it. Its value is too well known, and too generally acknowledged, to need comment.

ART. III. *An Abridgment of Cases argued and determined in the Courts of Law, during the Reign of his present Majesty; with Tables of the Names of Cases and principal Matters.* By THOMAS WALTER WILLIAMS, Esq. Vol. V. 8vo. pp. 1000.

THE third volume of the work completes the abridgment of all the public acts of parliament, from the thirty-first year of the reign of his present Majesty

to the forty-second. The public is already acquainted with its object and style of execution from the two former volumes.

ART. IV. *Observations on the Rules of Descent, and on the Point of Law, whether the Brother of a Purchaser's paternal Grandmother shall be preferred in the Descent to the Brother of the paternal Great Grandmother of a Purchaser.* By W. H. ROWE, of Gray's Inn, Conveyancer. 8vo. pp. 117.

THIS is a long and laborious argument in support of the opinion of Mr. Justice Manwood, on a point of dry and remote law, in opposition to the reasoning against it of Mr. Justice Blackstone, and others who have coincided with him,

but particularly in answer to a pamphlet published upon the subject by Mr. Watkins, four years ago, entitled "An Enquiry into the Question." It is written with learning and ingenuity.

ART. V. *Reports of Cases argued and determined in the High Court of Chancery, collected by John Dickens, Esq. the late Senior Register of that Court, and revised by JOHN WYATT, Esq. Barrister at Law.* 2 vols. 8vo. pp. 875.

THIS is a posthumous work of the late venerable Mr. Dickens, who, for a very long period of time, had a seat in the Court of Chancery. He had, it seems, collected the whole of these cases, extending through almost the whole of the last century, in his own hand-writing, and left them, though without arrangement, obviously intended for publication. In this state Mr. Wyatt, who had before presented his profession with another ex-

cellent book, finding them to contain "a valuable selection, remarkable for a correct narrative of facts, a concise yet clear statement of the question, and a conspicuous report of the judgments," revised and prepared them for press. As far as we have been able to examine them, we have seen every reason to coincide in this character with the editor, to whose judgment much may be confided.—An excellent index is added,

ART. VI. *A Treatise of the Pleas of the Crown.* By EDWARD HYDE EAST, Esq. of the Inner Temple. 2 vols. 8vo. pp. 1126.

MR. EAST very modestly observes in the preface to this valuable work, that he would not have presumed to have ventured on a new arrangement and discussion of a subject already so ably and authoritatively treated of by Lord Hale and Mr. Serjeant Hawkins, had he not been possessed of additional materials. But that the lapse of ninety years since the last of those authors published his book, and the accumulation of matter, both from statutes and adjudged cases, had rendered a revision of this most interesting branch of our law so highly desirable, that he thought it would prove an acceptable offering to the members of his profession, however far the execution of it might fall short, in point of ability, of those models which they had been accustomed to contemplate.

The sense entertained by the profession of the magnitude and importance of Mr. East's undertaking, and their confidence in the care and ability of the author, were most forcibly displayed in all private collections and notes being immediately laid open to him, and in his being permitted freely to avail himself of the private labours of judges so highly distinguished as Foster, Yates and Gould, and Buller. But in addition to these valuable sources of information, he was allowed to consult the book which has been long kept for the use of the judges, and in which are entered those cases which have been reserved for their opinion, with their determinations upon them.

Thus aided, with a mind ever bent upon the subject, and enriched by the learned and liberal communications of the ablest lawyers of the time, Mr. East, after fifteen years preparation, brought forth his work; a work whose execution must be as gratifying to his friends as it is valuable to the public, and which will hand down his name to distant times with those who have most contributed by their writings to the honour of their profession.

In the course of the preface a very interesting memoir is given of the late Justice Buller, which will be read with avidity by the numerous admirers of that most extraordinary man.

A short index is given of the general heads; one of cases, and another of no less than four hundred and fifty-six statutes, which are cited and referred to in the work.

These two volumes contain the following chapters, whose respective lengths and importance we have marked by reference to the pages.

Chap. 1. Offences against religion, morality, and the church establishment, p. 1 to 36; 36 pages.

2. High treason and other incidental offences immediately against the allegiance due to the king, p. 37 to 138; 102 pages.

3. Misprision of treason, p. 139 and 140; 2 pages.

4. Offences relating to the coin and to bullion, p. 141 to 197; 57 pages.

5. Homicide, p. 198 to 375; 178 pages.

6. The respective duties of the vill, the coroner, and others, upon a homicide committed, p. 376 to 391; 16 pages.

7. Mayhem or felonious maims, p. 392 to 403; 12 pages.

8. Felonious, malicious, and unlawful assaults upon the person, with intent to kill, wound, or otherwise injure the party, or to rob him, or obstruct him in the execution of his duty, p. 404 to 427; 24 pages.

9. False imprisonment and kidnapping, p. 428 to 432; 5 pages.

10. Rape, and the wilful carnal knowledge of female children, p. 433 to 449; 17 pages.

11. Forcible or fraudulent abduction, marriage, or defilement, p. 450 to 462; 13 pages.

12. Polygamy or Bigamy, p. 463 to 472; 10 pages.

13. Offences touching clandestine and illegal marriages, p. 473 to 479; 7 pages.

14. Sodomy, p. 480; 1 page.

15. Burglary, p. 481 to 523; 43 pages.

16. Larceny and robbery, p. 524 to 791; 268 pages.

17. Piracy, p. 792 to 812; 21 pages.

18. Cheats, p. 813 to 889; 27 pages.

19. Forgery, p. 840 to 1003; 164 pages.

20. Falsely personating another, p. 1004 to 1011; 8 pages.

21. Arson, p. 1012 to 1035; 24 pages.

22. Malicious or fraudulent mischief, p. 1036 to 1103; 68 pages.

23. Threatening letters or writings, p. 1104 to 1126; 23 pages.

The aim of the author at a very comprehensive and systematic arrangement will immediately appear from this statement. That circumstance which consti-

tutes the peculiar nature and weightiest part of an offence is made the character of a genus, and includes under its general title all the species and varieties of the crime. Thus chap. 16, of larceny and robbery, extends through two hundred and sixty-eight pages of the book, and embraces every offence of which theft is the prominent feature; but it does not extend to burglary; because, though that offence include a theft, or an intention of theft, it has the more important character of a breaking into the house at night, and therefore constitutes a chapter by itself.

In this classification, chap. 16, larceny and robbery, chap. 5, homicide, chap. 19, forgery, chap. 2, high treason, are the most extensive; and as a specimen of the author's more detailed divisions of his subject, and his mode of investigating it, we will give a fuller account of the first of these.

To each chapter of the work is prefixed an analysis of its contents, executed with that care which distinguishes the whole performance. But we cannot agree with our author in the propriety of placing them at the head of each chapter, instead of collecting them at the beginning of the book. By the method he has adopted, the whole of the volumes must be turned over to find the contents; and a reader is deprived of the advantage of seeing the total division and arrangement of the subject at once, which often very greatly facilitates his discovery of the passage or learning of which he is in search.

In the chapter on larceny the author begins by stating, that the offence of feloniously taking the personal property of another is denominated either *larceny* when the fact is accomplished secretly, or by surprise, or fraud; or *robbery* when accompanied by circumstances of violence, threats, or terror, to the person despoiled. He then divides the subject into

I. Of simple larceny, its definition, and an illustration of the component parts of such definition; in the course of which are noticed the variations which have from time to time been introduced by statute.

II. Of larceny clam and secrete from the person.

III. Of robbery, properly so called.

IV. Of grand and petit larceny and robbery, with their several punishments.

V. Of principals, accessaries, and receivers.

VI. Of the trial, indictment, appeal, evidence, and verdict.

VII. Of the restitution of stolen goods.

As to the 1st head, the author examines the definition of larceny by Bracton, Lord Coke, Mr. Justice Blackstone, Eyre, &c. and gives it thus: "the wrongful or fraudulent taking and carrying away by any person of the mere personal goods of another, from any place, with a felonious intent to convert them to his (the taker's) own use, and make them his own property, without the consent of the owner."

He then pursues the investigation under this division.

1. What is a mere taking.

2. What a carrying away.

3. By what person.

4. Of what things.

5. From what place.

6. To whom belonging.

7 What is such evidence of the taking and carrying away, being wrongful or fraudulent, and with intent to convert the goods to the taker's own use, and make them his own property, without the consent of the owner, as will amount to *felony*.

These several heads again branch out into many subdivisions, and after the common law the statutes are stated in order of time. Under the last head, that of the felonious intent, the different grounds of defence are thus stated:

1. Evidence on denial of the fact.—Confession.

2. On claim of right.

3. On taking by mistake or accident.

4. On taking as a trespasser.

5. On finding.

6. On delivery by a third person.

7. Taking on delivery, by or on behalf of the owner, or by his consent or approbation.

(This falls into twelve subdivisions or qualifications in the mode of delivery.)

8. On taking through necessity.

Under the IIId head, besides the general matter and observations on the statute, Mr. East considers,

1. As to the manner in which the offence must be committed.

2. As to the situation of the party robbed.

3. The indictment and verdict.

Under the IIIId (robbery) these additional heads occur.

1. How far the value is material.

2. What shall be said to be a taking from the person.

3. What degree of violence or putting in fear is necessary.

The remaining titles are treated of with equal care and fulness, and the statute regulations are considered in order of time and subject matter. The VIth is peculiarly interesting and well executed.

The subjects of the other chapters are investigated in the same manner, so that each may be considered as a distinct complete treatise upon that head. In some, however, when the offence is different, and yet the legal doctrine applying to each is similar, as in rape and sodomy, the statement of it is not repeated, but in the latter chapter the contents of the former are referred to.

The style is clear, and the greatest care appears to have been taken to guard against equivocal expressions; though it is not to be expected that a work of such extent will be free from many small inaccuracies. In the use of his materials the author has acted judiciously; he has made copious extracts from the MSS. confided to him; his marginal notes of reference are very numerous; when cases are stated they are as much condensed

as their importance will admit of; and the arguments and opinions of the judges are only introduced in new, doubtful, and weighty points; but the material words of statutes are always stated at length. The work is well printed, upon paper very much superior indeed to what we are accustomed to see; and as an instance of consideration very seldom exercised, but certainly of great utility, not only the material words in the text, but the contents of the chapters and sections in the margin, are printed in italics, whilst the marginal references are in full roman characters.

In short, whether we consider this work in the value and extent of its additional matter over all former publications on crown law, or in the manner in which the whole has been arranged, and is now brought before the public, we cannot help congratulating the members of Mr. East's profession "on an offering which must be so acceptable to them," and our countrymen at large, on a publication which puts them in possession of so complete a body of the laws for which England will ever stand distinguished amongst nations.

ART. VII. *A Digest of the Bankrupt Laws, with a Collection of the Statutes and of the Cases argued and determined in the Courts of Law and Equity upon that Subject.* By BASIL MONTAGU, of Gray's Inn, Esq. Barrister at Law. pp. 374. 8vo.

THAT system of law which distributes the effects of a trader, no longer capable of discharging his debts, equally amongst his creditors, and not only relieves the unfortunate man himself from the pressure of existing demands, but enables him to begin the scheme of life anew, and acquire, undisturbed, the produce of a more successful labour, is the creature of commerce, and had advanced with us, since the year 1542 when it began, in proportion to the stupendous progress of our trade. By a series of no less than twelve existing statutes, and a vast body of decided cases upon them, it is supposed to have attained considerable maturity; and this author certainly puts that to the fairest test, when he attempts to investigate and exhibit the whole law of bankruptcy by a strict analysis. The two writers who had preceded him, and from whose works the profession derived great advantage, pursued very different plans. Mr. Cooke, under a loose arrangement, gave little more than a compilation of the cases. Mr. Cullen composed a very excellent treatise upon the

law. But Mr. Montagu's book is much more elaborate; besides an appendix, containing all the statutes and decided cases at length, with practical forms, he endeavours to state in the text a summary of the law with the most sententious conciseness; and where the doctrine admits of doubt, or requires explanation to support it, in the notes, by comparing and reasoning upon the cases and statutes.

The introductory chapter states that the whole work will be thus divided:

Book I. Of bankruptcy in general.

Part I. Considerations previous to issuing a commission.

Part II. Proceedings under a commission.

Part III. Invalidating a commission.

Book II. Of bankruptcy in particular cases: as of members of parliament, partners, executors, assignees, of persons who have before been bankrupts, country commissions.

The part now before us contains, Analysis.

Introductory chapter.

Book I. Of bankruptcy in general.

Part 1. Commissions previous to issuing a commission.

Introductory chapter.

Chap. i. What persons are liable to be bankrupts.

Chap. ii. The plan of dealing.

Chap. iii. The debt of the petitioning creditor.

Chap. iv. The act of bankruptcy.

The appendix gives all the statutes, with the cases at length, as far as they apply to the subject of the text. The analysis is similarly limited.

At first sight it must occur to every reader, that the plan of Mr. Montagu is too voluminous. The notes upon the text contain a full statement of the substance of the cases where there is any doubt. Can there then be any necessity to subjoin in the appendix the cases at length? All professional men have already upon their shelves, at no easy price, the cases of which the summary is given; and, it may be presumed, will consult their reports, whenever they have to form or advance an opinion on a question which may be agitated in the courts. To reprint, therefore, these cases in the appendix, appears to us not only unuseful, but highly objectionable: it very greatly increases the size and price of the work without adding at all to its value. But the author states in his pre-

face that his reasons for doing this were, 1st, To exhibit a perfect body of the bankrupt laws, together with its growth and gradual improvement; 2dly, To supersede the necessity of referring to a whole library for the scattered decisions; 3dly, To enable the reader to refer at once to the authority for the law stated in the text; 4thly, To prevent the possible mis-statement of the import of a case in the notes from being the cause of error.

We hope Mr. Montagu will reconsider these reasons before the publication of the further parts of his work. To us they are very far from carrying conviction. The public have only a right to exact from an author a faithful reference to, or statement of his authorities: in reasoning upon them he is not to be expected to be infallible; nor is he intitled to more favour for his mistakes because he obliges his readers to pay over again for the means of their correction.

For the text and subjoined notes Mr. Montagu is intitled to considerable praise. He has obviously read much, and digested his materials with great care; but from the compression of the matter in the text, and its strict analytical arrangement, it is calculated more for the memory and occasional reference than for direct reading.

ART. VIII. *A Compendium of the Laws respecting the Poor, including the Digest of Bott's Poor Laws, with the adjudged Cases and Acts of Parliament, continued to Easter Term 1803.* 8vo. pp. 321.

THE great utility and extensive sale of Bott's poor laws, as improved by Mr. Const, induced the editor to publish this enlargement of the digest which accompanies that work, by adding the parliamentary provisions and legal adjudications which have been since made.

He also proposed to himself to present by this work an epitome of those laws which should furnish to the practitioners at sessions, and to parish officers, every necessary information, without occasioning them the trouble or expence of the compilation at large. But in order to make it of the most extensive use, it still contains the references, as an index, to Mr. Const's book.

It may be regretted, however, that the editor did not thoroughly revise the work as a *digest*, and omit all obsolete and unnecessary matter; for though this might not have been required for it as an index, and would have been laborious, yet it would have conferred much greater value upon the performance, and have secured that confidence which is necessary to it when intended to be used as an original work.

In the appendix a sketch is given of one or two of those acts of parliament which have been found by particular parishes to have been so useful in the regulation of their poor.

ART. IX. *The Solicitor's Practice on the Crown Side of the Court of King's Bench: with an Appendix containing the Forms of the Proceedings, &c.* By WILLIAM HANDS, Solicitor. 8vo. pp. 524.

THE author's view in this production is to assist professional men in the

actual practice of crown law. He has, in the first place, treated in distinct chap-

ters of informations against magistrates; 2. against private persons; 3. of informations quo warranto; 4. of certioraris or sessions orders; 5. of certioraris or convictions; 6. of certioraris or indictments; 7. of outlawries; 8. of the writ of error; 9. of the writ of mandamus; 10. of the writ of attachment; 11. of the writ of habeas corpus; 12. of articles of the peace. These chapters occupy a small part of this large volume; the re-

maining part of which consists of precedents and practical forms of various kinds. This work, if it possesses that accuracy which can only be ascertained by long and frequent practical references to it, must be of very great utility to the gentlemen who practise in our criminal courts. Prefixed to it is a short account of the jurisdiction and proceedings of the court of King's Bench, and of the officers on the crown side of that court.

ART. X. *A Compendium of the Statute Laws and Regulations of the Court of Admiralty, relative to Ships of War, &c.* By THOMAS HARTWELL HORNE. 12mo. pp. 154.

THE object of this little book is to exhibit a concise view of the existing statute laws and regulations of our court of admiralty, concerning ships of war, privateers, prizes, and other matters connected with that subject. The author

rightly supposes any elaborate treatise, comprising the law of nations, to be superfluous, after the works of Lee, of Jenkinson, of Martin, and of Browne; and offers this as a compendium and manual of *British prize law*.

ART. XI. *An Essay on the Law of Patents for new Inventions: To which are prefixed, two Chapters on the general History of Monopolies, with an Appendix.* By JOHN DYER COLLIER. 8vo. pp. 316.

ALTHOUGH the writer of this treatise calls it an essay, "because it is not professedly complete," yet we are more inclined to believe that the title has been adopted from a little excess in love of the shew of learning, and an imitation of the admirable Sir William Jones. It is not only professedly complete, but is (as a law book) to a great degree redundant, and swells a very inconsiderable subject of English law into a large book. We do not deny that monopolies are a very important topic of political discussion. The consideration of their effects must indeed form a material head in every work upon the wealth of nations; but our English law upon the subject lies within a very small compass; and an investigation of it is, for a professional work, materially injured by extension. Even the essay on the law of bailments failed from this cause; and Mr. Collier must not be surprised, if he be not more favourably treated than Sir William Jones.

The author, after two interesting historical essays upon monopoly, in which are elegantly displayed a superior taste, and very extensive learning, proceeds to state the common and statute law upon the subject of patents, and the forms of the grant; he investigates its nature and duration; the authority under which, and

the condition upon which it is given; and treats of its infringement, repeal and surrender; of the preliminary considerations to obtaining it; and of the formulæ with which it is connected. In the chapters on these heads, the several determined cases and opinions of the judges are given at full length, with but a very meagre addition of other matter. The chapter on the repositories of patent records is curious and useful.

In the appendix are given notes, containing the statutes upon this subject, several ancient regulations, and a list of monopolies, by royal grant, from Henry VII. to Charles I. As an instance, generally illustrative of patent law, the author has stated the specification of Sir Richard Arkwright's patent, and all the formulæ attending its obtainment; the trial of a scire facias to repeal it; and the summing up at length of Mr. Justice Buller, on that occasion, to the jury; together with a plate, explanatory of the specification. These are followed by a very full list of patents obtained from 1st January, 1800, to 31st March, 1803; and another list of the patentees.

To the whole is added an advertisement, that persons desirous of obtaining patents may, by application to the author, be assisted in drawing up and passing their patents!

ART. XII. *The Practice of the Court of King's Bench in personal Actions: with References to Cases of Practice in the Court of Common Pleas. In Two Volumes octavo. Third Edition; corrected and enlarged. By WILLIAM TIDD, Esq.*

IN preparing this (the third) edition of the present work, some material alterations in the arrangement have been made. A new chapter has also been added in the removal of causes, from inferior courts, by writ of certiorari or habeas corpus, from such as are of record; or by writ of pone, recordare facias loquelam, or accedas ad curiam, from such as are not of record. The later decisions have also been incorporated in this edition, and more than sixty rules of court have been added; so that the work now contains a complete series of the rules of court from the beginning of the reign of James the First to the present time. Such errors as were discovered in the former edition are now rectified; and the author has not, as before, confined himself merely to the practice of the court of King's Bench, but has taken a view of the mode of commencing actions in the court of Common Pleas, and has in many instances shewn where the practice of

the two courts correspond, and where it differs. Still, however, the author has principally kept in view the jurisdiction of the court of King's Bench in personal actions; and has, in a great measure, confined his attention to the *process* of that court, and the times and manner of transacting its business. Such differences in the practice of the two courts as arise out of the cases, are particularly marked in the text, or more commonly in the notes. Several important acts of parliament, and rules of court, having been made since the present edition was sent to the press, these are noticed at the end of the work by way of addenda. Mr. Tidd has, by this edition, conferred a new favour on the profession. His work has, from its first publication, been considered as decidedly the best book on the subject; but as its matter is purely professional, the merit of it can be justly estimated only by professional men.

ART. XIII. *A Treatise on Captures in War, by RICHARD LEE, Esq. Second Edition with Notes. 8vo.*

THIS work, we are informed by the editor, is an enlarged translation of the principal part of Bynkershoek's *Questiones Juris Publici*, and has for its object the law of nations, relative to captures in war, as well of territory as of moveable property of every species. A few notes are subjoined by the editor, where the law of nations has undergone any alterations since the publication of the original work, or where the principles and doctrine were capable of additional illustration from more recent events. The whole work is contained in a small octavo volume, and is divided into chapters, arranged as follows: Chapter 1. war, what it is; 2. whether a public declaration is necessary to make a war lawful; 3. of reprisals; 4. of the nature of war between enemies, the rights which war gives over the person of the enemy, their extent and bounds; 5. when moveable goods, and particularly ships belonging to the enemy, become the property of the captors; 6. whether and where moveable things, and especially ships, may be given up to the recaptors; 7. how far the possession of unmoveables gained in war may be extended; 8. whether actions and credits of the enemy,

found amongst us when a war is begun, may be justly confiscated, and of the right to incorporeal things taken in war; 9. whether we may go to or pursue an enemy into the port or territory of a friend; 10. of the state of war as to neutrals; 11. of those things which may not be carried to the enemy of our friends; 12. whether it is lawful to carry any thing to cities and ports, &c. when besieged; 13. whether lawful goods are forfeited by means of unlawful uses; 14. of the goods of friends found in the ships of enemies; 15. of the goods of enemies found in the ships of friends; 16. of the right of postliminium, and whether things taken from the enemy, and brought into the territory of a friend, return to their postliminium; 17. of private captures, and how far the employers of privateers, or the state whence they came, are bound for any injury done by the persons employed therein; discussion of the question, if a ship, not having a commission as a privateer, takes booty, to whom it belongs; 18. of the method of trying prizes taken in war, appeals and costs; 19. whether it is lawful to insure the property of the enemy, or to enlist soldiers in the country of a friend; 20. right of

insures after ransom, contributions towards losses, loan on conquered land, hostages.

The first impression of the English edition of this work, appeared in 1759, and having since become very scarce, this second edition is now offered to the public. With the merits of the original work the world is already well acquainted, and the additions made to the present edition encrease its value. From this performance much information is to be acquired, and at the same time much

amusement, as it is free from those numerous quotations and references with which books on such subjects generally abound. The extreme uncertainty and difference of opinion which exist on this, as well as other branches of the law of nations, is much to be lamented; but perhaps this evil is inseparable from the very nature of things, and must, with some fluctuation of times and circumstances, be perpetuated by the want of an independent tribunal to which the disputes between nations can be referred.

#### ART. XIV. COLQUHOUN'S *Duties of a Constable.*

THE object of this work is to instruct fully in the various subjects of their duty every different description of constable known to the law of England; and the author expresses also a further hope that the acting magistrate may find it an useful compendium, with respect to several of those minor offences which require frequent appeals to his judgment

and decision in a summary way. A synopsis, or general view, is also given of the penalties applicable to those minor offences, cognizable by justices, which most frequently occur. Mr. Colquhoun enters very fully into the different topics of which he treats; and his industry in preparing a work of this useful nature merits praise.

#### ART. XV. *A General View of the Decisions of Lord Mansfield in Civil Causes.* By WILLIAM DAVID EVANS, Esq. *In Two Volumes quarto.* pp. 872.

The intention of the author of this publication is (as its title page announces) to bring into our view the various decisions and dicta of Lord Mansfield, on that infinite variety of legal questions to which his attention was called, during the very long time he presided in the court of King's Bench. The arrangement adopted by the author for this purpose is, with little variation, that of Blackstone's Commentaries. To a work like the present, it would undoubtedly have been matter of considerable difficulty to have given any very systematic arrangement, the infinite variety of detached matter opposing itself strongly to such an arrangement; but in adopting the plan of a work, framed for the purpose of exhibiting the outline of the whole body of our laws, we think the

author has yielded too implicitly to the difficulty which, we admit, the very nature of his subject imposed upon him. The opinions of Lord Mansfield are also too much quoted at length, as they are found, in the various reporters and observations of his lordship, of little importance, and which are obvious to the commonest minds, are mentioned and dwelt upon in a degree which they do not merit. With these defects, the work (which is extended to two large quarto volumes) can hardly be considered in any other light, than as a dictionary of the judgments and remarks of Lord Mansfield. Those, however, whom the frequent recourse to quotation, and the vast variety of minute unconnected matter, do not deter, may derive much amusement and information from the perusal.

#### ART. XVI. WILLIAMS'S *Abridgment of Cases.*

THIS work consists of a variety of determinations, on topics for the most part frequently occurring in practice, as replevin, usury, veneer and vendee, wager, wills, &c. These different heads follow each other in alphabetical order, and the cases under each head are arranged according to the matter contained in each. A full table of the principal subjects is also added, so that there is no

difficulty in acquiring the information contained in this volume. A very considerable number of cases are collected under each head; but the author has not, we think, so much abridged them, as to make it worth while for any professional man to repurchase what he must already have in his library, and the work is chiefly calculated for professional men.

ART. XVII. *A Compendious Law Dictionary, containing both an Explanation of the Terms and the Law itself.* By THOMAS POTTS, Gent. 12mo. pp. 620.

THE author's view in this work was to produce, in a small compass, a work which would not only be useful to professors of the legal science, but to mercantile men in general, by affording a ready explanation of the terms of law, and at the same stating in a very general way some of the leading points of law relative to each particular head respectively. Greater attention has been bestowed on those parts of the work which

relate to bankruptcy, insurance, and other branches of commercial law, it having been particularly the wish of the author to adapt the performance to the use of merchants. The whole is compressed into one octavo volume, containing above 600 pages of close print. The work appears to us to merit praise, but its accuracy can only be judged of by a frequent and habitual use of it.

ART. XVIII. *The Law of Copyright; being a Compendium of Acts of Parliament and adjudged Cases, relative to Authors, Publishers, Printers, Artists, Musical Composers, Print-Sellers, &c.* By JOSHUA MONTEFIORE. 8vo. pp. 59.

THIS small volume containing only 59 octavo pages, treats of the law relative to the rights of literary men and artists in the productions of their genius. The work commences with abstracts of the acts of parliament, as they respectively relate to authors, artists, printers, and publishers generally, and afterwards gives the judicial decisions under the several heads of distributive arrangement, to which they respectively belong. The law of copyright is not confined merely

to what is called literary property, in the common and more confined sense of the term, but extends equally to paintings, engravings, busts, models, maps, prints, musical compositions, and other similar productions. This little treatise is more fitted for those who are particularly interested in the rights and privileges of literary productions, than for the professional lawyer, but even to the latter it is not without its use.

ART. XIX. *The Trial of John Peltier, Esq. for a Libel against Napoleon Buonaparté, 21st February, 1803, taken in Short-Hand by Mr. ADAMS; and the Defence revised by Mr. MACKINTOSH.* 8vo.

NO trial has for many years so much attracted the public attention as that of Peltier, for libelling the First Consul of France. It was well known that the prosecution had been commenced at the instigation of the French government, and the stupendous events which had led the way to the publication complained of, and the elevation of the real plaintiff, gave to the expected eloquence of Mr. Mackintosh an interest almost beyond precedent.

The public was not disappointed; rarely has there been exhibited such powers of oratory, never was there a higher instance of the purity of law. Every auditor retired with emotions of delight from the eloquence of Mr. Mackintosh, only to be exceeded by those of his exultation and confidence, that he lived under a government, where equal justice was dealt to all, regardless of the condition of the persons, careful only of the right.

As a law publication, however, this work cannot with propriety occupy much space in our Review. The question of law was clear and unquestionable: the counsel for the defendant did

not doubt it, but endeavoured to shew that the writings complained of were general satire, and history, natural to persons situated like the defendant to compose, and not overstrained in the facts. Such a gloss could not succeed with a British jury, though supported by (in the words of the attorney general and the chief justice) almost unparalleled eloquence. In the excellent summing up of Lord Ellenborough, he stated the general sentiment of English lawyers, "That a publication defaming the persons and characters of magistrates and others in high and eminent situations of power and dignity in other countries, and expressed in such terms and in such a manner as to interrupt the amity and friendship between the two countries, is a libel."

The principal part of the book is upon subjects purely political, and connected with the person and character of Buonaparte; and which, for the most part, in different shapes, have often before been published. Mr. Peltier closes the trial with a second defence of himself in an address to the public upon the peculiar hardships of his situation.

ART. XX. *Select Criminal Trials at Justice Hall, in the Old Bailey; with the Opinion of the Twelve Judges on several interesting Points occurring in the Course of them; and Reserved for their Decision.* Vol. I. pp. 560.

THE object proposed by the editor of this work is to combine amusement with useful information. The trials are, we think, well selected, and include such as have excited most public attention, as those of Hackman, Dr. Dodd, Barrington, &c. Short accounts are also frequently added of the general deportment and behaviour of the persons during their trials, and after their conviction. The editor promises another vo-

lume in case the present should meet with a favourable reception; which we think it merits, as the accounts given are pretty full, and we believe faithful. Facts, such as are here presented to the mind, afford ample matter for reflection, and the mode in which hitherto works of this nature have been executed, makes it desirable that the present should be continued.

## CHAPTER XX.

## MATHEMATICS AND NATURAL PHILOSOPHY.

THE present year does not afford us a great number of works in the mathematical department, but it is distinguished by the names of men of great celebrity in science, and of one who is generally known by his fortunes in the political world. Carnot, the ex-director of France, was known as a mathematician, by his small work on Fluxions; his reputation will be increased by his Geometry of Position, in which he has laboured with great assiduity to reconcile together algebra and geometry, and correcting some erroneous opinions which had been long maintained by very eminent mathematicians. This may be considered as the most important publication that we have to announce. The reputation of Baron Maseres, not only as an author, but as a patron of science, is firmly established, and whilst he is continuing with such ardour and industry his great work on Logarithms, he can find time for tracts, in which the very important question of the generation of equations is discussed with great precision, and the question is placed on its true footing. The Baron is one of the few persons who has studied Vieta with attention, and is qualified to appreciate justly the merits of the founder, we might say, of true algebra. Dr. Small, of Edinburgh, in a work of no great bulk, has displayed indefatigable industry. Such calculations could not have been examined without equal talents and labour. We have introduced Montucla into this volume, because from accident he could not appear in the last. His history forms an important æra in mathematical science, but it contains much too great a variety of topics, and its general merits were previously too well established for us to enter into a minute detail of every particular. The author, however, could not be passed over without some account of a life occupied in science, but which, from the melancholy events of the late years, was too much embarrassed in matters foreign from study, to permit him to give his work that perfection at which he aimed. Lalande, in succeeding to him, performed the office of friendship, but was evidently overwhelmed by his many numerous engagements. The French are at present attached more to these studies than the English: in the midst of their preparations for war they seem to be duly sensible of their merits; and from their numbers we may expect either many new discoveries, or great improvements, in the mode of communicating instruction.

ART. I. *Histoire des Mathématiques. History of Mathematics; in which are described their Origin and Progress to the present Day; the principal Discoveries made in every Part of the Mathematics; the Disputes that have been raised among Mathematicians; and the principal Actions of those who have been most famous.* Second Edition. By J. F. MONTUCLA, of the National Institution of France. 3 vols. 4to.

THE former work of this celebrated world, and every one must regret that writer is well known in the mathematical he did not live to finish this work, and

that his studies should have been interrupted by the horrors of the French revolution. Montucla was born at Lyons the fifth of September 1725. His father was a merchant, who gave him an excellent education, and after studying at the Jesuits college in his native town, and pursuing the law at Thoulouse, he came to Paris and formed a connection with the most celebrated mathematicians of his times. The "*Recreations of Ozanam*" seem to have been the first work that he gave to the press; but he kept his secret so well, that it was sent to him as the reviewer of mathematical publications. About this time he was employed in the *Gazette de France*, and in 1756 he translated from the English every thing relative to inoculation for the small-pox, which was then introduced into France under the auspices of the court. The "*History of the Mathematics*" appeared first in 1758, in two volumes quarto, and was received with the approbation which such an effort at such a time deserved. He had announced his intentions of giving a third volume to the public; but the immediate execution of his plan was frustrated by an appointment as secretary to the administration at Grenoble, to which place he retired in 1761, and there, in 1763, formed a matrimonial connection. In 1764 he was removed from this place to Cayenne, where he acted as first secretary in the formation of the colony, and was also honoured with the title of king's astronomer. On his return to Grenoble, after an absence of fifteen months, he soon gained another appointment, and became first clerk in the office of Public Buildings, or, as we may term it, the Board of Works, in which office he continued twenty-five years, employing his leisure hours in his favourite pursuits. In this time the only work published by him was a translation of "*Carver's Travels*," which he produced in 1783; when he was urged by Lalande to give a new edition of his *History of the Mathematics*, with the assurance of indemnification from loss by the bookseller.

A long time elapsed before this edition appeared, and the eventful years of the revolution account easily for the delay; but at last, on the seventh of August 1799, the two first volumes were published. The printing of the third volume was begun; but death interrupted its progress at the 336th page of the third volume, on the 19th of December 1779.

From this place Lalande undertook the completion of the work, in which it will not be difficult to discover what proceeded from his own pen, and what from the original author.

The revolution naturally produced a change in the circumstances of Montucla; but the new government was not totally insensible to his merits. He was a member of the national institution at its origin; in 1791 he was placed on the list of pensions; and in 1795 was employed in the analysis of foreign treaties. The state of his health did not permit him to accept the place of professor in the central schools; but the department fixed him in the central jury of instruction. For two years the subsistence of himself and family was derived from a lottery-office, and for four months only he enjoyed the benefits of a pension of about a hundred and twenty pounds a-year, granted to him on the death of *Saussure*. But, if in this respect he shared the usual fortune of men of his talents, the sight of those who acquired property without efforts did not create envy; and his modesty and generosity in such moderate circumstances rendered him a truly admirable character. His first introducer to the office at Grenoble was *M. Baudouin de Guentadouc*, who was overwhelmed in the calamities of the revolution, and banished; but Montucla did not forget his benefactor in distress, and displayed that courage in his defence and support which entitled him to universal praise.

A work that is swelled out from two to four volumes large quarto, must contain much new, and probably great improvement in the old matter. This will be evident to any one who compares together the two works; yet we may say that the field is still open to future exertions, and the present work may be considered as a good guide to, rather than the completion of history. We do not speak this in disparagement of the author, who is entitled to great praise; but the very circumstance of its being completed by another person naturally renders the whole less perfect than it might otherwise have been. Throughout the work a spirit of nationality prevails; but if a jealousy of our nation is predominant, the more honourable are the testimonies which the author is compelled to render to some of our writers. Much may also be pardoned to him who dared, in bad times, to apologize for the unfortunate; and his indignation at the injustice done

to the monks, and proofs of the obligations we are under to the religious orders, ought not to be passed over in silence.

"I wish not," he says, "to shock the present manner of thinking on this subject, nor to undertake the defence of monkery. There were, it must be allowed, abuses in the monasteries; but what human institution, even those of philosophical or literary societies, is always freed from them? Abuses are like the ivy, which will at last cover old buildings, or diseases which destroy the human body. I allow it to be right and necessary to reduce these institutions extremely, and to allow in them only an easy and honourable subsistence, and by public authority the chains of the unhappy victims of ignorance, of youth, of family ambition, might have been broken. But was it necessary to drive back into the world, with a pitiful pension, cut to pieces a thousand ways, and oftentimes refused, a crowd of old men who, on entering into the world, must be a prey to misery or death? A few years would have put an end to their convents, and the reservation of twenty or thirty houses, as asylums for them, in such an immense territory, could not have been an object for envy or finance in a great and powerful nation, priding itself on generosity and humanity."

The history of algebra is extremely well given, and due respect is paid to the memory of Vieta; yet with all the wish to detract from the merits of Harriot, and to shew the errors in the account given by Wallis, the author does not seem to have been conscious himself of all the worth of his countryman. Vieta discovered the fundamental property of equations, or the nature of the co-efficients: he did not carry it to the whole extent of the proposition; but, on the other hand, he did not divert into any error. The property discovered by Vieta, and demonstrated by him in the case of certain equations, was said to be made general by Harriot; but in this generalization a strict regard was not paid to truth, nor to the rigour of mathematical demonstration. Vieta could not have made the discovery of Harriot, because he could not have allowed of the expression of negative, or false, or impossible roots; nor could he possibly have seen or allowed that such a root could enter into an equation. Where an equation really does admit of more roots than one, he shews the order of the co-efficients as far as he has considered the equations; and if his successors had followed him in the same track, they would, like him, have delivered only truth, and not have

led their disciples into inextricable labyrinths. We are willing therefore to allow to Vieta much more than his countryman has done, for science is of no country; and of all men in the world scientific men have little reason to boast of country, as their history is a proof of the little value set upon their labours when living, whatever boasts they may afford to those who scarcely will or can read their works when dead; and we allow also to Vieta the praise of leading the way by his pyramidal numbers to the famous binomial theorem, generally though improperly, and even by Montucla ascribed to Sir Isaac Newton.

We may observe that in the history of algebra, as well as every part of the work, this edition is much improved by the increased number of writers quoted on every subject, and we might add, that this is a very considerable part of the merit of the work; and we should have been under greater obligations to the successor of Montucla, if by a copious index he had rendered the access to every fact, discovery, and writer easier than it is at present. The book will be possessed by every mathematician of eminence, and must be considered by him chiefly as a book of reference; every thing therefore should have been calculated to increase the utility of the publication.

The interesting history of fluxions, from their disputed origin to the great improvements made in that part of science, is detailed with great accuracy and perspicuity; but we regretted that the works of La Grange, La Croix, and Arbogaste, could not have been sufficiently examined by this industrious writer. The present is an interesting period for the doctrine of fluxions: the French writers are taking bold steps; but, in general, in adopting new methods, and aiming at generalising their ideas, they run into a degree of obscurity which is not easily penetrated by those who are fond of the ancient mathematical precision. The important question on assurances, in which so much has been done in this country, is not noticed with the attention it merits. The works of Price, and Morgan, and Maseres, are indeed mentioned, but the extent of their discoveries is not properly laid before the reader.

In optics the former work is much improved; but it is evident that the completion of this part lay with the editor of the two last volumes. Newton and Herschel here meet with deserved praise;

and the question of achromatic glasses, in which so much credit is due to Mr. Dollond, and on which! so much labour was bestowed by the foreign mathematicians, is stated and examined in the writer's best manner. Marat, the detested author of so much cruelty in the French revolution, finds a place in this part of the work, and his pretended discoveries are treated with the contempt they deserve.

In astronomy we expected much from the reputation of the writer, for the greater part of this subject fell to the lot of the astronomer of France; but whether it is that the work not having been begun by himself would not add to his

reputation, or that he had not time to give it sufficient attention, we felt in this part of the work considerable disappointment. In the account of mechanics of modern date there are still greater marks of carelessness, and at times of partiality. But these remarks must be taken with great allowance to the merits and general assiduity of the writers. The work is a very important one, will add greatly to the improvement of mathematics and philosophy, and affords a fund of amusement and instruction not to be procured elsewhere, without great labour and expence, by the mathematician.

ART. II. *Geometrie de Position. Par L. N. M. CARNOT, de l'Institut National de France, de l'Academie des Sciences, Arts, et Belles Lettres de Dijon, &c. 4to.*

NEARLY half a century has elapsed since Baron Maseres published his use of the negative sign, or that mark in algebra which denotes the operation of subtraction. The work was acknowledged to have great merit, and the arguments in it were never answered; but still, such is the force of custom, very eminent mathematicians could not break themselves of their old habits, and they continued to use the sign of subtraction without a preceding number, from which that to which the sign was annexed was to be subtracted. Hence a number was said to be less than nothing, other numbers were called impossible, and these ideal beings became the objects of demonstration. The difficulties thus introduced into science gave such a mysterious appearance to algebra, that few would study it; and it is conceived at the present moment to require transcendent abilities and application to make any progress in it. The fact, however, is quite otherwise. It is the easiest and clearest of the sciences, and the whole difficulty in the use of the signs may be overcome with much less pains than are required to learn the common multiplication table.

The French and English nations have contended with each other on the honour of first introducing obscurity into the science; but it seems probable that the contention will soon be at an end, for in both nations men are springing up who seem determined to restore algebra to that purity with which it was taught originally by Vieta. In England, a few years ago, Mr. Friend published his "Principles of Algebra," in which he excludes entirely the notion of either a number

less than nothing, or an imaginary, or an impossible number; and he asserts, that whenever such an appearance takes place, "the error is either in the person who proposed, or in him who attempted to solve the proposed equation." This work was followed by an appendix by Baron Maseres, who overthrew entirely a supposed demonstration given by Clairaut of the existence of negative numbers, and the possibility of their producing by multiplication a positive number, and shewed that it was in the very outset founded on error.

Carnot, the author of the work before us, does not profess to be acquainted with the works of either of the writers we have mentioned; but he sees in the same point of view the confusion that has arisen in science by the introduction of a fiction. Instead of rejecting it however entirely, as they have done, he wishes to make a kind of compromise, and declaring it to be absurd, he would leave it in possession of the rights and privileges with which from the time of Descartes it has been indulged. Perhaps he thinks this an easier way of overthrowing the system in his country, for he accumulates instances of the false consequences that arise in reasoning upon the present plan, and concludes that they must have their effect at last in opening people's eyes, and restoring science to its ancient footing.

Among the instances which he adduces of the absurdity of considering negative numbers as capable of any of the processes of arithmetic, he introduces the following: First, from the laws laid down by Euclid in the fifth book of Euclid, since it is supposed that

$$1 : -1 :: -1 : 1$$

and  $-1$  being less than nothing,  $1$  is evidently greater than  $-1$ ; therefore in the proportion the first term is greater than the second, but the third is not greater than the fourth. The proportion then is evidently false,  $-1 \times -1$  cannot be equal to  $+1$ . Again,  $-3$  is less than  $2$ ; therefore  $-3^2$  is less than  $2^2$ . But  $-3^2$ , according to the prevailing doctrine, is equal to  $9$ , and  $9$  is greater than  $4$ . Therefore the square of  $-3$  is greater than the square of  $2$ , which is absurd; and, as the author says, "*Cette theorie est donc completement fausse.*" This theory is absolutely false. In the application to geometry the same is evident; for taking a point in the diameter of a circle produced, and drawing a line from that point through the circle, we have two values according to the supposed doctrine of negative quantities; for the distances between the point of the convex and concave parts of the circle derived from the equation  $x^2 + cx = ab$ , and these two values are, the one  $x = \sqrt{\frac{1}{4}c^2 + ab} - \frac{1}{2}c$ ; the other  $x = -\sqrt{\frac{1}{4}c^2 + ab} - \frac{1}{2}c$ . The first is evidently true, but the latter being a negative value cannot be taken in the same direction, and consequently cannot here have an existence. In the same manner it will follow, from an algebraical expression, for the radius of the circle, and allowing the usual doctrine of negative quantities, that the radius of a circle may be both negative and positive.

From the above and similar instances the author concludes, that

"Every negative quantity standing by itself is a mere creature of the mind, and that those which are met with in calculations are only mere algebraical forms, incapable of representing any thing real and effective. 2. That each of these algebraical forms being taken, with a proper consideration of its sign, is nothing else but the difference of two other absolute quantities, of which the greatest in the case on which the reasoning depends, is the least in the case in which the result of the calculation is to be applied.

"To say of a quantity that it becomes negative, is to employ an improper expression, and one leading, as has been seen above, into error; and the true meaning of the expression is, that this absolute quantity does not belong to the system on which the reasonings have been established, but to another with which it is related; so that to apply the forms applicable to it for this first system, the sign  $+$  must be changed into the sign  $-$  in the resulting form.

The idea of a negative quantity being thus overthrown, what is to be done in future?

"Nothing is to be changed," says the author, in the usual processes. "we have only to substitute a clear and true idea in the room of one faulty and useless; and this is the object of this work. I think that I have accomplished it by substituting for the notion of positive and negative quantities, which I have opposed, that of quantities which I call direct and inverse; and the geometry of position is that where the notion of positive and negative quantities standing by themselves is supplied by that of quantities direct and inverse."

The mathematical reader will at once perceive the embarrassment in which the author was placed. He had reprobated the doctrine of negative quantities; but he could not fail of perceiving how often he was liable to run into them in the application of algebra to geometry. Here he conceived that the usual processes might be retained; whereas if the notion itself, as he has evidently proved, of negative quantities is "faulty and useless" in the science of algebra itself, it ought by no means to be permitted to stand one moment in its application to another science. The fact is, algebra knows nothing of position; that is peculiar to geometry; and when from the consideration of lines an equation is formed in algebra, the rules of algebra alone can be used in the solution of it; and the geometrician must previously tell what quantities he chooses to be greater or less than others, before the algebraist can give an answer to the question.

An instance occurs which the writer might have made clear to his purpose; but by not having rejected entirely in practice, though he has in his mind, the old theory, he runs into the same absurdities with common writers, and is then obliged to enter into an explanation. Suppose a problem to have brought us to this equation  $x^2 - 2ax + a^2 = b$ . Then, says the author, I deduce that  $x - a = +\sqrt{b}$ ; and of course he is obliged to shew us how the "unintelligible" phrase  $-\sqrt{b}$  is to be applied to any purpose. Whereas the algebraist who has never been shackled by negative numbers, would, on the equation being proposed, deduce all the conclusions in the simplest and easiest manner. He would first observe that  $a^2$  must be either greater than, equal to, or less than  $b$ . In the first case the equation becomes

$$2ax - x^2 = a^2 - b,$$

and subtracting both sides from  $a^2$ ,

$$a^2 - 2ax + x^2 = b.$$

Then taking the roots of both sides, (since the root on one side may be either

$$a - x, \text{ or } x - a,)$$

$$a - x = \sqrt{b}$$

$$\text{or } x - a = \sqrt{b};$$

That is,  $x = a - \sqrt{b}$ , or  $x = a + \sqrt{b}$ .

If  $a^2$  is equal to  $b$ , then

$$x^2 = 2ax;$$

and consequently  $x = 2a$ .

If  $a^2$  is less than  $b$ ,

$$\text{then } x^2 - 2ax = b - a^2;$$

$$\text{therefore } x = a + \sqrt{b - a^2}.$$

Thus the various values of  $x$  are ascertained without any interference of negative quantities: the reasoning is clear and just, and the geometrician takes the solution which suits the conditions of his case.

Our author not having seen these evident truths, is obliged, after a long deduction, to lay down these tedious conclusions.

"In order that the solution of a problem given by a particular root of an equation should be effective, the conditions proposed, the suppositions on which the reasoning is established, and the constructions or operations indicated by the root of this equation, should all be consistent with each other.

"That if there exists any incompatibility between the one and the other, this root can be considered only as the simple indication of another question analogous to the former; and to have its true meaning, we must renew the calculation upon other conditions or other suppositions, till consistency is established between them, or with the operation which the root modified on these changes would indicate.

"That consequently negative and imaginary roots are never true solutions of the proposed question, but simple indications of questions differing more or less from the former; that often they are only algebraical forms of no signification, which algebraical transformations have amalgamated with the real roots.

"That real and positive roots do not any more than negative or imaginary roots express actual solutions, and are only, like them, simple indications of analogous questions, when the constructions or operations to which they conduct us are not entirely consistent with the conditions proposed, and the suppositions on which the reasoning was established.

"That any equation, or root of an equation, cannot give an actual solution whilst it contains absurd quantities or operations incapable of execution, unless they destroy each other respectively, as in the case of real roots of the third degree.

"That however these unintelligible forms ought not to be neglected, and that they may be employed like real forms, because they may be made to disappear by simple algebraical transformations; and there will then remain only explicit forms immediately applicable to the object proposed, provided, as it has been before observed, that these forms, conditions proposed, and suppositions on which the reasoning is grounded, are all consistent with each other."

We have now then to apply our author's notions to the geometrical position. An equation conducted in the common mode leads him to certain false conclusions, from which he discovers some new relations of the proposed unknown quantity to some new conditions. This may be obviated by his direct and inverse quantities, by which from quantities given in a certain position he will discover the relation of each to the other in another position. Thus to take an easy instance, for the want of figures and of room will not permit us to introduce the more complicated, we will suppose the value of the square of the side of a triangle, required in terms of the squares of the other two sides. In this case, supposing the square of the side required to be opposite to the obtuse angle, and its value discovered upon that supposition; then to make it answer for the case of an acute angle, to which it is opposite, we must invert certain quantities. Instances are given, and very ingenious ones, of this inversion in a variety of cases. The study of them will be found very useful to the higher mathematician, and particularly to those entangled with the doctrine of negative quantities; but we must retain our doubts whether every question would not be more easily solved by the algebraical formula once established, being accommodated to every supposition, as in the case we have adduced, and then leaving the geometrician to adapt his cases to the solutions afforded him.

The work cannot fail of creating considerable interest in France, and among mathematicians in general throughout Europe. It will tend assuredly to the overthrow of the modern use of negative quantities; and it is very probable that after a little time foreigners will acquiesce in the opinion which has now made some progress in this country, that negative quantities are injurious to science, and that every useful deduction may be produced without their assistance.

ART. III. *Tracts on the Resolution of Cubic and Biquadratic Equations.* By FRANCIS MASERES, Esq. F. R. S. Cursitor Baron of the Exchequer.

THIS volume consists of six tracts, besides a preface of sixty pages explanatory of their contents. The first and fourth tracts are supplements to the appendix to Mr. Frend's "Principles of Algebra," containing farther remarks on cubic equations and Cardan's rule. The second is a very valuable comparison made between the methods of Ferrari and Descartes for resolving certain biquadratic equations, and as a preference is with reason given to the former of these methods, the tract is not unaptly stiled "Ferrarius redivivus." The third tract obviates some difficulties, and the application of Ferrari's method to the resolution of four forms of biquadratic equations. The fifth contains remarks on the doctrine of the generation of algebraic equations; and the last, a comparison between the resolution of the biquadratic  $rx - qx^2 + px^3 - x^4 = s$ , by the method of Dr. Waring and that of Ferrari.

All these tracts are written with the accuracy, diligence, and skill for which the author has long been distinguished. He maintains his opinion on the injury done to science by the introduction of negative quantities with firmness and dignity; and if any thing could produce a restoration of the ancient doctrine, it would be, one would think, the example of perhaps the oldest writer on algebra in Europe, who has, without the least necessity of applying to quantities less than nothing, investigated the most difficult problems in analytics.

"It is," he says, "owing to the doctrine of the generation of equations one from another by multiplication, and to that of negative quantities, or quantities less than nothing, that algebra has sunk from the dignity of a science or object of the understanding and reasoning faculty, to the condition of an art or knack of managing quantities by the eye and the hand, with little or no interference of the understanding."

This technical process is supposed to be the excellence of the modern art; for, according to Montucla, they relieve us from the trouble of thinking.

We cannot enter into the investigation of each several tract, though all may be studied with advantage by the algebraist. But the remarks on the doctrine of the generation of equations are too important to be cursorily passed by. It is well known that Harriot was the first inven-

tor of this system, and that it was adopted by Des Cartes; but it is not generally known, that without the supposition of negative quantities, Vieta had discovered and demonstrated the most important properties of equations, which are supposed to have been first pointed out by the new method. In the new method  $x$  is supposed to be equal successively to the roots  $a, b, c, d$ , &c. of an equation; and upon this supposition the following equations are formed, namely,  $x - a = 0$ ,  $x - b = 0$ ,  $x - c = 0$ , &c. and these equations, multiplied together, produce, by certain changes of signs, any equation that can be proposed. But if  $x$  is equal to  $a$ , it cannot be equal to  $b, c, d$ , consequently the whole system falls to the ground. This is as evident as any proposition in Euclid. A mathematician must not take a second step till the first has been fairly established. But the conclusion drawn is true, and this the Baron proves, for without making  $x - a = 0$ ,  $x - b = 0$ , and multiplying two nothings together, which is impossible, and an insuperable objection to the system, he shews how the equation may be produced in a simple easy manner, upon true principles. We will shew it in the case of a quadratic equation.

Let  $x$  be equal to  $a$ , and less than  $b$ . Therefore two equations may be formed and multiplied together, namely,

$$\begin{aligned} x &= a, \\ b - x &= b - x \\ \therefore bx - x^2 &= ab - ax \\ \therefore bx + ax - x^2 &= ab, \\ \text{or } x \times b + a - x^2 &= ab, \end{aligned}$$

Now let  $x$  be made equal to  $b$ , and consequently be greater than  $a$ . Therefore two equations may again be formed in the same manner, namely,

$$\begin{aligned} x &= b, \\ x - a &= x - a, \\ \therefore x^2 - ax &= bx - ab, \\ \therefore bx + ax - x^2 &= ab, \\ \text{or } x \times b + a - x^2 &= ab. \end{aligned}$$

If for  $b + a$  we substitute  $p$ , and for  $ab$  the term  $q$ , then  $px - x^2 = q$ ; a general form for equations of the second order, in which  $p$  must represent the sum of the roots, and  $q$  their products. In the same manner, if it were necessary, other equations might be produced by multiplication. But the plan does not seem to be of any use, as the properties of equations

may be deduced in a simple manner, by analysing an equation of a higher form, and bringing it down to its simplest component part.

Having in several instances applied this mode, and shewn that the coefficient of the second term is equal to the sum of the roots of the third, to the sum of the products of each pair, and so on, where the equation has as many roots as it has dimensions, the Baron proceeds to prove that those truths were known to Vieta, and he first gives the fourteenth chapter of the original, and then transforms it into modern terms. The evidence is thus complete, and due honour must be ascribed to him who, ignorant of the science of the moderns that a quantity could be less than nothing, or a number impossible, deduced with the rigour of ancient demonstration those properties which, by many, are supposed to have been first made known by Harriot's invention.

The obscurity of Dr. Waring's writings has tortured many an algebraist, and as long as persons content themselves with mere general expressions without application to practice, it is not likely that they should form a clear idea of the excellence of any method for discovering the roots of a complicated equation. In a complete biquadratic  $ax - qx^2 + px^3 - x^4 = s$ , the various suppositions that may be made will make great changes in the estimate of a solution; and after a very exact comparison

of the modes of Waring and Ferrari, the Baron gives the preference to that of the latter. Since the method given by Waring, though "it proceeds upon clear and certain grounds when it is applied only to trinomial quadratic equations, in which the cube of the unknown quantity is wanting, becomes too intricate and unsatisfactory when it is applied to quadrinomial biquadratic equations, or such as have all their terms complete."

Though we admire the perspicuity which prevails throughout the Baron's writings, we cannot but think that his love of it leads him frequently into unnecessary prolixity. There are certain operations with which a young algebraist must make himself acquainted before he makes any progress in science; but if he is qualified to read these tracts, the repetition of such operations is superfluous, and to the higher mathematician is irksome. Again, the old algebraists having been brought up under geometri- cians, naturally brought their terms, which belong to discrete quantity or number, to a resemblance of those of continued quantity or extension. Hence the terms quadratic, cubic, biquadratic, sursolid were used; but in algebra they express merely the number of times a number is multiplied into itself, and as this may be carried far beyond any analogy with geometry, it seems in these times to be useless to endeavour to preserve it.

ART. IV. *An Account of the Astronomical Discoveries of Kepler, including an Astronomical Review of the Systems which had successively prevailed before his Time.* By ROBERT SMALL, D. D. F. R. S. 8vo.

THE labours of Kepler are known to, and justly appreciated by, those only who have paid the deepest attention to physical astronomy. The confirmation of his theory by Sir I. Newton, and the comparative ease with which the laborious calculations of Kepler may now be performed, have superseded in great measure the necessity of studying his works; and the generality of the practical astronomers of the present day look no farther than Sir I. Newton as the origin of all the modern discoveries in this important science. But without Kepler this island could not have boasted of a Newton; and the progress of the human mind, from the first conceptions of sense to the natured reflections of judgment, is a subject which cannot but be highly gratifying to every man of science.

This subject is in the work before us developed with great judgment, and the writer's researches cannot be followed but by those who are deeply read in mathematical investigation. The principal motions and inequalities of the heavenly bodies are first described, and then the various theories which the ancients, particularly Ptolemy, adopted to explain them. The inefficacy of those theories is pointed out, and the steps taken by Copernicus previous to the establishment in his own mind of the true system; and the difficulties in his way which prevented his early promulgation of it, are investigated with great sagacity. It is not wonderful that the truth should not have been immediately acknowledged, when we reflect on the effect of prejudice over the human mind. To place the sun in

the centre of the system; to give motion to the earth, which the senses declared to be immovable; to oppose the prevailing opinion of between five and six thousand years; to contradict the reputed truths of revelation; these were obstacles that required a most ardent mind to surmount; and we may rather wonder that Copernicus, a man of science, more attached to his study than to the world, should venture to permit his name to be attached to such heterodox sentiments. Death prevented him from suffering any evil consequences from his doctrine; and it perhaps was favourable to his reputation that his book could silently insinuate among the chosen few those notions which must have offended the great and little vulgar of those times, and brought upon the author the censures and punishments of the church.

There were difficulties also in his system which even were too great for some real astronomers to surmount, and these, added to ancient prejudice, gave birth to the system introduced by Tycho Brahe. He perceived clearly that the Ptolemaic system could no longer be maintained; but he was not prepared to dismiss the earth from its ancient station. The circular motion embraced by Copernicus served to keep him in his errors; but his numerous observations were particularly beneficial to science, and prepared the way for the calculations of Kepler, by which a new theory was to be established.

Kepler adopted the Copernican system, and in the year 1600 had the benefit of enjoying the society of Tycho Brahe, at Prague, in Bohemia. Fortunately the Dane was then employed in observations on Mars, with a view to verify its approaching opposition in the sign of Leo; and the degree of excentricity of this planet was a great advantage in discovering the nature of its orbit. Here the opposition between his and his patron's sentiments led to a most laborious examination of ancient tables, and calculations from them; and the inclination of the orbit, after repeated failures and many injurious methods, was at length discovered by him to be invariable; and after farther most laborious efforts to make his observations correspond with a circular motion, he found them ineffectual, and was reduced to the necessity of looking out for some other theory.

The labour employed by Kepler in endeavouring to preserve the motion of Mars in a circle is almost incredible, and

the astronomer will appreciate it who gives himself the trouble of considering only the time employed in a few of the calculations which this work contains. From the suspicion that the orbit might not be circular to the conviction that it was not so, neither the time nor the progresses were so long as in previous attempts; yet within this time he had given up his first idea of calculating areas, and might have been lost in the labyrinth of his calculations, if he had not discovered the distances in a circular orbit to be totally inconsistent with those deduced from observation.

But much was to be done before his mind was satisfied, and the necessary steps to obtain this conviction are clearly pointed out; and after all, accident led the way to the great discovery, which was the foundation both of Kepler's and of Newton's fame. He had discovered that the breadth of the lunula, cut off by the real orbit of Mars from the excentric, was but half of that cut off by the oval; and that even at  $90^\circ$  from the apsides, where it was greatest, it did not exceed 660 parts of a semi-diameter, or 152350. His disappointment here was great; but fortunately for him whilst he was contemplating the subject, it occurred to him that these 660 parts were equal to 432 parts of a semi-diameter 100000; that is nearly to 429 the half of 858, which he had found to be in the same parts the extreme breadth of the lunula, cut off in the oval theory; and turning his attention to the greatest optical equation of Mars, which is between  $5^\circ 18'$  and  $5^\circ 19'$ , he perceived that 429 was also the excess of the scant of  $5^\circ 18'$  above the radius 100000. Here new light broke in upon him; he pursued it with ardour; the circular motion was given up for the elliptical, not without extreme perplexity, and "*almost approaching to derangement of mind*;" and he was occupied in the famous problem afterwards called the Keplerian, from the mean anomaly to find the true, or, by a line drawn from the focus, to divide a semi ellipse in any given ratio.

Nothing but the utmost ardour for science, indefatigable industry, and perfect knowledge of figures, could have enabled the discoverer of the facts relative to the planetary system, to ascertain that the planets moved in elliptical orbits, described equal areas around the sun in equal times, and that the squares of their periodical times varied as the cubes of their mean distances from the

sun. On reviewing his labours we cannot help exclaiming with the poet,

*Tantæ molis erat romanam condere gentem.*

To the work before us we would refer our mathematical readers for an insight into these labours; and though there are

some oversights, from the distance we presume of the author from the press, we cannot withhold the tribute of applause for this effort to give the mathematical world a competent idea of the merits of Kepler.

ART. V. *Connaissance des Temps a l'Usage des Astronomes et des Navigateurs pour l'An XIII. de l'Ere de la Republique Française. Publiée par le Bureau des Longitudes à Paris. 8vo.*

THIS very excellent work cannot fail to be studied with attention by every astronomer. If in the parts which it has in common with our nautical almanac, it can by no means pretend to rival the annual publication of our astronomer royal, the additional parts give it an interest, which must make this work most sought after in foreign countries. The first part contains articles similar to those in the preceding volume; the second part commences with a very interesting history of astronomy for the year 8. In the commencement of it the historian, Jerome Lalande, passes in review various discoveries which have done honour to the eighteenth century. Among them are to be reckoned the discovery of a planet and eight secondaries, sixty-eight comets, the aberration and nutation of the stars, the passage of Venus over the sun, and hence the true distance of the sun and planets, calculations of the irregularities produced by attractions, particularly by those of Jupiter and Saturn, lunar tables exact to a quarter of a minute, and fifty thousand new stars; to these may be added the improvement of instruments, sectors, circles, chronometers, and the telescopes of Short and Herschel.

The commencement of the present century is distinguished by various events. A very curious one is likely to throw some important lights on the theory of the moon's motion. Among the manuscripts of Delisle was found a copy in Arabic of the work of Ebn Jounis, written in the tenth century; the original was discovered to be at Leyden, and the French ambassador, by means usual with the French, procured the transmission of it to Paris. It contains 400 pages in quarto, small character, and Caussin is employed in translating the whole work, which, with the original, will be given it is expected to the public.

The prizes for tables determining the longitude, apogee and node of the moon, were divided between Burg and Bou-

vard, who made their calculations from a great number of observations by Maskelyne. These have been increased by Burchhardt, and Parceval and Laplace have both added to the knowledge we have thus acquired on so difficult a subject.

Vidal is remarkable for the number of observations communicated of the planet Mercury, for he sees the planet every day, and even within a few minutes of the sun. This skilful astronomer lives at Mirepoix, where, says our author, "it is probable that no one knows so remarkable a character, whose fame is by this publication to be transmitted to the whole universe, and to posterity."

Mars has given employment to Michael Lalande, to Burchhardt, Tricouche, Oriani, Wurm, who have calculated his perturbations; and Bouvard has calculated those of all the planets, by the forms given by La Place.

The grand work on the meridian line from Dunkirk to Rodez has been printed, and Mechain is employed on the southern part. The observations of Vidal on the stars below the tropick, will soon be printed. From the description of the astrolabe found by Gale in Synesius, Delambre has been led to draw up an essay on the history of astrolabes, their construction and properties. Burchhardt has discovered a formula to represent the deviations of the needle observed at Paris since the year 1580, whence it appears that its greatest western deviation is thirty, and its greatest eastern deviation only twenty-three degrees.

The printing of the celestial history has been continued, as well as of the astronomical bibliography. The printing of the table of sines for the thousand parts of a quadrant, begun by Borda, has been completed under Delambre.—Triesmacher has collected the calculations of all the eclipses observed since the year 1747; and Goudin has determined all the circumstances which will

take place in the eclipse in the year 1847, the most considerable of the nineteenth century. Duvaucel, who has given delineations of eclipses for the last thirty years, has delineated also this important eclipse for every country, whence it appears that it will be annular in England, France, Turkey, and as far as Cochin-China.

Malaspinga, whose voyage round the world had been announced, is still in prison, but his observations have been, or will be made use of in the charts now forming in Spain. The king of Denmark has erected a board of longitude, of which Bugge is made director. Schröter, of Lilienthal, has established a manufactory of telescopes, whence they may be procured, it is said, at a tenth part of the price demanded in London. With his telescopes he has made many observations on Mercury, whose rotation on its axis he calculates at twenty-four hours five minutes. He has frequently seen also through them little streaks of very feeble light, which last two or three seconds; whence it is inferred that the hydrogen and oxygen extend very high in the atmosphere, for the meteors or globes of fire which astonish us at the distance of some hundred rods, become starry streaks at the distance of a league, and telescopic stars at the distance of three or four leagues.

From Egypt we learn the news of the great antiquity of their observations, and the news is received without any remark of its incongruity with historical records. We may allow an antiquity of four thousand years; but when they come to seven or fourteen thousand years, nothing but the credulity of French infidelity can entertain the supposition for a moment. The writer, if he has not overcome the prejudices of infidelity, has exhibited the instance of an extraordinary victory over another prejudice, which is very strong in his own country, and not uncommon in ours. He recommended an eminent astronomer for a particular service, but that astronomer was not a Frenchman.

The reason appeared decisive against his being employed; and "in vain did I exert myself," says the writer, "to destroy the prejudice."

We have thus selected as much as our limits would permit us of this history, which, as it is to be continued annually, will excite an interest among astronomers throughout Europe. The zeal manifested by the French in this respect does them great credit; and it will be followed to the great advantage of science in other nations, if they only follow the French plan of forming a board consisting only of men eminent in the peculiar science which is intended to be encouraged.

A variety of useful tables follows this history: those on Mercury and Mars, and the occultations of some stars, are particularly worthy of notice. The report on the lunar tables, made by La Grange, La Place, Mechain, and Delambre to the board of longitude, is worthy of their high characters. In the History of Astronomy for the year IX. or 1801-1802, the obliquity of the ecliptic is determined to be  $23^{\circ} 28' 6\frac{1}{2}''$ , and its secular diminution  $36''$ . At Bologna some curious experiments on the fall of bodies have been made, to prove the rotation of the earth; and similar preparations are proposed to be made at Hamburgh. Burchhardt has calculated from fifteen thousand barometrical observations, the effects of different winds on their heights; whence he concludes that the mean height with a southern wind is 27 inches 11,3 lines, and with an eastern wind 28 inches 1,9 line. Its height on the shore of the Mediterranean is 28 inches 2,2 lines, and on the shore of the Atlantic 28 inches 2,8 lines.

Two excellent memoirs are given on the new planets Olbers and Piazzi. The longitude of various places is ascertained; and the quantity of 500 pages, which the government has ordered to be annually given to the public, is filled up with matter which must tend very much to promote astronomical researches.

#### ART. VI. *Recreations in Mathematics and Natural Philosophy.* By C. HUTTON.

THE Recreations in Mathematics, by Ozanam, have been long known and received with general approbation. Since his time many improvements have been made in science, suggesting a variety of new sources of amusement. Montucla seized them with his usual sagacity, and

thus enriched the original work with his own observations. His efforts were well received in France, where the mathematics are cultivated with great success, and the readers are not only very numerous, but not to be discouraged by deductions derived from the first elements of arith-

metic and geometry. In this country the work will naturally labour under some disadvantages, though the translator has himself added to its utility by inserting several articles omitted by Montucla, and adapting others to the meridian of London. To those who have

made some progress in the mathematics, the Recreations will be really such, and convey beside a great deal of instruction; and the editor deserves well of the mathematical world for giving to so valuable a foreign publication an English dress.

ART. VII. *Observations on Reversionary Payments; on Schemes for providing Annuities for Widows, and for Persons in old Age; on the Method of calculating the Values of Assurances on Lives; and on the National Debt. Also, Essays on different Subjects in the Doctrine of Life-Annuity and Political Arithmetic; a Collection of new Tables, and a Postscript on the Population of the Kingdom.* By RICHARD PRICE, D. D. F. R. S. *The Whole new arranged and enlarged, by the Addition of Algebraical and other Notes, the Solutions of several new Problems in the Doctrine of Annuities, and a General Introduction;* by WILLIAM MORGAN, F. R. S. Sixth Edition. 2 vols. 8vo.

THE several editions of this very valuable work are so well known to the public, that it is not necessary here to enlarge upon the contents of these volumes. It is needless to say that the contents of the former editions are arranged in the best manner, because from the acknowledged talents and abilities of the editor, whose life has been employed in the pursuits recommended by his uncle, and whose investigations, presented to the Royal Society, exceed any thing of the kind in the mathematical world, nothing else could be expected than that this edition should surpass all that have gone before it. The work is absolutely necessary to all who engage in the numerous plans at present for providing for future payments dependent on lives; and the experience the editor has had in one of the greatest magnitude, qualifies him to determine with great precision on the probable stability of those which are born only to wither in a short time, or to take deep root and flourish. Indeed, the advice given by him cannot be too often repeated, that every society of this kind should every five or six years calculate its real value, whence its rise or decline may be determined, or proper correctives be applied. The fluctuating state of property makes a great difference in all these calculations. If the plan is made accurately, according to the Northampton tables, when money is at five per cent. interest, a great change must necessarily take place in the circumstances of the society, if money should rise or fall to six or four per cent. The present state of the country makes these things very precarious; and if Dr. Price was alarmed for the state of the nation, the editor

seems to be justified in his additional fears.

“Had Dr. Price lived to witness the profusion of the last ten years, he would probably have moderated the severity of this censure. The debt which appalled him, when it amounted to 230 millions, has lately swollen to the enormous mass of 540 millions; and the yearly expenditure of a peace-establishment, which he considered insupportable at 16 millions, will in future require an annual taxation of more than 84 millions!—The paper-circulation, which he so justly deplored when he first published this work, appears to have been then only in its infancy: it has now completely inundated the country. The coin has disappeared, and the bank, for whose credit he was apprehensive, has for many years ceased to pay its notes in specie. The American war, which he regarded as injurious and disgraceful to the kingdom, has been succeeded by another infinitely more ruinous, and more degrading in its consequences. Had he therefore lived to witness these, and a long train of other calamities, which are too deeply felt to need the recital of them—had he lived to behold the man, during whose administration they were produced, retiring from office in triumph, and congratulating the nation on the envied state of prosperity to which it had been lately exalted, he would have changed the object of his resentment, and acknowledged that Lord NORTH had long lost the distinction assigned to him in this preface.”

The variety of tables in this work, and the mathematical demonstrations of intricate problems, make it of peculiar advantage to every one engaged in this species of calculation; and the science cannot be under better auspices than those of the editor, who, while he is embalming his uncle's memory, is laying the surest foundation for his own well-deserved fame.

ART. VIII. *An Analysis of the Principles of Natural Philosophy.* By M. YOUNG, D. D. 8vo.

THE heads of a course of lectures are contained in this work, which will be useful only to tutors who are engaged in a similar employment, or those who having gone through a course of natural philosophy, wish to refresh their memory, by reviewing frequently the objects of their studies. Demonstrations are very seldom given to any article; but where they are given, it is done with great taste and judgment. Mechanics, hydrostatics, aerostatics, hydraulics, pneumatics, acoustics, optics, electricity, magnetism, are analysed in the order specified. The work would have been rendered much more valuable by references to the works where a demonstration might be found of each article: this is done sometimes, but much too sparingly; and we cannot say that the author is always very successful in his definitions. Thus we are told that space is the order of things which co-exist, and time is the order of things which exist in succession; whence few persons, we apprehend, will find any assistance in forming to themselves an idea of the things defined.

In demonstrations we have observed that the author is more successful, and we will insert one on the greatest velocity communicated through an elastic ball to another at rest.

“Let A and C be two given bodies, between which is inserted the body X of intermediate magnitude; if the velocity of A be called  $a$ , the velocity of C =  $\frac{2Aa}{A+X} \times \frac{2X}{X+C}$

$$= \frac{4Aa}{A+C+X}, \text{ a maximum; but the}$$

numerator is given, therefore this quantity will be greatest, when the denominator is least, that is, when  $\frac{AC}{X} + X$  is least,

because A and C are constant; now the rectangle  $\frac{AC}{X} \times X$  is a given quantity, being equal to AC; therefore the sum of  $\frac{AC}{X}$  and X is least when they are equal, that is,

when  $\frac{AC}{X} = X$ , and  $AC = X^2$ ; that is, when X is a mean proportional between A and C.”

The difficulties attending the problem of Huygens on the ultimate velocities of bodies descending in fluids are well known. The demonstration of this author is well adapted to the subject.

“Mathematically speaking, bodies descending in fluids will not acquire their ultimate and uniform velocity in any finite time whatever.

“The absolute force with which the body descends is the difference between its weight and the weight of an equal bulk of the fluid; and this difference divided by the weight of the body will be the accelerating force, which let us suppose equal to  $d$ ; now the resisting force increases as the square of the velocity  $v$ , and therefore will be equal to some constant quantity multiplied into  $v^2$ ; let this quantity be  $e$ , therefore the absolute accelerating force, upon the whole, will be  $d - ev^2$ . Let the constant force  $d$  be represented by the given line AC, and let the decrement of this force by the resistance, be AK, and consequently the absolute accelerating force = KC; also let the absolute velocity AP of the body be a mean proportional between AC and AK, and therefore in the subduplicate ratio of AK. Let the increment of the resisting force be KL, and the contemporaneous increment of the velocity be PQ; with the centre C, and the rectangular asymptotes AC, CH, let the hyperbola BNS be described, meeting the ordinates AB, KN, LO. Because AK :: AP<sup>2</sup>, the moment of the former KL will be as the increment 2APQ of the latter; that is, as AP × KC, for the increment PQ of the velocity is as the absolute accelerating force KC; therefore KL × KN :: AP × KC × KN :: AP, because KC × KN is constant. Therefore the indefinitely little hyperbolic area KNOL :: AP. And the hyperbolic area ABOL is composed of the particles KNOL always proportional to the space described with that velocity, the particle of time in which KL is generated being given. Consequently, when KC the absolute accelerating force vanishes, that is, when the motion of the body becomes uniform, the space described ABSHCA, and therefore the time, will be infinite.”

ART. IX. *A Practical Treatise of Perspective, on the Principles of Dr. Brook Taylor.* By E. EDWARDS, Associate and Teacher of Perspective in the Royal Acad. 4to. pp. 350.

TECHNICAL and scientific men are constantly at variance. The technical man, without understanding a single

principle of the art by which he makes his fortune, produces a work whose execution the scientific man neither can nor

desires to emulate. What is the use then of science, says the artist, and why should I waste my time on the acquisition of that which cannot render me an equivalent return? Thus most of the artists are in the situation of a land-surveyor, who not long ago was asked what were the best books to read to obtain knowledge of his art. There are none, he replied; the only way to learn it is by becoming apprentice: and the good man, on farther examination, did not really know that there had been such a being in nature as Euclid, though he was then employed at a great expence on considerable inclosures. Artists then who catch up only the floating ideas of their art, must be content to grovel on like the land-surveyor: they may produce many pleasing effects in the line in which they have been brought up, but they cannot go beyond their rude instructions; they are merely workmen, and must not aspire, without risque of exposing themselves, to any eminence in their profession.

On the other hand, the artist who could not stir without rule or compass, must evidently be as incapable of producing a work of genius. There are limits of ignorance and exactness, within which his sphere of action is confined; and to know them well is a great acquisition. Numbers transgress daily the common rules of perspective, because they have considered them as unnecessary to their art, and the first acquisition of them has appeared difficult. To prescribe the reading of Euclid to the young Apelles, would appear a task insupportable; yet if an hour of a day for the first year of his professional life, from fifteen to sixteen, was employed in this study, he would find it a very easy matter, and for ever after be sensible of the benefits derived from this easy study.

The author of this work, a very valuable work to every young artist, is sensible of the propriety of this advice. Perspective cannot be understood without a knowledge of angles, lines, and surfaces. He dedicates a few pages to this knowledge; but the student who enters upon the study of the other parts of his work, with a complete knowledge derived from Euclid's eleventh book of the properties of planes, will feel no embarrassments in understanding every principle laid down in the theory of perspective. They who are content with the ruler and the compass, and the mere direction how to use them, feel no confi-

denice in a difficult operation, compared with those who see the grounds of each process, and are able to demonstrate the truth of every thing they are about to perform.

The work is entirely practical, and derived from the best work written upon the subject, which every body knows to have proceeded from Dr. Brook Taylor. After explaining and defining, in an easy manner, the principal terms in the art, it lays the basis properly in the elucidation of a square and a cube, and thence proceeds in an easy and gradual manner through more complicated and difficult figures. The measurements are in general well laid down, and the young student in the academy who will take his rule and compasses, and copy, on a scale of his own, every figure in this work, which he may, with very little interruption to his other pursuits, perform in the course of a couple of years, will find at the end of that time that he has obtained an accuracy of knowledge of inestimable use to him in his future career.

We recommend particularly to his attention the discourse at the end of the work, a discourse replete with information, and from which painter, sculptor, and architect may derive much useful information. It is singular that the study of perspective should be so much neglected by the latter; but there are reasons in the following extract to convince him of his error, in neglecting so important a study.

“The architect should always be possessed of the science of perspective, and that in no trifling degree; for by its assistance he will be enabled to determine with himself, and to demonstrate to others, the future effects of his designs and drawings, whenever he is employed to erect buildings.

“But the practice of making geometrical or orthographical drawings, is by custom so firmly established among the architects, that little hope can be entertained of introducing any other mode of drawing their designs. Yet, in consequence of this general practice, many able men have found themselves deceived when they saw those designs executed; while their disappointment was no more than a natural effect of the established practice; for in the orthographical or geometrical drawings, all the parts are described equally prominent and visible, as well those which recede as those which project; but in the building, the parts which recede will appear lower than those which project; they will even be sometimes concealed, if viewed from certain points; which circumstance leads to another observation, that will encourage the

architect in the practice and study of perspective.

"All public buildings, particularly those in towns, are generally placed on some particular spot or situation; consequently they can be seen only from particular stations. The architect will therefore do well to examine and consider those stations or points of view from which his building will be seen, and then conduct the design of the exterior elevation of his edifice accordingly. Yet all the precaution here recommended will be useless to him, who does not understand perspective, or who will not practise it.

"It may be objected that making perspective drawings would be attended with too much trouble, and be inconvenient to the workman; because he could not, without equal skill in the science, be able to find out the measures of the parts by the scale; but this objection will vanish, when it is observed, that in the composition of great works every method should be practised which can ensure success: and that the making some additional sketches or drawings in perspective, although the minute parts are not determined by the absolute rules, will be sufficient; especially, if those sketches are of the parts of

which there may be any doubt concerning their future effect; and in many cases this will save the expence of a model. Another strong recommendation to this practice is, that an architect labours under a disadvantage not known to the painter, which is, that he cannot alter or correct his works after they are finished; and therefore it is more particularly incumbent on him to guard against errors or mistakes by all the means in his power.

"But should the advice here given be slighted, in what relates to the designs being drawn perspective, yet let the architect be assured, that he who is master of the science will possess resources by which he will be enabled to dispose particular parts of his buildings with such art, as may produce very striking and uncommon effects. It is true, that there are no examples of such artificial effects to be seen in this country, and but few in others, except in theatres. Yet such are by no means impracticable; therefore this hint is offered, which may be greatly improved by the skilful architect, who is master of perspective; but which will be useless to him who is ignorant of it."

**ART. X.** *Evening Amusements; or, the Beauty of the Heavens displayed. In which several striking Appearances to be observed on various Evenings in the Heavens during the Year 1804 are described: and several Means within Doors are pointed out by which the Time of young Persons may be innocently, agreeably, and profitably employed. Intended to be continued annually.* By W. FRENCH, Esq. M. A. and Fellow of Jesus College, Cambridge. 8vo. pp. 187.

AMONG the numerous excellent books that have been composed within the last thirty years for the use of young persons, there is not one which has succeeded in giving a familiar description of the appearances of the heavens, and the fundamental truths of astronomy.—This deficiency is at length supplied by the work before us, which is admirably well adapted to interest young persons in the changes that are constantly taking place among the heavenly bodies, and to familiarise them with many curious and important phenomena, of which numbers even of well educated people, for want of so skilful and scientific a guide, are almost wholly ignorant.

We select the following paragraph as a specimen of the manner in which Mr. French has executed his design.

"On the twenty-third at sun-set the moon appears in the eastern part of the heavens, and near to it a bright star, which is the second star in the Bull, being between one and two degrees to the north-west of her. At half past five the three stars in the Ram are on the meridian, at a quarter past seven the Pleiades are on the meridian, at eight Aldebaran, and

at a quarter past nine the Moon, when the most beautiful constellation in the heavens is to be discovered also on the meridian, and the observer will be gratified with an effulgence, with which the most brilliant collection of diamonds bears no comparison. Carry your eye down from the Moon, in the direction of the meridian, about twenty-six degrees, and three bright stars in a line, at the distance of about a degree between the two adjacent ones, will arrest your attention. These three stars now cross the meridian line in the direction nearly from south-east to north-west, and below them are three more stars of smaller magnitude, in the direction of the meridian. The first three stars are called the Belt, the three smaller stars are called the Sword of Orion; the constellation, to which they belong, taking its name from a fabulous hero of ancient times. In the meridian, about ten degrees above the first star in the Belt, are three small stars, which are in the head of Orion, and about five degrees to the south-east of these three stars, is a star brighter than any other star in this constellation, which is the first star of Orion, or the star in his right shoulder: and about four degrees to the south-west is the third star of Orion, or the star in his left shoulder. About nine degrees to the south-west of the middle star in the Belt, is the second star of Orion, or

star in his left foot. When your curiosity is sufficiently gratified with the singular position and beauty of the Belt and Sword, and brightness of the first, second, and third stars of Orion, an effulgence, to the south-east of the Belt, and about twenty-three degrees from the

middle star of the Belt, cannot fail of striking you with wonder and pleasure. This is the most brilliant of the fixed stars, and is called Sirius, or the first star of the Great Dog. At present its position and brilliancy, hereafter its history, will excite your attention."

## CHAPTER XXI.

## NATURAL HISTORY.

THE publications of the present year in this department of science, will scarcely admit of being exhibited in one regular synoptic view. The most important entirely new works are, beyond all dispute, Lambert's Description of the Genus Pinus, and Montague's History of British Shells. Dr. Shaw's General Zoology advances in its course with undiminished excellence; and Dr. Turton's additional volume of his translation of the Systema Naturæ will be as acceptable to the English student of botany, as his former ones were to the zoologist. Mr. Daniel's Rural Sports affords many instructive articles to gratify the naturalist, but will be read with more avidity by a different class of readers. The new Dictionary of Natural History published at Paris, must be considered at present as only begun, but the celebrated authors who have made themselves responsible for its several articles, cannot fail to raise the expectation of the public, and to excite an earnest desire of its continuance and completion. Spallanzani's Tracts must always bear a high value with those who wish to become acquainted with the general physiology of animals and vegetables, but as the first edition of the English translation has been published several years, it would not have been entitled to our present notice, if the second edition had not been corrected throughout, and considerably enlarged.

ART. I. *General Zoology, or Systematic Natural History*: By GEORGE SHAW, M. D. F. R. S. &c. Vol. 4.

IT is pleasant after a short separation to rejoin an intelligent fellow-traveller, from whose extensive acquaintance with the country, and liberal communications concerning it, we have already derived much entertainment and instruction; and though we are not likely to accompany him again through scenes equally luxuriant and romantic, we still associate with his person, the prospects which we have formerly enjoyed, and find something to delight us in our passage over many a dreary heath. With sensations of this kind we take up the fourth volume of Dr. Shaw's General Zoology. We recognize the countenance and manners of an old friend. We enter at once into his stile of composition; and though his present subject may not promise us all the satisfaction which the former part of his work afforded, we

are persuaded that we shall not rise from it disappointed and displeased.

Our great philologist, essayist, and biographer has pronounced with his usual oracular authority, that what is not known cannot be told. We shall not, therefore, blame our guide, if he do not impart to us all the knowledge we wish to obtain concerning the class of animals on which he has now entered. They are inhabitants of an element in which we ourselves cannot live; and which consequently affords us but few opportunities of observing their particular habits and modes of life; even those who frequent our rivers and sport in our shallow streams, offer themselves only casually and transiently to our notice. They perform some of the most important functions of their being, either in the deepest abysses of the waters, or conceal-

ed from our view by shelving rocks and aquatic plants. In fact we know little of such as are most familiar to us, besides their external form, their inward structure, the arts which are employed to effect their destruction, and the gratification which they give to us when they are served up at our tables. How little, then, can we even hope to learn concerning the numerous kinds which are natives of the ocean! The present volume affords a proof, that some of them constantly remain at its bottom, and can never become known to the naturalist, if they do not happen to be gorged by ravenous individuals of other kinds, and if those individuals do not rise to the surface and become the spoil of the fisherman before they have digested their own prey.

Still, however, it is desirable that all which is actually known concerning them should be presented to us in a scientific form, and adorned with the graces of composition, as far as the nature of the subject will admit. Within the space of less than half a century, our acquaintance with nature has, indeed, been wonderfully increased by the means of numerous voyages and travels to almost every part of the globe, made by professed naturalists, who have taken with them equal capacity to distinguish and curiosity to explore. The discoveries and observations of these, Dr. Shaw has collected with his usual diligence and exactness; nor has he neglected to consult the writings of the best compilers and arrangers. To the Count Cépède and Dr. Bloch he has been much indebted, and has made some happy alterations and improvements from the suggestions of his own experienced judgment. The present volume, which like each of the former three, inconveniently consists of two distinct, and in the present case, very unequal segments, contains the natural history of the apodal, the jugular, and the thoracic fishes. The next volume, which is to be published early in the spring of 1804, will contain the abdominal and the cartilaginous ones, and will complete this part of the work.

The detail of the several genera in each order, and species in each genus, is preceded by a general description of the external and internal parts of fishes, chiefly taken from the works of Dr. Monro. It is drawn up with distinctness and precision: but we cannot help expressing a wish, that for the sake of general readers, the anatomical terms

had been a little more familiarly explained. This introduction might also have been extended with advantage to an account of such peculiarities in the general œconomy and manners of fishes as have been sufficiently ascertained. For though it must be confessed that comparatively little is yet known concerning them, it is certain that much more might have been collected than is to be found in the present work. Dr. Shaw's Zoology has acquired a popular reputation which it will not support, if it do not unite entertainment with instruction, and please as much by the variety, as by the accuracy of its information. The account of the three principal, and as it should seem only acute organs of sense in this part of the animal creation will give general satisfaction.

“The organ of smelling is large, and the animals have a power of contracting and dilating the entry to it as they have occasion: it seems to be mostly by their acute smell that they discover their food, for their tongue seems not to have been designed for a very nice sensation, being of a pretty firm cartilaginous substance; and common experience evinces that their sight is not of so much use to them as their smell, in searching for their nourishment. If you throw a fresh worm into the water, a fish shall distinguish it at a considerable distance; and that this is not done by the eye is plain, from observing that after the same worm has been a considerable time in the water, and lost its smell, no fishes will come near it, but if you take out the bait, and make several little incisions into it, so as to let out more of the odoriferous effluvia, it shall have the same effect as formerly. Now it is certain that had the animals discovered this bait with their eyes, they would have come equally to it in both cases. In consequence of their smell being the principal means they have of discovering their food, we may frequently observe them allowing themselves to be carried down with the stream, that they may ascend again leisurely against the current of the water; thus the odoriferous particles swimming in that medium, being applied more forcibly to their organ of smell, produce a stronger sensation. The optic nerves in fishes are not confounded with one another in their middle progress betwixt their origin and the orbit, but the one passes over the other without any communication;

so that the nerve which comes from the left side of the brain goes distinctly to the right eye, and vice versa; indeed it should seem not to be necessary for the optic nerves of fishes to have the same kind of connexion with each other, as those of man have; for their eyes are not placed in the fore-part, but in the sides of the head; and consequently they cannot look so conveniently at any object with both eyes at the same time.

"The crystalline lens in fishes is a complete sphere, and more dense than in terrestrial animals, that the rays of light coming from the water might be sufficiently refracted.

"As fishes are continually exposed to injuries in the uncertain element in which they reside, and as they are in perpetual danger of becoming a prey to the larger ones, it was necessary that their eyes should never be shut; and as the cornea is sufficiently washed by the element they live in, they are not provided with palpebræ: but, as in the current itself the eye must be exposed to several injuries, there was a necessity that it should be sufficiently defended; which, in effect, it is, by a firm, pellucid membrane, seeming to be a continuation of the cuticula stretched over it; the epidermis is very proper for this purpose, as being insensible, and destitute of vessels, and consequently not liable to obstructions, and *thus becoming opaque*. In the eye of the skate tribe there is a digitated curtain which hangs over the pupil, and which may shut out the light when the animal rests, being somewhat similar to the tunica adnata of other animals.

"Altho' it was formerly much doubted whether fishes possessed the sense of hearing, yet there can be little doubt of it now; since it is found that they have a complete organ of hearing, as well as other animals, and likewise that the water in which they live is *proved to be* a good medium. Fishes, particularly of the skate kind, have a bag at some distance behind the eyes, which contains a fluid and a soft cretaceous substance, and supplies the place of the vestibule and cochlea: there is a nerve distributed upon it, similar to the portio mollis in man: they have semicircular canals, which are filled with a fluid, and communicate with the bag; they have likewise a meatus externus, which leads to the internal ear. The cod-fish, and others of the same shape, have an organ of hearing somewhat similar to the former,

but instead of a soft substance contained in the bag, there is a hard cretaceous stone."

We are sorry to be compelled to observe, that through the whole work, as well as in the preceding quotation, there are numerous instances of negligence, in some of which it is impossible to reconcile the construction with the rules of grammar. Three of these we have printed in italics. The first sentence of the last paragraph but one is particularly ill formed.

In the order Apodes, Dr. Shaw has introduced ten genera, in addition to the eight which appear in the 12th edition of the *Systema Naturæ*; *Anguilla*, *Synbranchus*, *Sphagebranchus*, *Monopterus*, *Odontognathus*, *Comephorus*, *Triurus*, *Leptocephalus*, *Stylephorus*, and *Sternoptyx*.

Linnaeus included in his genus *Muræna*, not only the celebrated Roman *muræna* which has no pectoral fins, but also the common English eel, and several others which are furnished with them. Gmelin has unaccountably followed him in this disposition, as far as the *muræna romana* and *colubrina* are concerned, though there actually appears in his edition of the *Systema Naturæ*, a new genus expressly formed for four species not known to Linnaeus, all distinguished by the want of pectoral fins. Bloch has adopted his genus, and has very properly added to it the Roman *muræna*. but through a strange want of judgment, has called the eel and its congeners, *muræna*, a name by which they have never been known in any age or country of the world, and has retained Gmelin's generic name, *gymnothorax*, for the *muræna* and its true congeners, who are destitute of pectoral fins. It cannot be denied that the latter name happily expresses the essential generic character, but we much doubt whether, on that account, a name should be ejected which has been for ages in peaceable possession, and has, moreover, the sanction of classic authority. Dr. Shaw, with a due regard to prescriptive right, has reinstated the ancient name, and has also restored to the proper eels their ancient designation, *anguilla*: but we think that he should have placed the genus *muræna* before that of *anguilla*, as a better connecting link with the serpents in the preceding class. To the Linneæan *anguilla* he has made no addition, but has fallen into two unfortunate oversights in copying from the

*Systema Naturæ* the synonyms of the conger and serpens. Under the conger, instead of giving the generic specific character, he has repeated verbatim that of his *vulgaris*, the *muræna anguilla* of Linnæus: to the serpens, he has attributed that which belongs to the ophis, and which he himself had actually transcribed as such in the preceding page\*.

The genera *Synbranchus*, *Sphagebranchus* and *Monopterus* all agree with the *muræna* in having no pectoral fins. The first differs from it in having only one spiracle, and the second in having two; in both, placed beneath the neck. The *monopterus* differs from all the three in having only a caudal fin, and in the position of its nostrils, which are placed between or above the eyes, instead of being, as in most fishes, before them. The genus *synbranchus* is taken up from Dr. Bloch, and has only two species, both natives of Surinam. The *sphagebranchus* and the *monopterus* have each only a single species. The former is adopted also from Bloch, and is conjectured by our author to be the *muræna cæca* of Linnæus. Bloch's specimen was received from Tranquebar. The latter, also a native of the East Indies, is described by Cépède, from the MSS. of Commerson, by whom it was considered as a species of *muræna*. We are inclined to think that Commerson was right in his judgment. The absence of pectoral fins is an admirable generic character, appropriate, comprehensive and exclusive. The position and number of the spiracles, and the want of one or more fins besides the pectoral ones, afford excellent marks for specific characters, or where they are found in more than one species, for a subdivision into families. It is to be lamented that there is no figure of the *monopterus*. To the genus *gymnotus* whose essential generic character is the want of a dorsal fin, two species are appended, from Gmelin's edition of the *Systema*, which are furnished with that limb. For this Dr. Shaw apologizes, and pleads a complete resemblance in every other respect; but the apology does not appear to us to be admissible. Generic characters, like statute laws, should never be infringed, as long as they are suffered to exist. If, by a change of circumstances, they become inadequate to their original design,

they should, by all means, be repealed, and better substituted in their place. But while they continue a part of the established code, their authority should be sacred. Nothing places the imperfection of natural history in a more striking light, than the frequent occurrence of such qualifying expressions as *in most species*, *most generally*, &c. in generic characters.

The account of the *gymnotus electricus*, the celebrated electrical eel, as it has been generally called, is curious and instructive.

“ The peculiar species of electricity or galvanism, exerted at pleasure by this extraordinary animal, is such as greatly to surpass that of the torpedo, so long the subject of admiration both in ancient and modern times. The electric *gymnotus* is a native of the warmer regions of Africa and America, where it inhabits the larger rivers, and is particularly found in those of Surinam: in Africa it is said chiefly to occur in the branches of the river Senegal. It is a fish of a disagreeable appearance, bearing a general resemblance to a large eel, though somewhat thicker in proportion, and of a much darker colour, being commonly of a uniform blackish brown. It is usually seen of the length of 3 or 4 feet, but is said to arrive at a far larger size, specimens occasionally occurring of six, seven, or even of ten feet in length. It was first made known to the philosophers of Europe about the year 1671, when its wonderful properties were announced to the French academy by Mons. Richer, one of the gentlemen sent out by the academy to conduct some mathematical observations in Cayenne. This account, however, seems to have been received with a degree of cautious scepticism by the major part of European naturalists, and it was not till towards the middle of the late century that a full and general conviction appears to have taken place; the observations of Mons. Condamine, Mr. Ingram, Mr. Grævesend, and others, then conspiring to prove that the power of this animal consists in a species of real electricity, being conducted by similar conducting substances, and intercepted by others of an opposite nature. Thus, on touching the fish with the fingers, the same sensation is perceived as on touching a charged vial; being sometimes felt as far as the elbows; and if touched by both hands, an electric shock is conveyed through the breast in the usual manner. Fermin in particular, who during his residence in Surinam, had frequent opportunities of examining the animal, demonstrated by experiment that fourteen slaves holding each other by the hands, received the shock at the same instant;

\* Since the above was written, we have found the latter error mentioned in the table of errors, but the former remains unnoticed.

the first touching the fish with a stick\*, and the last dipping his hand into the water in which it was kept. The experiments of Dr. Bancroft were equally satisfactory. After this, viz, about the year 1773, Mr. Williamson, in a letter from Philadelphia to Mr. Walsh, so celebrated for his observations relative to the electricity of the torpedo, communicated his own highly satisfactory experiments on the gymnotus. On touching the animal with one hand, in such a manner as to irritate it considerably, while the other was held at a small distance from it in the water, he experienced as strong a shock as from a charged Leyden vial. The shock was also readily communicated through a circle formed by eight or ten persons at once; the person at one extremity putting his hand in the water, near the fish, while the other touched the animal. It would be tedious to recite all the various modifications of these experiments, and it is sufficient to add, that all conspired to prove the genuine voluntary electricity of the animal; though occasionally exhibiting some variations from the phenomena of common electricity. It is by this extraordinary faculty that the gymnotus supports its existence: the smaller fishes and other animals which happen to approach it, being instantly stupified, and thus falling an easy prey to the electrical tyrant. So powerful is the shock which this fish in its native waters is capable of exerting, that it is said to deprive almost entirely of sense and motion those who are exposed to its approach, and is therefore much dreaded by those who bathe in the rivers it inhabits."

We observe with pleasure that this extract is written in Dr. Shaw's best manner, and affords a sufficient proof, that when he pays due attention to his language, he is a correct and elegant writer. The article is concluded by two accurate descriptions, drawn out to a considerable length; the one of its exterior form, by Dr. Garden, of Charles Town in South Carolina; the other of its internal structure, by Mr. Hunter: both copied from the 65th volume of the Philosophical Transactions.

The genus *odontognathus* was instituted by Cope, and derives its name from two strong moveable laminae or processes attached to the upper jaw. It consists of a single species, which is common about the coast of Cayenne in South America.

The genera *comephorus* and *triusus* have been formed also by Cope, each for the sake of a single species.

The *comephorus* is so called, we presume, from the bristle-like rays of the second dorsal fin, which stretch beyond the membrane: but as such bristle-like

rays are by no means peculiar to it, a more appropriate name might have been devised. The Count is not always happy in the formation of generic names. Dr. Pallas first discovered it in the Lake Baikal. By him it was improperly referred to the jugular fishes, and described as a species of *callionymus*. As such it appears in Gmelin.

The *triusus*, or triple tail, owes its name to the unusual prolongation of the anal and dorsal fins: the former almost as far as the termination of the tail, the latter rather beyond it, producing the appearance of three tails. No more than five individuals have hitherto been seen; and these were discovered by Commerçon in the stomach of a scomber, in the Indian seas.

The *leptocephalus*, tho' unknown to Linnæus, has for some time been familiar to naturalists, from the description of Mr. Pennant, in whose British Zoology it was first introduced to the notice of the public. Its generic name, which expresses the smallness of its head, was given it by Gronovius.

The *stylephorus*, so called on account of the curious position of its eyes, which stand on pillars somewhat similar to those of the genus *cancer*, excepting that they are considerably broader, was first described and figured by Dr. Shaw himself in the Linnæan Transactions, and afterwards in the Naturalist's Miscellany. The description and figure are copied in the present work. It is a native of the West Indian seas.

The *sternoptyx*, so named from the singular fold on each side of its breast, had already appeared in Gmelin. No more than a single species is known, and that is a native of the American seas.

In the thoracic order, the new genera are, *gymnetrus*, *vandellius*, *macrourus*, *gobiomorus*, *acanthurus*, *eques*, *trichopus*, *gomphosus*, *ophiocephalus*, *lonchurus*, *holocentrus*, *bodianus* and *trachichthys*.

The genus *scarus* had already been adopted by Gmelin.

The *gymnetrus ascanii*, which derives its generic name from the absence of the anal fin, has long been known to fishermen in the northern seas, preceding or accompanying the shoals of herrings, and therefore called by them the king of the herrings, on account of its superior size, has only within a few years engaged the attention of naturalists. It was first

\* Probably a green or moist one.

described by Dr. Ascanius from a specimen, the length of which was ten feet, and its diameter about six inches; the diameter, as Dr. Shaw's text informs us, being equal, through its whole length; but in the figure annexed, the diameter sensibly diminishes from the anus; and we presume that, when he speaks of its length, he means to include the whole fish from the extremity of the head to that of the tail. The construction of the ventral fins is extremely singular. The ventral fins, says Dr. Shaw, if they can be said to deserve the name, consist of a pair of extremely long single rays or processes, terminated by a small ovate expanded tip or finny extremity. Besides two varieties which may possibly prove distinct species, one drawn and described by Dr. Russel, from a specimen taken near Visagapatam, the other described by Dr. Shaw, from an imperfect specimen in the British Museum, two other species are added: the first, an excellent one, with a striking specific difference; the other of a dubious kind, described and copied by Cope, from a coloured Chinese drawing. It is destitute, says Dr. Shaw, of the ventral fins or appendages so remarkable in the other species. But if we may judge from the situation in which the fins are placed in the figure, we should rather consider it as having large ventral fins and no pectoral ones. On the accuracy of a Chinese drawing, there can, however, be no dependence. If the pectoral fins happened to be small, they would be passed over as unworthy of notice, by an artist who could have no idea of their importance in a scientific classification. It is, therefore, to be wished that no descriptions, taken solely from a drawing, should ever be admitted into a system of natural history, unless they are known to have been made by a real naturalist.

The genus *vandellius* contains only a single species, found very rarely in the Mediterranean and Atlantic seas, and considered by Dr. Vandell of Coimbra, as closely allied to the genus *trichiurus*. It is described from a specimen in the British Museum.

The only species of *macrourus*, at present known, has been detached from the genus *coryphæus* by Dr. Bloch, partly on account of its head, which does not precisely answer to those of the *coryphæni*, but chiefly on account of its long, gradually tapering tail, whence the generic name is formed. It differs also

in having two dorsal fins; but that circumstance is not of consequence enough to be admitted into the generic character.

The genus *gobiomorus* was instituted by Cope, and contains those species which differ from the genuine gobies, in having the rays of the ventral fins separate, instead of being united, as in that genus, into a funnel. This dissimilarity suggested, we suppose, the latter part of the compound name, *μωρος* from *μειρω*, divide: but in its present composition, it rather conveys the idea of a divided goby, than of a goby with a divided ventral fin; not to mention that *μωρος* is generally used by Greek authors to denote the portion assigned to any one by fate, sometimes the stroke of death, sometimes judicial punishment, and sometimes any calamity. The Greek language certainly runs with great facility into expressive and pleasing compounds, and is therefore generally to be preferred in the formation of characteristic generic names, but it does not follow that no Greek compound can be harsh or ambiguous. The new genus in Dr. Shaw's arrangement contains three of Gmelin's gobies, and three others from Cope; but from two of these, that author has formed distinct genera, calling one *gobiomoriodes*, and the other *gobiesox*, because the position of the dorsal and anal fins gives it in some respect the habit of a pike. The Count has a violent passion for splitting genera.

The genus *acanthurus* consists of such species of the Linnæan genus *chætodon*, as, in contradiction to the principal character of that genus, have moderately broad and strong teeth, rather than slender, setaceous ones; they are also furnished on each side of the tail with a strong spine: this last particular has afforded an excellent generic name; the former rendered it absolutely necessary, either to change the generic character, or to eject these intruders, who do not correspond with it.

From the same genus the solitary species of *eques* has also been separated by Dr. Bloch, on account of its teeth which are not disposed in a single row, but in several concentric ranges. The nature of the teeth themselves is not mentioned in the description, but as from the figure they appear to resemble those of the *acanthuri*, and as the manner in which they are arranged would have formed a good specific difference, there seems to us no sufficient reason for esta-

blishing a new genus. There are, moreover, in several of the acanthuri, bands similar to those from which the generic name, *eques*, is fancifully chosen. The genus *trichopus* is characterized by a compressed body, and ventral fins with an extremely long filament. It consists of five species, which are distributed by Cope into three new genera, which he calls *osphronemus*, *trichodopus*, and *monodactylus*. As all the first four have the long filament of the ventral fin, and differ only in the number of its rays, they may with great propriety be united in one genus; but the fifth, the *monodactylus*, wanting that essential particular, cannot be a *trichopus* as long as the generic character and generic name are suffered to remain.

The generic name and character of *gomphosus* are taken from the jaws which are lengthened into a tubular snout, and in which the Count Cope fancied he found some resemblance to a nail or wedge. It contains two species, both natives of the Indian seas.

The two genera *ophiocephalus* and *lonchurus*, the former so named from the dissimilar scales of its head as in snakes, the latter on account of its lanceolate tail, were both introduced by Dr. Bloch. They are acknowledged by Dr. Shaw to have a greater affinity to the genus *sciæna* than any other; and as they agree with it in its only essential character, the scaly head, we know not why they should be separated from it.

With the generic characters of *holocentrus* and *bodianus* we confess ourselves completely posed. They stand verbatim thus:

#### HOLOCENTRUS.

Habit of the genus *perca*.

Gill-covers scaly, serrated, and aculeated.

Scales (in most species) hard and rough.

#### BODIANUS.

Habit of the genus *perca*.

Gill-covers scaly, serrated and aculeated.

Scales (in most species) smooth.

They exactly resemble each other, except in the roughness and smoothness of their scales; and if it were not for the unlucky parenthesis which occurs in each, the distinction would be plain and easy. A rough-scaled fish, with the characters possessed in common by each of the genera, we should call an *holocentrus*; a smooth-scaled one, a *bodianus*. But

how are we to determine in what cases a smooth-scaled fish is an *holocentrus* and a rough-scaled one a *bodianus*? Of this the generic character is totally silent. In hopes of finding a clue to guide us through the labyrinth, we examined the description of the scales in every species of the two genera; and behold the result of our labour! We found that the scales of one of the *holocentri* are large and denticulated at the edges; of seven, middle sized; of three, rather small than large; of six, small; of five, very or extremely small; of one, crenulated; of one marked by a white spot; and that in nine instances they are not mentioned at all. We were told also that the scales of one of the *bodiani* are very large with pale edges; of three, middle-sized; of two rather small than large; of one, small; of one, tipped with blue; of one edged with silver; and that in six they are entirely disregarded.

We had thus learnt something concerning the size and colour of the scales; but as far as relates to these, any one of the species might be placed with equal propriety under either of the genera; and with respect to their roughness or smoothness, we were still as much at a loss as ever. Conceiving that we must have overlooked some part of the description, and attributing the oversight to the infirmity of eyes impaired by the midnight watchings of many years, we first trimmed our lamp; then wiped our spectacles; and then took down a pair of greater magnifying power, which we use only to mend our pen and on other special occasions; but all to no purpose. As our last resort we applied to all our fellow critics "in solemn divan assembled;" but still in vain. The difficulty was no sooner stated, than every one, as if all were animated by one soul, rapidly exclaimed, *Davus sum, non Ædipus*: it is a knot which none but a god, or one inspired by the gods can untie. To be serious; generic characters so constructed are a disgrace to science. They assume a scientific appearance; but they teach nothing.

The genus *trachichthys*, aptly but rather harshly so denominated from its strong and spiny scales, was instituted by Dr. Shaw himself, and first described by him in the *Naturalist's Miscellany*. The large carinated scales of its abdomen, connected with its want of teeth, afford a well discriminated generic character. It is found on the coasts of New Holland.

After a careful survey of all the new genera, we cannot but wish that in the admission of them, Dr. Shaw had been less frequently guided either by the Count Cope or Dr. Bloch. Both of them are infected with the mania of multiplying genera: and where he has differed from them, he has in almost every instance manifested superior judgment. We have intimated on a former occasion that we have no objection to a large genus, provided its essential character be clearly and accurately defined. Nothing then remains to be done, but to break it into subdivisions or families; and when the systematizing naturalist has exercised his sagacity in this necessary task, the investigating student will pursue his researches with facility and pleasure.

In the course of the work numerous species have been added to many of the Linnæan genera; but as they are chiefly natives of distant seas, and described from dried specimens, nothing more than a bare description, and that often an imperfect one, can be expected. The species of *sparus*, *labrus* and *perca*, are numerous in the *Systema Naturæ*, and it is confessed by Linnæus himself, that these three genera and the *sciaenæ* are not easily distinguished from each other. The large additions which have since been made to them have increased the confusion. The generic characters of *sparus* in particular, are not sufficiently discriminated either by Linnæus or Dr. Shaw, though the latter has not hesitated to differ materially from his great master. In the *Systema Naturæ*, the lips of the *spari* are said to be double, and those of the *labri* single. In the *General Zoology* the direct contrary is asserted. Those of the *spari* are described as thick; and those of the *labri* as thick and doubled: but no notice is taken of the lips in any of the detailed descriptions, and as far as can be judged from the species there figured, there seems to be some of both kinds in each of the genera. In the *Systema Naturæ*, the species of *sparus* are 26, and of *labrus*, 41; in the *General Zoology*, those of the former are 162, and of the latter, 104. Dr. Shaw acknowledges that many of these may probably be only varieties, and that possibly some may have been repeated and described under each genus. It should seem that in the present state of the subject, the best method would be to throw the whole into one genus, if a good generic character can be obtained,

and then to divide it into natural families; or if it do not readily yield to such a distribution, to form artificial ones, and to arrange them in a synoptical table at the head of the genus, similar to those which Linnæus has placed at the head of the classes in the three kingdoms of nature, for which he will always receive the hearty thanks of every young naturalist.

For the entertainment of our readers, and as an additional specimen of Dr. Shaw's style and manner, when he does not transcribe from preceding writers, we shall give his account of the *echeneis remora*.

"The extraordinary faculty which this fish possesses of adhering at pleasure with the utmost tenacity to any moderately flat surface, was not unobserved by the ancients, and is described in terms of considerable luxuriance by Pliny in particular, who giving way to the popular prejudices of his time, represents the *remora* as possessing the power of stopping a vessel in full sail, so as to render it perfectly immovable in the midst of the sea.

"The real fact is, that the *remora* being a fish of very weak powers of fin, takes the advantage of occasionally attaching itself to any large swimming body, whether animate or inanimate, which it happens to encounter; adhering to ships, as well as whales, sharks, and many other of the larger fishes: it has even been observed by Commerson, that the *remora* is so ill calculated for supporting a long and laborious course in the water, that when left to its own exertions, it generally swims on its back, and that in an unsteady and feeble manner. It is therefore necessary that it should avail itself of the occasional assistance of some larger floating body. For this purpose the upper part of the head is wonderfully constituted; presenting a large, flat, oval shield or area, traversed by numerous dissepiments or partitions, each of which is fringed at the edge by a row of very numerous perpendicular teeth or filaments, while the whole area or oval space is strengthened by a longitudinal division or septum. So strong is the power of adhesion which the fish by this apparatus is enabled to exert, that we are assured by Commerson, whose observations on this subject are detailed by Cope, that, on applying his thumb to the shield of a living *remora*, it was affected not only with a strong stupor, but even with a kind of paralysis, which continued for a considerable time after withdrawing his hand. When attached, as is frequently the case, to the skin of a shark or other large fish, it quits not its hold when the former is drawn out of the water, but continues adhering after the death of the animal; nor is it easy for the strongest arm to effect its separation, unless it be pulled in a lateral direction, so as to force it to slide along the surface of the skin.

"When a great many of these fishes are thus adhering at once to the sides of a ship, they may in some degree retard its motion, by preventing its easy passage through the water, in the same manner as any other extraneous substances are known to do; nor can it be thought improbable that the 'adhesion' of these fishes in considerable numbers to the side of a small canoe in the earlier ages of mankind, may have operated still more powerfully, and not only have impeded its progress, but even have caused it to incline towards one side; and the tale once related, might have gradually grown into the exaggerated powers afterwards ascribed to the animal.

"A second reason of the remora's thus attaching itself to the larger fishes and to vessels is, that it may be in readiness to avail itself of the occasional remains of the prey of the former, or of the offals thrown out from the latter; being naturally voracious, and by no means delicate in its choice, and frequently following vessels in great numbers in order to obtain occasional supplies of food. The remora also, especially in stormy weather, adheres to rocks, like the lump-fish and some others.

"The remora is principally an inhabitant of the Mediterranean and Atlantic seas. Its general colour is an uniform brown, without any material difference of shade either on the upper or lower surface. It sometimes however varies in colour, and Commerson assures us that when a great number of these fishes are attached either to the side of a vessel or to a large fish, it is not very uncommon to see one or two which differ from the rest in being of a whitish colour. The skin is smooth and destitute of scales, but marked with numerous impressed points or pores; the mouth is large, and furnished with very numerous small teeth; and the lower jaw is rather longer than the upper: the eyes are small, with yellow irides: the lateral line commences above the pectoral fins, and from thence pretty suddenly descending, runs straight in the tail, which is of a slightly forked, or rather lunated form. The number of transverse divisions on the shield of this species varies from sixteen to twenty, but the most general number is eighteen. The fish grows to the length of about eighteen inches."

Dr. Shaw seems to attribute the adhesive power to the fringe of perpendicular teeth or filaments on the edge of each partition. We strongly suspect that the effect is to be accounted for on the principles of pneumatics, and that the apparatus, in its general manner of operation, is similar to a simple amusement of children, which consists in raising up a stone by the means of a spring fastened to the middle of a piece of wet leather. If the filaments were of a glutinous nature, and the whole of the tenacity arise from that circumstance, it is not easy to

conceive how the animal could readily disengage itself at pleasure, or how, in consequence of a force laterally directed, it should slide with comparatively so much ease on the body to which it is attached. The remora, we apprehend, previously to its adhesion, diminishes the breadth of its shield by a muscular contraction of the dissepiments or partitions; so as to fill up the intermediate furrows, and to form a plane surface in close contact at all points with the substance on which it is about to fix. It then instantly restores its shield to its former state, and each furrow becomes nearly a vacuum, on which the external air and water presses with a force, greater or less, in proportion to the dimensions of the intervening surface. The use of the fringe of filaments is probably to let in the air or water by a similar muscular contraction, and at once to remove the cause of the adhesion. The common goby, and perhaps all the gobies may adhere to rocks, and set themselves at liberty, by a similar contraction and dilatation of the funnel shaped central fins.

Mr. Pennant asserts in his *British Zoology*, that the tunny frequents our coasts, but not in shoals like the tunnies of the Mediterranean; and that they are not uncommon in the lochs on the western coast of Scotland, where they come in pursuit of herrings, and often during night strike into the nets and do much damage. Dr. Shaw, though he quotes Mr. Pennant, and does not dispute his authority, appears to think them of less frequent occurrence, and speaks of them as accidental stragglers. Such we have reason to believe is the case. In the summer of 1801, we ourselves happened to be at Inverary in the height of the herring fishery, which that year was remarkably abundant, and enquired of an old fisherman whether any tunnies had been lately taken, with a faint hope that we might be fortunate enough to obtain a sight of this rare British fish. He did not know it by the name of mackrel sture, which Mr. Pennant says it bears in the west of Scotland, but on a little farther explanation recognized it as what he called an overgrown mackrel, and said that one was taken in Loch Fine about 30 years before, of five or six hundred weight, but that he had not heard of any in the Loch since. Mr. Pennant was there in 1769, and probably saw the same fish; or several stragglers might have accidentally wandered to the same coasts about the

same time. We suspect that the vanity of the Highland fishermen led them to represent a rare instance as a common one.

The account of the *chætodon rostratus* is curious, and with it we shall close our account of Dr. Shaw's important work.

This fish is a native of the fresh waters of India, and is celebrated for the extraordinary manner in which it takes its prey, which chiefly consists of the smaller kind of flying insects: when it observes one of these either hovering over the water, or seated on some aquatic plant, it shoots against it from its tubular snout, a drop of water, with so sure an aim as

generally to lay it dead, or at least stupefied, on the surface. In shooting at a sitting insect, it is commonly observed to approach within the distance of from six to four feet, before it explodes the water. When kept in a state of confinement in a large vessel of water, it is said to afford high entertainment by its dexterity in this exercise, since if a fly or other insect be fastened to the edge of the vessel, the fish immediately perceives it, and continues to shoot at it with such admirable skill as very rarely to miss the mark. The same faculty is possessed by the *sparus insidiator*, and some few others belonging to very different genera.

ART. II. *Rural Sports*: By the Rev. WILLIAM B. DANIEL. 3 Vols. large 8vo.

IT is asserted by one of our English poets in an early part of the last century, that the satyric muse ought not to be silent, when amidst other prevailing enormities,

Churchmen scripture for the classics quit,  
Polite apostates from God's grace to wit.

He probably alluded to the great Bentley, at that time in the zenith of his reputation as a classic scholar, and to Dr. Zachary Pearce, afterwards Bishop of Rochester, who had then recently published an improved edition of Longinus. We are persuaded that every candid judge will pronounce the censure to be illiberal and severe. Those eminent men, while they added to the treasures of literature and the reputation of their country, by their unwearied labours on the valuable remains of Greece and Rome, were so far from deserting or negligently performing the duties of their sacred office, that they rendered the study of such authors as are usually stiled profane, of admirable use in the explanation of the holy scriptures, and the defence of their religion against the attacks of its adversaries. Dr. Bentley's sermons at Boyle's lectures, the first that were delivered on that occasion, entitle him to a high place in the class of divines. Dr. Pearce's *Vindication of the Miracles of Christ*, and his posthumous notes on a considerable part of the New Testament, are a sufficient proof that he was not inattentive to his peculiar profession as a minister of the gospel.

But if so slight a deviation from the direct duties of the clerical character, could so far "chafe" the poet's "spleen"

as to compel him to exchange "panegyric" for "satire," how would his wrath have boiled over, and how caustic would have been the ebullition, if he had lived at the beginning of the nineteenth century, and had cast his eye upon *Rural Sports* by the Rev. Wm. B. Daniel! What would he have said of the boisterous apostates from the grace of God to the mysteries of the dog kennel? We honestly confess that we ourselves, though far from wishing to possess an equal degree of rigorous strictness, could not avoid wishing that the epithet *Reverend* had not appeared in the title page, and that we should have been better pleased, if, instead of writing on the pleasures of the chace, the avowed ecclesiastic had been employed in collecting the various readings of Sophocles or Euripides. In the first effusion of a humour which we acknowledge was tinctured with somewhat of the spleen, we were tempted to give a paraphrastic translation of his motto, *Vitanda est improba Syren desidia*; and to understand it as a declaration, that if he did not hunt and shoot he must be in bed all the winter, or at the best spend his days in an arm chair, dozing over a relaxing fire. We recollected the arch reply of a Quaker, more than thirty years since, to a reverend sportsman who was boasting of his infallible skill in finding a hare: "If I were a hare, I would take my seat in a place where I should be sure of not being disturbed by thee from the first of January to the last of December." "Why where wouldst thou go?" "Into thy study."

Such were our feelings when we first

took up Mr. Daniel's work. But a little reflection gave our thoughts a different turn. We considered that a fondness for rural sports, though it certainly does not indicate a very studious mind, is by no means incompatible with much moral worth; that it is not every one who "can make the closet the centre of his existence by a sedentary life;" and that a man may follow the hounds or carry a gun, and yet be a conscientious parish priest, be a pattern to his flock of public and private virtue, and have a heart warm as melting charity to the afflicted poor of his neighbourhood. A certain monitor within, also whispered, in good time, that some of us grave and sober critics, who have the same *bundle* to our names,\* are not always actually engaged in the express business of our profession. We do not pretend to assert that we are composing a sermon when we are writing a review on a book of rural sports. We are conscious that we have often been seen peeping into a hedge bottom, not indeed in search of a hare, but of a rare plant; and that in the prosecution of our favourite pursuits, we have climbed the steeps of Snowden, and traversed the rocks of Staffa, with as great a transport as can be produced by the most brilliant fox chase, which old Tom Noel or Meynel himself ever knew.

\* All these sagacious reflections might have been spared, if we had recollected a little sooner that our business is not with the author but with his work. We are not sorry, however, that we have been induced to review the temper of our minds, before we pass a judgment on the performance of another man: for in consequence of this self discipline, we trust that we are better prepared to form a fair and impartial estimate of its merits, and entertain a hope that we may, in some measure, remove or lessen the scruples of our more serious readers.

Mr. Daniel has accustomed himself to read and think, as well as to pursue the diversions of the field. In the course of his work he manifests so much cheerful good humour, sterling good sense and unaffected honesty, that we can readily believe him a favourite member of the Essex hunt; and do not doubt that he often checks by his presence the indecency and profaneness which

would otherwise escape from the lips of many a rough country squire, when the declining sun has warned the party to retire from the open air into the dining-room, and to exchange the noisy and active sports of Diana for the equally noisy but less active joys of Bacchus.

A reflecting mind will give an air of science to its amusements, as well as to its graver occupations. There are sportsmen whose superiority to a fox or a hare is founded almost entirely on the distinction between the pursuer and the pursued; and who differ from the hounds, their companions in the chase, in having only two legs and riding comparatively at ease on the back of a horse, while their hounds have four and run on foot. Our author is not one of these. He is not satisfied with merely catching his game; but is animated with the laudable ambition of forming an acquaintance with its character and habits; and of knowing all that has been said of it by writers on natural history. The knowledge which he has acquired, he has benevolently wished to communicate; and has added to the information obtained from others, so many observations of his own, that he will be deservedly quoted in future systematic works as an original authority. On this account we do not scruple to allow him a respectable situation in this department of our Review. He does not indeed arrogate to himself the high and mighty character of author; but modestly presents himself to the public under the humble appellation of compiler. He frankly acknowledges that a large portion of the contents of his volumes has been collected from various publications; but at the same time asserts, and truly asserts, that "the fresh matter is considerable: and that the whole is arranged in a novel and distinct system."

Rural sports may be distributed into three grand classes, hunting, fishing, and shooting. These accordingly constitute the several parts of the work.

Hunting, again, may be divided into fox-hunting, stag-hunting, hare-hunting, coursing, and the less noble pursuit of those animals which go under the general denomination of vermin.

The treatise on hunting is introduced by a panegyric on the dog and a general

\* It is a favourite observation of one of our brave naval commanders, that the chief difference of rank among British subjects consists in some men having handles to their names, and others not.

history of the kind; for which, like all his recent predecessors, he is much indebted to the luxuriant fancy and elegant pen of Buffon. Like him he derives from the shepherd's dog many of the numerous varieties which have been the effect of domestication: but in opposition to that popular naturalist, he asserts that the dog will couple both with the wolf and the fox, and that the dogs of Greenland and Kamptschatka are of wolfish origin. Among the many instances which he has given of that instinctive sagacity in his favourite animal which nearly approaches the confines of intellect and reason, one or two appear of dubious authority; but the collection is the most copious which we have seen, and will be entertaining to readers of every description.

Having given this general account of the species, he proceeds to those which are more particularly connected with rural sports, and amongst these the fox-hound takes the lead.

With respect to the size and shape of fox-hounds, and their management both in the kennel and the field, he takes for his guide "that well informed fox-hunter who has favoured the world with his thoughts on that particular diversion." But he does not blindly rely on "this compleat master of the science:" he sometimes gives a different opinion of his own "founded on long and successful practice:" though, as he modestly intimates, the difference "may have resulted from local situation." On the construction and œconomy of the dog-kennel, he has a right to assume a decisive tone; for he is master of one himself, and, in whatever concerns it, is perfectly at home. But Mr. Meynel, he informs us, is, perhaps, "the only man compleatly skilful in making the most of any particular hound by nicety of feeding." "Hounds," he adds, "to do their work in style, should be well in flesh, and that flesh, firm; they should never be fat—a *fat* hound, a *fat* horse, or a *fat* man, if propriety be at all consulted, can have no business at a fox chase."

The conclusion of the following paragraph concerning the height and shape of the fox-hound will relax the muscles of the most rigid cheek into a smile.

"The height and shape of the fox-hound, is next to be considered: and doubtless the difference of country may excuse a variability of opinion in this respect; but there are

certain hounds well adapted for business; and which will not suffer themselves to be disgraced in any country; and these are the middle sized. All animals of that description are strongest and best able to endure fatigue. In the colour of their hounds most sportsmen have their prejudices; in their shape, it is presumed they must all agree; to look well they should be nearly of a size, if they appear of the same family it will be an addition, and if handsome withal, they are then perfect so far as respects their appearance; but there are necessary points in the shape of a hound, which ought ever be attended to, for if he is not of perfect symmetry, he will neither run fast, nor bear hard work; much speed is required, and he should possess adequate strength. His legs should be straight as arrows; his feet round, and not too large; his shoulders should lie back; his breast rather wide than narrow; his chest deep; his back broad; his neck thin; his head small; his tail thick and bushy, and which, if he carries well, will add to his comeliness. It must be kept in mind, that although a small head is mentioned as one of the requisites of a fox-hound, that it is to be understood as relative to beauty only; for as to goodness, large headed hounds are in no wise inferior. As an instance: amongst a draft of young hounds from Earl Fitzwilliam's was one, of whom Will Dean, his Lordship's huntsman, made this remark in his letter: "that he could not guess at Lord Foley's dislike to the hound called Glider, then sent, which was of the best blood of the country, being got by Mr. Meynell's Glider, out of Lord Fitzwilliam's Blossom, and was moreover the most promising young hound he had ever entered, unless his lordship took a distaste to the largeness of the head; but he begged leave to assert, although it might appear a trifle out of size, there was a world of serious mischief to the foxes contained in it." The event justified Dean's prediction in its utmost latitude, for Glider was a most capital chace, and long a favourite stallion hound, notwithstanding the magnitude and inelegance of his head."

The directions concerning the breeding, education, and future government of fox hounds are equally full and explicit. But we have neither room to follow him in his details, nor capacity to pass a judgment on their merit. On this occasion we are obliged to employ that implicit faith which we are sensible does not properly belong to the workshop of a reviewer. But in the present instance there is no alternative. *Rural Sports* must either be reviewed by an incompetent critic, or it must not be reviewed at all. For when, from the days of Le Clerc to the present hour, did a fox-hunter take his place at any of our boards?

The diseases of dogs are treated of at large. The most fatal of these are that

called distinctively the distemper, and canine madness. The former, which, Mr. Daniel tells us, "is the most fatal (the plague only excepted) that any animal is subject to," has been known in this country only about forty years; and has become milder and less frequent within the last twelve or fifteen. Man however has been favoured by its appearance; for it is asserted, "on the experience of those placed in situations least likely to hazard a conjecture," that since the distemper has made its havoc among the species, *canine madness* has not been so common. Of this latter dreadful disorder, and its baleful effects, many particulars are given, with a variety of medicines recommended by different persons for its cure. Many of these are known to be ineffectual; and in the author's opinion, no antidote for the poison yet discovered can be safely relied on. But he recommends from his own experience a preventive which has been known from the time of Pliny, and which surely ought to be enjoined on every breeder of dogs by a positive law under the sanction of a severe penalty. On so interesting a subject, we deem ourselves bound by our duty to the public to transcribe the passage.

"The prevention of the direful effects of canine madness seems to have been attempted in the early ages; to accomplish this, Pliny recommends the worming of dogs, and from his time to the present, it has most deservedly had its advocates. Very strong proofs have been adduced of its utility, nor is it natural to imagine, so easy and effective an operation would have been omitted, had not more virtue been attributed to it, than it really possesses, and wherein it failed, the absolute prevention of madness was said to be the consequence, whereas the fact was and is, that taking out the worm, has nothing to do with annihilating the disorder, although it will most certainly hinder the dog seized with it, from doing any hurt to man or beast. A late author asserts he had three dogs that were wormed, bit by mad dogs at three several periods, yet notwithstanding they all died mad, they did not bite nor do any mischief; that being determined to make a full experiment, he shut one of the mad dogs up in a kennel, and put to him a dog he did not value; the mad dog often ran at the other to bite him, but his tongue was so swelled, that he could not make his teeth meet; the dog was kept in the kennel until the mad one died, and was purposely preserved for two years afterwards, to note the effect, but he never ailed any thing, although no remedies were applied to check any infection that might have been received from the contact of the mad dog.

"The compiler has had various opportunities of proving the usefulness of worming,

and inserts three of the most striking instances, under the hope of inducing its general practice.

"A terrier bitch went mad that was kept in the kennel with forty couple of hounds, not a single hound was bitten, nor was she seen to offer to bite. The bitch being of a peculiar sort, every attention was paid to her, and the gradations of the disease (which were extremely rapid) minutely noted, the hydrophobia was fast approaching before she was separated from the hounds, and she died the second day after; at first warm milk was placed before her, which she attempted to lap, but the throat refused its functions; from this period she never tried to eat or drink, seldom rose up, or even moved, the tongue swelled very much, and long before her death, the jaws were distended by it.

"A spaniel was observed to be seized by a strange dog, and was bit in the lip, the servant who ran up to part them, narrowly escaped, as the dog twice flew at him; a few minutes after the dog had quitted the yard, the people who had pursued gave notice of the dog's madness, who had made terrible havoc in a course of ten miles from whence he had set off. The spaniel was a great favourite, had medicine applied, and every precaution taken; upon the fourteenth day he appeared to loath his food, and his eyes looked unusually heavy, the day following he endeavoured to lap milk, but could swallow none; from that time the tongue began to swell, he moved himself but seldom, and on the third day he died; for many hours previous to his death, the tongue was so enlarged, that the fangs or canine teeth, could not meet each other by upwards of an inch.

"The hounds were some years after parted with, and were sold in lots, a madness broke out in the kennel of the gentleman who purchased many of them, and although several of these hounds were bitten and went mad, only one of them ever attempted to bite, and that was a hound from the Duke of Portland's, who in the operation of worming had the worm broke by his struggling, and was so troublesome that one half of it was suffered to remain; the others all died with symptoms similar to the terrier and the spaniel, viz. a violent swelling of the tongue, and a stupor rendering them nearly motionless, and both which symptoms seemed to increase with the disease.

"The idea that worming prevents a dog from receiving the infection when bitten should be exploded; but the foregoing facts shew how far it may be recommended for the restriction of a malady horrid in its effects where a human being is concerned, and which to the sportsman and the farmer, is attended with such dangerous and expensive consequences."

The account concludes with anecdotes of fox-hounds and fox-hunters. The following, we believe, are new, and will be generally entertaining.

"The speed of the fox-hound was well ascertained by the trial at Newmarket, betwixt

Mr. Meynell and Mr. Barry, and this account of the training and feeding the two victorious hounds, is from the person who had the management of them. Will Crane was applied to, after the match was made (which was for 500 guineas), to train Mr. Barry's hounds, of which Bluecap was four, and Wanton three years old. Crane objected to their being hounds that had been entered some seasons, and wished for young hounds, who would with more certainty be taught to run a drag; however the hounds were sent to Rivenhall in Essex, and as Crane suggested, at the first trials, to induce them to run the drag, they took no notice; at length by dragging a fox along the ground, and then crossing the hounds upon the scent, and taking care to let them kill him, they became more handy to a drag, and had their exercise regularly three times a week upon Tip-tree Heath; the ground chosen was turf, and the distance over which the drag was taken was from eight to ten miles. The training commenced the first of August, and continued until the 28th of September, (the 30th the match was ran); their food was oatmeal and milk, and sheeps' trotters. Upon the 30th of September the drag was drawn (on account of running up the wind, which happened to be brisk,) from the rubbing-house at New Market Town end, to the rubbing house at the starting post of the Beacon Course, the four hounds were then laid on the scent; Mr. Barry's Bluecap came in first, Wanton (very close to Bluecap) second; Mr. Meynell's Richmond was beat by upwards of a hundred yards, and the bitch never run in at all; the ground was crossed in a few seconds more than eight minutes; three score horses started with the hounds; Cooper, Mr. Barry's huntsman, was the first up, but the mare that carried him was rode quite blind at the conclusion. There were only twelve horses up out of the sixty, and Will Crane, who was mounted upon a king's plate horse, called Rib, was in the twelfth. The odds before running were seven to four in favour of Mr. Meynell, whose hounds it was said were fed during the time of training entirely with legs of mutton.

"The speed of Merkin, a fox-hound bitch bred by Colonel Thornton, was still superior; she was challenged to run any hound of her year five miles over Newmarket, giving 200 yards, for 10,000 guineas, or to give Madcap 100 yards, and run the same distance for 5000. Merkin had run a trial of four miles, and the time he performed it in was seven minutes and half a second. This bitch, of whom a portrait is here given, was sold in 1795 for four hogsheads of claret, and the seller to have two couple of her whelps.

"Madcap at two years old challenged all England for 500 guineas. Lounger, brother to Madcap, did the same at four years old, the challenge was accepted, and a bet made for 200 guineas, to run Mr. Meynell's Pillager; the parties were also allowed by Col. Thornton to start any other hound of Mr. M's, and Lounger was to beat both; but

upon Lounger's being seen at Tattersall's by many of the first sportsmen, his bone and form were so capital, that it was thought proper to pay forfeit, which was done by giving Colonel T. a pair of gold couples.

"Lounger was afterwards sent as a present to the Duke of Northumberland, by Colonel T. for a stallion hound, his grace's keenness perhaps exceeding that of any other fox-hunter in the kingdom, and which shewed itself in one instance by his having the fox's head *deviled*, after a very severe chase, and eating the greater part of it."

\* \* \* \* \*

"Enthusiasm in religion, love or politics, has seldom exceeded that which Mr. Carter shewed for fox-hunting; this gentleman possessed a respectable estate near Witney, in Oxfordshire, and could boast the best hounds and horses in that part of the country. In his dress, manners and accommodation, the huntsman and whipper-in were evident models of his imitation. Amidst the intercourse of friendship, and in the endearments of domestic life, the language of the chase was never forgotten, even his nearest relations were esteemed only in proportion to his darling amusement; those who were anxious for his affections, had no hopes of success, but by riding themselves into them over five barred gates; in short, throughout the surrounding country, fox-hunting Carter was the epithet by which he was universally known and distinguished: when he was one day endeavouring to leap a gate of unusual height, the leg of his favourite hunter caught between the upper bars, threw him on the other side, and tumbling with all his weight upon him, fractured one of his legs in such a manner, as to leave the sufferer only the dreadful alternative of amputation or death. Mr. C. was not long deliberating upon the choice; recollecting that he never should be able to keep the saddle at a fox chase with a wooden leg, he swore that he came into the world with two legs, and with two he would go out of it. In this determination he persevered, and after languishing some time, if to a man of his resolution and violent temper, the term languishing can ever be applied, he departed this life as he would have ended a fox-hunt, with the exulting shout of the death halloo, having previously bequeathed his estate (except an annuity of two hundred pounds to his wife,) to his favourite nephew, for no other reason than because whilst a boy he used to follow him through all the dangers and delights of the chase; and excluding all his other numerous relations, who were more careful of their limbs, and did not choose at the risk of their necks to obtain a chance of enjoying his property."

\* \* \* \* \*

"The insertion of the following replies from two huntsmen may be excused, as they tend to shew the absolute possession which the business of the chase had over every other action or idea. The first was, the Duke of

Richmond's huntsman, whose hounds being hunting at the end of the season 1788, and coming to a check, was asked the reason by his master; "Why, my Lord, it must be owing to those damn'd stinking violets, I think."

"The second was of Lord Stawell's huntsman, who having rode after his hounds into the garden of More Park, near Farnham, where the sward walks are kept remarkably neat, and where his horse was doing mischief, was called to very sharply by the gardener, who told him that his master and mistress never rode there; who was answered by the huntsman (going off in a gallop), "That's very strange, for I never saw finer riding ground in all my life."

The natural history of the fox himself succeeds, taken chiefly from Buffon and other writers, with original anecdotes which our limits will not permit us to insert.

The stag is the next animal of chase, and, as royal game, may be thought by some to have a right to priority in a book of rural sports. Mr. Daniel is of a different opinion; and with a benevolence which becomes him as a man, and a loyalty which does him honour as a British subject, feelingly expresses his regret that his sovereign, by an exclusive chase of the stag, deprives himself of a pleasure which would greatly add to his happiness.

"At the present day, as an object of chase to the sportsman, the stag requires but cursory mention; those indeed who are fond of pomp and parade in hunting, will not accede to this opinion, but the only mode in which this chase can recommend itself to the *real* sportsman, is, when the deer is looked for and found like other game, which hounds pursue; and it is not uncommon for an outlying fallow deer, tried for and unharboured in this way, to shew much sport with a pack of harriers, especially where the country is inclosed.

"At present very few hounds (except those of the royal establishment) are kept for this amusement exclusively; and were the king once to see a fox well found and killed handsomely, he would in all probability give a decided preference in favour of fox-hounds; for what a marked difference is there, between conveying, in a covered cart, an animal nearly as big as the horse that draws it, to a particular spot, where he is liberated; and cheerily riding to the cover side, with all the extacy of hope and expectation."

Of hare hunting, as might be expected after what has been said of the stag, Mr. Daniel makes little account. It is too tame and too stationary for his active spirit. He accordingly gives us scarcely any thing concerning it from his

own experience; but has been liberal in his quotations from other authors. Xenophon, Mr. Blome, the ingenious author of *Observations on Hare-hunting*, and Mr. Beckford are his authorities.

The following instance of an unconquerable passion for hare-hunting we have extracted as a curiosity.

"But various as are the sorts of hounds; and heavy the expence of keeping them, yet the manner in which the following little pack was managed, by the persevering economy of their owner, merits remark. With half a dozen children, as many couple of hounds, and two hunters, did Mr. Osbaldeston (clerk to an attorney) keep himself, family, and these dogs and horses, upon Sixty Pounds per annum. This also was effected in London, without running in debt; and with always a good coat on his back. To explain this seeming impossibility, it should be observed, that after the expiration of the office-hours, Mr. O. acted as an accountant for the butchers in Clare-market, who paid him in offal; the choicest morsels of this he selected for himself and family, and with the rest he fed his hounds, which were kept in the garret. His horses were lodged in his cellar, and fed on the grains from a neighbouring brew-house, and on damaged corn, with which he was supplied by a corn-chandler, whose books he kept in order. Once or twice a week in the season he hunted, and by giving a hare, now and then, to the farmers over whose grounds he sported, he secured their good-will and permission; and several gentlemen (struck with the extraordinary economical mode of his hunting arrangements which were generally known) winked at his going over their manors. Mr. O. was the younger son of a gentleman of good family, but small fortune, in the north of England; and having imprudently married one of his father's servants, was turned out of doors, with no other fortune than a southern hound, big with pup, and whose offspring from that time became a source of amusement to him."

Coursing is closely connected with hare-hunting; and here the natural history of the greyhound is properly introduced. The following anecdotes concerning its swiftness and ardour are selected, as affording points of comparison with the foxhound.

"With respect to the swiftness of the greyhound, the following questions were submitted to a gentleman, whose greyhounds are known to be as swift as any in the kingdom. Whether the speed of a greyhound is equal to that of a first rate race-horse for the distance of a mile, or for a greater or smaller distance? and, whether the speed of any hare (supposing the dog and hare to be started without the law usually allowed to the hare in course

ing) is equal to that of the greyhound; and to what distance, within that of a mile, the hare could exert that superiority of speed, supposing the hare to be the fastest animal of the two? His opinion was, that, upon a flat, a first rate horse would be superior to the greyhound, but in a hilly country, as in Wiltshire, a good greyhound would have the advantage; on the second point, that although he had seen many hares go away from greyhounds, laid close in with them, without a turn, yet he believes a capital greyhound (so laid in) would not suffer a hare to run from him without turning her. An incident, however, occurred in December 1800, which brought the speed of the greyhound and race-horse into competition. A match was to have been run over Doncaster course for one hundred guineas, but one of the horses having been drawn, a mare started alone to make good the bet, and after having gone the distance of about a mile, a greyhound bitch started from the side of the course, and ran with her the other three miles, keeping nearly head to head, which produced a singular race, and when they arrived at the distance-post, five to four was betted on the greyhound; when they came to the stand it was even betting. The mare won by about a head.

"In February 1800, a brace of greyhounds in Lincolnshire ran a hare from her seat to where killed, a distance, measuring straight, upwards of four miles, in twelve minutes: during the course there was a great number of turns, which very considerably increased the space gone over; the hare ran herself dead before the greyhounds touched her; this extensive course, in so short a time, is a strong proof of the strength and swiftness of the hare. Horses have been as much distressed in keeping up for their riders to see a course, as in much longer chases with hounds. The compiler recollects a hare being found close to the town of Bottisham, in Cambridgeshire, and which took away for the six-mile bottom, twenty two horses started, but only one could make a gallop at the conclusion of the course; the hare (who was within fifty paces of the cover) was dead some yards before the greyhounds, who were obliged to be bled to recover them."

\* \* \* \*

"The uncommon ardour and velocity of greyhounds have often occasioned their destruction. An instance happened many years since to a famous dog of the Rev. Mr. Corsellis, who chanced to be wind-bound at Dover. A hare in the neighbourhood had beat all her pursuers until this attack, when the dog was so superior to her in speed, and pressed her so close, that she ran for the cliff as her only chance of escaping; but the greyhound threw at, and caught her at the brink, and went with the hare in his mouth to the bottom of the precipice, where they were both literally dashed to atoms."

ANN. REV. VOL. II.

The first volume concludes with brief accounts of the rabbit, martin, badger, and otter.

The second volume, in compliance with a prevailing modern custom, is divided into two separate parts: a custom which, in our judgment, would be "more honoured in the breach than the observance." It cannot but be peculiarly displeasing to a naturalist, who loves to distinguish by appropriate characters all objects which bear different names. As matters are now ordered, we are utterly unable to determine in what the essential difference between a volume and a part of a volume consists.

The first part of the second volume, if part it must be called, is devoted to the calm and sober amusement of fishing in fresh waters. In every respect unlike the fox-hunter, the hare-hunter, or even the courser, the angler takes his solitary stand, and sometimes remains for hours together almost fixed to the same spot. Mr. Daniel, whose passion for the country and its amusements knows no bounds, notwithstanding his indifference to hare-hunting, which he probably thinks neither one thing nor the other, can steal along the verdant bank with the stillness of patient expectation, as well as follow the music of the cheerful horn and sweet-toned hound over ditches and five-barred gates. He speaks of both with the fondness of an amateur, and relates achievements in each.

—quorum pars magna fuit.

In this as well as the former section of the work, the preceptive part is preceded by a dissertation on the external form, inward structure, and general œconomy of fishes. Here also he appears chiefly in the character of a compiler; and though he has made extracts from various authors, he has drawn most of his materials from a *System of Natural History*, in four volumes, printed at Edinburgh in 1792; but, contrary to his usual practice, has often transcribed the language of the anonymous author, without once referring to his work.

A detailed description of the rivers of Great Britain and Ireland follows; but we know not for what reason or with what use. Its connection with the immediate subject of the work is too general to excite any lively interest. The geographer knows its value when accurate and complete; but a fisher on the

banks of the Thames, or the midland Ouse, cares little about the meanders of the Forth, the furious rapids of the Spey, or the majestic flow of the Shannon. To the naturalist, a full and particular account of the different kinds of fish, which are nearly peculiar, or most abundant in any stream, would be highly acceptable and gratifying; but for such a work only scanty materials are as yet to be found. Our author's information on this head is by no means discriminative or abundant. Thus under Bedfordshire all that we are told is, that the Ouse is a good river for trolling, and produces (as does the Hyee and the Ivel) pike, perch, fine eels, and common fish in abundance; and under Buckinghamshire, that its rivers produce trout, and good fish of other sorts. With respect to the last sweeping article, we may safely ask, what river does not?

Nor can we afford greater praise to the general execution of the design. Instead of following the course of nature, and tracing a river from its source to its mouth, he has followed the divisions of the counties; and, to make the confusion still greater, has arranged the counties in their alphabetical order. The same river is consequently often mentioned several times, and at the distance of several pages.

This total want of all real order has betrayed him into several considerable, and some laughable errors. He tells us, for instance, as a curious circumstance, that "crayfish will live in no stream which does not run towards the south. The gentleman," he adds, "who favoured me with it, has tried to stock, and it invariably happens that they disappear from waters that run in opposite directions, however apparently well adapted, from having plenty of their favourite food, water-cresses, &c. In confirmation of this remark, the rivers of Surrey have no crayfish, while those of Sussex abound with them." This would indeed be a curious circumstance, if the fact were well ascertained. But to destroy its credit at once, as far as it rests on the authority of the present work, it is attached as a note to the article Berkshire, the rivers of which, Mr. Daniel assures us, abound in crayfish; and who does not instantly perceive that the Berkshire rivers have the same direction as those of Surrey, and that as they fall into the Thames by its right bank, their course must, upon the whole, be to the north?

But this is by no means the most striking blunder into which our author has fallen through his inattention to the connected geography of the country. Confounding the two Loch-levens with each other, and connecting them in his ideas with the river Leven, which has no actual connection with either, but discharges the waters of Loch-lomond into the Clyde at Dunbarton, he has removed the fresh water Leven, with its celebrated island, in which the unhappy queen of Scots was confined, from the neighbourhood of Kinross, on the eastern side of Scotland, to the north of Argyleshire; and that its waters may not flow with those of its salt-water namesake into Loch-linnhé, he has compelled them to run over a ridge of mountains into the Loch-lomond river Leven, and delivered them to the care of the Clyde. Compared with this mighty achievement, the labours of Hercules are the sports of a child. It is, however, not altogether without example in modern times. A pedestrian traveller had, some years before, conveyed the river Dee over the mountains of Snowdonia, from Bangor, in the detached part of Flintshire, to Bangor in the county of Carnarvon; and instead of suffering it to run in its ancient channel by the walls of Chester into the æstuary which had, time out of mind, borne its name, had forced it into the waters of the Menai.

When this book of rural sports comes to a second edition, as we doubt not it soon will, Mr. Daniel will do well to write the account of rivers over again; or, as we should think more adviseable, entirely to expunge it.

In the progress of the work, the practical angler will receive much valuable information with respect to his rods and lines, his floats, his hooks, and his baits, both natural and artificial, which are described at great length and with great clearness; as also the particular times and modes in which the different kinds of fresh-water fish are to be caught. The directions are taken partly, of course, from old Walton, and partly from more modern authors: the descriptions of the different species, sometimes from Pennant, sometimes from the Scotch System of Natural History, and sometimes from the Elements of Natural History, printed also at Edinburgh, and reviewed in our first volume. But the author himself has furnished much original matter, and has enlivened the dryness of didactic and de-

scriptive detail, by intermingling with it numerous amusing and well authenticated anecdotes. The following account of the tench will, we are confident, be equally acceptable to the naturalist, the epicure, and the lover of wonders.

“The tench does not commonly exceed four or five pounds in weight: Mr. Pennant says he has heard of one that weighed ten, and Salvianus speaks to some that weighed twenty pounds: it is thick in proportion to the length; the scales are very small and covered with slime; the eyes are large, and of a gold colour; the irides are red; he is leather-mouthed, and sometimes there is a small barb at each corner of the mouth; the colour of the back is dusky, and dorsal and ventral fins of the same hue, and those of the male much bigger than those of the female; the head, sides, and belly of a greenish cast, most beautifully mixed with gold (especially those taken in rivers) which is in its greatest splendour when the fish is most in season; the tail is quite even at the end, and very broad.

“The tench loves still waters, and their haunts in rivers are chiefly among weeds, and in places well shaded with bushes or rushes; but they thrive best in standing waters, where they lie under weeds, near sluices, and at pond heads; they are much more numerous in pools and pits than in rivers, although those taken in the latter are far preferable; they begin to spawn in June, and may be found spawning in some waters till September; their best season is from that period till the end of May.”

\* \* \* \* \*

“Tench are said to love foul and weedy more than clear water, but situation does not always influence their taste; the compiler has taken tench out of Munden-hall Fleet, in Essex, belonging to Mr. Western, which was so thick with weeds, that the flews could be hardly sunk through them, and where the mud was intolerably foetid, and had dyed the fish of its own colour, which was that of ink, yet no tench could be better grown, or of a sweeter flavour; many were taken that weighed nine, and some ten pounds the brace; and the skull and back bone of one preserved at the Hall, which was found dead by the side of the water, when compared in length to any of those beforementioned, must have nearly doubled its weight. In a pond at Leigh's Priory, the compiler caught a quantity of tench weighing about three pounds each, of a colour the most clear and beautiful: but when some of them were dressed and brought to table, they smelt and tasted so rankly of a peculiar weed, that no one could eat them; some that were conveyed alive, and put into other water, soon recovered themselves from this obnoxious taint; an experiment that will always answer in this kind of fish, where it is suspected that there

is a necessity for cleansing them; and the above circumstance is recited to shew, that no decisive judgment can be formed from the external appearance of the tench, however prepossessing it may appear.

“The tench that has occasioned most animadversion, is that which the engraving represents; the unusual size and form are alike impossible to be accounted for; its bulk perhaps exceeds that of any one ever known to be an inhabitant of the most extensive waters of this country, and the shape, which seems to have accommodated itself to the scanty space allotted for its residence, together stamp it a *lusus naturæ*. Its history is, that a piece of water, at Thornville-royal, Yorkshire, which had been ordered to be filled up, and wherein wood, rubbish, &c. had been thrown for years, was in November 1801 directed to be cleared out. Persons were accordingly employed, and almost choked up by weeds and mud, so little water remained, that no person expected to see any fish, except a few eels; yet nearly two hundred brace of tench, of all sizes, and as many perch, were found. After the pond was thought to be quite free, under some roots there seemed to be an animal, which was conjectured to be an otter; the place was surrounded, and on opening an entrance among the roots, a tench was found of most singular form, having literally assumed the shape of the hole, in which he had of course for many years been confined. His length from fork to eye was two feet nine inches; his circumference, almost to the tail, was two feet three inches; his weight eleven pounds nine ounces and a quarter; the colour was also singular, his belly being that of a char, or a vermillion. This extraordinary fish, after having been inspected by many gentlemen, was carefully put into a pond; but either from confinement, age, or bulk, it at first merely floated, and at last with difficulty swam gently away. It is now alive and well.”

For the gratification of another class of readers, we shall select a shorter article.

“In this country many acres of swampy, moorish grounds, producing little feed for cattle, and, in the present state, a trifling rent, might be profitably converted into fishponds, particularly within thirty or forty miles of the metropolis. An acre of water, after being two years stocked, will annually yield two hundred carp, and one hundred tench, that will sell upon the spot to the London fishmongers at a shilling each; an income to be obtained from no other produce to which such sort of land can be appropriated.”

The last part of this work is devoted to the pleasures of the gun, as far as they have for their object the pursuit of the feathered tribes; for, we believe, our author would esteem it a sin, little inferior,

in point of moral turpitude, to a breach of one of the ten commandments, to shoot a hare. It is introduced, like the preceding parts, by a view of the general character and habits which distinguish the order of birds. The author then particularizes the bustard, the pheasant, the common and red-legged partridge, the cock of the wood, the black cock, the moor cock, or, as it is more commonly called in the north of England, moor game; giving descriptions of each from Pennant and others, and adding liberally from the stores of his own personal knowledge.

The history of these birds, and of those which are not protected by the game laws, and which are known to sportsmen by the general name of wild fowl, would afford matter for copious extracts, equally curious and pleasing; but we are persuaded that we have already given enough to excite a desire of possessing the whole; and we heartily recommend the volumes of *Rural Sports* to a place in the great hall or dining-room of every country squire in the kingdom. They will operate as medicines to the mind, when the badness of the weather forbids those masculine pursuits which prevent the want of physic for the body: they will save a long frost from many a bitter curse; and will lighten the service of the whole household, from the butler to the scullion, from the huntsman to the stable-boy, by keeping their master in good humour.

Under every division of the work, that nothing may be wanting for the direction of the sportsman, the various laws which have been made from time to time for the preservation of game, are distinctly and chronologically specified, with the addition of a few adjudged cases. The account of the old forest law is particularly full.

We had almost forgotten to notice, what we ought by no means to omit, the admirable engravings by which the descriptions of the quadrupeds, fishes, and birds mentioned in the work, are illustrated. As natural history figures, many of them have uncommon merit. The fishes, in particular, we are obliged, though reluctantly, to prefer to those of Mr. Heath in the fourth volume of *General Zoology*. There is also in many cases an expression of character and spirit which shews the hand of a master. In this last respect, the terrier and fox, the snared hare, the

wounded pheasant, the covey of partridges, the brood of partridges, the setter and black grouse, the old English setter, and Pluto and Juno, are eminently excellent. The figure of the tench caught at Thornville royal is valuable on account of its singularity.

Notwithstanding we have already transgressed so much, we cannot deny ourselves the satisfaction, nor Mr. Daniel the justice, of letting him make his own bow to the readers of our Review, as well as to the rest of the British public.

“The compiler here closes his labours. On the various topics which he has undertaken to treat, he has endeavoured to direct the attention to whatever he thought of sufficient importance to repay, or of tendency to amuse it. In selecting this information, he found his work grow upon him, and it has, in consequence, considerably exceeded its intended bulk. Some particulars, which he did not originally design to touch upon, he afterwards found to be so intimately blended with the main purport of the book, that the total omission of them would have left it defective.

“In the most common pursuits, as well as in the most complicate science, there is a certain previous knowledge requisite, to enable us to prosecute them with facility and success. Without some such knowledge, even the pastimes of the field will rarely compensate the time and trouble expended upon them. This knowledge it has been the compiler's aim to impart. His instructions have been drawn from writers of the greatest merit. Whenever he has ventured to differ or to doubt, he has done so from the teachings of actual experiment; opportunities of intercourse he has enjoyed with the best judges; his own means of intelligence have been considerable; and the implements he has himself recommended have undergone repeated and successful trials.

“Of the subject itself, which has engaged his researches, he has only thus much to remark. The diversions of the field have been not seldom regarded as the resources of vigorous idleness and intellectual vacancy; they have been condemned, as unconnected with that dignified activity of mind which explores the tracks of science, and extends the empire of reason. But must every amusement be renounced which does not contribute to expand our understanding? It is a cynical and sickly philosophy, which would decri any recreation, which neither pollutes the manners nor hurts the mind. The pursuits of the sportsman lure us from the smoke of cities to the healthful breezes of the forest, and the animating enjoyments of the field; neither is it true, that they are so closely allied to stupefaction, as some censors would persuade us. The man of moral feeling and lively fancy may, in the midst of such pursuits, indulge

them to the utmost. "There is no one," (says the eloquent Zimmerman) "who may not, by quietly traversing the mountains with his gun, learn to feel how much the great scenes of nature will influence the heart, when assisted by the powers of the imagination. The sight of an agreeable landscape; the various points of view which the spacious plains afford; the freshness of the zephyrs; the beauty of the sky, and the appetite which a long chase procures, will give energy to health, and make every new step seem too short. The privation of every object that can recal the idea of dependence, accompanied by domestic comfort, wholesome exercises, and useful occupations, will add vigour to thought, and inebriate the heart with the most delicious sensations." Where, indeed, hunting and the pursuit of a game form the sole employment of people, it tends naturally, and almost inevitably, to give a coarseness, and rusticity to the character; but there is no danger of this in modern times. Such recreations, on the contrary, may serve to temper the polished effeminacy of the age, and to prevent its degenerating into a too soft and artificial urbanity. The magistrates in the Greek republics encouraged a taste for music among the citizens, as contributing, by its harmony, to allay the ferocity inspired by gymnastic and military exercises. In modern Europe, there is more need of caution, lest all the more boisterous and manly diversions should be exploded, and there be nothing left to counteract the emasculating tendency of our luxurious and fashionable manners.

"Of the laws made for the protection of game we have before spoken. Much has been at various times said respecting the severity of great landed proprietors towards their humble tenantry; and examples of individual oppression have been adduced, in proof of the complaint alledged. It is too true that men invested with power do not always use it with discretion: we are but too apt to be more attentive to our own pleasure than to our neighbour's peace; but still, we believe, that the instances of the extreme exertion of the power involved in the exclusive right to kill game, have been greatly exaggerated. It is indeed to be regretted, that in any, even in a single case, the game laws should be perverted from the rational objects which occasioned their introduction: should any such instances arise by an adherence to the letter, they can never occur without an infringement of their principle. Those who derive a peculiar advantage by any legislative ordinance, ought to be careful so to employ it, as not to harass the excepted part of their fellow-subjects. It is the particular duty of such persons to act with an eye to the true spirit and intention of the laws which regulate the pursuit of game: and to remember, that, although they reserve to them an exclusive participation of rural sports, they confer no right to infringe the privileges, or interrupt the happiness, of even the humblest classes of the state."

We have only to add, what a Roman actor might, but a modern writer must not, say for himself,

Valete & plaudite.

ART. III. *Testacea Britannica; or, Natural History of British Shells.* By GEORGE MONTAGUE, F. L. S. 4to.

THOUGH in our last volume we had not the satisfaction to give Mr. Montague unqualified praise, we are truly glad to meet with him again. He is too valuable an acquaintance to be willingly lost, and we rejoice to find that he now presents himself before the public in a better form and dress, so as to make his communications both more instructive and more pleasing. He has exchanged the alphabetical for the scientific arrangement, and enables us to perceive at once with clearness and accuracy, how far that branch of natural history which he has undertaken to illustrate, has advanced under his hands. His style too is much more pure and perspicuous. It is, indeed, still blemished by a few negligences, which a very little care would easily have prevented: but in general it has that simplicity which is suited to his subject, and is such as a man naturally writes, when he is in full possession of

his subject, and gives the produce of his own observation and reflexion.

Conchology, we readily confess, is that part of natural history which has always appeared to us the most embarrassing and the least instructive. It is well known that Linnæus himself engaged in it with reluctance, and looked upon it as a degradation of science. It was, he thought, absurd to dignify the habitation, with the form and apparatus of classification and description; and to pass over, or slightly notice, the living inhabitant. The desire of completing his system at length overcame his scruples. The beauty of shells is so generally admired, that they will always occupy a distinguished place in public and private museums: and as the impossibility of meeting with the greater part of them in a recent state, must have damped, if it did not altogether extinguish, the hope of distributing them into general and

subordinate families, from prominent characters in the animals themselves, nothing remained but to observe the different forms of these external coverings, and to examine how far they were capable of being reduced to some kind of regular order.

Mr. Montague has adopted the Linnæan arrangement, with a few variations and improvements; and if it be not supereminently the best, it appears to be as natural and easy in practice, as any which has hitherto been formed. But though with Linnæus he has taken his generic characters from the form and structure of the shells, he has by no means lost sight of the animal inhabitants. Indeed, whenever it is possible, they should always be considered as strictly and naturally connected. The shell is not merely the habitation of an organized being: it is part of the being itself; formed from its substance; inseparably attached to it while it continues to live, and powerfully affecting its general habits and œconomy. We may, therefore, justly presume that the form and structure of the one will afford the best key to the essential characters of the other. It is acknowledged that "few of the Linnæan genera of testacea are wholly inhabited by the same animal." Nor is it at all surprising that two professedly artificial distributions, founded exclusively on separate and those far from primary characters, should not perfectly coincide. To form a truly natural arrangement, the conchologist must look beyond the outline of an aperture and the construction of a hinge: he must investigate the natural connection of a multivalve, of a trivalve, and of a univalve structure; of a fixed and of a moveable position; of a turbinated and not turbinated form, with a peculiar inward physiology and an external mode of life. Such an analogy will, we doubt not, one day be found: and though the complete discovery may be far distant, every step towards it, and every attempt to make the first step, is worthy of praise, and will not be without its due reward. Linnæus has referred most of the testaceous vermes to some of the genera of his order mollusca, or vermes without a testaceous covering; and tho' he was far from supposing that each of his artificial genera of shells had a peculiar corresponding mollusca, he seems to have taken it for granted, that all the species of each particular genus are of the same kind. To his two genera of

multivalves, chiton and lepas, he has assigned respectively the doris and the triton. Of the bivalves, he has assigned to the pholas, the mya and the solen, an ascidia; and also to the mytilus, but with a mark of doubt: to the tellina, the cardium, the mactra, the donax, the venus, the spondylius, the chama, and the ostrea, he has assigned a tethys; and also to the arca, but with a mark of doubt: to the anomia, an unnamed mollusca, and to the pinna, a limax. Of the univalves, he has assigned to the argonauta, a sepia; to the nautilus, an unnamed mollusca; to all the rest, except the dentalium, the serpula, the tereedo, and the sabella, a limax; to the three former of these, a terebella; and to the last, a nereis. With the generic characters of these, translated from the *Systema Naturæ*, Mr. Montague has very properly introduced his work, and has added the spio and the amphitrite, formed since the time of Linnæus. He has also subjoined Muller's arrangement of univalve testacea by their several animals.

In the genus chiton, Mr. Montague has added to those of Pennant in the *British Zoology*, and of Da Costa, the cinereus, the albus, and the fascicularis of Linnæus; and the septemvalvis, a nondescript: but has given no information with respect to the animal.

The genus lepas, Mr. Montague, following Dr. Pulteney, has divided into two, as not possessing any similitude, except in that of the animal inhabitant. Those of the sessile kind he terms balanus, and continues the pedunculated ones under their original title. The new British species of balanus are the rugosus of Pulteney; and the conoides of Donovan. To the anatifera, the only proper species of lepas in Pennant, are added, the anserifera and scalpellum of Linnæus, the fascicularis of Ellis, and the sulcata, a new and elegant species found on *Gorgia Flabellum*, near Portland Island.

The lepas seems a connecting link between the balanus and the mollusca genus triton, the only known species of which inhabits the clefts of submarine rocks. The animals in all the genera are fixed, and appear to have the same general habits, the approximating sides of the rock affording to the triton litoreus a defence, and performing the office of a shell.

The pholas has received no addition to Pennant's British species, but the striatus

of Linnæus; and it is doubted whether it is an original native of our coasts, or become naturalized in consequence of being brought by ships from southern climates. Like all its congeners, it is a borer, and, in conjunction with the *teredo navalis*, effectually destroys the planks of a ship; the *pholas* perforating across the grain, and the *teredo* insinuating itself with the grain.

The addition to Pennant's and Da Costa's British species of *mya*, are, the true *pictorum* of Linnæus, found hitherto in England only in the river Kennet, above Newbury in Berkshire; the *pictorum* of Pennant, Lister, Da Costa, and Donovan, being a different species, not described by Linnæus, is called by Mr. Montague *ovalis*, the *inæquivaivis* of Walker: the *prætenuis* of Pulteney: and the *suborbicularis*, the *distorta* and *bidentata*, *nondescripts*. The first is found in hard limestone at Plymouth, and is dredged up in Salcomb-bay, detached from any other substance, so that it seems to be a borer only when it finds limestone: the second is found also in limestone at Plymouth: the third is of a doubtful genus, but as it is more nearly allied to the *mya* than any other, it is placed there for the present.

As a specimen of Mr. Montague's easy and perspicuous manner in his descriptions and critical remarks, we shall extract his account of the *mya dubia* of Pennant, with the interesting information contained in his appendix.

#### I. PHOLADIA.

*Mya Dubia*. Br. Zool. t. 44. f. 19.—Turt. Lin. iv. p. 179.

*Chama Parva*. Da. Costa. p. 234.

*Pholas Faba*. Pult. Cat. Dorset. p. 27.

"M. with a thin, brittle, opaque shell, of a light colour, and oval shape, marked with fine concentric striæ: the beak is small, but prominent, placed at one end: the valves when shut, have a large oval gape or opening in front, opposite the hinge. Inside white: hinge furnished with a small plate, or rudiment of a tooth, projecting inwards.

"There seems to have been various opinions with respect to the class in which this shell should be placed.

"Mr. Pennant, who first gave it to the public, met it in the Portland cabinet; and seemed to be doubtful with regard to the genus in which it ought to be placed, by the trivial name of *dubia* he affixed to it.

"Da Costa has placed it with his *chama*, which consists chiefly of Linnæan *myæ*. Dr. Pulteney has made it a *pholas*; we presume under the authority of Dr. Solander. It does not however appear that there ever were sufficient grounds for placing it in the *pholas* genus. Even Dr. Pulteney himself remarks, that he has seen several of these shells, but had not seen one with the accessory valves, the essential part of the character of that genus.

"Mr. Pennant and Da Costa mention its possessing a tooth, or the rudiment of one. This circumstance perhaps has more inclined us to fix it in the *mya* genus; others may perhaps hereafter remove it to the *mytilus*; for the small elevation of the hinge is scarcely to be denominated a tooth."

"Plentiful at Torbay, in fragments of limestone, driven on shore by winter storms, but is not to be found in the rocks, which are ever uncovered by the lowest ebb tides; and of course is rarely obtained alive: in this state, however, we have procured it, and proved beyond doubt, that it cannot belong to the *pholades*, as it is void of accessory valves.

"The perforations, in which these shells are concealed, are sometimes lined with concreted, calcareous substance, closely connected with the rest of the stone, and equally hard, composed of several coats, or laminae, of a different texture, not unfrequently half a line, or more, in thickness: the openings to these chambers are small, and have somewhat the appearance of two holes broken into one, which is adapted to the shape of the tubes of the animal.

"The inhabitant is an *ascidia*, with two very long, slender, white tubes, exceeding the length of the shell; these are connected together their whole length, but terminated by two orifices, ciliated with fleshy fibres, of a dark purplish-brown: the body is also white; near the posterior end is a foramen, through which, a small foot, or sustentaculum, is sometimes protruded, and doubtless the apparatus, which assists in perforating rocks, being always placed in its cell with that end downwards, and incapable of turning.

"It is probable this, as well as all other similar animals, whose habits are to perforate stone, are provided with an acid, or some solvent menstruum capable of performing that office: it must also be recollected, that this, seemingly laborious task, is not affected in any given time, but is the work of years; as the chamber for the lodgment of the animal only requires enlarging as the shell grows.

"Stone of a vitrifiable nature, is impenetrable to these animals, but all such as are wholly, or even partly calcareous, are more or less attacked; and while this, the *mytilus rugosus*, *donax irus*, *venus perforans*; and

\* This remark might be attended with considerable national advantage, if pursued with experimental application, under the direction and encouragement of Government. A coating of pounded flint, or glass, laid on timber with a firm cement, would effectually preserve it from the calamitous ravages of the *teredo navalis*, and other animals of similar habits.

some others, are destroying the hardest lime stone; the pholades are performing similar works, assigned by nature, on softer substances, such as chalk, indurated clay, and wood, which in like manner are perforated by some solvent power; not by the thin, fragile shells; that cover such animals, as some have erroneously asserted, and is too generally credited. All these become fixed in their cells for life, for as they enter in the most minute state, the excavations are conic, with the small end outwards, so that the shells are as it were become enclosed.

"It is most probably, the young of these, and other perforating ascidiæ, that drill the small round holes so frequently observed on shells; and not the trochi, which are incapable of such works."

We have only to observe, that in the second paragraph, instead of *class*, Mr. Montague should have said *genus*. With respect to its class and its order, there has been no difference of opinion.

To the genus *solen* are added the minutus of Linnæus, a rare British species found burrowed in land limestone at Plymouth: the fragilis of Pulteney: the squamosus, the pinna and the novacula, nondescripts; the latter in every respect like the siliqua, except in the hinge, which is furnished with one strong blunt curved tooth in each valve at one end, destitute of lateral-laminæ: these teeth turn contrary ways, and when closed clasp or hook into each other. As the cultellus of Pennant is certainly not that of Linnæus, it is here called antiquatus, the name given it by Solander in the Portland cabinet. Pennant, Da Costa, and Pulteney, have all erred in giving it but one tooth in each valve; whereas in one valve it has two, into which the single tooth of the other closely locks; but they are brittle, and easily destroyed.

The alterations and additions in the genus *tellina* are numerous. The incarnata of Pennant, the ferroensis of Pulteney, the radiata of Da Costa, and Lister, and the trifasciata of Donovan is called fervensis, its trivial name in Gmelin and Turton. The donacina of Linnæus is supposed to be the trifasciata of Pennant. The planata of the British Zoology, and Turton, the polita of Pulteney, &c. is called tenuis after Da Costa and Donovan. The carnaria of Pennant is supposed to be the incarnata of Linnæus. The additions are, the lactea, the carnaria, and the inequalvis of Linnæus: the remies? and reticulata? of Linnæus, called fausta and proficua after Pulteney: the striata, and the fabula, of Gmelin: the squalida and læta

of Pulteney; (depressa? and punicea of Gmelin: the maculata of Adams:) the rotundata (undata? Pulteney) and the flexuosa, a variety of which is erroneously given by Donovan as the venus sinuosa of Pennant.

The additions to *cardium* are the aculeatum and the medium of Linnæus: the exiguum (pygmæum of Donovan and Turton): the discors (tellina pisi-formis?) the amnicum (tellina amnica of Gmelin, rivalis of the Linnæan Transactions, &c.), and the lacustre (tellina lacustris of Gmelin, &c.): the rubrum and muricatum described by Walker: the nodosum, the elongatum, and the arcuatum, nondescripts. The animal of the corneum, the amnicum and the lacustre, all fresh water species, is an ascidia with a long tongue-shaped foot, by which it moves backwards by jerks, dilating and contracting it alternately. They are all viviparous, and are probably either androgynous or hermaphrodite, as all those which Mr. Montague dissected early in June contained perfect young.

Under the genus *Macra*, several errors of former authors are corrected. Pennant has mistaken the true *macra stultorum* of Linnæus for his *tellina radiata*; and has given for the *macra stultorum*, a shell which has generally been supposed a variety of the *solida*, here made a new species, and called *subtruncata*. He has also taken a shell not known to Linnæus for his *venus borealis*. It is the *macra listeri* of Gmelin, &c., the *tellina plana* of Donovan, *compressa* of Pulteney's catalogue, which latter name Mr. Montague adopts. The animal has "two slender tubes placed near, together at the anterior end; one, about three inches long, is continually thrown about in search of food, such as insects, which may be seen passing up this transparent syphon, with the current of water it is continually taking in, and discharging at the shorter tube, placed nearer the hinge; retaining only the nutritious matter: but it occasionally ejects the superabundant waters from both tubes." The *macra lutraria* of Linnæus, and the *hians* of Pulteney, and the *Lin. Trans.* having been confounded, the difference between them is clearly described by Mr. Montague. The animal of these two species is not a tethys but an ascidia. The additions are the *glauca* of Donovan, the *dealbata* (pellucida Gmel.), the *boysii* (alba of Mr. Wood. *Lin. Trans.*), the *triangularis*, and the *tenuis*, nondescripts.

Under the genus *donax*, the additions are the *complanata* and the *plebeia*, noticed before only by Lister; and the *castanea*, a nondescript. The error of Pennant in calling the *donax irus* of Linnæus, *tellina cornubiensis* is also rectified. This species perforates the hardest lime stone. Its animal inhabitant is an *ascidia*, and not a *tethys*; which is probably the case with most which perforate other bodies.

The additions to the genus *Venus* are the *paphia*, *pectunculus fasciatus* of Da Costa; the *tigrina* of Linnæus: the *granulata* of Gmelin: the *pullastra* of Mr. Wood: the *minima*, the *subcordata*, the *triangularis*, the *spinifera*, and the *perforans*, nondescripts. Pennant's *erycina* is determined to be the *verrucosa* of Linnæus; his *rugosa*, the *galina* of Gmelin and our author's *striatula*; his *mercenaria* the *islandica*, and not the *mercenaria* of Linnæus, which is the wampum of the American Indians, and has not been found on our coasts; and his *litterata*, the *decussata*.

The *chama* is rendered a British genus, for the first time, by the insertion of the *chama cor*, found about the Hebrides.

Under the genus *Arca*, the *glycimeris* of Pennant is referred to the *pilosa* of Linnæus on the authority of Pulteney; the *barbata* to the *lactea*, in opposition to Pulteney; and the *tortuosa* to the *noæ*. The *minuta* of Gmelin is the only addition.

The genus *ostrea* is divided into two, after Pennant and others; those which are aurited being separated from the rest under the generic denomination of *pecten*. A difference also is pointed out in the hinge, that of the *pecten* having a small sub triangular, that of the *ostrea*, a transverse, striated cavity.

The *lineatus*, first noticed by Dr. Pulteney, and sent by him to Da Costa, is the only addition to Pennant's species of *pecten*. His *subrufus* is referred to the *opercularis* of Linnæus.

The *ostrea striata* of Donovan, first noticed by Lister, is in the body of the work, added to the *edulis*, the only species in Pennant, but in the appendix is removed to the genus *anomia*. Mr. Montague has recently taken alive a few large and strong specimens, adhering to old bivalves.

The *aculeata* and *undulata* of Gmelin are the only additions to the genus *anomia*. The *squamula* is supposed to be

the young of the *ephippium*, and the *cepa* not to be distinct from it.

To the *mytili* of Pennant are added the *crista galli* and *discors* of Linnæus; the *avonensis*, which seems to have been described by Lister; the *striatus* from Walker; the *ungulinus* of Donovan; and the *præcisus*, resembling the *solen minutus*, and the *discrepans*, nondescripts.

The following original observations annexed to this genus will give pleasure to our readers.

"We shall here take the liberty of remarking, that very great attention is requisite to discriminate some of the minute bivalve shells, and separate them from the bivalve *monoculi*.

"The great affinity that the coverings, or shells, of some of this class of insects, bear to the *testacea* tribe, has in all probability caused many to have been considered as small species of *mytilus*, or the fry of larger; for many such *monoculi* are capable of shutting their valves intirely, and inclosing every part of the animal: in which state they always are when dead, so that it is no easy matter to discriminate.

"Mr. Walker is not the only one who has fallen into this error, in his figures 76, 77, and 78, all of which we have received from Sandwich, and have found them in other parts.

"The first is found in fresh-water, and is not much unlike *monoculus conchaceus*, Gmelin Syst. p. 3003, but is longer, in proportion to its breadth, than the figure given of that insect by Donovan, British Insects, i. t. 5.

"The other two, given by Mr. Walker, are marine *monoculi*; both found on oysters, and other rugged shells: and is not uncommon on the coast of Devon: especially No. 77, about the byssus of the *pinna ingens*: both these appear to differ only in shape, and do not seem to have obtained a place amongst the *apterpus* insects. When examined under a microscope, the shells are punctured all over.

"To these supposed *mytili* of Mr. Walker, we may add the *monoculus conchaceus*, which has been sent to us for such; and we could enumerate many others, which inhabit both salt and fresh-water, that might readily be mistaken for minute shells: one of which is figured in Tab. 14 No. 8. of this work by mistake, not having an opportunity of examining the animal till after the plate was engraved.

"This and another species of *monoculus* in every respect like it, but of a longer and more cylindric shape, is found on oysters on the south coast of Devonshire; and on the byssus of the *pinna ingens*; a general repository for *monoculi* and very minute shells, especially *nautili* and *vermiculi*.

"These two species of *monoculus* are extremely smooth and glossy, of a blush-co-

lour when alive, or fresh, and opaque yellowish-white when dead; and are distinguished from any other, by the remarkable sinus in front, near the end, through which is a groove or channel; but this perforation is only to be distinguished when the valves are laid open. Had Gmelin made any mention of this singular structure, we should have been inclined to think these were his *M. luteus* and *M. flavidus*:\* but as we have not at present an opportunity of consulting the figures of those insects given in Muller, must leave the matter to be decided by entomologists; craving pardon for this digression.

"We cannot however quit the subject without remarking, that the surest distinction between the shells of the bivalve monculi and the minute bivalve testacea is, that the latter always, more or less, possess some concentric wrinkles or annulations of growth, as well as some appearance of umbo or beak: such therefore, which are destitute of these marks, may with confidence be referred to the former.

"If any such doubtful objects are put into water, even after the animal has been long dead and dried; and when softened, the valves carefully opened with the point of a fine needle, and afterwards put into a drop of water under a microscope; the antennæ and legs will soon appear, if a monoculus."

Linnæus, on the authority of Hasselquist, calls the animal of the pinna, a limax, to which it has not the smallest affinity. It appears more nearly allied to the animal of the mytilus, which is called by Linnæus an ascidia with a mark of doubt. It seems to be entirely destitute of locomotion, being immovably fixed by its byssus to other bodies. The muricata of Linnæus is added to the two former British species. The genus nautilus, the second of the Linnæan univalves, was not admitted into the British Zoology. A number of minute species have since been discovered by Walker and others, some known to Linnæus and others not. Mr. Montague has given 16 species.

The animals of all the 12 following univalves are said to be a limax, but, as Mr. Montague observes, "the greater part of them do not correspond with the definition of the mollusca animal. It is well known that most, if not all, fresh water, as well as most marine univalve shells are inhabited by an animal possessed of only two feelers, destitute of eyes at their tip, but (*having them*) placed at their base, varying in situation in different subjects. But besides this difference, the circumstance of the aquatic testacea, be-

ing inhabited by animals of different sexes, and not hermaphrodites, as in the mollusca limacis, have not been sufficiently attended to. It will be found also that some are viviparous, and others oviparous: and it is remarkable that all those with four tentacula, whose eyes are placed at the summit of the two longest, are hermaphrodite, and are all land species. Those with two tentacula, and their eyes situate on the head, are of different sexes, and except two known species at present (*turbo elegans* and *carychium*) are all aquatic.

"That the Linnæan limax ought to be divided there cannot be the least doubt; but we cannot agree with Muller, that it is capable of forming so many genera, by the mere circumstance of the eyes being placed a little more or less behind, or on one side of the tentacula. There seems, however, to be two strong natural divisions: first, those with ocellated tentacula; and second, such as have their eyes situated on the head: each of which might again be divided into two families; thus,

### 1 LIMAX.

"Body oblong, creeping, with a longitudinal, flat disk, or sustentaculum, beneath; foramen, or aperture, most usually placed on the right side: tentacula ocellated.

"Terrestrial hermaphroditical.

"\* Tentacula four: eyes two, placed at the summit of the two longest.

"\*\* Tentacula two.

### 2 LUBRICA.

"Body oblong, creeping, with a longitudinal flat disk, or sustentaculum, beneath; foramen, or aperture, most usually situated on the right side: tentacula not ocellated: eyes two, placed on the head. Mostly aquatic, and of different sexes,

"\* Tentacula, or feelers, four, one of which is plumose.

"\*\* Tentacula two.

"To the first division of the limax would belong all the mollusca tribe usually termed slugs: of these the limax cinereus and agrestis, Gmelin p. 3100, and p. 3101, appear to be the link between the testacea and mollusca, (being possessed of a shelly substance under the shield upon the back,) connecting these land animals together; as some of the marine bullæ do that of the aquatic: bulla aperta, haliotoidea, and plumula, equally conceal their shells.

"The circumstance of some of the naked limaces possessing a shell internally, the anatomical enquiries of Swammerdam and Lis-

\* The antennæ indeed of the one figured in this work was not simple, but composed of several bristles.

ter could not overlook; both these authors have described and figured it.

"That these animals therefore belong as much to the vermes testacea as many of the bulla, there is no doubt; but it was not thought necessary at present to form a new genus on purpose, for a shapeless shell of irregular growth.

"It is usually somewhat oval, sometimes flat and thin, with a membranaceous margin; others are half as thick as they are broad, and rarely possessed of any concavity: colour silvery-white, or of a micaceous appearance; the upper side is a little convex, and slightly wrinkled concentrically to the smaller, or posterior, end: the under part is sometimes rough, and granulated with crystal-like shining angles.

"This shell is the lapis limacis or snail-stone of authors, and is said to have been used for medical purposes: according to popular opinion, it cures the tertian ague, if fastened to the patient's arm."

"Favanne has figured several species of limax in his Zoomorphose, tab. 76, that appear to be the intermediate link between such as possess an internal shell, and those with testaceous covering; these have only a small shell attached to the posterior end. But as no such have been discovered in England, we only mention it to shew the nice gradations in nature's work; and how utterly impossible it is to divide that chain, which she has so admirably linked together."

The cypræa pediculus of Pennant is separated from the pediculus of Linnæus on the authority of Dr. Solander, whose trivial name, arcticus, is adopted: and it is doubted whether the pediculus of Borlase and Donovan, not uncommon on our shores, be not also a different species, on account of its wanting the sulcus on the back, so invariable in the foreign ones. To this genus are added, the bullata and the voluta; the former doubtful whether only a variety of the pediculus; the latter found in the West Indies, but never before given as a British shell, though it is sometimes taken alive by the oyster dredgers in Salcomb Bay. Its animal when alive extends a thin membrane from each side the aperture, and almost covers the shell. The pediculus has the same property to a great degree, and when in motion under water has a very elegant appearance, from its diversity of colours.

Under the genus bulla, Mr. Montague is rich in information concerning the animal inhabitants. The curious gizzard-like substance found in the lignaria has been described by Mr. Hum-

phreys in the 2nd vol. of the Linnæan Transactions. The extraordinary structure of three other species is so well described in the present work, that we cannot resist the temptation of laying before our readers the account of the halio-toidea.

"The animal, like that of the preceding species, so completely envelopes the shell, that not the least appearance of it is to be discovered, either in a dead or living state. It is of an oval shape, and of a reddish, or brown colour; sometimes nearly white: has much the appearance of a contracted, naked limax, and indeed seems to be nearly allied to that class of animals.

"The upper part of the body is very convex, covered with a thick, tough, ligamentous skin, that conceals the shell, and extends downwards on each side, where the edges are thin, and detached from the body: in the fore part of this margin is a sinus, through which the animal protrudes an appendage, or arm, somewhat flat, a quarter of an inch in length, the extremity of which is bifid; the lower division terminating in a thread-like process. The body of the animal beneath, or rather the sustentaculum, is oblong and flat, with a deep depression between it and the marginal skin: the head is furnished with two small, white tentacula, at the base of which, are two small black eyes.

"The shell may be felt under the skin on the back, but is difficult to be extracted without breaking, from the extreme toughness of the part that covers it; the best method of effecting it, is to make a longitudinal incision on the back, with a pair of sharp pointed scissors.

"The animal is possessed of considerable locomotive power; and when in motion, frequently contracts the margin or loose skin into wrinkles, or folds, exposing the sides of the body.

"It is in size three times as large as its shell, and is incapable of much contraction, or expansion: at first sight might be mistaken for the animal of *B. aperta*, but on comparison, will be found essentially different externally, and more particularly in being destitute of the testaceous gizzard, so remarkable in that animal.

"In the singular circumstance of the shell being enclosed within the animal of some of this class, there is a considerable analogy between them and the lypsysia. The *L. depilans*, possesses a flexible, corneous substance under the skin on the back, termed a shield; which differs only from these species of open bullæ in not being of a testaceous substance: this is of an oval shape, pointed at one end, which turns inward, and a little to one side, in a sub-convoluted manner: it is

marked with concentric wrinkles: colour purplish-brown.

"This, therefore, seems to be the link between the true mollusca animals, and the testacea: and it is probable future researches may discover, that many which have hitherto been considered as belonging to the mollusca tribe, are really testaceous, upon dissection."

The additional species are the *aperta*, the *hydatis*, the *fontinialis*, and the *hypnorum* of Linnæus; the *akera* of Gmelin; the *catena* (*punctata*? Adams) the *truncata* and the *emarginata* of Adams; the *obtusa* described by Walker; and the *halioidea*, *plumula*, *umbilicata* and *diaphana*, non-descripts. The account of the animal of the *fontinialis* is worth transcribing.

"The animal is of a light colour, with a yellowish cast: tentacula two, setaceous, long: eyes two, black, placed underneath, at the base of the tentacula. When in motion, it covers great part of the shell with a thin pinnated membrane, thrown out on the right side, extending quite behind, and partly on the left side, covering the smaller volution: this membrane is very deeply divided or digitated, the points of which meet, and sometimes intersect on the back of the shell; and are so transparent as scarce to be distinguished, but by the assistance of a glass. The sustentaculum, or foot, is long and narrow: the foramen, or common aperture, is on the left side, as must be the case with all the animals of this kind inhabiting heterostrophe shells.

"It has very considerable loco-motive power, and transports itself by adhering to the surface of the water with the shell downwards: against which it crawls with as much apparent ease as on a solid body; and will sometimes let itself down gradually by a thread affixed to the surface of the water, in the manner of the *limax filans*\* from the branch of a tree.

"The property of crawling under water, against its surface, is not wholly confined to this species; but we know of no other testaceous animal capable of suspending itself under water in the same way."

The additions to the genus *voluta*, are the *pallida* of Linnæus, the *denticulata* and *alba*, described by Walker, and the *catenata*, a non-descript.

Under the genus *buccinum*, the additional species are the *perdix* of Linnæus; the *bilineatum* of Gmelin; the *lineatum* of Da Costa, &c.; the *ambiguum* and *hepaticum* of Pulteney; the *terrestre* (*Acicula*, Muller; *obtusulum*, Turton, who describes two shells under the same name,

one with five spires, the other with three, of which Mr. Montague does not seem to have been sensible, though he has given that with three spires, under the name of *obtusulum*, and has referred to another of Walker's minute shells;) four other minute shells copied from Adams; and the *cinctum* and *minimum*, non-descripts.

In the genus *murex*, the British Zoology is enriched by the *purpureus*, the *linearis*, the *muricatus*, the *turricula*, the *rufus*, the *sinuosus*, the *attenuatus*, the *gracilis*, the *septangularis*, and the *tubercularis*, all non-descripts. The additions to *trochus* are the *tumidus* and the *fusus*.

We have hitherto distinctly specified the additions which have been made in the present work to the British species of Pennant and Da Costa, the only two modern writers who have professed to bring them into one collective view; and this we have done, that our readers may form an idea of the progress which has since been made in this department of natural history; and in this particular, may be able to estimate the obligation it is under to Mr. Montague. The remainder of the genera are treated with equal distinctness, and illustrated by critical remarks, equally judicious and discriminating, and are enlarged by at least an equal number of additional species; but the limits of the present article will not permit us to pursue them in detail. We will, therefore, only make two or three extracts from such parts as appear most original and instructive.

The following rules for distinguishing a reversed shell may be useful to young conchologists:

"Nothing appears more confused and incomprehensible, than the various descriptions of different authors, concerning the spiral turns of a heterostrophe shell; some call it from right to left, others, vice versa, from left to right.

"Every conchologist knows, that most convoluted shells turn one way, and that there are a few species which are heteroclitical, or invariably turn contrary to the usual manner: some indeed have doubted, whether this is a permanent character; there requires, however, no argument to prove it is so, to those who have taken the trouble to examine the common species of heterostrophe shells, which daily present themselves to our notice in our rural walks. Indeed, it is rather strange, that not one of these shells, whose nature is to have their spires turn in

\* For an account of the *limax filans*, see Lin. Trans. vol. iv. p. 85, tab. 8.

the more unusual manner, has (to our knowledge), ever been met with to vary from that formation; as such accidental deformities have been found, in a few instances, amongst those which are usually termed dextrals, or have the more usual spiral turns, and have become *lusus heterostrophon* shells.

"In order, therefore, to explain which way the turn of the spiral convolutions of a reversed shell takes, omitting the vague signification of turning to the right or left; we shall observe, that the more common turn of shells is with the apparent motion of the sun, or as the index or hand of a clock moves.

"But in order to be more clearly understood, let us compare the spiral volutions of a shell to a common cork-screw, and we shall find, that whether the mouth or apex is placed upwards, the spires will turn from the upper to the lower end like a common screw, which is in the same direction as the index of a time-piece, and what is commonly understood by a dextral or right-handed screw. As a further definition, such shells have their aperture on the right side, when examined with that end downward, and is in the direction of the sun's apparent motion.

"On the contrary, a reversed shell, when placed in a perpendicular position, has its spiral volutions in an opposite direction to the motion of the index of a watch, or a clock, or to a common screw, and in fact resembles what is usually termed a sinistral, or left-handed screw. These have their aperture on the left side, or opposite the left hand of the person holding the shell, with the mouth downwards, and the opening is opposite the sun's apparent motion.

"In order to determine whether a flat shell, whose volutions are laterally placed, is a reversed species, we have only to examine which way the volutions turn from the apex or centre towards the mouth; and if we find it contrary to the motion of the index of a watch, it is a *heterostrophe*, or reversed shell; and, vice versa.

"In some of the more depressed species of helix, or nautilus, attention is requisite to be paid to the mouth, in order to determine which is really the upper side of the shell, for it is on that side the spiral turns are to be taken from the centre or apex; and in most instances this is to be determined by the oblique direction of the aperture to the under part, where the lip rarely extends so far as on the upper part. In fixed shells, such as *Serpula*, there is no difficulty, as the side which is sessile must be considered the base or under part; thus in the *Serpula lucida*, the fixed part is sometimes very small, and the mouth protrudes spirally upwards, in a contrary direction to the sun, and therefore must be considered a reversed or *heterostrophe* shell, the same as if the volutions nearest the mouth had turned laterally upon the centre or fixed ones.

"This shell, indeed, is most frequently found with regular lateral volutions; and

though subject to great variety, with respect to contortions, it invariably turns the aperture one way.

"In some species of nautilus, however, there can be no rule to ascertain whether it is dextral or sinistral; for when the aperture is exactly lateral, the lip collapses the body equally, and the sides of the shell similar, as in *N. calcar*. it cannot be defined.

"In others of that genus, as in *N. beccarii* and *beccarii perversus*, two shells, the principal distinction of which is the contrary turn of their volutions, it is easily determined by the convexity of the upper side, and, of course, the aperture being placed somewhat beneath."

As a corrective of the romantic particulars which have been published concerning the amours of snails, our readers will be pleased with Mr. Montague's more sober relation:

"It may be expected in the history of this animal, so long celebrated for acting the part of Cupid in its amours, that something should be said upon a subject so singular and extraordinary.

"So much, however, has been already written by different authors on the loves of snails, which requires more than common faith to credit, that we must beg to refer our curious readers to the more recent accounts of the actions of snails in love, given in the first volume of the *Naturalist's Miscellany*; where the author very properly prepares the reader for the belief of such wonders, by saying, 'I must request my readers to summon all their philosophical faith to receive the surprising particulars.'

"That the hermaphroditical animal of the helix *aspersa*, as well as *h. nemoralis*, (or at least some of them,) possess small testaceous spiculi at certain seasons, must be admitted; but that they are missile darts, we have much reason to doubt, though it is natural to suppose the animals are furnished with them, for the purpose of stimulating each other to love, because it is only at that season they are found to possess them. If such are ever discharged at each other, we have been extremely unfortunate in our observations, for in no one instance could we ever find the dart penetrated, though at the time the animals are close, the point may irritate: but it is neither sufficiently strong, nor sharp-pointed, to penetrate the tough skin with which these animals are furnished; and, indeed, the extremely viscid secretion, with which they are so copiously provided, adheres so strongly to these spiculi, when wholly projected from the body, that they are for a time held by it. Perhaps we may be told hereafter, that this tough excretory fluid is used as a cord to regain these darts after they have been discharged, but such we should hold equally fabulous, with much of the accounts related by various authors.

"These celebrated love-darts are subpellucid white, and very brittle, about a quarter of an inch or three-eighths in length, and somewhat triangular, like the blade of a small sword."

Next to the *serpula*, a new genus is formed for such as bear some affinity to that tribe, but do not come under the Linnæan generic character, being independent, and not affixed to other bodies. These, which are entirely of the more minute kind, and were almost wholly unknown to Linnæus, Mr. Montague has brought together, under the generic name *vermiculum*.

The genus *teredo*, our author proves, has been misplaced in the system. It is a complete multivalve, and ought to be placed with the *pholas*, or between it and the *balanus*, for it has no affinity either to the *serpula* or *dentarium*. In a future edition, Mr. Montague will undoubtedly so place it.

The introductory remarks to the genus *sabella* are so judicious, as well as new, that we shall make no apology for subjoining them as a concluding extract:

"Before we enter upon the descriptions of the several species of *sabella* indigenous to the British coasts, it may not be improper to remark, that in placing them amongst shells we have deviated from our own opinion, and have followed the system of Linnæus, and other later writers, in continuing this genus amongst the *vermes testacea*.

"The tubes in which the animals of this class are enclosed, are all, more or less, composed of extraneous matter agglutinated together, such as sand, gravel, and broken shells, of a finer or coarser texture, according to the nature of the animal inhabitant, and not prepared by a testaceous secretion from the body of the animal, forming a compact solid substance, the true character of a shell.

"Amongst the *sabellæ* of Linnæus, many larvæ of sub-aquatic flies are placed, several of which are to be found in our rivers and stagnant waters; but these, deriving their origin from winged insects, have no claim of affinity to a *sabella*, much less to a place in conchology.

"We are not aware that any true *sabella* is found in fresh water; and certainly no winged insect has yet been discovered to perform its change from the larva to the perfect fly, in salt water

"Gmelin has enumerated a great many *sabellæ* which inhabit fresh water, principally on the authority of Schroeter, many of which are varieties only of the same imperfect insect: the larva of the *ephemera vulgata*, some that of *phryganea*, and perhaps other neurop-  
terous insects.

"The tubes or cases in which these lar-

væ are concealed, are formed of whatever extraneous matter is near, and which is increased as its growth requires. This accounts for the many elegant varieties of such tubes. Some are composed wholly of small shells of various kinds, others of fragments of shells mixed with sand, bits of stick, stalks or fibres of plants; and it is remarkable, that some species attach pieces of stick longitudinally, while others bite off short pieces and place them transverse, like basket-work, some placing them triangular, others quadrangular or lozenge shaped; but the most beautiful variety is that found in waters abounding with *helix nautilus*, with which we have seen these cases completely coated, in a regular and most elegant manner, with their apertures outwards, and some of the animals yet alive. Another variety, coated with fine sand and minute bits of shining mica, found in Cornwall, and other streams running over micaceous granite, is deserving notice; but we must not enter further on a subject which more properly belongs to entomology.

"Why a part of the Linnæan *sabellæ* should be removed into the *mollusca* class of *vermes*, and others left amongst the *testacea*, is difficult to determine; for those whose inhabitants are *nercis*, have no more claim to a place amongst shells, than such as are inhabited by an *amphitrite* or *terebella*; and might, certainly, with as much propriety, be transferred to their proper animal class.

"That the *sabella* genus should be wholly expunged, and the several animals placed in their respective genera amongst the *mollusca*, there can be no doubt; for those whose cases are made up of agglutinated fragments of shells, the *exuvæ* of other animals, are as little deserving a place amongst *testacea*, as those formed wholly of sand, or composed of both. Such are equally extraneous substances, foreign to the animals, and are only attached by a mucous or glutinous secretion, which forms the internal coating, and is the only part of such tubes really belonging to the animals; and which, in any species, cannot be termed more than coriaceous, but more commonly membranaceous, of a thin, flimsy, flexible substance when moist, but extremely fragile when dry."

Upon the whole, we congratulate the lovers of natural history on the expectation which they may justly form, of a further elucidation of British conchology from the continued labours of so acute, so rational, and so diligent an observer. Mr. Montague is cultivating the proper field for the produce of real knowledge. Instead of gratifying an ill-founded scientific vanity, in collecting a great variety of rare specimens from the shores of the Indian and Pacific Oceans, of which nothing more than the shell is likely to be ever known, he is solicitous to become well acquainted with all that

relates to the comparatively few species which are found on his native coasts, and in the woods, the fields, and the streams to which he has daily access. Here the animal inhabitant may be studied and understood; and here principles may be investigated and established, which may be analogically applied to the shells of distant countries, and may gradually lead to a system founded on the primary and invariable lineaments of nature.

We have only to add, that figures of some of the rarer and hitherto unpublished species are given, drawn and engraved by a female friend of the author, for the execution of which a needless apology is offered. They are such as natural history figures should be, faithful delineations of the originals, correctly drawn, and clearly expressing the distinguishing characters.

ART. IV. *Goldsmit's Natural History abridged, for the Use of Schools.* By Mrs. PILKINGTON. 8vo.

IN our former volume we expressed our satisfaction in contemplating the improved system of education, which is gradually making its way in our private schools. Our public ones, which boast of ancient foundation, and possess the advantage of established fame, are, we fear, too strongly wedded to prescribed and supposed venerable forms, to admit of any innovation. None are more sincerely disposed than ourselves to acknowledge the value of classical attainments. We regard them as equally essential to the character of a scholar and a gentleman. Without them no one has a right to aspire to the profession of law, physic, or divinity: no one can properly discharge the duties of a statesman, or a magistrate.

But still they ought by no means to engage the whole of our attention in those early years, when alone a due preparation can be made for the active and beneficial employments of mature life. The productions of nature in what are usually called its three kingdoms, and the laws under which bodies act upon each other, are the materials on which men of all ranks and degrees are to work, and the rules by which they are to direct their operations. The former are the subjects of natural history: the latter of natural philosophy. In some occupations they are of indispensable necessity: in all, they are of admirable use. In the higher stations of life they are of peculiar importance, as affording perpetual and inexhaustible means of filling up those hours of leisure, which are too generally lost in listless ennui, or disgraced by dissipation and vice.

The man of large estate, the soldier, and the sailor, should, above all others, be naturalists. The latter are compelled by the duties of their office, the former is enabled by the independence of his

fortune, and his freedom from professional confinement, to traverse distant regions, and to obtain the most favourable opportunities of studying their various productions. And if they have no turn for natural pursuits, how much vacant time will they be in danger of mis-spending? How much must they often suffer from an incapacity to find either business or amusement? But if they have been well instructed in the elements of natural science, how will they rejoice in the wide field of observation which opens upon them on every side? With what transport will they enter upon a new climate, and survey the novelties which burst upon their view? And how much will the progress of useful knowledge be accelerated by their enlightened researches?

For this purpose, it is not sufficient to put into their hands an indigested history of animals, plants, and fossils, thrown together without order, and without principles. Such a one may amuse them for a few hours; but will as soon be forgotten, and scarcely ever resumed. Nothing can be of durable and substantial benefit, which does not in the outset call their judgment into action, and accustom them in its progress to examine and to compare, to define, and to arrange. System is the one thing needful. A bad one is better than none: but the best is certainly to be desired; and even of this best, they should be carefully taught the deficiencies; that in all their observations they may direct their attention to its advancement, and may skilfully employ their talents in raising it nearer to perfection. When a disposition to analyze and to methodize is produced, the stamina of a naturalist are formed: every succeeding year will add to his strength: no bounds can be set to his growth; and,

as is said of cartilaginous fishes, he will continue to increase as long as he continues to live.

We fear the work now before us will not greatly contribute to this pleasing effect. Mrs. Pilkington has been singularly unfortunate in the author she has chosen to abridge, and in the judgment she has formed of his character. She misleads her fair pupil, Miss Elphinstone, when she informs her in the dedication that Goldsmith, as a natural historian, has obtained universal credit. She has been strangely misinformed, or she would not have said in her preface, that his history of animated nature is justly and universally admired. The fact is, Goldsmith was no naturalist. Whenever he wrote from the spontaneous impulse of his own mind, he wrote in verse: and among the poets of the latter end of the eighteenth century, he is of the first order. But, like many other men of genius, he was too indolent to do much without an additional stimulus. When he wrote in prose, he wrote for bread.

Goldsmith, said Dr. Johnson, is writing a history of ancient Rome, and he will make it as entertaining as a novel: he might have added, and as little entitled to credit. Master of a pleasing style, he had a happy facility in working up the materials of other writers into an elegant and imposing form: but as he possessed no extensive range of knowledge, and was almost equally void of discriminating and of combining powers, he compiled always without judgment, and too often without care. With respect to his natural history, he is said to have acknowledged that he treated what he thought a trifling subject in a trifling manner. Fortunately for him there was then in the English language no popular view of the subject

which could boast of any degree of elegance, and his work had an extensive sale. It may still continue to amuse those who read only for amusement, but it has no further claim; nor can any abridgment of it be ever employed with advantage as an elementary book. Such a book is still a desideratum in our language; and it is, we fear, an acquisition which we are not likely soon to obtain. To make it what we wish it to be, will require an union of genius and science, which is rarely employed in providing the first rudiments of knowledge for the young. We know of only one living writer, who has all the qualifications necessary for the task, and is, at the same time, accustomed to the consideration of entering into the imperfect views, and supplying the wants of the uninstructed mind. No one who has read (and who has not read?) the sketches of natural history, scattered through the little volumes entitled *Evenings at Home*, can be at a loss to guess whom we mean. That writer's plain and elegant style, and happy talent for familiar illustration, would be most beneficially employed in conducting the unpractised naturalist through the three kingdoms of nature, in explaining the principles on which the classification of their various parts has been conducted, and in selecting such details as would render the whole equally interesting and instructive.

At present, we can only lament that Mrs. Pilkington has bestowed her time and attention on a work which will not fulfill her laudable intentions. But in justice to her it is incumbent upon us to add, and we add with pleasure, that her abridgment, as far as we have compared it with the original, is faithful and elegant.

ART. V. *A History of Quadrupeds, adapted to the Capacity of Youth. By Mrs. MARY TRIMMER, of Kentish Town.* 8vo.

WHEN this history of quadrupeds was first announced, we felt some prepossession in its favour. We did not, indeed, expect that it would realize the ideas expressed in our last article, but the respectable name of Trimmer induced us to look for some judgment in the arrangement, and for much moral instruction in the application of its materials. A glance at the title-page lowered our hopes, by introducing to us

a Mrs. Mary Trimmer, and not the well-known author of various publications for the use of young persons, which have been so generally circulated and approved. A slight view of the work completely dispelled them, and convinced us that, if Mrs. Pilkington's Abridgment of Goldsmith must by no means aspire to the honour of being admitted as an elementary book, for the instruction of youth in an advanced

stage of their education, Mrs. Mary Trimmer's compilation will have no just cause of complaint if it be consigned to the very lowest form. In some respects, it may be advantageously put into the hands of such as have just advanced beyond their hornbook, and have learnt to put syllables together. The figures will excite the curiosity, and some of the details will fix the attention of the little urchins, much better than a book of moral sentences; the subject itself will more usefully enlarge their ideas than is done by most of the fictitious tales which at present form the principal rudiments of their learning. But before it can become fit for this humble office, it must receive some material defalcations and corrections: nothing must be said in it about procreation, rutting seasons, and organs of generation; nor should a child be told, what every one but a child in natural history knows to be false, that the argali and the musmon

are different animals; and that "there are seven species of camel which live in a wild state in the deserts of Arabia and Africa, and in the temperate parts of Asia."

We have too lively a recollection of our youthful feelings to take pleasure in speaking unfavourably of a professed female production: some feeble remains of gallantry incline us to indulge the persuasion that something of a *ruse de guerre* has been employed on this occasion, and that, like poor Slender in the play, instead of sweet Ann Page, we have got hold of a great lubberly boy: but if there be really a Mrs. Mary Trimmer, of Kentish Town, in existence, we must honestly advise her to betake herself to some other calling, and to employ her time in making caps, or puddings and pies, or in short any thing within the limits of innocence, rather than a book on natural history.

ART. VI. *Tracts on the Natural History of Animals and Vegetables. Translated from the original Italian of the Able SPALLANZANI, by John Graham Dalzell, Esq. Advocate.* Second Edition. 2 vols. 8vo.

THE curious experiments of the late indefatigable Abbe Spallanzani, on several subjects of natural history, and particularly on animal physiology, are well known in every part of Europe. So long ago as 1765, appeared his dissertation on microscopic animalcula, in which he established their animality in opposition to Needham's theory of a vegetative power, and Buffon's of organic molecules. It was followed 1768, by his celebrated prodromus on animal reproduction, particularly of the heads of snails, the feet and tails of water newts, &c. after amputation. In 1776, the principles of his first dissertation were farther developed and supported, in his tracts on the natural history of animals and vegetables, the translation of which is now before us. And finally, in 1778, were published his dissertations on animal digestion, and the generation of animals and vegetables. The latter dissertations were translated into English in 1784, with an introductory analysis of the tracts on the natural history of animals and vegetables; but the tracts themselves did not appear in our language till the year 1799, when they were printed at Edinburgh without the name of the translator. In the first edition, the tract on the animalcula of infusions

was considerably abbreviated: those on seminal vermiculi, on animals and vegetables confined in stagnant air, on animals killed and revived, and on the origin of the plantulae of mould, were given entire; with the addition of two memoirs on the reproduction of the head of the terrestrial snail, by Mr. Bonnet, of Geneva. With respect to the latter, the translator observed in his preface, that Signor Spallanzani (besides his prodromo) published two memoirs *sopra la riproduzione della testa nella lumache terrestri*, which would with more propriety have formed part of the volume; but that he was not so entirely master of his own time, as the superintendence of publishing two or three hundred pages would require. He also confessed, that in some passages he had not been able to ascertain the author's meaning with precision; a confession which was fully verified by the frequent obscurity of the translation.

In the second edition, with which we are more immediately concerned, the name of the translator appears, and many improvements have been made. The dissertation on the animalcula of infusions is given nearly entire; nothing being now omitted but a part of the controversy with Mr. Needham, which, in the present day, would be uninteresting

to most readers: and two epistolary dissertations are added on the same subject, addressed to the author by Mr. Bonnet. To Bonnet's memoirs on the reproduction of the heads of snails, are prefixed two memoirs on the same subject by Spallanzani; and to the whole, are annexed three memoirs on the reproduction of the members of the water newt by his Genevan friend. Occasional notes by the translator are now also for the first time, introduced, with some general preliminary remarks to supply the place of other elucidations. The translation itself is in this second edition not only corrected and revised, but so much altered in all its parts as to render it almost a new work: the former errors and obscurities are not only generally removed, but the construction of the sentences is frequently changed, and the whole reads much more like an original. Still, however, a few imperfections remain, arising partly from the improper use of some of the auxiliary verbs which our countrymen in the northern part of the island are scarcely ever able entirely to surmount, and partly from too close an adherence to the Italian idiom in rendering the conjunctive and other particles. In some cases, the meaning must be gathered from the connection, and not from the literal force of the English expression. Thus, when relating the result of Pistorini's experiments on animals confined in stagnant air, he tells us, that "two animals died *as soon* as one, though Pistorini used the same vessels and animals of the same size and species." The sentence, detached from the context, would direct our attention to the circumstance of their not living longer, whereas the wonder was that they lived as long, that is, did not die sooner.

From the notes and introductory observations, Mr. Dalzell appears to have acquired an extensive acquaintance with the subjects discussed in the original work, by actual experiment, as well as by extensive reading and close thinking; and we cannot but consider this improved edition of the translation as a valuable addition to our English stock of physiological knowledge. The general results of the experiments have, indeed, been so frequently mentioned in different publications, that they have now but little attraction on the score of novelty.—But still it was desirable that the English reader should have an opportunity

of becoming acquainted with the manner in which they were obtained, and with the particular details on which they are founded. It is equally pleasant and instructive, to view the progress of a superior mind in its patient researches after truth; to follow it through its miscarriages no less than its successful efforts; and to perceive how one step suggested another, and either led to a conclusion apparently satisfactory, or ended in doubt and perplexity.

The genius of Spallanzani was penetrating and cautious, ardently desirous of investigating the secrets of nature, and unwilling to rely on first appearances. He never formed a decisive judgment till he had done all in his power to survey the subject in all its relations: he had also a happy facility in diversifying his expedients for the acquisition of knowledge; and if at any time he was induced to repose in a false theory, his mistakes were owing to the imperfect state of knowledge which was common to all his contemporaries. His observations and reasonings on the effect of stagnant air on animal life, were made before the late brilliant discoveries concerning the constitution of the atmosphere: we cannot wonder, therefore, that he attributed the death of animals in close vessels to noxious exhalations from their bodies, and not to a change in the constituent parts of the air itself.

His correspondence with Bonnet, and his manner of conducting the controversy with Needham and Buffon, bear all the marks of a candid and liberal mind. Considering those who were engaged in the same pursuits with himself as auxiliaries and not as rivals, he pointed out their mistakes with an amiable delicacy and a kind solicitude not to wound their personal feelings. But, as is too common with men of letters, in his judgment of those whose studies took a different direction from his own, he was supercilious and unjust. Of Linnæus and his followers, he always spoke with contempt, and servilely copying Buffon, absurdly distinguished them by the disparaging appellation of Nomenclators. But if he had not arrogantly disdained to profit by the talents and labours of a man, who will be esteemed by impartial posterity, greatly his superior in the utility as well as variety and extent of his investigations, he would not have given the name of Tremella to a *Conferva*,

and have spoken of it in so loose a manner, as to make it impossible to determine what species he meant.

Mr. Dalzell laments, in his preface, that the subject of animal reproduction has been less studied in Britain than on the continent; and that there are few or no original experiments in English. We confess that it is not with us an occasion of regret. When we read that four hundred and twenty-three snails were compleatly, and three hundred and twenty partially, decapitated by Spallanzani, in one course of experiments, and are told that a prodigious number have suffered the same fate, with a great variety of other mutilations, from the scalpel and scissors of other observers, our pity for the sufferers overbalances the pleasure of an increased acquaintance with the power of nature; and turning with horror from the mangling operations, as from the guillotine of a Robespierre, we instinctively ask, *cui bono?* We well know that this question has often been put to the curious naturalist by the ignorant and foolish: but we must also insist that there are occasions on which it may laudably be adopted by the wise. When no natural feeling of our frame is counteracted, and no actual good sacrificed, there are no researches into the hidden treasures of nature, however idle and unprofitable they may at present appear, which ought to be despised. An increase of knowledge will in time always lead to increase of power. But when the investigation cannot be pursued without inflicting torments on sensitive beings; and when there is also no apparent likelihood of producing benefit either to ourselves or to them by the proceeding, that christian benevolence which ought to extend to all the creatures of God, will surely restrain our hands, and direct us to studies more consonant with its benign spirit.

Mr. Bonnet, indeed, fearing that the mind of the compassionate reader would

revolt at some of his experiments, begs him to consider, "that animals which after losing one or several limbs, continue gradually devouring the prey presented, undoubtedly cannot experience the sensation of pain to the excess which our own sensations lead us to imagine; and that we are very insufficient judges of what passes within an animal so remote from us in the scale of living beings." We are willing to hope that the humane sentiment of our great poet may not be physically just. But though we should not admit that

"— the poor beetle which we tread upon,  
In corporal sufferance feels a pang as great  
As when a giant dies;"

still it cannot be denied that a snail has some feeling: it cannot be supposed that it lives as comfortably without a head as with one, and that the time required to renew the amputated part is a pleasant part of its existence.

It is certain, that till the process is completed, it is unable to eat; and we know not that we have any right wantonly to deprive a sentient creature of an enjoyment, which some philosophers, if we may judge from their appearance at a good dinner, seem to place, in their scale of human felicity, but a few degrees below the point of *summum bonum*.

Let us, then, rest satisfied with the experiments which have already been made. They have established the fact; and have left no room for reasonable doubt.— They have proved that the impartial parent of every being has made up to the lower tribes of animals, in tenacity of life, what has been denied to them in delicacy of feeling. Henceforward, let snails and newts, and all their cold-blooded brethren, enjoy the undisturbed possession of the limbs which their Creator has given them:

And if a few inferior joys  
Be all of life they share,  
Let pity plead within our breasts  
That little all to spare.

ART. VII. *Nouveau Dictionnaire d'Histoire Naturelle appliqué aux Arts, principalement à l'Agriculture & à l'Economie rurale & domestique. Par une Société de Naturalistes & d'Agriculteurs.* 8vo.

BOMARE's dictionary of natural history has, for a considerable time, been the standard work of its kind in France, and has been received with respect in other parts of Europe. It is the work of a real naturalist, and contains

an immense number of interesting details. But the three kingdoms of nature occupy too wide a space, to be discerned in all their parts by the eye of any one man. In the animal kingdom, the insect order alone would find abundant

employment for a whole life. The lovers of natural history, will therefore, be pleased to meet with a new work of a similar kind, and still more comprehensive in its general plan, undertaken by some of the most eminent naturalists in France; each confining himself to the particular branch which he has most diligently studied.

In the present work, the history of quadrupeds and birds is executed by Sonini, author of *Travels in Egypt*, and editor of an improved edition of Buffon. His arrangement of quadrupeds is that which he himself has already laid before the world in his supplement to Buffon: in the birds he has adopted the nomenclature and method of Latham. A long bodily indisposition has prevented this able and well-known naturalist from extending his labours to the reptiles and fishes. These, with the naked and testaceous mollusca, and the vermes, have fallen to the lot of Bosc, member of the society of natural history at Paris, and of the Linnæan society in London. -- Desmaret also has furnished some articles on quadrupeds, and Vieillot on birds. The coleopterous insects are described by Olivier, author of *Travels in Greece*, and of the principal articles on the natural history of insects in the *Encyclopédie Methodique*. The other orders of this class are undertaken by Latreille, associate member of the national institute. Virey, the author of the *Natural History of Man*, and the editor of the present work, has charged himself with the articles on the structure and faculties of man and other animals. The veterinary art is treated by Huzard, an approved professor of that branch of medicine.

The vegetable kingdom is divided between Bosc, Du Tour, Cels, Thouin, Tollard, and Parmentier. Bosc has detailed the genera with their most useful species, and has particularly laboured the synonyms, referring the whole to the artificial system of Linnæus, and the natural ones of Jussieu and Ventenat. Du Tour has chiefly confined himself to cultivated vegetables, whether natives of France or exotics; for the latter of which he is particularly qualified, having resided at St. Domingo in the capacity of a planter. Tollard has principally attended to vegetable physiology, and Parmentier to domestic and rural economy.

The mineralogy is the work of Patrin, who has spent eight years in Russia,

and has studied the science among the mountains of Daouria, and along the chains of Ural and Altai.

The application of chemistry to the different productions of nature, especially to plants and minerals, has been assigned to Chaptal, well known for his chemical knowledge. Physics properly so called, and meteorology, are the department of Libes, professor of natural philosophy in the central schools of Paris.

Such an assemblage of eminent names will naturally raise the expectations of the public; and, we are persuaded, these expectations will not be disappointed. The first six volumes are now on our table, which include only the three first letters of the alphabet; and if the work proceeds as it has commenced, it will form a more extensive and accurate collection of natural history than has hitherto been laid before the public.

The articles *Ane* (Ass), *Aigle* (Eagle), *Alouette* (Lark), and *Autruche* (Ostrich), by Sonini; *Cochon* (Hog), by Sonini and Parmentier; *Coucou* (Cuckoo), by Vieillot; *Baleine* (Whale), by Virey; *Cheval* (Horse), by Huzard; *Abeille* (Bee), *Araignée* (Spider), and *Cochenille*, by Latreille; *Chenille* (Caterpillar), and *Chrysalide*, by Olivier; *Corps organisés*, *Animal*, and *Alimens*, by Virey; *Arbre*, by Tollard and Thouin; *Bette* (Beet), and *Cacaoyer* (Cacao), by Parmentier; *Bois*, (Wood), *Botanique*, *Cafoyer* (Coffee), *Canne à Sucre* (Sugar Cane), *Cannelier* (Cinnamon), *Chanvre* (Hemp), *Chene* (Oak), *Chou* (Cabbage), and *Cottonier* (Cotton Tree), by Du Tour; *Argent* (Silver), *Argill* (Clay), *Basalte*, and *Bitumes*, by Patrin, are extended to a considerable length, and are rich in information.

None of these admit of sufficient abridgment to come within our prescribed limits. We shall, therefore, translate part of two shorter articles, as specimens of the work. The first shall be from the article *Chameau*, by Desmarest; the other from the article *Chamignons*, partly written by Bosc, and partly by Parmentier.

“ *CHAMEAU* (Camel), the name of a genus of quadrupeds, belonging to the first section of the order of ruminants, characterised not only by their having three kinds of teeth, but also by their great height, their divided upper lip, long and arched neck, one or two dorsal bunches, and naked callosities at the joints of their legs and the lower part of their breast, &c.

“ The camel, though placed in the order

of ruminants, differs from its congeners in some striking particulars. It has not a completely cloven horny hoof, but only a small nail at the anterior extremity of each lobe, (doigt,) and a kind of callous very hard sole common to them both: the lobes themselves are separated from each other by a shallow furrow. In the lower jaw it has six cutting and two canine teeth; in the upper, it has two cutting teeth inserted in the os intermaxillare, a character found in no other ruminating animal, and one or two canine on each side, which become rather large as they grow old. The grinders are exactly similar to those of other ruminants. It has five stomachs; but the fifth is only an appendix to the paunch, and serves to hold a certain quantity of water, which the animal forces back into its mouth, when it is sensible of thirst.

"The camel genus is confined within a zone of three or four hundred leagues in breadth, and which extends in length from Morocco to China. One of its species, the camel with one dorsal bunch or the dromedary, occupies the whole length on its southern side: the other, the camel with two bunches, or the camel properly so called, is found on its northern side, but only from the ancient Bactriana to Persia. The former, though a native of a warm climate, cannot bear excessive heat: it ceases both in Africa and in the East Indies, where the elephant commences, and cannot comfortably live either under the burning sky of the torrid, or in the mild air of a temperate zone. The latter, though best suited to a temperate climate, can subsist in a more rigorous one; for it has been brought by the Buretes and Monguls as far north as the Lake Baikal. Bactriana, now Turkestan, appears to be its original habitation; and there it is now found in the greatest abundance.

"It is only the camel with two bunches which has preserved the ancient name. The other has received the denomination of dromedary, though, as we shall see under that article, the word dromedary, in its proper sense, is confined to such individuals of the species as have been trained for riding and excel in swiftness."

\* \* \*

"**CHAMPIGNONS** (mushroom), the first and lowest family in the scale of vegetable life. The different species of which it is composed resemble other plants solely in their mode of growth; and differ from them in having neither leaves nor flowers, nor any thing of an herbaceous nature, and being more simple in their form and organisation.

"Theophrastus, Dioscorides, Pliny, and all the ancients in general, attribute the origin of mushrooms to a certain viscous substance produced by vegetable putrefaction. Their commentators have been of the same opinion. Clusius is the first who asserted that mushrooms spring from seeds. Boccone, Mentzel, Tournefort, Micheli, and

afterwards Gleditch, Haller, Hedwig, Linnaeus, Beauvois, and above all Bulliard, have supported the same side of the question.

"The discovery of animalcula induced several learned men, Butner, Weis, Muller, Scopoli, &c. to suppose that mushrooms have an animal origin: and Necker and Medicus, two German naturalists, have recently considered them, the former as a new union of the decomposed cellular tissue of vegetables; the latter as a decomposition of their pith and juice, which change their nature by means of a certain quantity of water and heat; that is, to adopt the author's own language, mushrooms are a vegetable crystallization.

"It was reserved for Bulliard to dissipate the doubt of naturalists, by proving that mushrooms are organised nearly in the same manner as stamiferous vegetables; that they have fibres, vessels, roots, flowers, and seeds; that they have a primary development, a gradual increase, and a succeeding decay; and that they do not finally perish till, like all other organised beings, provision has been made for the continuance of the species.

"In fact, says Bulliard, no mushroom can exist which has not been produced from the seed of another individual; and that which is vulgarly called the spawn of mushrooms, is nothing but the seeds agglutinated to some other body. The seeds of most mushrooms may easily be obtained by laying them, when fresh, upon a glass, which will soon be covered with them. As in other vegetables, they differ in number, situation, insertion, size, form, colour, &c. Some may easily be discovered without the aid of a lens: others are so small that the strongest magnifying power can scarcely render them visible. These seeds transported by the winds, attach themselves to different bodies, by means of a gluten which moistens their surface, are carried by rain into the earth, and if circumstances favour their development, whole fields are soon covered with mushrooms.

"All these facts have been established by Bulliard; but still it has not been fully proved that these rudiments of a future plant are really seeds. Gærtner is of opinion that they are a kind of gems or buds. I myself suggested this idea to Bulliard, when I was engaged with him in making experiments on the subject; but though it is supported by the analogy of alcyones, and other polypes, as determined by the experiments of Trembley and others, which I repeated at the same time, he was not willing to admit it as a general principle, and yet acknowledged it to be just in the case of the esculent truffle.

"I have since examined numerous individuals of both these classes of organised beings, and strengthened by the authority of so able a judge as Gærtner, with the recent one of Minbel, I am fully convinced that these rudiments of mushrooms are true buds, separated from the plant nearly in the same manner as the young polype is separated from its parent. This process we shall further

explain under the articles polype and plant. Some species of the mushroom tribe attain to their full maturity in five or six hours; others require not less than a year for that purpose. Their growth is produced by interseption: that is to say, the mushrooms by means of their roots or organs performing the functions of roots, draw from the earth, or the particular bodies on which they grow, a lymphatic juice, which properly distributed as far as the first divisions of their fleshy fibres, increases their length and breadth, and gives them more or less solidity. Those whose substance resembles cork, have a striking resemblance to the trunks of trees, of which the boletus ignarius may be produced as an instance, which adds every year a new system of tubes, and produces new embryos in the same manner as trees produce new flowers and new fruit. In the woody species the growth depends upon various movements of the vegetable fluid, and there is an elaboration not only of the proper juices, but also of the nutritive lymph which passes into the capillary vessels. In the fungacious ones the lymphatic humour filtrates through the interstices of their substance, like oil in cotton, while their proper juices circulate along the capillary vessels.

"Plants, whose organisation is so different from that of all other vegetables, give out when analyzed peculiar products. The results of their artificial as well as of their natural decomposition, are very analogous to those of animal substances. Under water, they give out hydrogen, azote, and carbonic acid gas.

"Some species are employed in the arts: more are used as human food; and many of them are poisonous. The greater part of them are of no service to man, but afford nourishment to legions of the larvæ of insects.

"It is difficult to give any general character of unwholesome mushrooms. A knowledge of the different species is the only certain guide, and these are so subject to change their appearance, that there will often be reason to doubt. We should labour in vain were we to attempt to banish them entirely from the tables of the luxurious; but we cannot refrain from observing, that they have been proved to furnish little or no chyle, and consequently afford no nutriment: they digest only by the means of trituration, or to speak more properly, they do not digest at all.—They are nothing but seasoning to other meats.

"When mushrooms are gathered for the table, the old ones should be rejected; for it is a fact, that some which are innoxious when young, become dangerous when tending to decay; they then, also, lose much of their flavour.

"It has been determined by positive experiments, that vegetable acids are antidotes to their poisonous qualities. Any one who has suffered by them should, therefore, be

made alternately to vomit, and to drink vinegar diluted with water; and when there is a doubt of their goodness, it is advisable to steep them for some hours in vinegar.

"The effects of their poison are, vomiting, oppression, tension of the stomach and lower belly, anxiety, griping, violent thirst, heart-burn, dysentery, fainting, hiccup, universal trembling, gangrene, and death."

The latter part of the article is by Parmentier, who is of the same opinion with Bosc on the subject.

"Daily experience," says this able naturalist, "demonstrates that the best mushrooms, those which are a common ingredient in our ragouts, may be very dangerous either in consequence of their having been gathered too early or too late, of their having been exposed to the influence of fogs, stagnant air, or putrefying bodies; of their having been eaten to excess, or of a particular bodily constitution in the person who eats them. Jussieu, my colleague, who so successfully follows the steps of his uncles, is of opinion that all mushrooms are more or less prejudicial to health, and that many disorders are produced by them which are attributed to other causes.

"But notwithstanding these melancholy facts, gluttony will still prevail; mushrooms will continue to be eaten. It may be proper, therefore, to point out the means of preventing or lessening their dangerous effects. It will be prudent to keep them some time after they are gathered, to macerate them in cold water repeatedly changed, to mix with them in the dish of which they are to be an ingredient, some wine, or vinegar, or lemon juice, or some acidulous herb; above all, to chew them well, that they may be less likely to swell in the stomach into an indigestible mass; and, in fine, when any threatening symptoms begin to appear, to administer immediately emollient medicines, oils, acids, and especially emetics. But I again assert, that no mushroom is nutritious: it contains only a savoury substance, which may doubtless be found in other vegetables; and as it is not always possible to distinguish those which are essentially, from those which are occasionally pernicious, let us proscribe the use of them in our sauces, and employ in their stead artichoke bottoms, celery, or some other culinary herb, which, with a little management, may be made to acquire the seductive flavour of the perfidious mushroom.

"My experiments on these vegetables would have been incomplete, if I had not endeavoured to investigate their mode of acting on the animal economy, with the hope of discovering an effectual antidote to their poison. I mixed some noxious mushrooms with some minced meat, and caused a dog of moderate size to swallow the mixture. In a little time he became stupid; then manifest-

ed signs of nausea; and at length threw up the food which he had just taken: after this crisis he seemed to be better, but soon threw up a kind of viscous slimy matter; and the vomiting continued with intervals to his death, which took place in about ten hours.

“The design of my experiment did not permit me to administer to him any medicinal aid. I employed an able surgeon to open him, who having attentively examined the state of his stomach and other viscera, assured me that he perceived no signs of erosion or laceration, and nothing more than the characteristic effect of a violent emetic, an effect confirmed by the symptoms which preceded the death of the animal.

“It appears that vegetable poisons operate almost always in the same manner. I have given a dog some fresh hemlock, which produced effects similar to those of the poisonous mushroom. Wepfer, in his history of the water hemlock, proves by numerous examples, that the most noxious plants occasion the same kind of disorders. This physician gave wolfsbane to some animals which had for some time been kept without food: in almost half an hour they threw it up, with a thick, viscous, frothy substance, and were afflicted with violent reaching till they died. When their bodies were opened, nothing was discovered but the vestiges of a powerful emetic.”

We have selected the latter article on account of the important information which it contains; the former not so much for its excellence, for there are many much better, as for its differing from all former naturalists, in describing the camel with two cutting teeth in its upper jaw. Aristotle and Pliny both observe, that the camel is the only animal without horns, which has no teeth so situated; and in this representation, as far as we know, all succeeding authors have hitherto concurred.

We also regret that Desmarest, though he was aware of the impropriety, has continued the appellation of dromedary, as a general name of the species, with one dorsal bunch, of which it is in fact only a variety. The two species are

clearly described by Aristotle and Pliny, and called, one the Arabian, and the other the Bactrian camel. Διαφερουσι, says the former, *ἡ δὲ βακτριανὴ τῶν ἀραβικῶν αἰ μὲν γὰρ δύο εἴδησιν ἔχει, αἰδ' ἓνα*. Camelos, says the latter, *inter armenta pascit oriens, quarum duo genera Bactriani & Arabici, differunt quod illi binahabent tubera in dorso, hi singula*. —The word dromas occurs as a name of the camel in Livy, and is expressly attributed to the Arabian camel by Strabo. It is lengthened into dromedarius in the vulgate translation of the Old Testament, and in Jerom's Life of Malchius; who says, that the camel is so called on account of its swiftness. The latter term has been adopted by the moderns, but with some confusion in the application of it to the species. Aldrovandus, Gesner, Linnæus, and Buffon, have all given it to the camel with one dorsal bunch. Tepontinus, quoted by Gesner, Johnston, and Bell, the British traveller into Russia and China, reverse the names, and call the camel with two dorsal bunches the dromedary. Mr. Bell relates that he found many dromedaries on the banks of the Volga among the Tartars, who, he says, have few Arabian camels. It is not improbable that the name dromedary may be applied to a high-bred, swift-footed variety of both species. But however that may be, it is better to discontinue it entirely, as a specific appellation, and to follow Aristotle and Pliny in calling the species with one dorsal bunch the Arabian camel, as Dr. Shaw has judiciously done in his General Zoology.

The best account of the species and varieties of camel which we have seen, is in Russel's History of Aleppo. If our author had been acquainted with this work, and had particularly attended to the note quoted in our last volume, p. 945, he would, we doubt not, have given a different description of the apparatus for preserving fresh water in the stomach of this interesting quadruped.

ART. VIII. *A General System of Nature, through the Three Grand Kingdoms of Animals, Vegetables, and Minerals, translated from Gmelin's last Edition of the celebrated Systema Naturæ, by Sir Charles Linné, amended and enlarged by the Improvements and Discoveries of later Naturalists and Societies. By WILLIAM TURTON, M.D. Author of the Medical Glossary. Part 2. Vol. I. 8vo.*

IN our review of the former volumes of this translation we expressed a wish that Dr. Turton, instead of Gmelin's edition of the Systema, had taken for the ground-work of his version the last edi-

tion published by Linnæus, and had taken from Gmelin only such alterations and additions as are real improvements. When we first laid our hands on this fifth volume, which relates to the vegetable

kingdom, we felt a recurrence of the same wish with a greater degree of solicitous earnestness. The readers who require an English translation of that part of the work which describes the animal kingdom are comparatively few. Zoology, in its full extent, and in its more difficult branches, is not a fashionable pursuit with the unlearned; and there are many circumstances which will probably prevent its ever becoming generally prevalent. But botany has charms which are almost universally attractive: the love of plants is found in all ranks of life, and is peculiarly suited to the elegant taste and delicate feelings of the female sex. The number of greenhouses and stoves has rapidly increased within the course of a few years, and may justly be ranked among the most refined luxuries of the present age. The pleasure of possessing these must be greatly increased by a scientific acquaintance with their contents, and a capacity to arrange them according to their respective relations and affinities. It was, therefore, highly desirable, that the second part of the *Systema Naturæ* should appear in our native language, with the addition of the numerous exotics which, since the death of Linnæus, have been poured in upon us from the remotest regions of the earth. We were accordingly disposed to give a cordial welcome to this part of Dr. Turton's labours; but our pleasure was not a little diminished by the apprehension that our unlearned, and especially our fair readers, were to contemplate these treasures in the perverse arrangement of Gmelin. This was clearly announced to us in the title page. The fifth, as well as the former volumes, is said to be translated from Gmelin's last edition of the celebrated *Systema Naturæ*. But here, as in many other instances, we have found reason to acknowledge the truth of the old adage, *fronti nulla fides*; an adage which a reviewer almost instinctively translates, there is no trusting to title pages. Many a time has the discovery given us a painful mortification. For once, it affords us a lively pleasure. Dr. Turton, certainly not for his own advantage, has sacrificed truth to the uniformity of his title pages; and has not even thought it worth his while, either in a preface or by any other method, to give us any intimation of his departure from his original plan; and yet his fifth volume may with almost as much propriety be stiled a translation of

Ray's *Historia Plantarum* as of Gmelin's edition of the *Systema Vegetabilium*. He has not only separated the classes Icosandria and polyandria, which have been most absurdly blended together by the last editor, but has also replaced all the classes which had before been abolished by Thunberg, and has restored the whole of the Linnæan arrangement, with the single exception of the order monogamia, in the class syngenesia. And in this small deviation from the original system he is sanctioned by the sterling judgment of Dr. Smith and Professor Willdenow. He has, in fact, given the English reader an abridged translation of the last and incomparably the best edition of the *Species Plantarum*, now publishing at Berlin. The order of the genera and species, the terms of his generic and specific characters, and the additions of new plants are all taken from Willdenow, wherever Willdenow varies either from Gmelin or Linnæus. But it is not merely a copy of Willdenow; the new genera chiefly of Austrasian plants, instituted by Dr. Smith, with many new species under the old genera, which were not known to Willdenow, are carefully added; so that Dr. Turton's work has a just claim to be esteemed the fullest enumeration which has ever appeared, and will enable the female botanical student to find out the genus, species, and name, of the rarest exotics which she may have the happiness to possess.

Dr. Smith and Professor Willdenow having, without the knowledge of each other, named distinct genera in honour of Persoon, an honour well merited by his skilful investigation of the intricate tribe of fungi, Dr. Turton inadvertently inserted both genera, each in its proper place, under the same name. This error he has corrected in his table of errata, and has properly directed that Willdenow's personia should be called caraba, the name originally given to it by Aublet, its first describer; a disposition to which, we doubt not, the candour of the learned Professor will readily submit, from the consideration that Dr. Smith's genus is an original one, which has not been presented to the scientific world under any other name.

The translation is, as in the former volumes, generally faithful and judicious, and will be readily understood by all who are possessed either of Withering's, Hull's, Martyn's, or any other English elementary work. And to some of these

the young botanist must necessarily apply; for of Linnæus's introductory explanation of the vegetable kingdom only a small part is translated, giving little more than a brief account of the fructification. The definitions, as far as they go, are clear and accurate, that of the follicle excepted, which is said to be a single-valved pericarp, opening longitudinally on one side, and containing loose seeds. The idea directly conveyed by the last phrase is totally inconsistent with the essential principles of vegetation. Loose seeds can derive no nutriment from the parent plant, and will never come to maturity. The original is *folliculus membranaceus, univalvis, latere dehiscens, a seminibus distinctus*. Its meaning, though not completely express-

ed, certainly is that the *receptacle* of the seeds is attached to the pericarp at its base, and is unconnected with it in any other part.

The present volume includes the class polyandria, and Dr. Turton will doubtless wait for the completion of Willdenow's valuable edition, before he brings his version to a close, a consummation devoutly to be wished by the merely English botanist. We have observed several errors of the press, not mentioned in the table of errata; which, we trust, will be carefully corrected in a future edition; and as the botanical part of the work is likely to have a more extensive sale than the rest, Dr. Turton will probably be induced to reprint it in a detached form.

ART. IX. *A New Illustration of the Sexual System of Linnæus.* By ROBERT JOHN THORNTON, M. D. &c. Folio.

“ TO turn the penny, once, a wit  
Upon a curious fancy hit;  
Hung out a board, on which he boasted,  
‘ Dinner for threepence, boiled and roasted!’  
The hungry read, and in they trip,  
With eager eye and smacking lip:  
‘ Here, bring this boiled and roasted pray.’  
Enter potatoes, dressed each way:  
All stared and rose, the house forsook,  
The dinner cursed, and kicked the cook.  
My landlord found, poor Patrick Kelly,  
There is no jesting with the belly.

“ Now can't you guess the application!  
Don't raise too high an expectation.”

So sang, or so said our English Roscius, forty years ago, in one of his humorous prologues. Whether Dr. Thornton had never heard of this luckless Hibernian, or confident of his own powers, had no doubt of equalling the most lofty expectations which could possibly be excited, we know not: but certain it is, that he did not hesitate, previous to the appearance of this new illustration of the Sexual System in successive numbers, to publish a prospectus, at least as full of promise as the humbler board of poor Paddy. It was recommended alike to the lover of science and the lover of elegance, as a great *national work*: it was described at its outset, in a dedication to the queen, as intended to exceed all works of the kind on the continent, and to be not only (by employing the first artists of this country) a *national honour*, but an *eternal memorial* of that protection which is granted to science by her most gracious majesty: its patronage was pom-

pously announced as comprehending her most gracious majesty, their royal highnesses the prince and princess of Wales, and the duke of Gloucester; their serene highnesses the princess of Wirtemberg, and the princess Sophia of Gloucester; nine foreign kings and potentates; seventy-four English, and five foreign nobility; one hundred and ninety-four gentry; two hundred and sixty-six medical gentlemen, twenty florists, and fourteen public bodies, at the time when only one hundred and fifty subscribers were deficient, beyond which number not a single individual was to have the honour and happiness of possessing this *superb work*. Its claim to general admiration was to be founded partly on the fairness of the paper, the beauty of the letter, the accuracy of the figures, and the splendour of the coloured engravings: but, as in these, Dr. Thornton was to be indebted entirely to the talents and skill of professional workmen and artists, it would naturally be taken for granted, that the part executed by himself would possess an equal degree of pre-eminent excellence. He could not but be sensible that, as the superior qualities of the paper and type are merely decorations, so the engravings, though in some degree illustrative, are chiefly ornamental; and that the substance, the life, and the spirit must be sought for in the matter, the *facundia* and the *lucidus ordo* of the literary composition. For, if we suppose him unacquainted with the mishap of Patrick

Kelly, he could not be a stranger to the maxims of Horace. And if, for a moment, he had entertained the idea, that the richness and magnificence of the embellishments could compensate for the poverty and squalidness of the work itself, the

“*Inceptis gravibus plerumque & magna  
professis  
Purpureus, late qui splendeat, unus & alter  
Assuitur pannus*”

of the Roman didactic poet, must have occurred to his memory, and checked the insolence of the presumptuous hope.

Such a presumptuous hope he appears not to have entertained; but to have felt the necessity of keeping pace, in his own exertions, with the best artists of the age. His plan of the work, as it was detailed in his original proposals, and repeated almost verbatim in his first number, is such as required no small degree of knowledge and diligence.

“The object of this work, therefore, will be, to trace in as perspicuous a manner as possible, the philosophical principles of botany, from the earliest times, up to the present period; and by faithful and well executed engravings, of the several subjects of investigation, to render this curious and interesting enquiry level to every one's comprehension.

“Following the order of nature, I shall begin with the seed committed to the ground, and trace its various evolutions, until the root, stem, branches, and leaves are formed. I shall here chiefly dwell on the anatomy of the root, their diversity, of forms, and office.

“The object of my next consideration will be, to display the organized structure of the stem and branches, when I shall consider the several juices of plants, with the motion of the sap.

“Pursuing the course of nature, I shall next contemplate the various appendages attached to the stems and branches, explaining the organization and design of each.

“Next I shall examine into the structure and variety of leaves; their relationship to light; the evolution from them of oxygen and other airs.

“My next enquiry will be the food of plants, when I shall enter widely into the consideration of the principles of agriculture.

“Arriving at the flower, I shall consider its structure; the uses of the several parts which compose it; when a full enquiry will be made respecting the sexual relationship, with a refutation of the objections which have been raised against this doctrine.

“Thus far the natural history of botany.

“I shall next lay before my readers an

account of the origin of systems, when those of Rivinus, Tournefort, &c. will be given, with a full explanation of the sexual system of Linnæus.

“In the order of the discoveries, the lives of the several eminent botanists will be comprehended, with their portraits, including the most celebrated professors and botanical writers of the present day.

“After this introduction, I shall commence with a translation of the genera of plants of Linnæus.”

Here the delineation of the plan in the first number stops: but in the original proposals Dr. Thornton proceeds thus; “to which will be added, all the discoveries made since his time. In order to render the science of botany as simple as possible, the classes of Linnæus will be reduced to twelve, his genera new arranged, and tables given, invented by the author, comprising the easiest discriminating characters.”

It must strike all our readers that this proposed translation of the *Genera Plantarum*, is spoken of as the commencement of the work; but by what it is to be followed, we are not told. It seems, however, evident, that it could not be the intention of the author to comprize more than the introduction in the twelve or fourteen numbers, which, according to the original proposals, were to complete the splendid part of this great national work. And to effect this in the compass of about one hundred and sixty-eight folio pages would require a compression of matter, we believe hitherto unexampled. It would be to squeeze an *Iliad* into a nutshell.

Dr. Thornton's subscribers must soon have been sensible that his powers of compression are very feeble, and that he would execute only a small part of his plan within the assigned limits. This, however, he himself did not soon discover; for, after the publication of the fifth number, he still pledged himself to the purchasers, that the whole should not extend to more than twelve or fourteen, and should comprize *all the philosophical principles* of botany. It was not till the thirteenth number appeared, that a ray of light darted upon him, and convinced him that, the illustration of the seed vessel and seed being yet unfinished, the other branches of his promised philosophical enquiry could not be dispatched in the fourteenth. But this enlargement of his intellect was not all clear gain. It was obtained at

a lamentable expence of memory. Notwithstanding he had expressly declared in his first proposals; and had repeated more than once in the progress of the work, that his object was to trace, in as perspicuous a manner as possible, *the philosophical principles* of botany; he now, in 1802, gravely tells his subscribers, that "when he first *launched forth* his New Illustration of the Sexual System of Linnæus, the horizon was overcast, and the sciences and arts checked by the expences and uncertainties of a war involving the whole of Europe:" that therefore "no intention could at that time be entertained of entering into *philosophical disquisitions* : but the prospect of returning peace, and the revival of the arts, dawning, he was persuaded by several well-wishers to what *they were pleased* to call a *national work*, to enlarge his views, which were before, of necessity, so extremely limited; and considering the high *respectability* of the body of his subscribers, and the natural inherent *spirit* of the British nation, he has consented to their wishes, and trusts, and hopes, that in so doing, he has *the more satisfied* the large bulk of subscribers, fully able to appreciate the different values of a *full* or a *contracted* illustration of the most lovely of the sciences."

So true is the observation of the poet, that

"Nature to all things fixed the limits fit,  
And wisely curbed proud man's pretending wit.

As on the land while here the ocean gains,  
In other parts it leaves wide sandy plains;  
Thus in the soul while memory prevails,  
The solid power of understanding fails;  
When beams of warm imagination play,  
The memory's soft figures melt away."

He at length proposed that the work should extend to about twenty numbers. Seventeen are now before us; and we are called upon by our duty to the public to state how much is done, and to appreciate, to the best of our judgment, how well it is done. Knowing nothing of Dr. Thornton, but through the medium of his publications, and total strangers to all his connexions, we trust that our minds are free from every improper bias; and as we shall nothing extenuate, so we shall set down nought in malice.

The first section of twelve pages contains only the plan of the work. The second is devoted to an explanation of the three kingdoms of nature, and a fanciful comparison of the great families of plants, with the different ranks of civilized

society, translated with little variation from the *Systema Naturæ*. The whole would scarcely have filled two pages, but to swell it to the bulk of four, it is stuffed with two quotations from Milton, with a long note from Aristotle and Cicero, and a pious address to the Deity from Fenelon, which, having like Bayes's prologue, an universal fitness, would do equally well for any part of any system of natural history, that ever has been, or ever will be published.

Hitherto we have been only in the porch. The third section conducts us over the threshold, and introduces us into the vestibule of this magnificent *national* edifice. It is entitled, *The different kinds of seed vessels*, and informs us in a style of beautiful *simplicity*, that "as the crysalis of the silk worm is included in a golden tomb, so is the seed guarded in a similar manner: and that for the farther purpose of the protection of the seed, nature has sometimes filled this vessel with air, as in the bladder senna; or with down, as in the bean and cotton plant." The pericarp is distinguished, as usual, into the capsule, silique, legume, follicle, drupe, pome, berry, and strobile, with the addition of the nut, which Dr. Thornton exultingly tells us, twice within the compass of three lines, he has considered as a distinct species of pericarp; adding that the almond, which, according to Linnæus, is a dry drupe, perhaps would better *follow the ensign* of the nut. The berry (*bacca*) he defines, a pulpy seed-vessel, enclosing *numerous* seeds, dispersed throughout the pulp. By inserting the word *numerous* he excludes all the monospermous berries of Linnæus, as well as the fruit of the *rubus*, which, according to Linnæus, is a compound berry, having a single seed embedded in the pulp of each of its component parts. And to make it evident that his idea of a *bacca* is alike inaccurate and imperfect, he has figured, as an instance of it, the fruit, in popular language, called a strawberry; which Linnæus terms an improper *bacca*, and which, according to his own definition, is not a *bacca* at all.

The fifth section enumerates the component parts of the seed, to illustrate which Dr. Thornton, following almost every author from the days of Grew, has chosen the common garden bean. But with Grew before him, who is a model for clearness of method and perspicuity of description, though his style is now become obsolete and apparently stiff, he

has contrived, if contrivance it can be called, to jumble together a mass of matter, like the original chaos, without form and void. In the course of our literary labours we have seldom met with a more striking example of confused conceptions, puerile misplaced reflections, slovenly construction, and inaccurate, ungrammatical language. In support of part of our censure, we appeal without fear of contradiction to the following sentence.

"The pod of the bean, as you have before learnt, is a legume composed of two valves, which *were* the pieces or shells, which the bean divides into, filled with the softest down, which appears, viewed by the microscope, a clustre of blebs or bladders."

We have already hinted, that in the progress of the work, our author's memory seems to be impaired. We now begin to suspect that it was never very strong, owing, doubtless, to the impetuous and desultory character of his *imagination*; for of judgment, as our readers will soon be convinced, he has "a plentiful lack." Through the whole of what he pleases to call his Illustration of the Sexual System of Linnæus, he considers his readers as entirely ignorant of the first principles of botany and natural philosophy: but though he forms so mean an opinion of their knowledge, he makes them amends by attributing to them a flattering acuteness of apprehension, a certain intuitive discernment, which enables them to perceive what he ought to have said, and to penetrate into the inmost recesses of his mind, when more is meant than meets the eye or ear. He could not otherwise have considered them, as having already learnt that the pod of a bean is a legume composed of two valves. For all that he has told them concerning a legume is in the last section, and at the distance of little more than a single page, where it takes up not quite two lines, and where not a word about the valves is to be found. But like a true Englishman he spoils the compliment in the same breath. He seems to have no doubt of their receiving, on his simple authority, as palpable an absurdity as ever insulted the common sense of mankind; that these two valves of the pod, *i. e.* the case or covering of the bean, *were*, sometime, he does not say when, the pieces or shells into which the bean itself divides.

Of puerile misplaced reflection the following is a sufficient proof. "The bean itself naturally divides into two lobes. If

you examine the surface of these lobes there will not be found the smallest inequality, all is smooth and glossy, whereas the finest polish of human ingenuity is extremely rough. Only view the best wrought needle, it presents to your eye nothing but huge inequalities, whereas the works of the Almighty ever manifest the most astonishing perfection."

Nothing gives us a more sincere and lively pleasure than to observe the mind of the naturalist animated with a prevailing rational piety; but even piety itself loses much of its venerable character, when founded on misconceived ideas, or introduced on trivial occasions, and out of its proper place.

Of slovenly construction, the last member of the sentence first quoted, beginning with the second *which*, is a conspicuous instance.

Of inaccurate, ungrammatical language, there is scarcely a page in the whole work, where Dr. Thornton gives his own words, which would not afford at least one example. Let the following suffice.

"By making a transverse section along the lobes, there will be seen on the surface *small vessels* interposed among the *blebs*, which even to the naked eye has a greener appearance than the other parts."

To form an idea of the perplexity in the general arrangement, it would be necessary to read the whole section; but we cannot think it worth either our time or paper and ink, and we are persuaded that no one would thank us for giving ourselves the trouble of transcribing it.

The sixth section explains the uses of the several parts of the seed: and here, as according to his own account, he ventures to differ from other botanists, it is fit that he should be permitted to give his ideas in his own language.

"The pericarp is usually represented, by botanists, as solely destined for protection; whereas, its chief and primary use is the nourishment of the young seeds. Hence the pericarp, or column in its centre, serves the office of placenta to the embryos; the seeds being, as we saw before, attached to them by a thread, or pedicle, which bears an analogy to the umbilical chord of the *fœtus*, so little do even the subordinate parts of creation lose by comparison with the higher.

"This chord is very visible in the bean and nut, and indeed exists in every plant; but, as the embryos increase in growth, this attachment is dissolved, and vegetable par-

turetion may now be said to be performed : and as the chord becomes in the child a ligament, so the pod assumes a new appearance, and becomes a dry husk ; and its valves separating, the seeds are dropped from within its bosom, which may not be unaptly stiled a second birth.

“ An objection may, perhaps, be started to this doctrine, from the consideration of succulent and stony fruits ; but these, in their early stage, have the same organization as pericarps.

“ We have an example of this in the pear and the mango ; and it may be observed, that the deposit of hard, woody, or stony particles, does not take place till a considerable time after the full formation of the embryo. Young filberts, or the walnuts which we use for pickles, are also very familiar examples of the soft state of the early shell.

“ The woody shell may therefore be considered as a true pericarp ; and, as the manner in which the kernel is able to escape from its inclosure is a matter of no small wonder to the contemplators of nature, it certainly deserves our present consideration.

“ For the escape of the seed, the hard shell, acted on by heat and moisture, and the rarefaction of the air within, and force of the struggling embryos, endeavouring ‘ to burst their garments,’ opens ‘ its marble jaws,’ and this with a facility exceeding common apprehension.

“ For this purpose shells are like pericarps, which first seem of one valve, one entire piece, scarcely shewing even a line of separation, and then divide, as the occasion requires, into several different compartments, or pieces, but more usually into two, which might be conjectured from observing the natural division that takes place in walnuts, apricots, and other stone fruits.”

Confusion worse confounded !

How shall we understand the beginning of the second sentence, “ hence the pericarp or column in its centre ? ” Is it the *or* explanatory or disjunctive ? If explanatory, the whole and one of its parts are represented as the same thing ; and this, it cannot be denied, is in our author’s characteristic manner. He has already taught us, that the division of a bean may be converted into the divisions of its pod, the case or covering in which it is contained ; or to adopt a familiar illustration, that a man’s leg and thigh may become his stockings and breeches. But it would be uncandid to suppose him always blundering. Let the *or* then be disjunctive, and let us understand Dr. Thornton to mean, that sometimes the pericarp, and sometimes the column in its centre, serves the office of placenta to the embryos, still there is

no clear discrimination between the whole, and part of that whole. And with this interpretation, to what shall we refer the plural pronoun, *them* ? The word embryos is the only preceding plural substantive ; but the embryos are, in this case, the seeds themselves, and though it is too often true of the human species in a figurative sense, we never heard of any inanimate being that was either literally or metaphorically attached to itself. The plural pronoun must, therefore, be referred to the pericarp and its central column, taken collectively, and the *or* should have been *and*. But still there is the same want of distinction between a part and the whole ; for the columella or central column is considered by all botanists as part of a capsule which is one species of pericarp.

Despairing to make either sense or grammar of this part of the sentence, let us pursue the suggested analogy as it is further illustrated.

“ The thread, or pedicle, bears an analogy to the umbilical chord of the fœtus, and as after animal parturition is performed, the umbilical chord becomes in the child the suspensory ligament of the liver, so”—— Who would not expect to hear that the thread, or pedicle still retains its general form and firmness, and having discharged one important office, is made permanently subservient to another ? But we are told no such thing. “ The thread or pedicle is moreover well known to wither, and in a short time to lose the whole of its vegetable organization.” What then ? “ So the pod assumes a new appearance, and becomes a dry husk, and its valves separating, the seeds are dropped from within its bosom, which *may not be* unaptly stiled a second birth.” Thus, by a dexterous legerdemain, the pedicle entirely disappears, and we are presented with the pod, which our author has already told us, serves the office of a placenta to the embryo seeds, and which he now says, bears an analogy to the umbilical chord ; but he must be a skilful juggler indeed to render the deception complete, and make us imagine, that either one or the other of them resembles it in becoming a dry husk after the time of parturition, and permitting, “ by the separation of its valves, the new-born child to drop from within its bosom, so as to receive what may not be unaptly stiled a second birth.” So, unfortunate is Dr. Thornton in his attempt to, “ compare

the subordinate parts of the creation with the higher :” so little is he apprized, that a real general analogy may be rendered ridiculous by carrying it too far, and pursuing it too minutely.

The other parts of the quotation would afford ample matter for similar animadversion. The same confusion of ideas and terms prevails throughout. The woody or stony shell, which encloses the seeds of some plants, is now a true pericarp, and now only like one; and “for the escape of the seed, acted on by heat and moisture, and the rarefaction of the air within, and force of the struggling embryos endeavouring to burst their earments, it opens its marble jaws with a facility,” and in a manner “exceeding,” not only a “common,” but even Dr. Thornton’s “apprehension.”

The remainder of this comparatively long section consists chiefly of extracts from Grew and Bonnet, concerning the uses of the three coats of the arillus of the seed, and of the two inclosed lobes. He does not agree with Grew in thinking, that the chief design of the arillus is the filtering of the water for the nourishment of the seed, though he allows that, if the arillus be extremely thin, the water pervades it: but asserts, that “it is a wise protection for it, as the shell of an egg defends the young chick, and being indigestible, the seed passes through the bodies of animals when swallowed whole, and being of an oleaginous nature, prevents a too copious influx of moisture from coming to the lobes, which are sure to destroy them.” Indulging that “freedom of enquiry for which the present age is so remarkable,” and disdaining to receive “with oracular veneration the ipse dixit of a great name,” but at the same time “with all due deference,” he differs also from Linnæus himself, with respect to the propriety of calling these lobes cotyledons, and thinks that they are not analogous to the cotyledons of beasts, which correspond with the human placenta, but bear a much stronger affinity with the mammæ or breasts, and “form a kind of milk, which is conveyed to the plantule by means of the returning vessels which descend to it from the substance of the lobes.” As an illustration, if not a support of his opinion, he observes, that “the mucilage of almonds has obtained the appellation of *milk* of almonds, and that the liquor procured from barley when it is germinated is called sweetwort,” and adds with great gra-

vity, “new milk, we know, has precisely the same taste”!!! Surely the sensible appearance and qualities of these preparations are sufficient reasons for their respective names, without seeking for their origin in the physiology of the seed lobes. But no absurdity or opposition to fact can stop the Doctor in his ardent pursuit of analogies. As the number of cotyledons, we beg his pardon, of mammæ or breasts, is different in different seeds, “it is thus,” he observes, “with the parent animal which possesses two or more dugs.” This all the world knew. But we, at least, did not know that “the number of dugs is always proportioned by nature to the offspring to be produced, and that as in a litter of pigs, each pig always goes to its own dug, and never usurps that of another, so children, when first born, shew the same partiality to one breast.” If this were strictly and universally true, the cow must have at one birth at least double the young of the human mother; whereas both of them have generally only one, and the woman, we believe, has twins more frequently than the cow. We have consulted those who have had more experience in these matters than ourselves, and are assured that new-born children do not shew a partiality for one breast, but, which may easily be explained on other principles, are often found to incline to that which they sucked last. Were we even to admit the Doctor’s assumption as a fact, to make it harmonize with his system, a woman should always bear twins, each of which should have exclusively its own breast.

All that is said of the seminal or dissimilar leaves, with the exception of eight or ten lines, is taken verbatim from Grew and Bonnet: but these eight or ten lines demonstrate that Dr. Thornton did not understand what he had read and partly transcribed. For though Dr. Grew expressly and rightly says, that “the dissimilar leaves are the very lobes of the seed, divided, expanded, and thus advanced;” or as he afterwards explains it, “are nothing else but the main body of the seed,” and relates at large how he came to make the discovery; our author, with his usual misconception, says, that the seminal leaves *issue from* the seed, and may be called *appendages* to the lobes.

We find, as we proceed, in almost every page, new instances of the same carelessness and insufficiency. But we

are weary of pointing out the defects of this boasted *national* work, and of exposing the imbecility of its projector. We will, therefore, relieve our readers as well as ourselves from the prosecution of an irksome task, by making a rapid analysis of the remainder. Indeed we should not have extended our animadversions on it to so great a length, if it had not been so pompously obtruded on the public, and if Dr. Thornton had not so frequently been the herald of his own praise, in a succession of detached advertisements, which have carried the business of puffing to its acmé of perfection.

As there is an undeniable connection between vegetation and air, all the modern discoveries concerning the nature and constitution of the atmosphere are detailed at full length, and for the most part in the words of the original authors. The Illustration of the Sexual System of Linnæus includes, of course, a system of chemistry; it teaches the botanical student the analysis and synthesis of compound bodies; the properties of vital air and azote; of oxygen, caloric, and light; and the composition of water, which also, as essential to vegetable life, could not be omitted, nor consequently the nature of hydrogen or inflammable air.

The tenth section, entitled, the composition of fixed air, we are tempted to transcribe *at full length*; not to give our readers any information on the subject, but as a specimen of Dr. Thornton's, or his printer's skill in the art of dilatation, or of spreading out a small quantity of matter over a large surface of paper.

#### "SECTION X.

##### "V. The Composition of fixed air.

"Synthesis of carbonic acid air or fixed air; or the union of its two constituents parts—charcoal and oxygen air.

"As the composition of fixed air is easiest understood by synthesis, we shall only mention, that if wood or charcoal be burnt in oxygen air it will be converted into an acid gas, whose weight will equal the sum of the weights of the charcoal which has been consumed, and the oxygen air employed."

This, with the addition of four lines from Prior, prefixed as a motto; and of two short notes occupying less than six lines, on the properties of fixed air, and the proportion of its constituent parts; and, as Bob Short says in the Spectator, with the aid of proper distances, covers a folio page.

In the section on the connection of air with vegetation, besides two long quotations from Dr. Darwin's Botanic Garden, we have Mr. Boyle's original proposals, to try the effect of the pneumatic engine exhausted, on plants, seeds, &c. transcribed from the Philosophical Transactions of the Year 1665; an Account of the Institution of the Royal Society, and of the invention of the air pump; the experiments of Mr. Cruikshank, to shew the effect of soaked barley on air in a close vessel, and of Dr. Ingenhouz, with a view to ascertain what species or mixture of airs is most favourable to the growth of seeds.

The twelfth section discusses the question, whether oxygen is supplied to seeds through any other medium than water percolating the earth. And for this purpose Mayow, Evelyn, Sir Kenelm Digby, and Sir Hugh Platt, are produced as approximating to the truth, and Dr. Ingenhouz as really proving the fecundating power of vital air absorbed by the earth.

The thirteenth section is on the fertilizing power of snow. The names given in the new French calendar to the months, November, December, January, February, and March, being derived from the dew or fogs, the frost, the snow, the rain, and the wind, which are supposed respectively to prevail in those successive months, and which Dr. Thornton regards as the five great instruments of oxygenation, he cannot resist the temptation of giving the whole French calendar: and that we on this side of the water may not be behind hand with our ambitious rivals and adversaries, he patriotically proposes a new nomenclature to our English calendar, beginning with November, or as he would call it, the foggy month, and going on in order thro' the frosty, the snowy, the thawing, the windy, the showery, the budding, the flowering or mowing, the ripening, the reaping, the sowing and the shedding months. Each of these months in the new English calendar is illustrated by poetical quotations from Thomson, Watts, &c. which, if they answer no other purpose, fill nearly three pages. And who will complain that the room which they take up is misapplied, when he considers their close connection with the New Illustration of the Sexual System?

The essence of the thirteenth section consists of a quotation from Dr. Grew, on the nature of snow, a reference to

Miller and Evelyn, to prove that they considered snow as having the properties of a manure, and two experiments made by Hassenfratz to prove that there is more oxygen in snow than in rain water.

The fourteenth section, on the utility of winds, is rich in information, wonderfully compressed; for though swelled by two questions from the Botanic Garden, it takes up only two pages. Leaving out four introductory lines, the whole is verbatim as follows:

"In this month (February) the sun occasionally bursts out, and melts the ice and snow covering the earth.

"The globe being resolved, the month next in succession is Ventose (March), or, in our new English calendar, the *windy month*.

"The air being at this time compressed by cold, a greater quantity of oxygen is found in a given volume, and the winds act as a kind of bellows to the earth. Thus more oxygen is absorbed by the land, and (astonishing consequence!) the beneficial process of oxygenation is still farther carried on."

The answer to the question proposed in the fifteenth section, why rain promotes germination more than spring or river water, is equally concise. It appears from the experiments of Hassenfratz on rain water under an exhausted receiver, that the air which escapes contains a greater proportion of oxygen than either river water, spring water, or even atmospheric air.

To section the sixteenth, on the power of certain oxygenated substances to accelerate the progress of germination, the immortal Mayow, the unfortunate Lavoisier, the philosophic Humboldt, Professor Pohl, Jacquin, Vander Schott, Von Uslar, Dr. Hooper, and the learned Dr. Darwin, all contribute their respective quotas, Dr. Thornton keeping in the back ground, and addressing his readers only in a note, in which, however, with great self-complacency he informs them, that "his New Illustration of the Sexual System of Linnæus was begun long before Dr. Darwin's elaborate Phytologia, and the plan publicly proposed; and that the performances do not interfere, but mutually assist each other; that Dr. Darwin addresses his readers as already conversant in botany, and adepts in the new chemistry; whereas his work supposes in his readers a total unacquaintance with all kind of chemical and botanical knowledge; that he

expatiates on the several subjects he has to treat of, and leads his readers, step by step, from lesser to higher flights, enforcing all the while his instructions by plates, which, from their fine execution (as is universally allowed), may be as a substitute for the plants themselves, and which he conceives to be the readiest way of attaining a knowledge of the useful and delightful science of botany."

The seventeenth and eighteenth sections are on the earth's internal heat; and in them Dr. Thornton takes an ample range, for they occupy no less than sixty-six pages, nearly as much as all the preceding parts of the work.

In imitation of the divines of the sixteenth and seventeenth centuries, who frequently treated their subjects first negatively, and then positively, he gives the systems of those philosophers who have formed what he deems erroneous opinions on the subject. These are Dr. Darwin, Buffon, and Will. Whiston. Dr. Darwin's hypothesis of the original formation of suns, gives him an opportunity of laying before his readers a concise view of astronomy, from which we learnt, to our inexpressible surprise, that Venus, as well as our earth, has its satellite; and that this satellite of Venus was discovered in the last century. Had Dr. Thornton claimed this discovery himself, the authority of so great a man would have been indisputable; and we must have admitted it as a fact, even though the new secondary planet should still continue to elude the sight of Dr. Herschel, of the astronomer royal, and of every other astronomer in the world. But as we are told that the discovery was made in the last century, it must have been known to others as well as to himself; and as no trace of it is to be found in any professed treatise of astronomy, we may be allowed to doubt on the subject, and to suspect that Dr. Thornton has asserted what is not true. Long did we puzzle ourselves with attempting to investigate the source of the error, and so continually did it agitate our minds, that, for some time, we were deprived of our nightly rest, and we know not what might have been the effect upon our health and spirits, or whether we should ever have been equal to the severe task of writing this review, if we had not happily been freed from our anxiety by a kind of vision between sleeping and waking, which, on account of the solemn mysterious stillness by

which it was accompanied, is in our estimation entitled to more credit than the frantic ravings of an intoxicated Delphic prophetess. We, therefore, do not hesitate to pronounce with oracular confidence, that once upon a time Dr. Thornton, happening to be left alone in the parlour of a friend, took up a book on astronomy, which lay by chance in the window, or on a table, and opened it at the chapter where an account is given of the discovery made soon after the invention of the telescope, that Venus, in different parts of her orbit, has different phases, like those of the moon; and that unwilling to lose the knowledge which he had thus incidentally obtained, as soon as he got home he carefully entered it in his immense common place book; but through the natural infirmity of his memory, and the habitual confusion of his ideas, he mistook the appearance for the reality, and has ever since believed that Venus *has* a moon, instead of being in some respects *like* one. If a nocturnal revelation could stand in need of confirmation, we might produce a strong analogical argument in its support. For what can be more probable than that a writer, who does not discern the difference between a substance and its case, and between a whole and its part, should fancy identity and similarity to be one and the same thing?

The affirmative side of the question with respect to the earth's internal heat is, of course, that which Dr. Thornton himself espouses. He agrees with that set of philosophers, who entertain the opinion that it arises from the conflict of elements contained within her bosom. The mention of central fires produces a profusion of learning, and a multitude of quotations poetical and prosaic, occupying, in the form of notes, nine close printed pages, in which, among other curious particulars, *all intimately connected with the Sexual System of Linnæus*, we are told, that "the Greeks entertained the idea that hell, or place of the manes of departed people, was in the centre of the earth—that the Jews seem to have entertained the same notion, and that hence our Saviour, adapting his discourse to their conceptions, gives the parable of Dives and Lazarus—that the word infernal comes from inferus; and that on the stage these (he leaves us to guess who) are always represented with torches in their hands, and involved in flames—that there is nothing in natural

religion to authorize such a conception—that the innumerable stars above us are probably replete with inhabitants, and that we probably pass from one star or world to another star or world, according to our spent lives—that the pre-existence of the human race is supported both by revelation *as well as* reason—that the wisest of the ancients conjectured that there were no infernal regions and eternity of punishment—that Lucretius is one of these sages—and that the fables of the giants, and of the rape of Proserpine, are descriptive of burning mountains."

Earthquakes and volcanos draw our author into another series of notes, to the length of fifteen entire pages, and nearly the whole of almost as many more. In these notes, which are little more than quotations, we are *favoured* with Bishop Berkley's account of the eruption of Mount Vesuvius in 1717, and Sir William Hamilton's of those in 1779 and 1794—with a description of Mount *Ætna*, and of its eruptions in 1669 and 1755, and of the earthquake at Lisbon in 1755—with the composition and theory of gunpowder, aqua regia, fulminating gold, and fulminating silver—with an explanation of the cause of animal heat, which Dr. Thornton assures us was first discovered and maintained by himself—with the rationale of the affinities of aggregation and composition—with the theory of animal digestion—and with a history of the cases of several persons who have been consumed by an inward combustion.

Dr. Thornton, conceiving that he has amply considered the source and influence of heat on the seed, but of which (lost, we suppose, in the mass of multitudinous and multifarious matter which he had heaped about him on every side) he has forgotten to say even a single word, now proceeds to contemplate the power of the electric fluid in promoting the progress of germination. And as he presumes that his readers are no less ignorant of electricity than of botany, chemistry, and astronomy, he gives them the history of this science; of the various theories which have been formed concerning it by Dr. Franklin, Du Faye, and others; of the identification of the electric fluid with lightning, &c. &c. and then, less forgetful than he had been on the subject of the earth's internal heat, concludes with the experiments of Nollet, Berthollons, and D'Ormay, to shew

the influence of electricity on vegetation.

So far, or rather so little is this boasted national work advanced in its course. The various evolutions of the seed are not yet explained: the organized structure of the stem and branches, and of their various appendages; the structure and variety of the leaves, and of the evolution from them of oxygen and other airs; the food of plants, and the principles of agriculture; and lastly, the main professed object of the whole, the structure of the flower, with the illustration of the Sexual System, still remain behind. Nor is this all: the history of systems, and the lives of the most eminent botanists are to be given; before Dr. Thornton *commences* with a translation of the *Genera Plantarum*. If he had not been a novice indeed in the art of calculation; he must have been sensible that not twelve or fourteen, nor twenty, nor even a hundred numbers, will be sufficient to complete his design in the manner in which he has hitherto conducted it.

Sed ohe: jam satis est. The patience of the public must soon be exhausted. As to ourselves, we have not a drop left. Never were lavish promises more scantily realized. When the author himself appears, he exposes, what Dr. Johnson would have called, his inanity. But he is generally willing to avail himself of other men's labours. A very considerable part of the literary composition consists of quotations, most frequently verbatim, from various writers. Two quotations from Milton fill five pages. We have always thought that in the business of quotation, we reviewers are first-rate workmen: but in the presence of Dr. Thornton, we hide our diminished heads. His work is, indeed, little more than a piece "of shreds and patches," clumsily stitched together with coarse packthread, and instead of a na-

tional honour, may more justly be deemed a national disgrace.

But we are reminded that we have unaccountably overlooked the capital beauty of the publication; and that its merits, and its acceptableness with the public, rest chiefly on the excellence, the splendour, and magnificence of the engravings. We have all along been sensible of it, and in this respect are not at all disposed to be sparing of our praise. *Our* praise, however, is not needed. The smaller uncoloured botanical plates in general, but especially the larger coloured ones, do the highest honour to the artists, and will be lasting monuments of the fine taste and masterly execution which characterise the British nation in the present age. But when Dr. Thornton claims a share of the fame, we are reminded of a farce, which, in our play-going days, afforded us much amusement. It is called, if we mistake not, *A Peep behind the Curtain*, and is written on the plan of the Duke of Buckingham's celebrated dramatic satire. Its plot turns on the rehearsal of a musical piece, founded on the story of Orpheus and Eurydice, in which some cows are to be introduced, dancing to the lyre of the ancient bard. When every thing else is ready, the cows are wanting, and the prompter is dispatched in haste to enquire the reason of the delay. We quote from memory, and, after a lapse of thirty years, will not vouch for more than the general spirit of the dialogue. "The author," cries the trusty messenger out of breath, "is impatient to see his cows: he relies much on them for the success of his piece." "*His cows*," replies the indignant maker, "they are *my cows*: I know that his play will be nothing without them; and I will have *him* to know, that vain as he is, he shall not run away with the glory of the carpenter."

ART. X. *A Description of the Genus Pinus.* By AYLMER BOURKE LAMBERT, Esq. F. R. S. Vice President of the Linnaean Society. Folio.

WE have here another magnificent and costly publication, but of a very different character from the foregoing article. Mr. Lambert, well-knowing how to estimate the value of accurate ideas, perspicuous description, and just arrangement, has devoted his attention to the elucidation of a single genus, and has become a valuable addition to the

list of monographers in natural history. One of the species of the genus *pinus* is a native of our island, and several others have been so long cultivated among us, that they may be considered as nearly naturalized: but the genus itself has hitherto been imperfectly understood, and the greater number of its species have been very insufficiently discriminated.

Linnaeus has enumerated only 12 species in the last edition of his *Systema Naturæ*, and the *Hortus Kewensis*, though it has treated the subject better than any other work, "does not enumerate all the species that are now known, nor does it distinguish their characters correctly." Mr. Lambert, therefore, with a laudable ambition to supply the deficiency, and to promote the advancement of useful science, has personally and repeatedly examined those that grow within a considerable distance from the metropolis; has observed them in different periods of their growth; and has particularly attended to the progress of the cones from their first formation to their full maturity. He has also "consulted every author of repute, with a view not only to ascertain the most accurate specific distinctions, but also to collect every fact relative to the culture and uses of each species." As the result of his labours he has now laid before the public, new specific characters, comprehensive lists of synonyms, and minute descriptions in Latin, with various miscellaneous observations in English: and as an appendix, an account, written by Dr. Matton, of several substances prepared from different species of pine, and employed in medicine or for other purposes; a letter from Mr. Davis, of Hommingsham, in Wilts, on the different kinds of timber afforded by the different species; an extract from Coxe's Travels relative to Christiana deal; and a letter from Thomas Marsham, Esq. T.R.L.S. on the insects destructive to pines. The whole is illustrated by admirable figures which exhibit a branch of the plant, the inflorescence and the fruit in different stages of its growth; all, for the most part, in their natural size, with magnified dissections of the particular parts both of the flower and fruit. The magnitude of the plates required for this purpose, the excellent execution of the engravings, and the elegant stile in which the letter press part of the work is finished, have so greatly enhanced its cost, as to render it unattainable to many who would wish to be in the number of its purchasers. These luxuries must be reserved for those who can spare as many guineas as are specified in its advertized price. For the benefit of others we will copy Mr. Lambert's new specific characters entire, and abridge such of his observations on each species, as we imagine may be most gra-

tifying to the lovers of science and rural æconomy.

1. *Pinus sylvestris*; Scotch fir.

*Foliis geminis rigidis; strobilis junioribus pedunculatis, recurvis dependentibus; antherarum cristâ exigua.*

From this species is obtained what is called in London, yellow deal, in the country red deal, and sometimes, being generally imported from Christiana, Christiana deal. The Scotch fir raised in England is equal to the foreign in weight and durability, but is seldom so fine in the grain, and has a greater quantity of sap.

Most species of pine may be made to yield, and many of them produce spontaneously, a remarkable resinous juice usually called turpentine. The true *Terebinthus* of the ancients is obtained from trees of another genus, called by Linnaeus *pistachia*; but the produce of the Scotch fir is now most commonly used on all occasions when a *Terebinthinate* juice is wanted, either in medicine or the arts.

From this resinous juice is obtained the essential oil of turpentine, by distilling four pounds of it with five pints of water.

Common resin is the residuum of the process, which, pushed as far as the nature of the substance will admit, produces black resin or colophony.

Tar is obtained from the roots and other parts of old pines, and differs from the native resinous juice in having acquired a disagreeable empyreumatic quality from the action of fire, and in containing the saline and mucilaginous parts of the tree mixed with the extractive and the oily.

Pitch is procured by melting coarse hard resin with an equal quantity of tar.

2. *Pinus pumilio*: the mugho, or mountain pine. *Sylvestris* γ of Aiton, β of Gmelin.

*Foliis geminis abbreviatis strictis; strobilis ovatis, obtusis, minimis; junioribus sessilibus erectis.*

It grows on the tops of the highest mountains where scarcely any other tree is to be found, and often covers with its thick and almost impenetrable branches a very extensive tract. When its branches are broken, a transparent resin of a very fragrant smell exudes, which is collected and sold in the form of a native balsam.

3. *Pinus banksiana* ; Labradore pine, *sylvestris*  $\delta$  Aiton.

*Foliis geminis divaricatis obliquis ; strobilis recurvis tortis ; antherarum cristâ dilatatâ.*

This species is very rare in England, three only of any size are known by Mr. Lambert ; one at Paine's Hill, Surry ; another at Kew, and the third at Crome, the seat of Lord Coventry.

4. *Pinus pinaster* ; cluster pine.

*Foliis geminis elongatis ; strobilis verticillatis confertis, ovatis, sessilibus, pendulis, antherarum cristâ rotundatâ.*

The wood is soft, and in Switzerland is usually either cut into shingle for covering the roofs of houses, or employed for the extraction of pitch.

5. *Pinus pinea* ; stone pine.

*Foliis geminis ; strobilis ovatis maximis, seminum alis abbreviatissimis ; antherarum cristâ dentato-lacerâ.*

The nuts are of a large size, very hard, and contain kernels which have the sweetness of almonds. They are become an article of sale, and may be found in many of the London fruit shops. They possess a nutritive and demulcent quality, but from their oily nature soon become rancid and unfit to be eaten. The proportion of oil in them is, perhaps, greater than in the seed of any other plant ; one pound of them yielding five ounces, whereas the same quantity of linseed produces only two ounces and a half.

6. *Pinus maritima*.

*Foliis geminis tenuissimis ; strobilis ovato-conicis, glaberrimis, solitariis, pedunculatis.*

The only tree known to Mr. Lambert grows at Sion House. The figure is from a specimen in Sherard's Herbarium.

7. *Pinus halepensis* ; Aleppo pine.

*Foliis geminis tenuissimis, strobilis ovato-oblongis, reflexis, lævibus, solitariis, pedunculatis.*

This species is more like a shrub than a tree in England, and never grows to any great height in its native country. It does not well bear the cold of our winters, and is at present very scarce.

8. *Pinus massoniana* ; Indian pine.

*Foliis geminis, tenuissimis, longissimis ; vaginâ abbreviatâ ; antherarum cristâ dentato-lacerâ.*

The figure is taken from a specimen in the Banksian Herbarium, which was brought by Masson from the Cape of

Good Hope, where it had been raised from seeds sent from China. The specimen has only the male catkin.

9. *Pinus inops* ; Jersey pine, *Virginiana* of Gmelin.

*Foliis geminis ; strobilis recurvis oblongo-conicis longitudine foliorum ; aculeis squamarum subulatis rectis.*

Most of the pine tribe are very brittle in their texture ; but in this species the wood has almost pliability enough to be tied in a knot, and may therefore be useful for hoops, baskets, &c.

10. *Pinus resinosa* ; pitch pine.

*Foliis geminis ; strobilis ovato-conicis sessilibus ternis : squamis medio dilatatis inermibus.*

One of its most distinctive characters is the uncommon length of the sheath of its leaves. It is a native of North America.

11. *Pinus variabilis* ; variable leaved bastard pine. *Tæda*  $\gamma$  of Aiton.

*Foliis binatis ternatisque ; strobilis ovato-conicis subsolitariis : squamarum aculeis incurvis.*

Mr. Lambert has not seen more than two trees of this species in England : one at Paine's Hill, the other at Kew. Its native situation is the sea shore of North America.

12. *Pinus tæda* : *frankincensè* pine.

*Foliis ternis elongatis ; strobilis deflexis : spinis inflexis ; vaginâ foliorum elongatâ.*

A low tree on the sandy coast of North America,

There are two flourishing trees of this species at Sion House, but Mr. Lambert has never found any small flowers upon them. The male catkin is figured from a specimen brought from America by Mr. John Fraser.

13. *Pinus rigida* ; three leaved Virginian pine. *Tæda*  $\beta$  of Aiton.

*Foliis ternis : strobilis ovatis confertis : squamarum spinis reflexis : vaginâ foliorum abbreviatâ.*

14. *Pinus palustris* ; swamp pine.

*Foliis ternis longissimis : strobilis subcylindræis muricatis : stipulis pinnatifidis ramentaceis persistentibus.*

It abounds in Virginia and Carolina. The wood is soft and light, and very sparingly impregnated with resin. Only two of any size are known by Mr. Lambert, one at Kew, and the other at Lord Coventry's.

15. *Pinus longifolia* ; long leaved Indian pine.

Foliis ternis, tenuissimis longissimis, pendulis; stipulis integerrimis, deciduis; antherarum cristâ convexâ integriusculâ.

A native of the mountain of Napaul in the East Indies, where it grows to the height of more than a hundred feet. Described from a manuscript communication by Dr. Roxburgh.

16. *Pinus strobus*; Weymouth pine.

Foliis quinis; strobilis folio longioribus, cylindraceis, lævigatis; antherarum cristâ geminâ, subulatâ minimâ.

First cultivated in England by Lord Weymouth, whence its English name is derived. It abounds most in New York, New England, Nova Scotia, and Canada, where it grows to the height of two hundred feet on the best ground in the vallies, in the crevices of the mountains, and on the banks of rivers, to which the rains and melted snows carry down the fattest parts of the soil of the highest lands. The bark in old trees is abundantly impregnated with a whitish resin, which has a very agreeable odour. The wood is of a yellowish white colour of a tolerable hardness, very fine, almost resembling the white cedar, and works straight, smooth, and shining.

17. *Pinus cembra*; Siberian stone pine.

Foliis quinis: strobilis ovatis: seminum alis oblitteratis, antherarum cristâ reniforme crenatâ.

It flourishes most on the mountains of Switzerland and Siberia; is one of the hardiest of the genus, and of the slowest growth, seldom attaining the height of three feet in less than 14 years. Its timber is large, and has a finer grain than common deal, with a remarkably pleasant smell. The flowers have a more beautiful appearance than those of any other species, being of a bright purple colour; as are also the unripe, full grown cones, which have a bloom upon them resembling that of a ripe Orleans plumb. The kernels of the nuts, when stripped of a brownish rind, have the whiteness and softness of a blanched almond: they have an agreeable oily taste, and often form part of a Swiss as well as Siberian dessert; but Dr. Maton says, that when exposed to the air they sooner become rancid than those of the *pinus pinea*. From the shoots of the *pinus cembra*, bruised and macerated a month in water, is extracted an essential oil, called by the German writers Carpathian balsam, pellucid, very liquid, and of a whitish colour, having an odour and

taste like oil of juniper, and celebrated by them for its great medicinal virtues in disorders of very opposite characters.

The *pinus cembra* is at present very scarce in the nursery gardens about London, and bears a high price. Flourishing plantations of it are to be seen on Lord Clive's Estate in Shropshire; and in the grounds of Colonel Dixon, of Gledhow, near Leeds, in Yorkshire, by whose father, the late Jeremiah Dixon, Esq. it was propagated from cones procured in Switzerland. Several trees, two seventy years old, and others about fifty, are also growing at Mill Hill, in Middlesex, the seat of the late Peter Collinson, Esq. and now by a scientific kind of descent, in the possession of that very intelligent and indefatigable botanist, Richard Anthony Salisbury, Esq.

18. *Pinus occidentalis*; West Indian pine.

Foliis quinis longissimis, margine scabris: strobilis oblongis: squamis apice truncatis.

Dr. Swartz seems only to have seen trees of this kind without male flowers or fruit, and could procure only a branch with leaves, and a cone much mutilated. No figure is given.

19. *Pinus abies*; Norway spruce fir.

Foliis solitariis tetragonis; strobilis cylindraceis; squamis rhombeis, complanatis, margine repandis erosis.

Its wood is called white deal in England; is firm, straight, and regular in the grain; and is capable of resisting moisture for a long time. That which is grown in England is said to be more durable than that which is imported, and is particularly in demand for making ladders. On account of the fineness of its grain, and of its whiter colour, it is much used for cottage tables and other furniture; but in the North of England, at least, it was esteemed less durable than the red deal, and bears an inferior price. We who sometimes rise early in a winter morning and light our own fire when the rest of our household are in bed, know by experience that its chips are much inferior to those of red deal.

The common frankincense of the shops is probably no other, or at least is adulterated with, the resinous juice of this tree, which spontaneously exudes from its pores, and soon concretes into distinct drops, or tears. The genuine Burgundy pitch is prepared from this resinous juice.

20. *Pinus alba*; white spruce fir.

*Foliis solitariis tetragonis incurvis: strobilis cylindraccis laxis: squamis obovatis integerrimis.*

A native of North America above the 34th degree of north latitude, but it disappears southward. It is recommended by Wagenheim as a hardy, profitable tree; and is moreover one of the most ornamental of the abies tribe, growing with its branches feathered to the ground, and on account of the peculiar glaucous hue of its leaves, makes a beautiful appearance when mixed with other pines. Fine trees of this species may be seen at Milton-Abbas, in Dorsetshire, and at Paine's Hill. From its branches boiled with oats, biscuits and molasses, the American spruce beer is prepared.

21. *Pinus nigra*; black spruce fir.

*Foliis Solitariis tetragonis, undique sparsis, rectis, strictis; conis oblongis.*

A native of New England, Canada, &c. The young shoots and leaves, like those of the alba, are used in making spruce beer, and by some preferred to them.

22. *Pinus rubra*; Newfoundland red pine or spruce fir.

*Foliis solitariis, subulatis, acuminatis; strobilis oblongis, obtusis; squamis rotundatis, subbilobis, margine integris.*

First propagated in this country by Mr. Thoburn, in the gardens of Mess. Whately and Barret, at Brompton, where are a few trees, but too young to produce full sized cones. Its right to be received as a distinct species is not yet fully ascertained.

23. *Pinus orientalis*.

*Foliis solitariis tetragonis; strobilis ovato-cylindraccis: squamis rhombeis.*

This species is inserted only on the authority of Tournefort, who found it growing near Trebisonde. Mr. Lambert has not seen a specimen either recent or dried, but is inclined to think some cones brought from China belong to this oriental pine. Two of these cones are figured, as is also a branch copied from a drawing made by Aubriet, under the eye of Tournefort himself, and now in the possession of M. de Jussieu.

24. *Pinus picea*; silver fir.

*Foliis solitariis planis, subsecundis, strobilis cylindraccis erectis; bracteolis elongatis; antherarum cristâ bicorni.*

In Siberia, where this species is very abundant, it is considered by the Tartar herds as a sure indication that good

springs are at hand. Its wood is soft and not durable. Between the midrib and the edges of its leaves, there is a beautiful silvery white appearance, whence its English name is derived. It affords a liquid resin, sold in Germany under the name of Strasburgh turpentine, which is of a middle consistence between that of the terebinthus and the larix; in smell more agreeable than any other turpentine, except the cyprian; in taste the bitterest, yet least acrid.

25. *Pinus balsamea*; balm of Gilead fir.

*Foliis solitariis planis, subsecundis strobilis cylindraccis erectis, bracteolis abbreviatis, antherarum cristâ muticâ.*

A native of Nova Scotia, Canada, &c. Between its bark and wood are vesicles which contain a whitish transparent resinous juice, which is brought from Canada, under the name of Canada balsam, and apparently not very different in its qualities from the celebrated balm of Gilead exclusively the produce of *amyrus Gileadensis*. From its cones, which are of a beautiful glossy deep purple colour, there exudes also a great quantity of transparent resin. Some of the largest trees of this species in England are at Woburn Park and Warwick Castle. They are said to be more than 20 years old; but in this country they generally decay sooner.

26. *Pinus Canadensis*.

*Foliis solitariis, planis, denticulatis, subdistichis; strobilis ovatis, terminalibus, vix folio longioribus.*

It bears a great resemblance to the common yew, but is less stiff. A large tree planted by Mr. Peter Collinson, by whom it was first cultivated here, is still standing at Mill Hill.

27. *Pinus taxifolia*; Nootka fir.

*Foliis solitariis, planis, integerrimis, strobilis oblongis, antheris inflato-didymis.*

Figured from a specimen in the Banksian Herbarium, brought from the north-west coast of America by Mr. Menzies.

28. *Pinus lanceolata*; broad-leaved fir.

*Foliis solitariis lanceolatis, planis, patentibus; strobilis globosis; squamis acuminatis.*

Figured from a fine specimen in the Banksian Herbarium, brought from China by Sir George Leonard Staunton, Bart.

29. *Pinus larix*; larch.

*Foliis fasciculatis, deciduis; strobilis*

ovato-oblongis; squamarum marginibus reflexis laceris; bracteolis panduriformibus.

The wood of the larch, cut into shingles of about one foot square surface, and half an inch in thickness, is used in Switzerland for covering the roofs of houses. At first the roofs appear white, but in the course of two or three years become perfectly black by means of the resin extracted from the pores by the sun, which also stops up the joints of the shingles and renders them impenetrable to rain. Used for subterraneous and subaquatic purposes, it is very durable; and Pallas relates that, in Siberia, some burial places of an unknown nation, and of remote antiquity, still remain with beams and supporters of larch entire.

It is from the *pinus larix* that the true Venetian turpentine is extracted, but though it bears the name, very little of it is exported from the Venetian territories: but it is probable that the merchants of that country were the first who substituted it for the genuine turpentine of Cyprus. The true liquid-resin of the larch is obtained chiefly from France and Germany. That which is most commonly met with in the shops, comes from New England, but from what tree is uncertain.

The inner part of the wood of this tree yields a pure gum, scarcely inferior in its qualities to the Arabian gum, but appears to have been hitherto used only in Russia. It is dryish, of a reddish colour; and of a subresinous taste, but wholly soluble in water. It is found on the Ural mountains, when the forests have been set on fire by the carelessness of the huntsmen. During the combustion it exudes from the medullary part of the trunks, and is diligently collected by the natives, not only for the purpose of rendering their bows glutinous, but also of being eaten as a delicacy.

30. *Pinus pendula*; black larch.

Foliis fasciculatis deciduis, strobilis oblongis; squamarum marginibus inflexis; bracteolis panduriformibus acumine attenuatis.

A native of the cold mountainous parts of North America. The first tree planted in this country grew at Mill Hill, in the garden of the late Mr. Collinson.

31. *Pinus microcarpa*; red larch.

Foliis fasciculatis deciduis; strobilis subrotundis paucifloris; squamis inflexis; bracteolis ellipticis, obtuse acuminatis.

This species is scarce in England. The only tree of any size seen by Mr. Lambert is at Whitton, where it was planted by John Duke of Argyle. Mr. Loddige has cones both of this and the *pendula* sent annually from America. He has a large plantation of both species about eight foot high.

32. *Pinus cedrus*; cedar of Lebanon.

Foliis fasciculatis perennantibus; strobilis ovatis, obtusis erectis: squamis adpressis, rotundatis.

This celebrated tree is too remarkable to be mistaken for any other species. After the excision of a branch, the part remaining in the trunk gradually loosens itself, and assumes a round form like a potatoe. If the bark covering it be struck smartly with a hammer, the knot leaps out. This fact was communicated to Mr. Lambert by Sir Joseph Banks, and he has repeated the experiment himself. The cedar is extremely tardy in its increase of size, even under the most favourable circumstances. It has no title to its common epithet, lofty; since those which still remain on Mount Lebanon are by all accounts not very high; but their wide spreading branches beautifully illustrate the allusion made to them by the Psalmist in describing a prosperous people. The diuturnity ascribed by the ancients to the wood of the cedar does not correspond with that of *pinus cedrus*, but applies much better to the *cupressus horizontalis* of Miller. The word cedar was probably used by them, as it still is by us, with considerable latitude. The wood employed as a covering for black lead pencils is not *pinus cedrus*, but *juniperus Bermudiana*.

The late Sir John Cullum has taken great pains, in the Gentleman's Magazine for March 1779, to ascertain by whom the cedar was first introduced into England, and concludes that we are probably indebted for it to Sir John Evelyn. Some of the most vigorous in this country are at Paine's Hill, Whitton, and Chiswick.

All that have been mentioned by Sir John Cullum and Mr. Lambert are in the south of England. It is, we believe, not generally known that three fine cedars are now standing at Bierley Hall, near Bradford, in Yorkshire, formerly the seat of Dr. Richardson, author of several papers in the Philosophical Transactions, and mentioned with great respect by Dillenius in his preface to the third edition of Ray's Synopsis, and also in that to his own Historia Muscorum.

The granddaughter of Dr. Richardson is still living, and from her we have been favoured with the following particulars, which she has often heard from her uncle, who succeeded his father in the possession of the estate. When cedars were first brought into England, the largest one, then a very small shrub, was sent by Sir Hans Sloane as a present to Dr. Richardson, who, concluding that it would not bear an English winter, put it into a garden pot, and for some years placed it in his green house with the other exotics; but finding that whatever it gained in summer by being in the open air, it lost in winter, he grew tired of nursing, and ordered his gardener to dig a large hole in the corner of his flower garden, and fill it with good earth: here he planted it, and here it grew to a noble tree, but suffered considerably about 30 years ago by a high wind which happened when its boughs were heavily laden with snow, and tore off large arms to the amount of two cart loads of timber. Its present girth, at about one foot above the ground, is twelve feet three inches; at eight feet three inches from the ground, just below its division into two principal branches, fourteen feet: the extent of its longest branch from the perpendicular of the trunk, thirty-seven feet: one of the principal branches soon divides into three, the other into two. This tree must have been sent to Dr. Richardson before the year 1685, when Sir Hans Sloane, in a letter to Mr. Ray, expressed his surprise that a cedar in the garden of Mr. Watts should thrive so well as, without pot or greenhouse, to be able to propagate itself by layers that spring: but it could not be much before, for Dr. Richardson

was not then quite 23 years old. The other two were planted some years after, and were part of a cedar hedge which was clipped for some time, but rising too high, the remainder of the trees were taken away, and only these two suffered to grow. Bierley Hall is situated in a strong clay soil, and the neighbouring country abounds in coal and ironstone. Dr. Richardson corresponded with most of the principal botanists in Europe, many of whose letters are still in possession of the family; those of Sir Hans Sloane in particular are numerous, but none in which the cedar is mentioned happen to have been preserved.

32. *Pinus dammara*; Amboina pitch pine.

*Folii oppositis elliptico-lanceolatis, striatis.*

This curious species of pinus was first described by Rumphius, in his *Herbarium Amboinense*. A specimen of the leaves is preserved in the Herbarium of Sir Joseph Banks, who has lately received fragments of the cone also from Amboina. Dr. Smith has also discovered a specimen of the leaves in the *Sherardian Herbarium* at Oxford, among the plants collected by Dampier. It produces a resinous substance, described at large by Rumphius, and well known in India under the name of *dammar-puti* or white dammar.

Mr. Lambert informs us that he intends to follow up the present work with the illustrations of the remaining genera in the natural order of Coniferæ; and that several drawings of the species of *Dacrydium*, and the *Dombeya* of Lamarck are already finished, and will be given to the public as soon as possible.

## CHAPTER XXII.

## GENERAL SCIENCE.

THE Royal Society of London is the only one in Britain that has contributed in its collective capacity to the scientific history of the last year : it is, however, in itself a host, and the present annual volume will be found of unusual value and importance. The Philosophical Society of Calcutta has also published a volume of high respectability, and in consequence of the recent establishment of a college in British India, we may reasonably expect an accession of vigour and spirit to an institution, with which no other colonial society can presume to vie. Dr. Rees's Cyclopædia continues advancing with a firm and even pace, and promises to be no small credit to those who are engaged in the execution of so vast an undertaking.

ART. I. *Philosophical Transactions of the Royal Society of London for the Year 1803.*  
4to, pp. 514. sixteen plates.

THE Royal Society continues its exertions in the cause of science with unabated energy and success. It has published, as usual, an annual volume in two parts, containing a variety of curious and important information. The first article is the Bakerian Lecture.

1. *Observations on the Quantity of horizontal Refraction, with a Method of measuring the Dip at Sea.* By W. H. WOLLASTON, M. D. F. R. S.

Dr. W. relates a series of observations made on the Thames from Somerset House, which show that the quantity of horizontal refraction observable over a short extent of water is much larger than was supposed, and that this refraction, although no doubt in part to be attributed to a variation of temperature, and therefore of density in the lower stratum of the atmosphere, is also materially affected by other circumstances as yet unknown. The method of measuring the dip at sea, as proposed by Dr. Wollaston, is to ascertain by the back observation the whole vertical angle between any two points of the horizon ; half the excess of the angle above  $180^\circ$  should of course be the dip required. "The most obvious objection to this," the author remarks, "is the possibility

that the refraction may in some measure be different in opposite points of the horizon at the same time, but on the surface of the ocean in general, any partial variations of temperature can rarely be supposed to exist."

2. *A Chemical Analysis of some Calamines.*  
By JAMES SMITHSON, Esq. F. R. S.

Citizen Haüy, in his Elements of Mineralogy, has asserted, contrary to the general opinion of chemists, that calamine is a simple oxyd of zinc, contaminated frequently with carbonat of lime, to which it owes its character of effervescing with acids. In consequence of this, Mr. S. was induced to analyze some varieties of calamine, for the purpose of obtaining a more perfect knowledge of those ores. Calamine from Bleyberg afforded him,

Oxyd of zinc	- -	71.4
Carbonic acid	- -	13.5
Water	- - -	15.1
		<hr/>
		100.0

A dense mamillated variety from the Mendip hills yielded

Carbonic acid	- -	35.2
Oxyd of zinc	- -	64.8
		<hr/>
		100.0

A variety from Derbyshire, in minute pale yellow crystals, consisted of

Carbonic acid - - 34.8

Oxyd of zinc - - 65.2

---

100.0

The electric calamine of Regbania, in Hungary, afforded,

Quartz - - - - 25.0

Oxyd of zinc - - 68.3

Water - - - - 4.4

---

97.7

Loss - - - - 2.3

---

100.0

It deserves to be noticed, that the quartz, though in so large a proportion, was rendered soluble by means of the metallic oxyd in dilute sulphuric acid, as after a time the solution became gelatinous.

3. *Experiments on the Quantity of Gasses absorbed by Water at different Temperatures and under different Pressures.* By Mr. W. HENRY. 10. Appendix to ditto.

The first section of this paper relates to the absorption of gasses by water, under the usual atmospheric pressure. In this Mr. Henry has observed, that the proportion of carbonic acid gas absorbed by water, by means of agitation, depends greatly on the purity of the gas made use of. Thus when at the temperature of 55°; 20 measures of carbonic acid are agitated with ten of water, at least half the gas is absorbed; but from a mixture of 20 measures of carbonic acid with 10 of atmospheric air, 10 parts of water take up only 6 of carbonic acid. The cause of this diminished absorption is merely stated to be "connected with the proportion of common air contained in the unabsorbed residuum." Undoubtedly it is; but surely we may make a nearer approach to the true reason of the fact by supposing that a partition of the carbonic acid between the water and air takes place in the compound ratio of their respective quantities and chemical affinities; whereas, when pure carbonic acid is employed, the water unites with the acid to perfect saturation, on account of the absence of antagonist affinities. But Mr. Henry is disposed to believe, with Mr. Dalton, that the "absorption of gasses by water is purely a mechanical effect," a supposition, in our opinion, very incapable of accounting for many well-known facts. Common air cannot

be entirely expelled from water by long boiling and the action of the air-pump, but if water having been so treated is impregnated with pure carbonic acid, the small quantity of air contained in the water will be liberated, obviously on account of its affinity with the water being overcome by that of the carbonic acid.

The second section of Mr. Henry's paper treats of the influence of pressure in promoting the absorption of gasses, and presents us with the following very important general law, deduced from a series of fifty experiments on various gasses, that "under equal circumstances of temperature water takes up, in all cases, the same volume of condensed gas as of gas under ordinary pressure."

4. *Experiments and Observations on the various Alloys, on the specific Gravity, and on the comparative Wear of Gold; being the Substance of a Report made to the Right Honourable the Lords of the Committee of Privy Council, appointed to take into Consideration the State of the Coins of this Kingdom, and the present Establishment and Constitution of his Majesty's Mint.* By CHARLES HATCHETT, Esq. F.R.S.

This highly interesting paper is the joint production of Mr. Hatchett and Mr. Cavendish, and will be found, in all respects, worthy of the high reputation and acknowledged abilities of these philosophers. The experiments were undertaken at the desire of the privy council, in consequence of a considerable loss which the gold coin appeared to have sustained by wear within certain periods, which induced them to have an inquiry instituted, in order to ascertain whether this loss was occasioned by any defect in the quality, or figure, or impression of the coins.

The subject naturally divides itself into an enquiry concerning the effects produced upon gold by various metals when alloyed with it in different proportions; concerning the specific gravity of gold variously alloyed, and the modifications to which it is liable; and concerning the effects of friction in various circumstances. These are made the subjects of three sections, which we shall proceed to give some account of.

First, Of the effects produced upon gold by combination with other metals.

Arsenic, though it is with difficulty united with gold when the two substances are in small quantity and mixed in an open crucible, yet combines easily with this metal when applied to it at a

red heat, and in a state of vapour, in closed vessels. The alloy is of a grey colour when the proportion of arsenic is considerable, extremely fusible and brittle. If the arsenic is about 1-900th of the gold, the alloy retains the colour of gold, and, though brittle, bends in some degree before it breaks.

Antimony, either in fusion or a state of vapour, unites eagerly with gold, and in the proportion of 1-1920th destroys its ductility.

Zinc is also highly injurious to the ductility of gold, from which, however, it may be separated by heat; but this is not easily effected if, instead of pure zinc, brass is made use of.

Cobalt, in the proportion of four grains to an ounce of standard gold, begins to impair its ductility and colour. When it amounts to nineteen grains, the alloy becomes of a pale yellow colour, is brittle, and exhibits a fine-grained earthy fracture.

Nickel does not begin to render standard gold brittle in a smaller proportion than eight grains to the ounce.

Manganese unites with gold and renders it brittle, and is itself at the same time protected by the gold from the action of those metals which usually dissolve it.

Bismuth and lead have nearly the same effect as antimony; an alloy of standard gold, containing 1-1900th of either of these metals, being entirely destitute of ductility. If they are added in the proportion of half a grain in the troy ounce of standard gold, the alloy becomes remarkably spongy, and suffers a diminution of specific gravity.

Tin, in the proportion of eight grains in the ounce of standard gold, renders the alloy somewhat pale, but does not in the least degree affect its ductility; the bar may also be annealed at a low temperature without injury; but at a heat approaching the cherry red, or ten degrees of the pyrometer, the surface of the bar began to be covered with minute blisters or bubbles; it then curled up or warped on the edges, and after a time a complete solution of continuity followed, the bar falling down by its own weight from the supporters, in the form of a rough dark-coloured mass, having scarcely any metallic appearance. Hence it appears, that the assertions of Lewis and other chemists, respecting the remarkably ill effect produced on gold by a scarcely ascertainable quantity of tin, are erro-

neous, and probably originate from the lead, antimony, or bismuth, with which the tin may have been contaminated.

Iron, whether in the state of bar, or cast iron, or cast steel, unites with gold in the proportion of 1-12th, forming an alloy of a dull white colour, considerably harder than standard gold, but perfectly ductile.

Emery does not combine with gold.

Platina with gold forms a yellowish white ductile alloy.

Copper, when pure, in the proportion of 1-12th, if alloyed with gold, produces a deep reddish yellow perfectly ductile alloy. But many of the varieties of copper in commerce that are reckoned pure are not sufficiently so for mixing with gold, probably on account of a minute proportion of lead or antimony, as these may exist in the proportion of 1-120th without materially affecting the colour, ductility, or specific gravity of copper; yet when this copper is employed in the usual quantity for alloying gold, the mass will contain 1-1440th of lead, which we have already seen to be more than enough for rendering gold perfectly brittle.

The conclusion which Mr. Hatchett draws from the experiments of this section is, that only two metals, viz. copper and silver, are proper for the alloy of gold coin, as all the others either alter its colour or injure its ductility.

The second section treats of the specific gravity of gold when alloyed by various metals. In this Mr. Hatchett details the results of several experiments to show, that the specific gravity of gold alloyed with other metals is by no means that which results from a calculation of the respective densities of the component ingredients. The effects of bismuth and lead on gold are very similar to each other, and deserve to be noticed. Both these metals diminish the specific gravity of standard gold inversely as the quantity employed, till the proportion of half a grain of lead or bismuth in the ounce. Thus an ounce of alloy, 18dwt. 10grs. fine, with four grains of lead, is of the specific gravity 17.032; and when the lead is diminished to half a grain, the specific gravity is 16.627, being the minimum of specific gravity; for when the lead is further diminished to one-fourth of a grain, the specific gravity is equal to 17.039, and a similar ratio is observed with regard to bismuth.

Having shown that numerous irregu-

larities in the specific gravity of alloys of gold take place, from the chemical action of their ingredients, Mr. Hatchett proceeds to notice another cause of anomaly, arising from the unequal mixture of the heterogeneous particles; in consequence of which the lower part of a bar, when cast in a vertical direction, will be of greater specific gravity than the upper one, from the particles of gold having principally settled to the bottom; hence there will be a considerable difference in the results of an assay, as the specimen is taken from one or the other end of a bar. The circumstance, too, of casting in iron or sand will generally make a difference; the bar which is formed in an iron mould being *ceteris paribus* of greater specific gravity than if it had been cast in sand. Mr. Hatchett also discovered that even where the parts of an alloy were so perfectly mixed as not to separate at all on being cast, yet the bar is by no means of the same specific gravity throughout; for the lower part being pressed upon, while congealing, by the superincumbent metal, is of the greatest specific gravity; and the opposite end having to sustain only the atmospheric pressure is, of course, of the smallest specific gravity. Thus, a bar which proved to be throughout ten grains better than standard, was found to have the specific gravity of the top = 17.203, and that of the bottom = 17.387. Friction also was found to have a very sensible effect in lowering the specific gravity of metallic alloys.

The third section treats of the effects of friction on the comparative wear of gold and its alloys, which was ascertained in three circumstances: 1st, the friction between gold coin of the same or different qualities; 2dly, the friction of gold coin against silver and copper coin; and, 3dly, the friction of gold against gritty powders, metallic filings, &c. these being the different circumstances under which gold, in the course of circulation, is subject to wear. Instruments for friction were invented by Mr. Cavendish; and, from a vast multitude of experiments, it was concluded,

“1st. That when equal friction, assisted by a moderate pressure, takes place between pieces of coin which are in each series of a similar quality, then, abrasion is most commonly produced in an inverse ratio to the degree of ductility.

“2dly. That the contrary effect happens, when pieces of different quality rub against

each other; for then, the more ductile metal is worn by that which is harder.

“3dly. That earthy powders and metallic filings produce similar effects, and tend to wear the different kinds of gold in proportion to their respective degrees of ductility. Fine gold, being extremely soft and ductile, sustains a considerable loss, under many of the general circumstances of friction; and as at all times it appears certain, that the impressions which have been stamped upon it are most easily obliterated, even when actual abrasion does not take place, there is much reason to conclude, that gold of such extreme ductility is not that which is most proper to be formed into coin.

“But gold of the opposite quality, or at least so hard as to be just capable of being rolled and stamped, seems to be equally improper for the purpose of coin. For, even supposing that hard gold suffered, in every case, less by friction than that which is moderately ductile, (which is not however the fact) and allowing that standard gold may, by a fixed alloy, be rendered as hard as gold reduced by copper to 18 carats; without changing the standard proportion of gold, yet it would be very difficult always to make such standard gold of an uniform degree of hardness. Moreover, by some experiments which I purposely made at the mint, upon the rolling and stamping of gold of different qualities, it evidently appeared, that gold equal in hardness to that of 18 carats could not be employed with advantage; for, the additional labour which was required for the rolling and stamping of this hard gold, the frequent failure in making the impression, and the battering and breaking of the dies, fully proved, that the expence and difficulty attending the working of such gold, would by no means be compensated by any small degree of durability which it might possess over any other.

“The extremes of ductility and of hardness being therefore equally objectionable, it follows of course, that gold of moderate ductility must be that which is the best adapted for coin; and as nothing but silver or copper can be employed to alloy gold which is intended to be coined, it may be here observed, that whatever might have been the original motive for introducing the present standard of twenty-two carats, yet it appears, from the experiments lately described, that this proportion of 1-12th of the above-mentioned metals is (every circumstance being considered) the best, or, at least, as good as any which could have been chosen.

\* \* \* \* \*

“—there is every reason to believe, that our gold coin suffers but little by friction against itself; and the chief cause of natural and fair wear probably arises from extraneous and gritty particles, to the action of which the pieces may occasionally be exposed in the course of circulation. But still it must be repeated, that the united effects of every spe-

cies of friction to which they may be subjected, fairly and unavoidably, during circulation, cannot produce any other wear than that which is extremely gradual and slow, and such as will by no means account for the great and rapid diminution which has been observed in the gold coin of this country."

5. *Observations on the Chemical Nature of the Humours of the Eye.* By RICHARD CHE-NEVIX, Esq. F.R.S. M.R.I.A.

In the eye of the sheep the aqueous humour is of the specific gravity of 1.0009; when evaporated to dryness it yields a residuum in the proportion of 8 per cent. of the whole, which consists of albumen, gelatin and muriat of soda. The crystalline humour has a specific gravity = 1.10, contains no muriat of soda, and consists of albumen and gelatin in a much larger proportion to the water than is found in the aqueous humour. The vitreous humour agrees in every respect with the aqueous.

In the human eye the different parts exhibited the same chemical composition as those of the sheep, but the specific gravity of the aqueous and vitreous humours was = 1.0053, while that of the crystalline was = 1.0790.

The eyes of oxen contain the same substances as the respective humours of other eyes. The specific gravity of the aqueous and vitreous humours is = 1.0088, and of the crystalline = 1.0765; the density of this humour is not, however, uniform, being considerably greater in the centre, and diminishing gradually to the circumference.

6. *An Account of some Stones said to have fallen on the Earth in France, and of a Lump of native Iron said to have fallen in India.* By the Right Hon. CHARLES GREVILLE, F.R.S.

In our former volume, p. 878, we have given an account of Mr. Howard's very interesting paper on the analysis of stones said to have fallen upon the earth. Mr. Greville, in the present paper, mentions the receipt of three additional specimens since the publication of Mr. Howard's memoir. The first of these is a fragment of a stone in the museum of Bourdeaux, which fell near Roquefort, during the explosion of a meteor, on the 20th of August, 1789. The second fell, along with several others, in Armagnac, in the year 1790. The third is part of a stone, twenty-two pounds in weight, which fell not far from Ville Franche, in Burgundy, on the 12th March, 1798, also accompa-

nied by a meteor. The lump of native iron, mentioned in the title of this paper, fell, in the year 1620, in the purgunnah of Jalindhar, in the Panjab, during the explosion of a meteor. It was picked up while yet hot by the magistrate of the district, and sent in a sealed bag to the Emperor Shah Jehangire. Being weighed in the Emperor's presence, it was found equal to sixty ounces, and a sabre, knife, and dagger, were ordered to be made of it. The workmen reported that it broke to pieces under the hammer, upon which it was mixed with other iron, in the proportion of three parts *iron of lightning* to one of common iron; and from the mass were fabricated two sabres, one knife, and one dagger. This account was translated by Col. Kirkpatrick from an ancient manuscript that has been for many years in his possession.

7. *Observations on the Structure of the Tongue; illustrated by Cases in which a Portion of that Organ has been removed by Ligature.* By EVERARD HOME, Esq. F.R.S.

From the results of three or four cases, in which considerable portions of the tongue were removed by ligature without any bad consequences, Mr. Home is induced to conclude, that the internal structure of the tongue is less irritable than almost any other organized part of the body; that the substance interposed between the fasciculi of its muscular fibres is not connected with the nerves that pass through it; that the nerves of the tongue are more readily compressed and deprived of their power of communicating sensation than nerves in general, any injury done to them not being productive of diseased action in the trunk of the injured nerve; and that the tongue appears to have a power of throwing off its sloughs in a shorter time than any other part. Hence, the removal of any part of the tongue that has a tendency to become cancerous may be safely attempted.

8. *Observations of the Transit of Mercury over the Disk of the Sun; to which is added an Investigation of the Causes which often prevent the proper Action of Mirrors.* By WILLIAM HERSCHEL, LL.D. F.R.S.

The latter part of this paper is particularly valuable for the detailed observations of circumstances by which the action of telescopes is increased or diminished. The particular observations are incapable of abridgment; we shall there-

fore present our readers with the general results in Dr. Herschel's own words.

"—In order to see well with telescopes, it is required that the temperature of the atmosphere and mirror should be uniform, and the air fraught with moisture."

"This being admitted, we shall find no difficulty in accounting for every one of the foregoing observations.

"If an uniform temperature be necessary, a frost after mild weather, or a thaw after frost, will derange the performance of our mirrors, till either the frost or the mild weather are sufficiently settled, that the temperature of the mirror may accommodate itself to that of the air. For, till such an uniformity with the open air, in the temperature of the mirror, the tube, the eye-glasses, and I would almost add the observer, be obtained, we cannot expect to see well.

"But, when a frost, though very severe, becomes settled, the mirror will soon accommodate itself to the temperature; and we shall find our telescopes to act well.

"This explains, with equal facility, why no telescope just brought out of a warm room can act properly.

"Nor can we ever expect to make a delicate observation with high magnifying powers, when looking through a door, window, or slit in the roof of an observatory; even a confined place, though in the open air, will be detrimental.

"It equally shows, that windy weather in general, which must occasion a mixture of airs of different temperatures, cannot be favourable to distinct vision.

"The same remark will apply to auroræ boreales, when they induce, as they often do, a considerable change in the temperature of the different regions of the air.

"But should they not be accompanied by such a change, there seems to be no reason why they should injure vision.

"The warm exhalations from the roof of a house in a cold night must disturb the uniformity of the temperature of a small portion of air; so that stars which are over the house, and at no considerable distance, may be affected by it.

"Sometimes the weather appears to be fine, and yet our telescopes will not act well. This may be owing to dryness occasioned by an easterly wind; or to a change of temperature, arising from an agitation of the upper regions of the atmosphere.

"Or, possibly, to both these causes combined together. If moisture in the atmosphere be necessary, dry air cannot be proper for vision.

"And therefore, on the contrary, dampness and haziness of the atmosphere must be favourable to vision. Fogs also, which certainly denote abundance of moisture, must be very favourable to distinct vision. Nay, if the observatory should be surrounded by water, we need be under no apprehension on

that account. Perhaps, were we to erect a building for astronomical purposes only, we ought not to object to grounds which are occasionally flooded; the neighbourhood of a river, a lake, or other generally called damp situations."

9. *An Account of some Experiments and Observations on the Constituent Parts of certain astringent Vegetables, and on their Operation in Tanning.* By H. DAVY, Esq. Professor of Chemistry in the Royal Institution.

Mr. Davy is well known to the philosophical world as an able and acute investigator of chemical phenomena, and we will venture to assure our readers that they will find the present memoir to be worthy of the high reputation of its author. The first part contains some preliminary observations on the analysis of astringent vegetable infusions. For ascertaining the presence and quantity of tannin, Mr. Davy makes use of a solution of isinglass in distilled water; the application, however, of this reagent, he justly observes, requires some caution, since a concentrated solution of gelatin affords a considerably larger precipitate with a given quantity of tannin than when it is diluted. It is highly requisite also, that the gelatin should be quite fresh, as a very slight chemical change in it will, for the most part, destroy its power of precipitating with tannin.

After the separation of tannin from an astringent infusion, the next process is to disengage the gallic acid from the extractive matter; this, however, cannot be done with perfect accuracy: Mr. Davy appears to prefer the muriat of alumine, which throws down the greater part of the extractive matter, without materially acting on the gallic acid.

The infusion of galls is the first astringent liquor treated of.

The greatest sp. gravity of this, when prepared with the best Aleppo galls, at 55° Fahrenheit is = 1.068. 400 grains yield by evaporation 53 grains of solid matter, consisting of 9-10ths tannin, and 1-10th gallic acid, with a little extractive matter. Sulphuric and muriatic acids occasion a white precipitate of tannin, with some gallic acid and extract, which is resolvable in warm water. Nitric acid, except very weak, destroys both the tannin and gallic acid. Potash suspends the action of gelatin on the infusion, but its effect may be counteracted by the addition of an acid. The alka-

line earths produce copious precipitates, carrying down almost the whole of the tannin, gallic acid, and extract. Alumine and the oxyds of tin and zinc have a similar effect. The soluble matter of 500 grains of galls, when the water was gently evaporated, amounted to 185 grains, of which 130 were tannin, 22 mucilage, 31 gallic acid and extract, 12 calcareous earth and saline matter.

Catechu, or terra japonica, is the next substance treated of. The discovery of its tanning powers is owing to Sir Joseph Banks, who, from the taste, suspected in it the presence of tannin. Its habits with acids, earths, and alkalis, are extremely similar to those of the infusion of galls. 200 grains of the purest Bombay catechu appear to contain 109 of tannin; 68 of peculiar extractive matter; 13 of mucilage, and 10 of insoluble residue, chiefly sand and calcareous earth. 200 grains of Bengal catechu afforded 97 of tannin; 73 of extract; 16 of mucilage; and 14 of residue.

In the astringent barks, the interior white bark contains the greatest quantity of tannin, the middle or coloured part chiefly abounds in extractive matter, and the epidermis seldom contains either one or the other.

An ounce of the entire bark of the chesnut yielded 53 grains of soluble matter, 21 of which were tannin. The same quantity of oak-bark yielded 61 grains, of which 29 were tannin; and the Leicester willow furnished 71 grains, 33 of which were tannin.

An ounce of elm-bark gave 13 grains of tannin.

—————	common willow	11 grs.
—————	Sicilian sumach	78 grs.
—————	Malaga sumach	79 grs.
—————	souchong tea	48 grs.
—————	green tea	41 grs.

Of all substances catechu contains the greatest proportion of tannin, and for the common uses of the tanner, one pound of catechu is equal in value to two and a half of galls, to seven and a half of Leicester willow bark, to eleven of Spanish chesnut, to eighteen of elm bark, twenty-one of common willow bark, and three of sumach.

11. *Account of some Experiments on the Descent of the Sap in Trees.* By T. A. KNIGHT, Esq.

Mr. Knight showed in a former paper that the sap of vegetables, after having

been first absorbed by the bark of the root, passes into the alburnum of the root, trunk and branches; whence, by means of the central vessels, it arrives at the succulent part of the annual shoot, the leaf-stalk and leaf, from which, through the returning vessels of the leaf-stalk, it returns into the bark. In the present memoir he resumes this interesting subject, and points out the principal causes which influence the formation of wood by the descent of the sap through the bark.

Motion, according to Mr. Knight, has a very striking effect on the circulation of the sap and consequent formation of wood. Of two young healthy trees similar in every other respect, if one is bound to a stake so as to prevent the motion of the trunk, without compressing the bark, and the other is left at full liberty to be blown about by the wind, it will be found that the trunk of the former will enlarge very slowly in diameter, in proportion to that of the former. If the tree, instead of being bound tight, is allowed to have motion in one direction only, the enlarged diameter of the wood will be principally in that direction; a horizontal section of the trunk presenting an oval instead of a circle: hence trees in exposed situations have the greatest part of the wood deposited in the trunk and large branches, while those in thick woods being in part deprived of motion in the trunk, and also excluded from the light, the principal nourishment will be distributed to the branches and leading shoots: hence old trees whose bark is become rigid generate little wood; but when the outer bark is removed, the motion and free communication being restored, a very rapid enlargement of bulk takes place. If Mr. Knight's theory of the formation of wood be true, tuberous roots must also be formed of matter that has descended from the leaves through the bark. In order to ascertain this, he took a potatoe-plant, and carefully dividing the runners, which connect the tuber with the parent plant, he immersed both the divided ends in a decoction of logwood; at the end of twenty-four hours he found, that the coloured infusion had passed along the runners in both directions, but that it had not entered the vessels of the parent plant, whereas the vessels of the tuber were almost completely penetrated by this coloured injection.

12. *Enquiries concerning the Nature of a metallic Substance, lately sold in London as a new Metal, under the Title of Palladium.* By RICHARD CHENEVIX, Esq. F. R. S. M. R. I. A.

This is by far the most important chemical paper that has appeared during the last twelvemonth, and confers new distinction on the already illustrious name of its author.

The substance advertized by the name of Palladium, as a new metal, was possessed of the following properties. It was in the form of thin, flexible, not very elastic laminae, which had evidently been rolled out in a flattening mill; its sp. grav. was from 10.972 to 11.482: its galvanic properties were the same as those of gold and silver. Upon exposure to the blow-pipe, the surface not exposed to the flame became blue. When placed in an open vessel, in a temperature greater than required for the fusion of gold, no oxidization, or appearance of fusion, was observable. At a considerably higher heat it run into a button, of a greyish white colour, harder than wrought iron, and the sp. grav. of which was = 11.871. If sulphur is added, to Palladium, when strongly heated, a combination immediately takes place, and the mass remains fluid, even at a very low red heat. It unites with gold, platina, silver, copper, lead, tin, bismuth, iron, and arsenic, and the sp. grav. of the alloy is in most of the cases remarkably different from the result obtained by calculation. Thus the sp. grav. of equal parts of Palladium and platina ought, by calculation, to be = 17.241, but by experiment it amounts only to 15.141, being a deficiency of 2.1: on the other hand, equal parts of Palladium and bismuth, which, by calculation, should give a sp. grav. = 10.652 amounts, by experiment, to 12.587, being an excess of 1.935. The fixed alkalis diminish the brilliancy, and effect a partial solution of Palladium when fused with it. Ammonia, by long digestion, acquires a slight bluish tinge, and dissolves a minute portion of this metal. The three mineral acids, and the nitro-muriatic, act with more or less violence, and form beautiful red solutions; whence precipitates may be obtained by the usual reagents.

From some of the properties of Palladium, Mr Chenevix was induced to believe that platina was one of its ingredients; and, after some previous expe-

riments, he poured some green sulphate of iron into a salt of platina, and also into a salt of mercury, without occasioning any precipitation in either; but, upon mixing the two liquors, a copious deposit took place, exactly similar to the precipitate from nitro-muriatic of Palladium, by the same re-agent. The precipitate being exposed to a strong heat, entered into fusion, and produced a metallic button, not to be distinguished from Palladium.

In the course of his experiments on the combination of mercury with platina, Mr. Chenevix obtained various mixtures, which, though differing materially from platina, were yet by no means possessed of exactly the same properties as Palladium. The most successful method of preparing this alloy, he found to be the following.

Dissolve 100 grains of platina in nitro-muriatic acid, and add to the solution red nitrous oxyd of mercury, till the liquor is completely saturated, then pour in a solution of green sulphat of iron, and heat the mixture on a sand-bath; in less than half an hour a copious precipitate will fall down, which, when well washed and dried, is to be strongly heated in a charcoal crucible, and will afford a button, weighing 135 grains, consisting of about two parts platina to one of mercury.

All attempts made by Mr. Chenevix to decompose either the advertized Palladium or his own imitation of it were wholly without success, but in the various experiments to which they were subjected they comported themselves exactly in the same manner, so that no reasonable doubt can be entertained of their identity. The consequences that are drawn from these facts, by the author, are of the utmost importance. We learn that mercury, the most fusible and one of the most volatile of the metals, may be combined with another so as wholly to lose its characteristic properties; that no sort of dependence is to be placed on the calculated specific gravity of an alloy from the known gravity of its component parts, and that the obstinacy with which the metals have hitherto opposed all attempts at their decomposition, is far from being a reason for chemical philosophers, to give up in despair all further endeavours.

13. *An Account of the Sinking of the Dutch Frigate Ambuscade, of 32 Guns, near the*

*Great Nore, with the Mode used in recovering her. By Mr. JOSEPH WHIDBEY, Master Attendant in Sheerness Dock-yard.*

At eight o'clock in the morning of the 9th of July, 1801, the Dutch frigate *Ambuscade* left the moorings in Sheerness harbour, her fore-sail, top-sails, and top-gallant sails being set, with the wind aft blowing strong. In about thirty minutes she went down by the head, near the Great Nore; not giving the crew time to take in the sails, nor the pilot or officers more than four minutes notice before she sunk, by which unfortunate event twenty-two of the crew were drowned.

This extraordinary accident was owing to the hawse-holes being extremely large and low, the hawse-plugs not being in, and the holes being pressed under water by a crowd of sail on the ship, through which a sufficient quantity of water got in, unperceived, to carry her to the bottom.

The vessel, though sunk, having sustained no external injury, it became an object of importance to weigh her up; this was successfully effected by Mr. Whibbey, by means of lighters, in an ingenious manner, but incapable of being understood without a reference to the plate.

14. *Observations on a new Species of hard Carbonate of Lime; also on a new Species of Oxide of Iron. By the Count DE BOURNON, F. R. S.*

The carbonate of lime here described is in the form of hexahedral pyramids, is so hard as to scratch with great ease fluor-spar, and even to take off the polish of glass; it possesses a vitreous fracture, and cannot be reduced to the primitive rhomboid; Mr. Chenevix analyzed it, but found its composition to differ in no respect from the softer carbonate. The iron ore crystallizes in perfect cubes, is not affected by the magnet, and holds a middle station between the attractable octahedral iron ore and the hæmatites.

15. *Account of the Changes that have happened during the last Twenty-five Years in the relative Situation of Double Stars, with an Investigation of the Cause to which they are owing. By WILLIAM HERSCHEL, LL. D. F. R. S.*

The object of this interesting paper, which, from the minuteness of its details, is incapable of being abstracted, is to shew the probability, that many of the

apparently double stars are real binary combinations, held together by their mutual attraction.

16. *An Account of the Measurement of an Arc of the Meridian, extending to Dunnose in the Isle of Wight, latitude fifty degrees, thirty-seven minutes, eight seconds, to Clifton in Yorkshire, latitude fifty-three degrees, twenty-seven minutes, thirty-one seconds, in Course of the Operations carried on for the Trigonometrical Survey of England in the Years 1800, 1801, and 1802. By Major W. MUDGE, of the Royal Artillery, F. R. S.*

Major Mudge is well known as the able successor to General Roy in the important work of carrying on the trigonometrical survey of England. The memoir before us, though of vast consequence, is from its very nature incapable of abridgment. The first part is occupied by a very minute description of the zenith sector employed by Major Mudge, and the last specimen of the accuracy and ingenuity of the late Mr. Ramsden. To this succeeds an account of the operations in the year 1802, consisting of observations at Dunnose, the southern extremity of the meridian line at Clifton, near Doncaster, its northern extremity; and at Arbury Hill and the intermediate stations. In 1801 a base 26342.7 feet long was measured on Misterton-carr, in the north-west corner of Lincolnshire, being the fourth that has been ascertained in the progress of the survey (the three others were on Hounslow Heath, Salisbury Plain, and Sedgemoor.)

The ascertained distance between Dunnose and Clifton amounts to 108633.4 feet or 196.27 miles; between Dunnose and Greenwich 59.41 miles, and between Clifton and Greenwich 136.86 miles. The length of a degree on the meridian, latitude fifty-two degrees, two minutes, twenty seconds, is = 60820 fathoms, and of a degree, in latitude fifty-one degrees, thirty-five minutes, eighteen seconds, is = 60864 fathoms. By combining the observations of the English and French astronomers we have a series of triangles from Clifton to Barcelona in Spain, and the distance between the two places amounts to 441196.8 feet or 835.6 miles.

As an appendix to the memoir are subjoined the latitudes and longitudes of the places intersected in the survey of Essex, Suffolk, Surry, Middlesex and Kent.

ART. II. *The Philosophical Transactions, abridged.* 4to. Vol. I. pp. 744.

THE transactions of the Royal Society of London form the largest and most valuable collection extant of memoirs on mathematical and experimental philosophy. The early volumes, however, are extremely difficult to procure, and the price of the whole is greater than many persons can conveniently appropriate to this purpose. There are two ways of obviating these inconveniences, either by publishing a new edition of the entire work in a more economical form, or by means of judicious abridgment to bring it into still smaller compass. For our own parts we should

have preferred the former plan, yet this preference by no means renders us unwilling to bestow all merited commendation on the present work. The mathematical papers are entrusted to Dr. Hutton, those on natural history to Dr. Shaw, and the medical and chemical ones to Dr. R. Pearson. The memoirs of every class, as far as we have examined them, are very skilfully abridged, nothing useful is sacrificed to mere brevity, and the publication richly deserves, and we doubt not will obtain, the patronage of the philosophical world.

ART. III. *Asiatic Researches; or Transactions of the Society instituted in Bengal for enquiring into the History and Antiquities, the Arts, Sciences, and Literature of Asia.* Vol. VII. 8vo.

THE man of letters might well feel proud in contemplating the permanence and pre-eminence of literature, if that recollection were not accompanied by the melancholy knowledge, that all other things are perpetually changing and passing away. Arrian, and Joinville, and Froissart, continue to act upon mankind, when all the kingdoms of Alexander have lost their religion, their language, and their very names, when Louis is neither respected in his own country as one of her kings, nor revered as one of her saints; and when the Guelphs are seated upon the throne of the Plantagenets. The east, by its more rapid revolutions, more strikingly exemplifies this triumph of intellect over power.—Ferishta, and Castanheda, and Valentyn, are still consulted with interest, when the conquests of the Moguls, and the Portuguese, and the Dutch, have yielded to other invaders; and there may come a time, when Orme will be regarded like Barros as the historian of victories, of which no other effect shall be remaining.

With this feeling we have taken up this book, recollecting, in that kind of melancholy which will mingle itself with a smile, what mighty events have been necessary to its production! the voyage of Gama, the victories of Albuquerque, the loss of Sebastain, and the triumphs of Clive! If a link in the chain had been broken, we should neither have supped our cheerful cup of hyson this evening, nor have sate down after it to review the seventh volume of the Asiatic Researches.

The first article is on the course of the Ganges, through Bengal, by Major R. H. Colebrooke.

The Ganges, and the other rivers of Bengal, are frequently changing their course, sweeping away their banks, and forming other shores or islands with their spoils.

“It is chiefly during the periodical floods, or while the waters are draining off, that the greatest mischief is done; and if it be considered, that at the distance of two hundred miles from the sea, there is a difference of more than twenty-five feet in the perpendicular height of the waters, at this season, while at the outlets of the rivers (excepting the effect of the tides) they preserve nearly the same level at all seasons, some idea may be formed of the increased velocity with which the water will run off, and of the havoc which it will make on the banks. Accordingly it is not unusual to find, when the rainy season is over, large portions of the bank sunk into the channel; nay, even whole fields and plantations have been sometimes destroyed; and trees which, with the growth of a century, had acquired strength to resist the most violent storms, have been suddenly undermined, and hurled into the stream.

“The encroachments, however, are as often carried on gradually, and that partly in the dry season; at which time the natives have leisure to remove their effects, and change the sites of their dwellings, if too near the steep and crumbling banks. I have seen whole villages thus deserted, the inhabitants of which had rebuilt their huts on safer spots inland, or had removed entirely to some neighbouring village or town. Along the banks of the Ganges, where the depredations of the stream are greatest, the people are so accustomed to such removals, that they build their

huts with such slight materials only, as they can, upon emergency, carry off with ease; and a brick or mud wall is scarcely ever to be met with in such situations."

The islands which are formed with these ruins are taken possession of by the natives, as soon as they appear to be sufficiently firm. It generally happens, that in a few years they are united with the main land, the intervening channel being closed up; they are then distinguished from it by their having few or no trees. The largest at present existing contains about twenty square miles of land; but the same process by which they were formed, acts to their removal; and the system of creation and destruction, or rather of perpetual change and renovation, is for ever exhibited to the worshippers of the Trimourtee.

Upon the shallows of these rivers, Major Colebrooke offers a suggestion which deserves to be attended to.

"As the shallows which are produced from the causes above-mentioned are only partial, affecting only in a small degree, comparatively with their lengths, the channels of these rivers, it might be possible to counteract them in such a manner, as to produce a more equal distribution of water; and as the depth which would be requisite for boats of a modern burthen is inconsiderable, perhaps it might be effected with much less labour and expence than might at first be imagined.

"I was led to this supposition, from frequently seeing that the mere operation of dragging by force a boat, or budgerow, through any of the shallows, tended, by stirring up the sands, to deepen the channel. If, therefore, round or flat-bottomed boats can produce such an effect, in how much greater a degree might it not be done by means of a machine constructed for the purpose, which might be dragged to and fro through the shallow place, until a sufficient depth of water should be obtained for the passage of boats. If such machines, which might be contrived somewhat in the form of a large iron rake, and occasionally to go on wheels, were to be stationed at the several villages or towns in the vicinity of the shallows, it is possible that the Zeméendars might be induced, for a moderate consideration, to furnish people or cattle to put them in motion, whenever it might be necessary."

This paper is elucidated by charts and sections.

2. On Singhala or Ceylon, and the Doctrines of Bhoddha, from the Books of the Singhalais, by Captain Mahony.

The fundamental article of the Ceylonese mythology is singularly whimsical;

they hold the universe to be under the government of a bhoddha, for bhoddha is an official title. The present universe has been successively administered by four. The place is now vacant; but Sahampatta Maha Brachma, the supreme of all the gods, holds it *in commendam*, till Maitree Bhoddha, the fifth, who is to come, shall make his appearance. He is to be the last of this universe; and when this shall have past away, Maha Brachma will pass in ascent through the seventeen heavens above his own, till he attains at length the necessary qualifications to become a bhoddha himself.

The religion of Gautemeh, the last bhoddha, is that which now prevails in Ceylon.

Before his appearance on earth, he "was a god, and the supreme of all the gods. At the solicitations of many of the gods he descended on earth, and was frequently born as a man, in which character he exercised every possible virtue, by extraordinary instances of self-denial and piety. He was at length born of Mahamaya Devei, after a pregnancy of ten months, and had for father Soodoneneh Raja. He lived happily with his queen Yassodera, and forty thousand concubines, for thirty-one years; the six next he passed in the midst of wildernesses, qualifying himself to be a bhoddha. At the close of this period his calling became manifest to the world, and he exercised his functions as bhoddha for forty-five years. He died in Coosceamarapoorée, at the court of Malleleh Raja, Tuesday, the 15th of May; from which period the bhoddha wárooseh, or era of bhoddha, is dated, which now (A.C. 1797) amounts to 2399 years.

"Bhoddha is not, properly speaking, considered as a god, but as having been born man, and in the end of time arrived at the dignity of bhoddha, on account of his great virtues and extraordinary good qualities. The title of bhoddha was not conferred on him by any superior power, he adopted it by his own sovereign will, in the same manner as he became man; both of which events were predicted ages before. Bhoddha, after his death ascended to the hall of glory, called mookze, otherwise nirgoowane, which is a place above, and exceeding in magnificence the twenty-sixth heaven; there he will live for ever, in happiness and incorruptibility, never to be born again in the world; where his doctrine is at present extant, and will continue in all its splendour for five thousand years, according to his own prophecy."

Maha Brachma, and the whole host of deities, have neither flesh, bones, nor material bodies, yet they seem to have hair on their heads and teeth, and their skins are luminous. The breath of life in man

is compared to a leech, that must attach itself to one thing with its mouth, before it will loosen its hold on another with the tail. The body, therefore, does not die till this living spirit has found another resting place, which it chuses by a fatal instinct, according to its deserts.

That this religion has been conquered by the Bramins in Hindostan is certain; their bhooddha is like our doctrine of consubstantiation, the relic of a faith which once struggled for superiority, but is now obsolete and neglected. It is not, however, so easy to explain the traces of the Hindoo system which appear among the Ceylonese. A far more minute and methodical account of this mythology, as it exists in Ava, may be found in the last volume of the Asiatic Researches, by Dr. Buchanan.

3. Narrative of a route from Chunarghur to Yertnagoodum, in the Ellore Circar, by Captain J. T. Blunt.

Captain Blunt was employed by government to explore a route through that part of India, which lies between Berar, Orissa, and the northern Circars; he had with him a party of a Jamadar, and thirty Sepoys. The people among whom he travelled seem to have been desperate savages.

"I never indeed met with a people who shewed less inclination to hold converse of any kind with strangers, than these mountaineers in general. This disposition in a great measure frustrated every attempt I made to acquire information of their manners and customs; among which the sacrifice of birds, by suspending them by the tips of their wings to the trees and bushes, on each side of the road; and leaving them to perish by degrees, was almost the only peculiar one I could discover. The cause of this cruel practice I never could learn; yet I frequently observed, that although the birds were suspended at a convenient height for travellers to pass under them, the Goands would never do so, but always took a circuit to avoid them. I once observed a ram extended by the feet in the same manner. Their food appeared to be the most simple imaginable, consisting chiefly of the roots and produce of their woods.—They go for the most part naked; when cold they allerviate it by making fires, for which their forests supply them with abundance of fuel; and when the heat of the sun becomes oppressive, they seek shelter, and recline under the shade of large trees.

"They always endeavour to surprize their enemy, in preference to engaging him in open combat, however confident of superiority they may be. With that view, when on any hostile excursion, they never kindle a fire, but carry with them a sufficiency of ready-dressed

provisions, to serve during the probable term of their absence; they march in the night, proceeding with the greatest expedition, and observing the most profound silence. When day overtakes them they halt, and lie concealed in a kind of hammock, which they fasten among the branches of the loftiest trees; so that they cannot be perceived by any person passing underneath. From this circumstance of ambuscade, the idea has originated of their living in trees instead of houses.—When they have, in this manner, approached their enemy unperceived, they generally make their attack about the dawn, and commence it with a great shout, and striking of their spears against their shields. If they are successful in their onset, they seldom spare either age or sex; at times, however, they make captives of the children, and often adopt them into their families when they have none of their own; and the only slaves among them are captives thus taken."

There should have been a map to elucidate this journal.

4. An Account of a new Species of Delphinus, an Inhabitant of the Ganges, by Dr. Roxburgh.

5. Translation of one of the Inscriptions on the Pillar at Delee, called the Lat of Feeroz Shah, by Henry Colebrooke, esq.

There are six inscriptions upon this pillar; of five no translation has been yet favourable, they are therefore here engraved. The other was translated in the first volume of these Researches, by Sir William Jones, but from an imperfect copy; and it is worthy of remark, that the date which Sir William suspected to be 123 of the era of Vicramaditya, or A.D. 67, proves to be 1220 of that era, or A.D. 1161. If similar means of detection should ever be found, we have little doubt that all Hindoo chronology would shrink in at least an equal proportion.

6. An Account of the Kookies or Lunctas, by John Macrae, esq.

The Kookies are a race of mountaineers, living to the north-east of the Chittangong province, the least civilized of any of these mountain tribes that are as yet known to the Europeans; they have the flat nose, small eyes, and broad round face, which characterise all the natives of eastern Asia. They are divided into a number of distinct tribes, who may be said to be independent of each other, though all acknowledge the authority of one or other of their hereditary rajahs. The chieftainship in the tribes is elective.

They ornament the inside of their

shields with small pendulous plates of brass, which clatter as they toss about their arms, either in the fight or in the dance. The hunter, when in the forests, broils his food in a species of hollow bamboo. From the ashes of a different species of the same plant he extracts a kind of salt to season his meat; and with two pieces of dried bamboo he kindles his fire.

“The Kookies, like all savage people, are of a most vindictive disposition, blood must always be shed for blood. If a tiger even kills any of them, near a parah, the whole tribe is up in arms, and goes in pursuit of the animal; when, if he is killed, the family of the deceased gives a feast of his flesh, in revenge of his having killed their relation. And should the tribe fail to destroy the tiger in this first general pursuit of him, the family of the deceased must still continue the chase; for until they have killed either this, or some other tiger, and have given a feast of his flesh, they are in disgrace in the parah, and not associated with by the rest of the inhabitants. In like manner, if a tiger destroys one of a hunting party, or of a party of warriors on an hostile excursion, neither the one nor the other (whatever their success may have been) can return to the parah without being disgraced, unless they kill the tiger. A more striking instance still of this revengeful spirit of retaliation is, that if a man should happen to be killed by an accidental fall from a tree, all his relations assemble and cut it down; and however large it may be, they reduce it to chips, which they scatter in the winds for having, as they say, been the cause of the death of their brother.

In some of their customs they strikingly resemble certain North American tribes.

“When any person dies in a parah, the corpse is conveyed by the relations of the deceased, and deposited upon a stage raised under a shed erected for the purpose, at some distance from the dwelling-house. While it remains there, it is carefully guarded, day and night, from the depredations of beasts and birds, by some one of the family, and a regular supply of food and drink is daily brought and laid before it. Should more than one casualty occur in a family, the same ceremony is observed with respect to each corpse; and at whatever time of the year persons may happen to die in the parah, all the bodies must be kept in this manner until the 11th of April, called by the Bengalees Beessoo. On that day all the relations of the deceased assemble, and convey their remains from the sheds to different funeral piles, prepared for them on a particular spot without the parah, where they are burnt; as are also the several sheds under which the bodies had lain from the period of their decease. After

this melancholy ceremony is over, the whole party repairs to the house of him in whose family the first casualty occurred in that year, and partakes of an entertainment given by him in honour of the dead. On the following day, a similar feast is given by him in whose family the next casualty of the season had happened; and thus the feast goes round in succession, until one is given for each of the dead.

“In this pious preservation of the dead till a certain day in the year, when only the last solemn funeral rites can be performed to their remains, there is a singular coincidence in the practice of the Kookies with that of some of the tribes of the North American Indians, as related in Bartram's Travels; and it must appear a curious fact, that in so very particular an instance, there should be this similitude in the customs of two savage people, placed in such opposite parts of the world; where the climate, and other peculiar local circumstances, are so totally different.”

They believe a future state of rewards and punishments, conceiving that they can by no means so certainly ensure future happiness; as by destroying a number of their enemies. Acknowledging one omnipotent Creator, whom they call Khogein Pootteeang, they offer to him no prayer, but address them to Sheem Sank, an inferior deity, as a mediator with the Supreme Being; and as more immediately interesting himself in the concerns of individuals. Of Sheem Sank they have an idol, none of the Deity; they have no priests, each worshipping as he thinks best. To the Deity they sacrifice the gyal, as being their most valued animal; Sheem Sank must be contented with a goat; yet they pile up before his image the heads of all their game, and of all the enemies whom they slay, each having his own pile, and according to its size is his fame as a hunter or a warrior. In consequence, when they surprise and slay the Bengalee wood-cutters, whom they sorely annoy, it is remarked that they carry away nothing but the heads of their victims, and such salt as they may have had with them.

A very few words of their language are given, but these few indicate a scanty vocabulary, and a regular system of compounding words. Father, grandfather, and grandmother, are called p'ha, p'hoo, p'hee: meepa is a man, noo a woman, naoo a child, meepa-naoot'he, a boy or man child, noonaoot'he, a girl or woman child, noonaoo, or mother of children, the word for woman. The only other words given, except the

numerals, are chopooe and charnoo, brother and sister; and these are evidently derivative also, though the means of fully analyzing them are not to be found in this short list. This regularity is very curious, and should seem to indicate an unmixed race.

This whole paper is exceedingly interesting. The information was supplied by a native of the Runganeeah district, whom the Kookies carried away prisoner when a boy, and who, after a captivity of twenty years, found means to return to his family. If Mr. Macrae could procure from this man, or by any other means, a farther specimen of their language, it may lead to some important speculations and results.

7. On the Sanscrit and Pracrit languages, by H. T. Colebrooke, Esq.

From this very learned paper, we can only make such extracts as will be curious to persons not engaged in the study of the Indian languages.

"In a treatise on rhetoric, compiled for the use of Maniey a Chandra, Raja of Tirabhuetti or Tirkut, a brief enumeration of languages, used by Hindu poets, is quoted from two writers on the art of poetry. The following is a literal translation of both passages:

"Sanskrita Pracrita, Pais'achi and Magad'hi, are in short the four paths of poetry. The gods, &c. speak Sanskrita; benevolent genii, Pracrita; wicked demons Pais'achi; and men of low tribes and the rest Magad'hi. But sages deem Sanskrita the chief of these four languages. It is used three ways; in prose, in verse, and in a mixture of both."

"Language, again, the virtuous have declared to be four-fold: Sanskrita, or the polished dialect; Pracrita, or the vulgar dialect; Apabhhranja, or jargon, or mixed. Sanskrita is the speech of the celestials, framed in grammatical institutes; Pracrita is similar to it, but manifold as a provincial dialect, and otherwise; and those languages which are ungrammatical, are spoken in their respective districts.

"The Pais'achi seems to be gibberish, which dramatic poets make the demons speak, when they bring these fantastic beings on the stage. The mixture of languages, noticed in the second quotation, is that which is employed in dramas, as is expressly said by the same author in a subsequent verse. It is not then a compound language, but a mixt dialogue, in which different persons of the drama employ different idioms. Both the passages above quoted are therefore easily reconciled. They, in fact, notice only three tongues. 1. Sanscrit, a polished dialect, the inflections of which, with all its numerous anomalies, are taught in grammatical institutes. This the dramatic poets put into the

mouths of gods, and of holy personages. 2. Pracrit, consisting of provincial dialects, which are less refined, and have a more imperfect grammar. In dramas it is spoken by women, benevolent genii, &c. 3. Magad'hi, or Apabhhranja, a jargon destitute of regular grammar. It is used by the vulgar, and varies in different districts: the poets accordingly introduce into the dialogue of plays a provincial jargon, spoken by the lowest persons of the drama.

"There is one peculiarity of Sanscrit compositions which may also have suggested the opinion that it could never be a spoken language: I allude to what might be termed the euphonical orthography of Sanscrit. It consists in extending to syntax the rules for the permutation of letters in etymology. Similar rules for avoiding incompatible sounds in compound terms exist in all languages; this is sometimes effected by a deviation from orthography in the pronunciation of words, sometimes by altering one or more letters to make the spelling correspond with the pronunciation. These rules have been more profoundly investigated by Hindu grammarians than by those of any other nation, and they have completed a system of orthography which may be justly termed euphonical."

The same peculiarity exists in the Welsh. We will add also one specimen of Sanscrit etymology, the most striking that we have yet seen.

"Yuvan signifies young, and yauvana youth; the first makes yuva in the nominative case: this is adopted into Hindustani with the usual permutation of consonants, and becomes juba, as yauvana is transformed into joban. The same word has been also corrupted in Persian and Latin, where it stands juwan and juvenis. In many inflections the root of yuvan is contracted into yun, the possessive case, for example, forms in the three numbers, yunas, yunos, yunam: here then we trace the origin of the Latin comparative junior; and I cannot hesitate in referring to these Sanscrit roots the Welsh jevang, and Armorican joyank; as well as the Saxon yeong, and finally the English young. This analogy, which seems evident through the medium of the Sanscrit language, is wholly obscured in Hindustani."

We perceive, at the conclusion of this paper, that Mr. Colebrooke has made some progress in collecting lists of the most common terms in the various dialects of India, compared with words of similar sound and import in the ancient languages of Europe. We rejoice that a labour of such exceeding importance has been undertaken by so able a man, whose good sense seems to be equal to his great learning. It is only by the

history of language that the early history of the world can be in any degree elucidated. Shame upon this country, that we have no public institutions for this great purpose! that all that has been done, and is doing, should be the labour of unpatronized and unrewarded individuals!

8, 9. On the religious Ceremonies of the Hindus, and of the Bramens especially, by H. T. Colebrooke, Esq. Essays two and three.

The first of these essays appeared in the fifth volume of the Researches. Minute descriptions of ceremonies are not susceptible of abridgment, we can therefore only express in general terms our sense of this very diligent observer's merits, and our hope that his communications may occupy as large a portion of the subsequent volumes as they do of this.

The funeral prayer merits transcription.

"1. Foolish is he who seeks permanence in the human state, unsolid like the stem of the plantain tree, transient like the foam of the sea.

"2. When a body, formed of five elements to receive the reward of deeds done in its own former person, reverts to its five original principles, what room is there for regret?

"3. The earth is perishable, the ocean, the gods themselves pass away: how should not that bubble, mortal man, meet destruction?

"4. All that is low must finally perish; all that is elevated must ultimately fall; all compound bodies must end in dissolution, and life is concluded with death.

"5. Unwillingly do the manes of the deceased taste the tears and rheum shed by their kinsmen; then do not wail, but diligently perform the obsequies of the dead."

10. An Account of a Method for extending a Geographical Survey across the Peninsula of India. By Brigade Major Lambton. Communicated by permission of the Right Hon. the Governor of Fort St. George in Council.

11. On the Origin and peculiar Tenets of certain Mahammedan Sects. By H. T. Colebrooke, Esq.

12. A summary Account of the Life and Writings of Aoyar, a Tamul Female Philosopher. By the Rev. Dr. John.

Aoyar is one of the seven wise—we were about to say wise men of the Tamul, but that the license of the Hibernian dialect would have been somewhat violent, as four of the seven were women, Aoyar,

Uppay, Vallie, and Urnway; Tiruvalluwer, Adigaman, and *Kavailer*, of which last appellation we have wise men enough in Europe: The Hibernian dialect has, however, been used in the title of this paper, which, instead of the life of Aoyar, relates a not uninteresting fairy tale of the life of her mother. Three books, or rather chapters, of the moral sentences of this female philosopher are annexed; of all proverbs, ancient or modern, Jew or Gentile, which we have ever seen, they are beyond comparison the most inane and worthless. We design no censure on the translator. On the contrary, we think his labour has been well and usefully employed. He has enabled us to estimate the moral and intellectual state of a people, among whom Aoyar could rank as one of the seven philosophers. The first score will be a sample sufficiently large, and will justify our judgment.

"Charity be thy pleasure.

Be not passionate.

Be not a miser in giving.

Hinder none in charity.

Do not manifest thy secrets.

Lose not thy courage.

Exercise thyself in cyphering and writing.

To live on alms is shameful.

Give, and then eat.

Converse only with the peaceful.

Never cease to improve in learning.

Do not speak what is dishonest.

Do not raise the price of victuals.

Do not say more than thou hast seen.

Take care of what is most dear.

Bathe on each Saturday.

Speak what is agreeable.

Build not too large a house.

Know first one's character before thou art confident.

Honour thy father and mother."

13. Account of the St. Thome Christians on the Coast of Malabar. By F. Wrede, Esq.

Mr. Wrede is mistaken in saying that the discovery of christians on the Malabar coast was a matter of surprise to the first Portuguese adventurers. On the contrary, they went in the full expectation of finding them, and actually worshipped in the first pagoda which they entered, mistaking it for a christian church.

Much curious information is contained in this paper. The name of Christians of St. Thomas is here said to have originated with the chief who led them from Syria (for they were a Syrian colony, and are by the Hindoos most com-

monly called Surianee Mapila). Mar Thomé was the name of this bishop, the founder of their religion in Malabar, and in honour of him they always call their primate Mar Thomé, though his real name be Joseph or Abraham.

"In the Malabar histories (Keral Oudputtee), the first mention of a Syrian colony of christians is made in the reign of Cocorançon Pesumal, who probably lived in the sixth century; a wealthy Syrian merchant, of the name of Thome Cannaneo, is said to have landed at Cranganore, where he was well received, and induced to settle by great privileges granted to him by Perumal. He afterwards married two wives; one of the Nair, and one of some low cast, by whom he had a very numerous progeny, who, after his death, had great disputes about his inheritance. They were carried to such a degree, that at last they were obliged to separate themselves: the sons by the Nair woman settling in the southern parts, and the others in the northern parts of Malabar—where their descendants for a long time preserved their mutual enmity, and would on no account intermarry: there is also a still common tradition amongst them, that they descend (at least those that are from Syrian origin) from four principal Syrian families, who had successively settled on the coast.

"We find again mention made of two Syrian or Chaldaean bishops, of the name of Mar Sabro and Mar Brodt (or rather Mar Sapor and Mar Peroses) at Coilan, about one hundred years after its foundation, where they were extremely well received by the Raja, and permitted to build a church, which was still extant when Cabral first visited Coilan. The grants and privileges which they received from the Raja, were engraved upon copper-plates, which many centuries after were shewn to Archbishop De Menezes at Sevalcare (perhaps Mavileare), which are, in all probability, the very same that are now in possession of the Jews at Cochin.

"If one adds to these historical dates the name of Syrians retained by the St. Thomé Christians, their distinct features and complexion somewhat fairer than the rest of the Malabars, the style of their building, especially their churches, but above all the general use of the Syrian, or rather Chaldaean languages, which is preserved to this day in all their religious functions, even in those churches which have since embraced the Roman rite, and that to this day they take

their christian and family names from the Syrian or Chaldaean idiom, no doubt can remain but that the St. Thomé Christians are originally a colony of Nestorians, who fled from the dominions of the Greek emperors, after Theodosius the Second had commenced to persecute the followers of the sect \*."

Their first proselytes were made among the Bramins and Nairs, so that even at present they consider themselves equal in rank to those two casts, and are held by the Hindoos in higher estimation than the Portugueze Christians.

"As to their religious tenets, they followed generally the doctrine of Nestorius.

"They rejected the divine nature of Christ, and called the Virgin Mary only the mother of Christ, not of God. They also maintained that the Holy Ghost proceeded only from the Father, and not from the Father and Son.

"They admitted no images of saints in their churches, where the holy cross alone was to be seen.

"They had only three sacraments, baptism, eucharist, and the orders, and would not admit transubstantiation in the manner the Roman Catholics do. They knew nothing of purgatory; and the saints, they said, were not admitted to the presence of God, but were kept in a third place till the day of judgment.

"Their priests were permitted to marry, at least once in their life. Their rite was the Chaldaean or Syrian.

"They were married in the presence of their priests, who are called cassanas, and the whole ceremony consisted of tying a string round the girl's neck, as is the common practice of all the different casts on the Malabar coast.

"The cassanas were not permitted to use the Malabar language in their churches, and in instructing the youth, but taught them in the Chaldaean tongue.

"They reckoned their Sunday from Saturday evening at vespers, till the first matin on Sunday; so that after sun-rise they might work again.

"This was the happy situation of the Nestorians, or St. Thomé Christians, before the arrival of the Portugese in India."

Yet the following tradition, which was found by the Portugueze in India, and which is not noticed by Mr. Wrede,

\* "Nestorius was patriarch of Constantinople, A. D. 428, under the reign of Theodosius the Second. His heretical opinions were first declared in 429, and condemned by the first council of Ephesus in 431. But the Emperor was not prevailed on to banish Nestorius till 435; and four more years had elapsed before sentence of proscription passed against his followers.

GIBBON, vol. viii. pag. 297.

"Gibbon, however (b. 346), asserts on the authority of St. Jerome himself (ad Marcellam Epist.), that the Indian missionary, St. Thomas, was famous as early as his time.—Now Jerome died in 420, consequently the sect originally established in Malabar by Thomas could not have been that of Nestorius; yet Gibbon himself appears to have overlooked this inconsistency.

Note by the Secretary.

will show that their faith had in some degree assimilated itself to the superstitions of the country.

The Apostle Thomas had been driven from Coilan to Maliapur, and from thence, being still persecuted by the Gentiles, retired into the woods. A Gentile of Maliapur, who was hunting in the woods, saw one day a flock of peacocks on the ground, and one larger than the rest, standing on a stone in the midst of them. He let fly his arrow, the flock rose into the air, but the large peacock was slain, and immediately transformed into a man. Upon this the archer went into the city to say what he had seen. The governor accompanied him back to the woods to see this wonder, and there he found the body of St. Thomas, and the print of his feet in the stone. He built a church there, his disciples buried him, and placed the stone by his grave. The church was built like a christian church, with crosses on the altar, and one larger one in the centre, with a peacock carved upon it. It is now, says Castanheda, in a ruinous state, and surrounded with thickets, for the place is much dispeopled. A poor Moor takes care of it, there being no Christians near, and he asks alms of all who come there in pilgrimage, Christians or Gentiles, the Moors also giving to him.

It is remarkable that the legend, which is related by the oldest and most honest of the Portuguese historians of India, is omitted by their later writers, though they retain all the other tales of St. Thomas. They were evidently displeased at the heathenish character of the fiction, at the peacock on the cross, and the Gentiles' pilgrimage to a Christian church. Mr. Wredé also mentions a conformity to Hindoo manners in these Christians of St. Thomas. An Ex-Jesuit, who had laboured a long time as missionary among them, informed him that many of them preserve till now the manners and mode of life of the Bramins, as to cleanliness and abstaining from animal food, and that even he himself had been obliged to adopt the same regimen in order to gain credit.

When India was discovered by the Portuguese, these native Christians were rich, numerous, and respected. Frey Aleixo de Menezes, the archbishop of Goa, united them to the Romish church, at the famous synod of Odiapmer. After this event, thirty-two churches returned to the Maronite or Nestorian com-

munion; about eighty-four remain catholic, under the archbishop of Cranganor. These events no way affected the estimation in which they were held by the Malabar people and princes.

“The St. Thomé, or Syrian Christians, of both descriptions, never claimed the particular protection of either the Portuguese or Dutch, as the new Christians do, but considered themselves as subjects of the different rajahs, in whose districts they lived; and, as long as the old Hindoo system, and the former division of the country, under a variety of petty rajahs, was preserved, they appear to have enjoyed the same degree of freedom, ease, and consideration, as the Nairs. But when the rajahs and chiefs of Travancore and Cochin had subjected to themselves all the petty rajahs and chiefs, whose respective territories were situated within the lines of Travancore, they also overturned the whole political system established by Cherumah Perumal; and, by setting aside the immunities and privileges of the higher casts, they established a most oppressive despotism, in the room of the former mild, limited oligarchy: and we ought not to be much surprised to behold the present wretched situation of those formerly so flourishing Syrian villages, since we see the Bramins and Nairs stripped of most of their old prerogatives, and subject to almost the same oppressions and extortions.”

At this present time, after the manifold persecutions, oppressions, and successive revolutions, that have almost depopulated the whole coast, says the author, they are computed to amount to no less than 150,000 souls. Yet every circumstance has taken place that could distress and diminish them.

“The great number of such sumptuous buildings as the St. Thomé Christians possessed in the inland parts of the Travancore and Cochin dominions is really surprising; since some of them, upon a moderate calculation, must have cost upwards of one lack of rupees, and few less than half that sum. How different must have been the situation of this people in former times, in comparison with the wretched condition in which we behold them at present! scarcely able to erect a cadjan shed for their religious meetings over those splendid ruins, that attest at the same time their former wealth and present poverty. In the same proportion that their opulence decreased, their population also appears to have diminished. Alangada contained, before the year 1750, more than a thousand Christian families, who lived in substantial houses, of which the ruins are still extant, and bear evidence to the fact. Of those families, not full one hundred are now remaining, and them I found in the most abject state of misery. The same me-

lancholy contrast is observable at Angamalee, and many other formerly opulent christian towns and villages."

The new or Portuguese christians have suffered the same lamentable reverse of fortune. When their own empire fell the Dutch protected them; the rajah of Cochin has now turned a great part of them out of his dominions, by compelling them to accept some trifling consideration for their landed estates, and the rest he treats, if possible, more severely than his own Hindoo subjects.

We are glad to find that Mr. Wredé designs to publish a translation of the Annals of Malabar, known by the name of Kerol Oodputtee.

14. Account of an Hereditary living Deity, to whom devotion is paid by the Bramins of Poona and its neighbourhood. By Captain Edward Moor.

"Mooraba Gosscyn was a Bramin of Poona, who, by abstinence, mortification, and prayer, merited above others the favourable regards of the Almighty. Gunputty, the most common name in this country, among the many hundreds of Sree Ganesa, accordingly vouchsafed to appear to him, at Chinchoor, in a vision by night; desired him to arise and bathe; and, while in the act of ablution, to seize, and hold sacred to the godhead, the first tangible substance that his hand encountered. The god covenanted that a portion of his holy spirit should pervade the person thus favoured, and be continued as far as the seventh generation, to his seed, who were to become successively hereditary guardians of this sacred substance, which proved to be a stone, in which the god was to be understood as mystically typified. This type is duly revered, is carefully preserved, and hath ever been the constant companion of the sanctified person inheriting with it the divine patrimony.

"This annunciation happened about the year A. D. 1640, and six generations have since passed away.

"It doth not now appear what was the precise extent of the divine energy originally conceded; but it is inferred to have been a limited power of working miracles:—such as healing sickly uncleanness, granting to a certain degree the desires of pious supplicants, and the faculty of foretelling, under some restrictions, the events of futurity.

These gifts appear, indeed, avowedly to have been enjoyed in a more extensive degree by the first possessors, than by the latter. The Bramins admit that the farther the remove from the favoured man, in whom the god became incarnate, the greater is the chance of degeneracy; although such degeneracy might not have been inevitable. It is therefore presumable that the early inheritors

worked more conspicuous miracles than have of late been manifested.

\* \* \* \*

"The Deo is, *ex officio*, what is called a lewanna—but the term 'fool' may not, in this instance, as in most others, give the best translation of the word. He is totally unmindful and ignorant of worldly affairs—unable, they say, to hold conversation beyond the proposition, reply, and rejoinder, and then in a childish, blubbering manner. To some questions, on points of futurity, he replies, accordingly as he is inspired, in pointed negatives or affirmatives; to others enigmatically, or by benignant and indignant gesture; sometimes he is totally silent, and apparently absorbed in abstract cogitation, doth not recognize the suppliant. From such data is deduced how propitious or otherwise is the Almighty will on the pursuits of the petitioner.

"The ordinary occupations of the Deo do not differ materially from those of other holy men—he eats, takes wives to himself, &c. &c. like other Bramins, but by some is said to be exempt from illness; others say he is subject to bodily infirmities. So regular a life, however, in point of regimen, unruffled by worldly cares, may well ensure a continuance of health, and, in general, prolongation of existence.

"As the elder son inherits the spark of divinity, it is necessary that he also be a fool, as he hath ever proved. To the question 'Whether the second son being sane, and the other dying without male issue, the second, to whom the patrimony then descends, would become *dewanna* on his accession?' the Bramins demur: it hath never, they say, happened. God made the covenant, and the means of fulfilling it are not for man to point out."

Captain Moor visited the Deo. He asked him, what would the result of the war be between England and France, and when it would terminate. This was in January 1801. The Deo prophesied that it would end triumphantly and advantageously for the English within six moons; and he gave the Englishman to understand, that his favours and prayers had not been without their effect in raising England to its present power and prosperity. The Deo has not so much the appearance of an idiot as he ought to have; his eyes are keen, and his countenance expressive and not unpleasant; his son, however, is as stupid as beseems the heir-apparent to be.

15. Upon the Religion and Manners of the People of Ceylon. By Mr. Joinville.

This is a well-written and curious paper. We will extract from it an amus-

ing specimen of Asiatic computation, which will also explain the length of time required to ripen a deity into a boudhou.

“ According to the old Singalese authors, particularly Nimi Giateke, and the Boudhou Gunukatave, Boudhou transmigrated during four asanks, and one hundred thousand mahakalpes of years, from the time he took the resolution to become Boudhou, till that when he was born for the last time according to some, or, as others will have it, till he became Nivani. To form an idea of this period, the meaning of the words asanke and mahakalpe must be explained. There are two ways of explaining mahakalpe: the first supposes a cubic stone of nine cubits on each side; a goddess of great beauty dressed in robes of the finest muslin, passes once in every thousand years near the stone, at each time the zephyr gently blowing the muslin on it, till in this way it is worn down to the size of a grain of mustard: the space of time necessary for this is called antakalpe; eighty antakalpes make one mahakalpe. According to the second way of explaining the term, it is said, that the earth increases seven yoduns in one antakalpe; but a thousand years only increase it the thickness of one finger, in the opinion of the boudhists. It then remains to be seen how many fingers there are in one yodun. The calculation is as follows:

12 fingers make	1 viciet
2 viciets —	1 ricene or cubit
7 rienges —	1 jaté
20 jates —	1 isbe
80 isbes —	1 gaoué
4 gaoues —	1 yodun.—About 14

English miles. One yodun is, consequently 1075200 fingers—7 yoduns 7526400 fingers, which, multiplied by 1000, the number of years, makes 7526400000, the amount of an antakalpe, which, multiplied by 80, produces 602112000000 years, or one mahakalpe. The first computation, involving in it a calculation beyond the power of the human imagination to reach, leaves us nothing to say on the subject, except to express our total disbelief of it. The second is at least intelligible, and, it will be seen, bears a smaller proportion to an asanke, than a second does to a thousand centuries.”

One *asanké* is a number of years amounting to an unit with sixty-three zeros after it!

The system of casts which prevails in Ceylon is different from that upon the continent. The vellales, goi-vanses or lord labourers, are the first, for here the cultivators have triumphed. No *ragia* or royal cast exists, for no Singalese, that is, no person born of a Singalese father or mother can succeed to the throne, because no Singalese can prostrate him-

self before one of his own nation. If the king therefore dies, leaving no issue male or male relation, the crown is offered to some prince on the continent who professes the boudhou religion.

Neither have they a military cast, for all are obliged to fight on receiving the king's order. This is a great and manifest improvement. There exists one instance in Hindoo history of an army in the moment of success taking flight, because a few poor wretches of an impure cast attacked them in despair. Nothing can be more false and groundless than the opinions of those reasoners, who represent the system of casts as indestructible. No human institution would so soon crumble if it were wisely attacked.

“ The Rodi, or Rodias, are the last and vilest of all the casts. If one should touch a Rodias even unintentionally, one is rendered impure. These wretches are obliged to throw themselves on the ground, on their bellies, whenever they see a vellala passing, who gravely walks over them. But nature seems to have come to the relief of these unfortunate beings, by giving to them more beautiful women than to any of the other casts. But many of them are forced into the harams of the great, who have laid it down as a rule, that a Rodias woman is not impure for the men of superior casts, but only for their wives.”

When will the East India company be convinced that it is their ultimate interest, as well as their immediate duty, to convert their subjects?

16. A Chronological Table of the Moghul Emperors, from Umeer Tymoore to Alumgeer II. the father of the present Emperor Shah Alum, being from A. H. 736 to 1173, or A. D. 1335 to 1760. By Lewis Ferdinand Smith, Esq.

17. Demonstration of the Twelfth Axion of the First Book of Euclid. By the Rev. Paul Limrick.

18. Dagoberti Caroli de Daldorff *Scarabæorum* (i. e. *Insectorum quæ sub nomine generis superioris Scarabæus militaverunt in Fabricii Entomologia Systematica emend. & auct.:*) *distributio in genera proxima (id est naturalia) divisiones, subdivisionesque, instrumentis cibariis, larvorum imaginumque victu & oeconomia, aliisque insecti perfecti partibus consultis.* No. I.

19. An Account of the Bazeegurs, a Sect commonly denominated Nuts. By Captain David Richardson.

These vagabonds Captain Richardson, by cogent proofs, identifies with the gip-

sies. The name Bazeer-gur may be literally rendered a juggler; and juggling, singing, dancing, and tumbling, form their trade, to which the women add palmistry and the practice of physic, or rather quackery among their own sex. They call themselves Mohammedans, but they have blended Hindoo superstitions with the religion of Mohammed, and also added others peculiar to themselves; for they consider Tansyn, a famous musician, who flourished under Akbar, as their tutelary deity. The writer suspects that they occasionally eat human flesh, and one of their tribes, if we may credit very respectable testimonies of the fact, are frequently guilty of sacrificing human victims to Kalee, under circumstances of horror and atrocity scarcely credible. Among such a people it is remarkable that the pantheistic faith should be found, that one spirit pervades all nature, and that their souls being each a particle of that universal spirit, will of course rejoin it when released from its corporeal shackles.

We shall copy one of the notes to this paper, containing a singular account of the poet Kubeer.

“He was a weaver by trade, and flourished in the reign of Sher Shah, the Cromwell of Indian history. There are, however, various and contradictory traditions relative to our humble philosopher, as some accounts bring him down to the time of Ukbur. All, however, agree as to his being a soofee or deist, of the most exalted sentiments, and of the most unbounded benevolence. He reprobated with severity the religious intolerance and worship of both Hindoos and Moosulmans, in such a pleasing poetic strain of rustic wit, humour, and sound reasoning, that to this day both nations contend for the honour of his birth, in their respective sects or tribes. He published a book of poems that are still universally esteemed, as they inculcate the purest morality, and the greatest good-will and hospitality to all the children of man. From the disinterested, yet alluring doctrines they con-

tain, a sect has sprung up in Hindoostan under the name of Kubeer-punt-hee, who are so universally esteemed for veracity and other virtues, among both Hindoos and Moosulmans, that they may be with propriety considered the Quakers of this hemisphere. They resemble that respectable body in the neatness of their dress and simplicity of their manners, which are neither strictly Moohummudan nor Hinduwee; being rather a mixture of the best parts of both. A translation of Kubeer's works, with the life of that sage, and an account of his followers, relative to their tenets and societies, remain still as desiderata in the history of India. The time of Kubeer's death seems involved in equal obscurity with the manner of his decease and burial. They relate that he lived a long time at Kasee, near Gya, and sojourned also at Jugurnath: he gave great offence to the Buckmuns, by his conduct and tolerant doctrines. When stricken in years, he departed this life among a concourse of his disciples, both Moosulmans and Hindoos. They quarrelled about the mode of disposing of his remains, which were placed in another apartment during the dispute. The Moosulmans were, it is alleged, victors, and buried him accordingly. The Hindoos affirm, however, that his body, during the altercation, disappeared, and a lotus flower was found in its stead, which they have carefully preserved. Be this as it may, it is certain that his name is held in great veneration by those two very different people; those called Kubeer-punt-hee seem, nevertheless, to have rather more of the Hindoo than Moosulman in their composition, which so far decides the contest in their favour.”

20. On the Burmha Game of Chess compared with the Indian, Chinese, and Persian Game of the same Denomination. By the late Captain Hiram Cox.

These comparative descriptions cannot be understood without referring to the annexed tables or plans of the game.

These are the contents of this seventh volume. As in the collections of every society, there is the chaff and the wheat together; but we have reason to be thankful for the labours of the Asiatic society.

ART. IV. *Cyclopædia; or, a new Universal Dictionary of Arts, Sciences, &c.* By ABRAHAM REES, D.D. F.R.S. with the Assistance of eminent professional Gentlemen. 4to. Vol. II. from *Ana* to *Art*.

THE first volume of this important undertaking has been already noticed by us (*Ann. Rev.* v. I. p. 859), and it gives us pleasure to be able to announce that the present volume is equal in merit to its predecessor. On account of the magnitude of the work, and the abundance of

excellent matter which it contains, we feel peculiarly anxious that it should be rendered as perfect as the plan of a general dictionary can admit of: we shall, therefore, in the rapid enumeration of its contents, to which we are restrained by the limits of our own work, insist princi-

pally on the errors and deficiencies which have suggested themselves to us in the perusal, in order that they may be corrected and supplied in the succeeding volumes.

Among the *mathematical* articles, the first of importance that occurs is *Analysis*, in which we approve highly of the discrimination made between the ancient and modern analysis, and the recommendation to adopt "the method of the ancients in the commencement of our studies, as it serves to form the mind, and to fix proper habits, to which the method of the moderns should succeed, as it is best suited to extend our views beyond the present limits, and to assist us in making new discoveries and improvements." It is justly observed also in this article, that Newton himself investigated his theorems in a different manner from that in which he has delivered them; as they are commonly "analytical calculations, disguised by substituting the name of lines for their algebraical value." We may add, that the generally believed report at Cambridge is probably true, that the last proposition of the seventh section was one of the first discovered by him, and that he was led by it to expand his system in the manner in which it now appears. We need not add, that the investigation was made by the method of fluxions, and the fluents were afterwards converted into areas, to be visible to the eye.

In the account of the *Angle of contact*, we regretted that the demonstration was not given of the ratios of the evanescent subtenses in curves of different orders. It would not have occupied the space of more than four lines, and the article would have been complete. This defect may be remedied under the article *Contact*.

*Anomaly* is, very well explained; but in this, as in several other articles, we do not find sufficient attention paid to the labours of the present generation. The problem of Kepler is of great importance, and has employed the talents of the first mathematicians. Their methods are mentioned, and Keill's is given at length; but no notice is taken of Mr. Ivory, whose very able paper upon this subject, pointed out in our first volume, deserved the consideration of, and ought not to have been unknown to the writer of this article.

A very good account is given of *Apel-*

*lonius* of Perga and his work, which of course led to the notice of various writers on conic sections: and due praise is given to the very ingenious attempt of Mr. Walker to deduce all the properties of the curves, commonly called conic sections, from the 24th proposition of Sir Isaac Newton's universal arithmetic. It is rather singular, however, that the writer of this article should not have been acquainted with two other treatises of conic sections, upon a similar principle with Mr. Walker's. A gentleman of Cambridge, about sixteen years ago, brought with him from the continent the conic sections of Boscovich, with which he was so much pleased, that he drew up a course of lectures from them for the use of his pupils, which, with the work itself, he afterwards put into the hands of Mr. Newton, of Jesus College. Mr. Newton was equally pleased with the system, which he improved very much, by rejecting the musical proportion, and giving demonstrations of his own wherever they were requisite. His system was published by the university; and it is remarkable, that just as it was going to the press the manuscript of Mr. Walker was sent to Cambridge, and put into the hands of the gentleman who had brought the treatise of Boscovich from the continent, and who was struck with this remarkable coincidence in demonstrations between two writers who had no intercourse with each other. The merit of Mr. Walker is universally acknowledged, and it cannot be depreciated by this account; but it will afford to mathematicians some pleasure to compare together the different processes used by two eminent writers, from the same hypothesis, and the improvements made in these processes.

The article of *Approximation* is more defective than we could well have expected. Baron Maseres has treated this subject with his usual accuracy; but his name is not mentioned in the article; nor is the least notice taken of his tracts on the resolution of affected algebraic equations, in which the methods of approximation by Dr. Halley, Mr. Raphson, and Sir Isaac Newton are compared together, and the advantages and disadvantages of each balanced with the utmost degree of precision. Dr. Hutton is represented as being the discoverer of a peculiarly convenient method of approximating to the roots of pure powers; and thus De La-guy is deprived of the honour due to him.

For De Laguy gave first to the world the expression  $n + \frac{N - n^r}{r + 1 \cdot n^r + r - 1 \cdot N}$   $\times 2n$  for a near value to the root of the number  $N$ , where  $r$  is the index of the root, and  $n$  a near approach to it. By bringing this term to a common denominator, we have it equal to

$$\frac{r + 1}{r + 1 \cdot n} + \frac{r - 1 \cdot Nn + 2Nn - 2n^{r+1}}{r + 1 \cdot n^r + r - 1 \cdot N}$$

which is equal to  $\frac{r + 1}{r - 1 \cdot n} + \frac{r + 1 \cdot Nn}{r - 1 \cdot N + r + 1 \cdot n^r}$

or  $\frac{r - 1 \cdot n^r + r + 1 \cdot N}{r - 1 \cdot N + r + 1 \cdot n^r} \times n$ . This lat-

ter expression is that which Dr. Hutton has given in his tracts, but by no means supposing that he had made any great discovery, for it is merely the reduction of a fraction to a common denominator; and as, in many cases of this kind, an expression is supposed to be simplified by such an operation, this change is declared to be peculiarly recommended for practice. We apprehend that upon trial De Laguy's will be found to have the superiority. Several other methods of approximation might have been mentioned, which are to be found in the books of algebra, as that from Raphson, by which having found the small difference nearly between the root and the number assumed, this small number is used in the second power, and thus a new figure is gained with little or no trouble; and by applying the whole number found, instead of the unknown number, in the given equation, and dividing the known number by the unknown side, the powers of the unknown number being diminished by unity, a still nearer approach may be frequently made. An opportunity for introducing these improvements will occur under the article Equation.

Under the article *Apsides*, it is properly observed, that Sir Isaac Newton has shewn that when the force varies inversely as the square of the distance, the line of the apsides is stationary; but as the equation to the apsides is easily deduced for any law of the force, we would rather have seen it introduced in this place, whence the truth of Newton's position might easily and satisfactorily have been derived. From the conjecture thrown out, that Sir I. Newton was led by Kepler's observation, that equal areas were

described in equal times at the apsides, to discover that the same held in every part of the orbit; we trust that due justice will be done to Kepler in this work. His merits are not sufficiently known in this country; and from their little acquaintance with him, many lose the pleasure that is derived from tracing the progress in science in different ages.

The article *Arch* gives us the nature of circular arcs in geometry, and arches in architecture: for the former, some expressions are given without this theory; for the latter, the deficiency of this article is most deplorable. One would suppose that the writer of this article had never heard any thing of arches since Dr. Hutton had written his treatise upon bridges; that he had never been in company where the plan of a bridge with one arch over the Thames in London was mentioned; nor knew any thing of the various proposals delivered into the house of commons; or of the elegant experiments made by Mr. Atwood; or his scientific treatise, which has explained the whole of the difficulties once entertained on this subject in the clearest and most satisfactory manner. Mr. Atwood has published a treatise on the equilibration of arches, known to every mathematician probably in Europe, except the writer of this article. In this treatise he has shewn that the source of equilibration is to be found in the properties of the wedge, and has calculated the force of each wedge in the arch, as also the weight of any section of the arch. His theory also he has reduced to practice in the most elegant experiment that ever was made. A bridge of one arch is constructed of small polished brass wedges: the span is, we believe, less than a yard: the weight and form of each wedge is constructed according to the principles of his treatise, and thus an arch of equilibration is presented to the eye. To confirm the truth of it, a segment of the arch is removed, the remaining segment being supported by its abutment, and a hold fixed to a string which goes round a pulley, and at the other end of the string a weight is fixed, which keeps the segment of the arch in equilibrio. This weight agrees with, and confirms the truth of the principles derived from the properties of the wedge. But though the treatise has been published a considerable time, has been noticed in the Reviews and monthly publications, and the experiment has been seen and admired by numbers, both

natives of this country and foreigners, not the least notice of either is taken in this article; and for such silence, or strange want of information in a writer, evidently not deficient in talent, it is difficult to account. We trust that when we come to the article *Bridge*, the defect will be compensated by due notice of the labours and merits of Mr. Atwood.

The *biographical* articles being selected with judgment from the best dictionaries, are, of course, respectably executed; but they do not appear to contain much original information, or original remark: occasional instances, however, occur, which exhibit the hand of a master, of which the articles *Arnold* and *Arne* are pleasing examples; from the latter of which we shall select a specimen.

“The general melody of our countryman, if analyzed, would perhaps appear to be neither Italian nor English, but an agreeable mixture of Italian, English, and Scots. Many of his ballads, indeed, were professed imitations of the Scots style; but in his other songs he frequently dropped into it, perhaps without design.

“Arne never was a close imitator of Handel; and was almost the only English composer of the last century, who did not build his fame on imitations of his works, and who was not proud to hear his admirers say of his compositions—“‘Tis all Handel!” On which account Arne was never thought, by the votaries of their great model, to be a sound contrapuntist. However, he had an inward and secret reverence for his abilities, and for those of Geminiani, as well as for the science of *Pepusch*; but except when he attempted oratorios, theirs was not the merit requisite for him, a popular composer, who had different performers and different hearers to write for. In the science of harmony, though he was chiefly self-taught, yet being a man of genius, quick parts, and great penetration in his art, he betrayed no ignorance or want of study in his scores.

“The oratorios he produced were so unfortunate, that he was always a loser whenever they were performed. And yet it would be unjust to say that they did not merit a better fate; for though the chorusses were much inferior in force to those of Handel, yet the airs were frequently admirable. But besides the great reputation of Handel with whom he had to contend, Arne never was able to have his music so well performed, as his competitor had always a more numerous and select band, a better organ, which he played himself, and better singers.

“None of this ingenious and pleasing composer's capital productions had full and unequivocal success but *Comus* and *Artaxerxes*, at the distance of twenty-four years from each other. *Rosamond*, his first musi-

cal drama, had a few songs in it that were long in favour, and the *Judgment of Paris* many; but except when his sister, Miss Arne, afterwards Mrs. Cibber, sung in them, he never gained any thing by either. Thomas and Sally, indeed, as a farce, with very little musical merit, was often acted; and previous to that, *Eliza* was a little while in favour; but the number of his unfortunate pieces for the stage was prodigious. Yet none of them were condemned or neglected for want of merit in the music, but words, of which the Doctor was too frequently guilty of being the author. Upon the whole, though this composer, who died March 5th, 1778, had formed a new style of his own, there did not appear that fertility of ideas, original grandeur of thought, or those resources upon all occasions, which are discoverable in the works of his predecessor *Purcell*, both for the church and stage; yet, in secular music, he must be allowed to have surpassed him in ease, grace, and variety; which is no inconsiderable praise, when it is remembered, that from the death of *Purcell* to that of *Arne*, a period of more than fourscore years, no candidate for musical fame among our countrymen had appeared, who was equally admired by the nation at large.

The *historical* and *geographical* articles are, for the most part, satisfactory. We find a long and interesting account of *Amazons*; in which the discordant opinions of the ancient and modern writers, from *Herodotus* to Mr. Bryant, relative to the existence of savage tribes consisting wholly of females, are well detailed. The general account of *America* contains several errors; is diffuse on points of small importance; and most mortifyingly defective respecting the only people of any consequence, the *Mexicans*, *Peruvians*, and *Hunter* races between the *Mississippi* and *Atlantic*: these deficiencies may, however, be supplied hereafter. All that is known with certainty relative to the *Andes* is to be found in the travels of *Don Ulloa*, in *Helms's Journal*, and the *Letters of Humboldt*, in the *Journal de Physique*. Recourse has been had to all these authorities, and a very excellent article is the result. *Arabia* and *Arabs*, if we except a little diffuseness, are two articles of considerable merit. The *Argonautic* expedition furnished an opportunity of discussing some very curious, though obscure, points of ancient geography, of which, however, the writer of the article has not availed himself.

In the *Natural History*, we still observe the inconsistency which we men-

tioned in our last volume, of only a partial adherence to the Linnæan nomenclature. Thus the large genus *Anas* is converted merely into a reference, the species being described under their specific names. We turned therefore to *Anser* for the *anas anser*, where we found a meagre description, with a further reference to *Goose*; to *Antarctica* for *anas antarctica*, which is wholly omitted; to *Arborea* for *anas arborea*, under which name the compleat description of this species is placed; so that by this absurd confusion several species will be omitted, and others referred on from article to article, to the great trouble and perplexity of the reader. *Animalcule* is superficial, from the writer having recourse to none but English authors. In the zoological articles use has been properly made of Dr. Shaw's work; and the botany is largely extracted from Martyn's Miller.

There is no mineralogical article of any importance; but the chemical part of the volume before us is very rich. *Ammonia*, *Animal matter*, *Antimony*, *Arama*, and *Arsenic*, are the most elaborate, and manifest in the writers extensive enquiry, and an intimate acquaintance with laboratory details.

In the department of *Arts* and *Manufactures* there are only a few articles, but these are excellent, and contain much new and accurate information: as a specimen, we shall quote the whole article *Aquatinta*.

"**AQUATINTA**, in the history of the arts, a method of producing engravings very much resembling drawings in Indian ink.

"The principle of this process consists in corroding the copper with aqua fortis, in such a manner, that an impression from it has the appearance of a tint laid on the paper. This is effected by covering the copper with a powder or some substance which takes a granulated form, so as to prevent the aqua fortis from acting where the particles adhere, and by this means cause it to corrode the copper partially and in the interstices only. When these particles are extremely minute and near to each other, the impression from the plate appears to the naked eye exactly like a wash of Indian ink; but when they are larger, the granulation is more distinct: and as this may be varied at pleasure, it is capable of being adapted with great success to a variety of purposes and subjects.

"This powder or granulation is called the aquatinta grain, and there are two general modes of producing it.

"We shall first describe what is called the powder grain, because it was the first that

was used. Having etched the outline on a copper plate prepared in the usual way by the coppersmith (for which see the article Etching) some substance must be finely powdered and sifted which will melt with heat, and when cold adhere to the plate, and resist the action of aqua fortis. The substances which have been used for this purpose, either separately or mixed, are, asphaltum, Burgundy pitch, rosin, gum copal, and gum mastic; and in a degree all the resins and gum resins will answer the purpose. Common resin has been most generally used, and answers tolerably well; though gum copal makes a grain that resists the aqua fortis better. The substance intended to be used for the grain must now be distributed over the plate, as equally as possible; and different methods of performing this essential part of the operation have been used by different engravers, and at different times. The most usual way is to tie up some powder in a piece of muslin, and to strike it against a piece of stick held at a considerable height above the plate. By this, the powder that issues falls gently, and settles equally over the plate. Every one must have observed how uniformly hair powder settles upon the furniture after the operations of the hair dresser: this may afford a hint towards the best mode of performing this part of the process. The powder must fall upon it from a considerable height, and there must be a sufficiently large cloud of dust formed. The plate being covered equally over with the dust or powder, the operator is next to proceed to fix it upon the plate, by heating it gently, so as to melt the particles. This may be effected by holding under the plate lighted pieces of brown paper rolled up, and moving them about till every part of the powder is melted. This will be known by its change of colour, which will turn brownish. It must now be suffered to cool, when it may be examined with a magnifier; and if the grains or particles appear to be uniformly distributed, it is ready for the next part of the process. The design or drawing to be engraved must now be examined, and such parts of it as are perfectly white, are to be remarked. Those corresponding parts of the plate must be covered, or stopped out, as it is called, with turpentine, or what is better, mastic varnish, diluted with turpentine to a proper consistence, to work freely with the pencil; and mixed with lamp-black to give it colour; for, if transparent, the touches of the pencil would not be so distinctly seen. The margin of the plate must also be covered with varnish. When the stopping out is sufficiently dry, a border of wax must be raised round the plate in the same manner as in etching, and the aqua fortis properly diluted with water, poured on. This is called biting in; and it is that part of the process which is most uncertain, and which requires the greatest degree of experience. When the aqua fortis has been on so long that the plate, when printed, would produce the lightest tint in the drawing, it is

poured off, and the plate washed with water, and dried. When it is quite dry, the lightest tints are stopped out, and the aqua fortis poured on as before; and this is repeated as often as there are tints to be produced in the plate.

“ Although many plates are etched entirely by this method of stopping out and biting in alternately, yet it may be easily conceived that in general, it would be very difficult to stop round and leave out all the finishing touches, as also the leaves of trees, and many other objects, which it would be impossible to execute with the necessary degree of freedom in this manner.

“ To overcome this difficulty, another very ingenious process has been invented, by which the touches are laid on the plate with the same ease and expedition as they are in a drawing in Indian ink. Fine washed whiting is mixed with a little treacle or sugar, and diluted with water in the pencil, so as to work freely, and this is laid on the plate covered with the aquatint ground, in the same manner and on the same parts as ink on the drawing. When this is dry, the whole plate is varnished over with a weak and thin varnish of turpentine, asphaltum, or mastic, and then suffered to dry, when the aqua fortis is poured on. The varnish will immediately break up in the parts where the treacle mixture was laid, and expose all those places to the action of the acid, while the rest of the plate remains secure. The effect of this will be, that all the touches, or places where the treacle was used, will be bit in deeper than the rest, and will have all the precision of touches in Indian ink.

“ After the plate is completely bit in, the bordering wax is taken off by heating the plate a little with a lighted piece of paper; and it is then cleared from the ground and varnish by oil of turpentine, and wiped clean with a rag and a little fine whiting, and then it is ready for the printer.

“ The principal disadvantages of this method of aquatinting are, that it is extremely difficult to produce the required degree of coarseness or fineness in the grain, and that plates so engraved do not print many impressions without wearing out. It is therefore now very seldom used, though it is occasionally of service.

“ We next proceed to describe the second method of producing the aquatint ground, which is generally adopted. Some resinous substance is dissolved in spirits of wine, as for instance common resin, Burgundy pitch, or mastic, and this solution is poured all over the plate, which is then held in a standing direction till all the superfluous fluid drains off, and it is then laid down to dry, which it does in a few minutes. If the plate be then examined with the magnifier, it will be found that the spirit in evaporating has left the resin in a granulated state, or rather that the latter has cracked in every possible direction, still adhering firmly to the copper. A

grain is thus produced with the greatest ease, which is extremely regular and beautiful, and much superior for most purposes to that produced by the other method. After the grain is formed, every part of the process is conducted in the same manner as above described.

“ Having thus given a general idea of the art, we shall mention some particulars necessary to be attended to, in order to ensure success in the operation. The spirits of wine must be rectified, and of the best quality; what is sold in the shops containing camphor, would entirely spoil the grain.

“ Resin, Burgundy pitch, and gum mastic, when dissolved in spirits of wine, produce grains of a different appearance and figure, and are sometimes used separately, and sometimes mixed in different proportions, according to the taste of the artist, some using one substance and some another.

“ In order to produce a coarse or fine grain, it is necessary to use a greater or smaller quantity of resin; and to ascertain the proper proportions, several spare pieces of copper must be provided, on which the liquid may be poured, and the grain examined before it is applied to the plate to be engraved.

“ After the solution is made, it must stand still and undisturbed for a day or two, till all the impurities of the resin have settled to the bottom, and the fluid is perfectly pellucid. No other method of freeing it from those impurities has been found to answer. Straining it through linen or muslin fills it with hairs, which are ruinous to the grain.

“ The room in which the liquid is poured on the plate must be perfectly still and free from dust, which, whenever it falls on the plate while wet, causes the grain to form a white spot, which it is impossible to remove without laying the grain afresh.

“ The plate must be previously cleaned with the greatest possible care, with a rag and whiting, as the smallest stain or particle of grease produces a streak or blemish in the grain.

“ All these attentions are absolutely necessary to produce a tolerably regular grain; and after every thing that can be done by the most experienced artists, still there is much uncertainty in the process. They are sometimes obliged to lay on the grain several times before they procure one sufficiently regular. The same proportions of materials do not always produce the same effect, as it depends in some degree upon their qualities, and it is even materially affected by the weather. These difficulties are not to be surmounted but by a great deal of experience; and those who are daily in the habit of practising the art, are frequently liable to the most unaccountable accidents. Indeed it is much to be lamented, that so elegant and useful a process should be so delicate and uncertain.

“ It being necessary to hold the plate in a slanting direction, in order to drain off the

superfluous fluid, there will naturally be a greater body of the liquid at the bottom than at the top of the plate. On this account, a grain laid in this way is always coarser at that side of the plate that was held lowermost. The most usual way is, to keep the coarsest side for the foreground, being generally the part that has the deepest shadows. In large landscapes, sometimes various parts are laid with different grains, according to the nature of the subject.

"The finer the grain is, the more nearly does the impression resemble Indian ink, and the fitter it is for imitating drawings. But very fine grains have several disadvantages; for they are apt to come off before the aqua fortis has lain on long enough to produce the desired depth; and as the plate is not corroded so deep, it sooner wears out in printing. Whereas coarser grains are firmer, the acid goes deeper, and the plate will throw off a great many more impressions. The reason of all this is evident, when it is considered, that in the fine grains the particles are small and near to each other, and consequently the aqua fortis, which acts laterally as well as downwards, soon undermines the particles, and causes them to come off. If left too long on the plate, the acid would eat away the grain entirely.

"On these accounts, therefore, the moderately coarse grains are more sought after, and answer better the purpose of the publisher, than the fine grains which were formerly in use.

"Although there are considerable difficulties in laying properly the aquatint grain, yet the corroding the copper, or biting in, so as to produce exactly the tint required, is still more precarious and uncertain. All engravers allow, that no positive rules can be laid down, by which the success of the process can be secured: nothing but a great deal of experience and attentive observation can enable the artist to do it with any degree of certainty.

"There are some hints, however, which may be of considerable use to the person who wishes to attain the practice of this art.

"It is evident, that the longer the acid remains on the copper, the deeper it bites, and consequently the darker will be the shade in the impression. It may be of some use, therefore, to have several bits of copper laid with aquatint ground of the same kind that is to be used in the plate, and to let the aqua fortis remain for different lengths of time on each; and then to examine the tints produced in one, two, three, four minutes, or longer. Observations of this kind frequently repeated, and with different degrees of strength of the acid, will at length assist the judgment in guessing at the tint which is produced in the plate; a magnifier is also useful to examine the grain, and to observe the depth to which it is bit. It must be observed, that no proof of the plate can be obtained till the whole process is finished.

"If any part appears to have been bit too dark, it must be burnished down with a steel burnisher; and this requires great delicacy and good management not to make the shade streaky: and the beauty and durability of the grain is always somewhat injured by it, so that it should be avoided as much as possible.

"Those parts which are not dark enough must have a fresh grain laid over them, and be stopped round with varnish, and subjected again to the aqua fortis. This is called Re-biting, and requires peculiar care and attention. The plate must be very well cleaned out with turpentine before the grain is laid on, which should be pretty coarse, otherwise it will not lie upon the heights only, as is necessary in order to produce the grain. If the new grain is different from the former, it will not be so clear nor so firm, but rotten.

"We have now given a general account of the process of engraving in aquatinta; and believe that no material circumstance has been omitted, that can be communicated without seeing the operation. But after all, it must be confessed that no printed directions whatever can enable a person to practise it. Its success depends upon so many niceties and attention to circumstances apparently trifling, that the person who attempts it must not be surprised if he does not succeed at first. It is a species of engraving simple and expeditious, if every thing goes on well; but it is very precarious, and the errors which are made are rectified with great difficulty.

"It seems to be adopted chiefly for imitations of sketches, washed drawings, and slight subjects: but does not appear to be at all calculated to produce prints from finished pictures, as it is not susceptible of that accuracy in the balance of tints necessary for this purpose. Nor does it appear to be suited for book plates, as it does not throw off a sufficient number of impressions. It is therefore not to be put into competition with the other modes of engraving. If confined to those subjects for which it is calculated, it must be allowed to be extremely useful, as it is expeditious, and may be attained with much less difficulty than any other mode of engraving. But even this circumstance is a source of mischief, as it occasions the production of a multitude of prints that have no other effect than that of vitiating the public taste.

"Engraving in aquatinta was invented by Le Prince, a French artist, who kept his process for a long time secret: and it is said he sold his prints at first as drawings. But he appears to be acquainted only with the powder grain, and the common method of stopping out. The prints which he produced are still some of the finest specimens of the art. Mr. Paul Sandby was the first who practised it in this country, and it was communicated by him to Mr. Jukes. It is now practised very generally throughout Europe, but no where more successfully than in this kingdom."

In medicine, surgery, and anatomy, a few articles of importance appear; but many which we should have looked for are referred to another part of the alphabet.

*Amphibious* stands, we believe, as in the former edition. It is given as belonging to natural history; but the observations are chiefly anatomical, and mostly antiquated. In some future part we have a claim to expect a much more valuable article, as many important additions have been made by anatomists since the date of the authorities here given. The whole article ought therefore to have been either entirely recomposed, or entirely referred to a future part.

*Amputation* is a long and important article, drawn up with much care. The historical sketch of the operation descends no lower than Ambrose Paré, the history of the subsequent improvements being included in the descriptions of the operation itself. The author (in contradiction to the assertions of Mr. John Bell) denies that Paré was the inventor of the ligature; but acknowledges the pre-eminent merit of this great man.

The first discovery of the flap operation is traced to a Mr. James Young, surgeon at Plymouth, in the year 1769, who appears to have often performed it: so that it is not the original invention of M. Verduin or Sabourin, who have both claimed it. All the varieties of the process are there described, from the best authorities. Many questions relating to the propriety of amputation in different cases are left untouched; but they will be introduced with equal propriety under Gun-shot wounds, Fracture, &c.

Anatomy is divided into five distinct articles, probably by different writers. First, the history of anatomy is sketched with elegance and perspicuity, but with a mortifying conciseness and rapidity. Comparative Anatomy is given with still more uninformative brevity. Vegetable Anatomy is trifling, erroneous, and antiquated, but is chiefly referred to vegetable Physiology, from which we confidently expect better things. A full and elegant view of Picturesque Anatomy follows: it is addressed chiefly to the artist. Great and deserved praise is given to the muscular figure dissected for the Royal Academy by Dr. William Hunter, and the cast of it by Banks. Veterinary anatomy is the most complete, and is de-

scribed with reference to the beautiful plates on this subject at the end of the volume.

In the opinion of the author of this article, the turf seems to have been a better school for the breed than the care of horses. There seems to be much justice in his observations.

"Indeed, on pursuing an historical retrospect of the state of this science in England, it has seemed to us, for the last hundred years and upwards, to have been taking a retrograde course, which we feel rather disposed to attribute to the unbounded rage for horseracing, which, while it was of great service to the British nation, by encouraging the best breeds of strong and fleet horses, was of disservice, by promoting an artificial, vitiated taste with regard to these animals, which overawed all attempts at modest enquiry respecting their diseases. The knowledge of horses was supposed to consist in a sort of intuition, which was not to be defined or taught to others. Jockeys, sharpers, and gamblers, were supposed principally to possess this knowledge, which was all that was thought necessary respecting them, and all farther information could be of no use. Jockeys before this period were of small note, but from being entrusted with the secrets of the course, soon became engines of great importance in pursuing this species of traffic, and men at length were brought to resign their understandings to them, imagining it a subject too mysterious and difficult for them to comprehend: hence also appears to have arisen the great difficulty of founding a seminary for the veterinary medicine and surgery in this kingdom, which was almost the last country in Europe that adopted this salutary step for the improvement of the art. A more fair and candid mode of considering the subject has now arisen; and a style of writing and enquiry, which must (however it may labour under difficulties for a time) bring forth light, and, with the great improvements in chemistry, and all the arts and sciences which can promote it, will soon place it on a footing far beyond what was known in ancient and modern times."

Some very judicious observations are given on the nomenclature of veterinary anatomy; and the errors that have arisen from too servile an imitation of the human.

*Aneurism* is a full and very important article, containing much valuable matter in a moderate compass, and brought down to the present time.

*Aphtha* is classed under surgery: it belongs, however, more to physic, and is a complete practical article.

*Apoplexy*, we believe, is little altered from the former edition; so that we look for more information on this important subject in the future articles referred to.

A few *antiquarian* articles occur, which have afforded us much pleasure. *Archery* and *Armour* are so excellent, that we wish they had been longer; they appear to have been drawn up by the

late ingenious Mr. Strutt. A like praise and a like regret may be extended to *Arms* in heraldry.

The *ecclesiastical* and *theological* articles, *Apocalypse*, *Apocrypha*, and *Arians*, appear to be drawn up with perfect impartiality, and contain all the information to be required or expected on these topics.

## CHAPTER XXIII.

## EXPERIMENTAL PHILOSOPHY.

THE works included in this department of our present volume are not numerous, nor of first-rate importance; they bear, however, a considerable value, and we doubt not will be received by the public with complacence. Professor Aldini's volume on Galvanism exhibits a full detail of the wonderful effects produced by this newly-discovered agent on the nerves and muscles of animals recently killed. Mr. Johnson's laborious compilation of the scattered facts, illustrative of animal chemistry, merits great praise for its accuracy and minuteness, and will be acknowledged as a most useful body of facts and opinions by all those who are engaged in this interesting pursuit. Mr. Cavallo's Experimental Philosophy is well calculated to inspire young people with a desire of penetrating further into the majestic temple of Nature; and Mr. Accum's System of Chemistry will be welcomed by the amateur, and may be gleaned with profit by the more experienced chemist. Dr. Black's Lectures, which some years ago would have deserved the first rank among the popular systems of this science, from the delay in their public appearance, are likely to engage the attention of those principally who have enjoyed the pleasure and advantage of his personal instructions, and of those who are anxious to become acquainted with the style and manner of this eminent philosopher.

ART. I. *The Elements of Natural and Experimental Philosophy.* By TIBERIUS CAVALLO, F.R.S. *Illustrated with Copper Plates.* 4 vol. 8vo.

THE phenomena of nature cannot fail of making an impression in various degrees on every mind: some will acquiesce in the idlest surmises, whilst others, by a comparison of various effects, will be enabled to class them together, and thus arrive to some general property to which these appearances may be referred. In making this classification it will appear, that number and extension are two qualities which enter into the consideration of most of these effects; and hence, without the study of the mathematics, the knowledge of the cause of effects in nature must remain very imperfect. As many persons are unwilling to take the labour which is required to make the necessary progress in these studies, it becomes an object of some importance to devise means of rendering the science as popular as possible, and

great praise is due to those who exert themselves in this manner. At the same time all readers should be informed, that not only their ideas must be very imperfect, but that they in the end take more trouble in investigating any subject in the popular way, than they would do by examining it on its true principles. Thus in explaining the motion of the heavenly bodies, the great principles are, that a body acted upon by two powers will describe the diagonal of a parallelogram, whose sides are the lines of directions of the powers; and that a body revolving round a center of force will describe equal areas in equal times about that centre. Now to him to whom parallelograms and triangles are familiar, the demonstration is simple and easy; to others the ideas must be always confused, and it will be very dif-

ficult to make them comprehend the nature of the curvilinear motion.

The author of this very valuable work has done, however, as much as could be expected from any one, for the general reader. He goes through every branch of natural philosophy, whether it can be referred or not to mixed mathematics, and in both parts shews himself eminently qualified for the work which he has undertaken. If in his text he consults the ease of the general reader, he gives information sufficient in his notes to exercise the talents of, at times, even the higher class of mathematicians.

The first volume is assigned to mechanicks; the second to hydrostatics, pneumatics, and the general principles of chemistry; the third to caloric, optics, electricity, and magnetism; the fourth to astronomy, aerostation, meteors, weights and measures. This arrangement does not appear to us to have any advantage over the common mode in which the phenomena to be explained on mathematical principles are kept by themselves, under the heads of mechanics, hydrostatics, optics, and astronomy.

The first volume begins with a general description of natural philosophy, and points out the true rules of philosophising, not omitting to hold out a necessary degree of scepticism, at the same time that the student is put on his guard "not to become a blind believer or a useless sceptick." The general properties of matter are then explained, with the nature of the laws of motion; and we were rather surprised at finding ourselves precipitated in the next chapter into the difficulties of centripetal and centrifugal forces, and the centre of gravity, which generally remain till the student has familiarised himself with the more simple effects of mechanical motion. The theory of percutient motion then follows, and we are brought next to the nature of compound curvilinear motion; in the latter of which the fourth proposition of the second section of Newton is explained. These, to us appearing very difficult chapters, are followed by the doctrine of motions on inclined planes and of pendulums; and then we are introduced to the mechanical powers, which in most books of this kind are the first things taught, and the deviation from the general method does not appear to be followed by any advantage to either teacher or learner. The chapter on compound engines

and machines deserves commendation, both in itself and as pointing out fit objects for study; for many persons who pursue in theory the doctrine of motion, find themselves much at a loss when they are called upon to apply their knowledge to any practical purpose.

The very excellent work of Cotes on hydrostatics leaves little to be said on the theory; but many improvements have been made since his time, particularly in discovering the specific gravities of bodies, and the motion and properties of air, which are in this work dilated upon with great propriety. In treating the doctrine of optics, we were agreeably surprised at finding inserted the observations of, as he is called, a recent anonymous writer, concerning the inflections of light. They were published in the year 1799, and proceed, we understand, from the pen of a gentleman who studied the Newtonian theory with great diligence at Cambridge, and after an absence of several years returned about that time to this country. The observations have not been noticed so much as they deserved; the experiments are in a high degree ingenious, and the result is far from establishing the Newtonian theory. The author of the work before us makes the following remark upon the whole of this intricate subject.

"A close examination and application of this doctrine to a variety of phenomena, which have been observed by various ingenious persons, especially of the present age, render this theory of colours doubtful in almost all its parts. In the first place, it may be doubted whether there really are only seven distinct primitive colours, or an indefinite number of them, which are perhaps produced by some unknown modifications of white light. The breadths and the gradations of the supposed seven primitive colours, in the prismatic spectrum, are the greatest foundation for the above-mentioned doubt. With respect to the thin transparent plates of which all bodies are supposed to consist, we are greatly in want of experimental confirmation; and even if we were sure of their existence, it would be difficult thereby to explain, how are the fixed and unchangeable colours produced by them in all directions.—Such doubts may be seen in all the modern writers on optics, to whose works, which are principally to be found in Transactions of Societies, Journals, &c. I shall refer the inquisitive reader, who may wish to be informed on the subject, or to extend our knowledge of nature."

The passage of light through glasses, or reflected by mirrors, may fill volumes,

and cannot indeed be rendered very intelligible, without more attention to figures than will be bestowed by the general reader. This part of the subject is therefore very properly brought into a narrow compass, and the volume that might have been employed upon light alone, surrenders up one half to electricity, galvanism, and magnetism.

In the fourth volume, the system of the world is explained in the usual manner, and the latest discoveries are inserted. The addition of two new planets to the system and of the discoveries of Herschel and Schroeter, give an additional interest to this part of the work, and of them the author has very judiciously availed himself. Aerostation is well known; as to its general facts, as a science, it remains still in its infancy. The child sees

its bubble rise with the same pleasure as the multitude the balloon; the direction of the progress of either still depends on the breath of the lad, or the caprice of the winds. It is, however, a curious subject; and with that of meteors, and the falling of stones in different parts of the world, will be perused with pleasure.

On the whole, the work is admirably well adapted to give a general idea of a number of interesting topics. From its size, it cannot be supposed to dilate sufficiently upon any article to satisfy the diligent enquirer; but as a book of reference, and an easy explanation of philosophical subjects, it merits the attention of the general reader, and does great credit to the author.

ART. II. *An Account of the late Improvements in Galvanism, with a Series of curious and interesting Experiments, performed before the Commissioners of the French National Institute, and repeated lately in the Anatomical Theatres of London. By JOHN ALDINI, Professor of experimental Philosophy in the University of Bologna, Member of the Medical and Galvanic Societies of Paris, of the Medical Society of London, &c. To which is added, an Appendix, containing the Author's Experiments on the Body of a Malefactor executed at Newgate, &c. &c. Illustrated with Engravings.*

THE impression made by the experiments of Professor Aldini will not easily be effaced from the memory of those who were fortunate enough to be witnesses of them. When this ingenious foreigner left England, he put his manuscripts into the hands of the editor of this work, (whose name does not appear) partly in French, partly in Latin. They are here all collected and published in English, and, together, form a series of most curious and interesting experiments, more surprising perhaps than were ever presented in one point of view, and affording abundant matter for present contemplation and future enquiry.

The subject being as yet but new, no more of theoretical reasoning accompanies the recital of matter of fact, than necessarily attends the researches of ingenious men; it is therefore to the facts and original discoveries that the reader's attention will be chiefly directed. A few of them we shall mention, not as an abstract of the whole, (which ought to be consulted in the work itself, and with the assistance of the plates) but as an inducement to those of our readers who pursue the fascinating science of physiology, to attend to a subject which promises so rich a harvest in an unexhausted field.

The first part of this volume treats of the nature and general properties of galvanism. The facts are reduced to a number of general propositions, each of which is proved by an appropriate experiment. In all, the ultimate object is to produce, by various methods, muscular motion in different parts of animals recently killed.

Thus the first proposition is, that muscular contractions are excited by the development of a fluid in the animal machine, which is conducted from the nerves to the muscles, without the action of metals. This is proved in the following experiment:

“ Having provided the head of an ox which had been recently killed, I thrust a finger of one of my hands, moistened with salt water, into one of the ears, at the same time that I held a prepared frog in the other hand, in such a manner, that its spinal marrow touched the upper part of the tongue. When this arrangement was made, strong convulsions were observed in the frog; but on separating the arc, all the contractions ceased. This experiment will succeed still better, if the arc be conveyed from the tongue of the ox to the spinal marrow of the frog.”

A real attraction, never before observed, between muscle and nerve, is proved by the following experiment:

"I held the muscles of a prepared frog in one of my hands, moistened by salt water, and brought a finger of the other hand, well moistened, near to the crural nerves. When the frog possessed a great deal of vitality, the crural nerves gradually approached my hand, and strong contractions took place at the point of contact. This experiment proves the existence of a very remarkable kind of attraction observed, not only by myself, but also by those whom I requested to repeat the experiment."

This, however, requires much delicacy and accuracy in the preparation to succeed.

Galvanism is excited by the simple contact of the nerve of an animal with its own muscle. It is thus proved:

"Having prepared a frog in the usual manner, I hold the spinal marrow in one hand, and with the other form an angle with the leg and foot, in such a manner, that the muscles of the leg touch the crural nerves. On this contact, strong contractions, forming a real electrico-animal alarm, (carillon), which continue longer or shorter, according to the degree of vitality, are produced in the extremity left to itself. In this experiment, as well as the following, it is necessary that the frogs should be strong and full of vitality, and that the muscles should not be overcharged with blood."

Many curious facts are given, to shew the general relation between galvanism and electricity; and the author inclines to the hypothesis of an animal pile existing within every animated body, and acting similarly to the voltaic pile.

In the second part, Professor Aldini treats of the influence which galvanism has on the vital powers, and under this head are contained those astonishing and celebrated experiments, of exciting commotions in the decapitated trunks, or the heads of large animals, by means of the voltaic pile conveyed to the nervous and muscular systems. The Professor has employed both the larger brutes and human subjects; the latter, criminals decapitated by the sentence of the law in Bologna, whom the alarmed and astonished spectators saw again rolling the eyes, gnashing the teeth, menacing with the arms, and for an instant resuming the actions of life.

—nova desuetis subrepens vita medullis  
Misceatur morti, tunc omnis palpitat artus,  
Tenduntur nervi, distento lumina rictu  
Nudantur—remanet pallorque rigorque  
Et stupet illatus mundo.

We must relate two of the experi-

ments as examples of these astonishing phenomena:

"The first of these decapitated criminals, being conveyed to the apartment provided for my experiments, in the neighbourhood of the place of execution, the head was first subjected to the galvanic action. For this purpose I had constructed a pile, consisting of one hundred pieces of silver and zinc.—Having moistened the inside of the ears with salt water, I formed an arc with two metallic wires, which, proceeding from the two ears, were applied, one to the summit, and the other to the bottom of the pile. When this communication was established, I observed strong contractions in all the muscles of the face, which were contorted in so irregular a manner, that they exhibited the appearance of the most horrid grimaces. The action of the eye-lids was exceedingly striking, though less sensible in the human head than in that of the ox."

The larger animal shewed equally powerful commotions.

"Having provided an ox recently killed, the head of which was not cut off, I formed an arc from one ear to the other, interposing the pile. The immediate result was a commotion, so violent in all the extremities of the animal, that several of the spectators were much alarmed, and thought it prudent to retire to some distance. I then cut off the head, and formed an arc from the spinal marrow, first to the diaphragm, and then to the sphincter ani. In the first case the diaphragm experienced violent contractions, in the other I obtained a very strong action on the rectum, which even produced an expulsion of the fæces."

It is remarkable that Professor Aldini could excite no contraction in the heart of any of the subjects by the galvanic pile. However, on carefully repeating the experiments, some other Italian philosophers have succeeded in this point; the heart therefore is susceptible of galvanic influence, but with difficulty.

The third chapter contains a short view of the medicinal powers to be expected from galvanism; they appear to be very similar to those of electricity. The following use of one or the other is new and singular:

"Before I conclude this article, I must suggest a hint respecting the application of galvanism to diseases of the teeth, founded on information communicated to me on this subject by Mr. Fowler, an eminent dentist in London; when the caries is concealed from the sight. Mr. Fowler employs the following method to discover the affected tooth: He first insulates the patient, and having put into his hand the electric chain, he applies a

small piece of wire to the *dens sapientiæ*, drawing it gradually over its surface; he then applies it to the next tooth, repeating the operation, and proceeds in like manner with the rest till he comes to the diseased tooth, which discovers itself by a violent pain, producing an involuntary commotion in the body. It is always remarked, that when this tooth is extracted, it exhibits a carious part not before visible. This method, therefore, is of great importance, as it frequently happens in such cases that the dentist, not being able to distinguish the diseased tooth from the rest, is obliged to draw some that are sound before he can discover it."

Several experiments on the action of the galvanic pile on the blood, bile, urine, and other animal secretions follow. They deserve to be recorded, but nothing conclusive can be deduced from them, nor is it at all certain whether the change is any more than purely chemical.

Two interesting dissertations follow, which were read by the author of the Institute of Bologna in the years 1793 and 1794. They are partly historical of the discoveries relating to galvanism, partly experimental, and partly controversial. The latter chiefly turns upon the opposite systems adopted by Galvani and Volta, the former supposing the galvanic action to originate in the living animal as a consequence of its organization, the latter ascribing the contractions only to external electricity, proceeding from the armatures, and not to any electric virtue in the animal.

Three other appendixes are added to this volume. The first contains a summary of the experiments performed on the body of a malefactor hanged at Newgate, whilst Professor Aldini was in London. They have already been published separately, but they well deserve a place in this collection.

The second appendix contains a report of similar experiments made by Vassali, Cardi, Giulio, and Rossi, on three criminals decapitated at Turin. The only circumstance enlarged on, is the much-questioned sensibility of the involuntary organs to galvanic action in warm-blooded animals. This sensibility is denied by Volta, and, as we have before mentioned, could not be detected by Aldini in the heart; however, the above experimenters fully ascertained it. They observe,

"We tried the influence of galvanism on the heart in three different ways.

"1st, In arming the spinal marrow by means of a cylinder of lead introduced into the canal

of the cervical vertebræ, and thus conveying one extremity of a silver arc over the surface of the heart, and the other to the arming of the spinal marrow. The heart of the first individual subjected to our experiments exhibited very visible, and very strong contractions. The experiments were made without the intervention of any kind of pile, and without any armature applied to the heart. It is very remarkable, that when the former is touched first, and then the arming and spinal marrow, the contractions of the heart which follow are more instantaneous and stronger, than when the arming of the spinal marrow is first touched, and then the heart. In a memoir on galvanism, read in the last public sitting of the academy, I gave an account of a great number of experiments, made especially on frogs, which exhibited a similar phenomenon. In these animals I observed, a great number of times, that when the arming of the crural nerves was touched first, and then the muscles of the thigh, there were no contractions, or the contractions were exceedingly weak; and, on the other hand, that when the muscles of the thigh were first touched, and then the arming of the crural nerves, as long as the least vitality remained in the organs, the contractions of the muscles were constant and violent."

The second experiment was by arming the par vagum and the great sympathetic nerve. The third was by the pile itself, composed of fifty plates of silver and an hundred plates of zinc. Here,

"By making the negative extremity of the pile to communicate, by means of respective conductors, with the spinal marrow, or merely with the muscles of the back or breast, laid bare, and the positive extremity immediately with the heart, instantaneous and violent contractions were obtained; and the contractions were produced also when the heart was made to communicate with the negative extremity of the pile, and the spinal marrow with the positive extremity.

"We shall observe, in regard to contractions of the heart, that of all its parts the apex is the most susceptible of motion, and the most sensible to the galvanic influence: we must observe also, that the contractions produced by communication with the pile were not only strong, but that they continued a long time even after the communication was destroyed."

The last appendix relates an experiment on the transmission of galvanism through a considerable extent of water in Calais harbour.

The contents of this volume are somewhat desultory, but the experiments are so numerous, so wonderful, and so well contrived, and it contains so many curious conjectures and remarks on the theory of galvanism, that it must be

considered as a most important acquisition to physiology. Perhaps it is the corner-stone of some noble monument of human wisdom, in as grand and useful a research as can employ the intellect, and exercise the ingenuity of man.

We may add, that the plates are well

executed, and the translator and editor has performed his office in a most respectable manner, that shews him to be acquainted with the subject as well as the language of the work which he here presents to the English reader.

ART. III. *History of the Progress and present State of Animal Chemistry.* By W. JOHNSON, M.B. In three Volumes.

THE utility of a work like the present cannot be better shewn than in the author's words.

"Modern chemistry has already thrown great light on several parts of the animal system; it has, within these last few years, commenced an investigation of several of the functions of the body, and explained the manner in which they are carried on with some degree of success. The processes of respiration, of digestion, of animalization, and the action of oxygen upon vital organization, no longer remain in that state of total darkness in which they were so lately developed, whilst the proficiency already attained in this department of the science has established the animal analysis upon so firm and broad a basis as to promise in future the happiest results. Other functions remain to be investigated, such as sanguification, ossification, nutrition, and the secretion of the different fluids; to which may be added the action of those powers that produce diseases, and that of medicines on the animal body; but it is by pursuing the same method of an analytical reasoning that their operations are to be explained, and their nature thoroughly understood. Every preparation is already made for this grand work, and there is reason to believe, that the route which has hitherto been explored will conduct the philosopher to a more precise and exact knowledge of the phenomena of the animal economy, and to the formation of a more perfect theory of the laws that govern the vital and mental world.

\* \* \* \*

"For such an undertaking a material advantage, however, seemed to be wanting: a compilation in which the enterprising experimentalist could be made acquainted with the facts and observations of those who had preceded him. It is true, several learned foreign chemists have attempted to supply this deficiency, and Gren, Hildebrandt, Jacquin, and De la Grange, have published compilations on the subject; but their plans appear to have been too limited, and their descriptions too concise: many of the phenomena recorded in the analysis of animal substances have been excluded, some of the most interesting particulars have been forgotten. In the work now presented to the public a different plan has been pursued, a more enlarged

scale has been attempted, and an endeavour has been made to give the whole a more connected and systematic arrangement. For these purposes, the author is principally indebted for his information to the *Elementa Physiologiæ* of Haller, the *Encyclopédie Méthodique* of Morveau and Fourcroy, and to Leonhardi's German Translation of Macquer's Chemical Dictionary, with the excellent additions. At the same time, copious extracts have been occasionally selected from more recent publications, particularly those collections of different learned societies, to whose diligence and industry chemistry presents her choicest store. From the former, the early historical part has been chiefly taken; from the latter, the state of analysis of the present day. With such assistance, it is to be hoped, the deficiencies of former compilers may have been in some measure supplied, and the knowledge they have collected increased, by having had access to a more extensive mass of materials, and to later discoveries."

A compilation of this kind requires considerable talents. The author should be extensively read in physiology and in chemistry, and in some degree in natural history; he should have abundant patience and diligence in research, judgment in the arrangement, and impartiality in selection. Amidst the immense profusion of chemical detail which lies scattered in books of various languages, it is the most valuable present that can be made to the young physiologist to perform for him that task of selection which is so irksome to original genius, and which is rewarded with no higher reputation than that of pains-taking industry. It is therefore with great satisfaction that we find this important office performed in these volumes, in a way highly creditable to the author, who has presented by far the completest view of animal chemistry that exists, and one which is calculated to be a standard book of reference for every medical and chemical library.

The nature of the work renders any particular specimen unnecessary; we shall therefore only mention that the plan

is very simple and unembarrassed. The two first volumes are occupied with the chemical analysis of all the solids and fluids of animal bodies, including a history of every important series of experiments that have been made in modern times, and are scattered through journals, elementary works, miscellanies, &c. in different languages. Of these, the German authorities have been examined with considerable minuteness, and indeed the general execution of the work somewhat reminds us of German industry and of German exhaustiveness in selection.

The third volume examines the chemical changes that take place in the living body, of which the subjects of animal heat and respiration stand conspicuous, and are treated with peculiar care.

As the author only aims at accuracy in compilation, and clearness in description, it would be unfair to expect a different excellence; his task is well performed, and we doubt not that public approbation will bear testimony to its utility.

ART. IV. *A System of Theoretical and Practical Chemistry. In Two Volumes, with Plates.* By FREDERICK ACCUM, Teacher of Practical Chemistry, Pharmacy, and Mineralogy, and Chemical Operator in the Royal Institution of Great Britain. 8vo. pp. 800.

CHEMISTRY is now become a subject of such vast extent, that a familiar acquaintance with every branch of this science is hardly to be expected from any individual, nor have we yet seen a single system which has any real claim to be considered as perfect. In some the pneumatic part is chiefly insisted on, in others the metallic substances are the favourite objects, others again are principally valuable for the chemistry of vegetable and animal bodies. The forte of some authors consists in a clear and perspicuous account of the prevailing theories and opinions, while others endeavour to render themselves useful to the operating chemist.

The work before us is a very convenient manual for a lecturer, and will be found of equal use by the student who wishes to repeat in his own laboratory some of the most striking and beautiful experiments of modern chemistry. The first volume, which is principally occupied by caloric and the gasses, is the most useful, and contains a multitude of well selected experiments which are not generally known. The second volume, which comprehends the metals, earths, acids, alkalies, compound salts, vegetable and animal substances, &c. is much too crowded to be of any great value. The general plan which Mr. Accum has adopted, with regard to those substances that he treats of the most at length, is to appropriate a chapter to each, which he divides into two sections; in the first he enumerates the characters, and the several modes of obtaining the substance in a pure state, and the second is appropriated to experimental proofs of the va-

rious properties with the rationale of the more complicated processes.

As a specimen of the work we shall select part of the second section concerning phosphorated hydrogen gas.

#### “ EXPERIMENT I.

“ *Phosphorated hydrogen gas takes fire on coming into contact with atmospheric air.*

“ This may be evinced by charging a small retort with potash, phosphorus and water, in the manner mentioned before, applying heat and dipping the mouth of the retort into a basin of water. The bubbles of the air, which come from the retort and pass through the water, will burst with a slight explosion, and produce flashes of fire in the circumambient air. A circular dense white smoke rises horizontally like a ring, enlarging itself continually, and forming a sort of corona extremely beautiful if the air be perfectly tranquil.

“ The finest effect is produced when the flashes of gas succeed each other but slowly.

“ *Rationale.* We have noticed before, that phosphorated hydrogen gas is nothing but hydrogen gas holding phosphorus in solution. When this gaseous fluid is presented to the atmospheric air or oxygen gas, the minutely divided phosphorus rapidly attracts oxygen and kindles, setting fire at the same time to the hydrogen gas in contact with atmospheric air, and hence phosphoric acid and water are formed.

“ The circular crown of white smoke which rises after the explosion of the gas, originates from the coat of water which enveloped the bubble of the gas; this water, together with what is formed during the explosion, is suddenly converted into vapour, it unites to the phosphoric acid produced, and thus constitutes the circular crown of smoke which rises in a ring.

“ If a wider-mouthed phial be filled with phosphorated hydrogen gas, and left in that

situation over mercury, the gas will take fire when suffered to escape into the air by inclining the phial.

*Remark.* This last is a hazardous experiment, the phial is often burst to pieces; it is therefore necessary to surround it with a cloth in order to avoid dangerous events. An elastic gum-bottle may be used for this purpose with safety.

#### “EXPERIMENT II.

*Accension of phosphorated hydrogen gas by means of oxygen gas.*

“Fill a receiver with oxygen gas and convey into it a few bubbles of phosphorated hydrogen gas. At the instant of the union of the gases a brilliant flash of fire takes place, accompanied with a report.

“The rationale of this experiment is analogous to the former.

*Remark.* Great caution is necessary in performing this experiment. The dilatation of the gases, which takes place during the explosion is so great, that the vessel is apt to be blown to pieces. Not more than a single small bubble of the phosphorated hydrogen gas should be conveyed into the oxygen gas at once, except the receiver be made of very thick glass.

#### “EXPERIMENT III.

*Accension of phosphorated hydrogen gas, by means of oxygenated muriatic acid gas.*

“If fresh-prepared phosphorated hydrogen gas and oxygenated muriatic acid gas are mingled together over mercury, a considerable detonation takes place, accompanied with a lambent green flame and dense white vapours.

*Rationale.* All that happened in the last experiments take place in this instance. The oxygenated muriatic acid gas is robbed of its oxygen, and becomes converted into simple muriatic acid gas; and water and phosphoric acid are produced. The evolved heat inflames the phosphorus which was dissolved in the gas.

*Remark.* For the success of this experiment it is essential that both gases are fresh prepared. The receiver in which the mixture is made should be very strong, in order to guard against accidents.

#### “EXPERIMENT IV.

*Phosphorated hydrogen gas burns with a green light in nascent oxygenated muriatic acid gas, under the surface of water.*

“Put into an ale-glass, or Florence flask, one part of phosphoret of lime, broken into pieces of the size of a pea (not in small fragments or in powder) and add to it half a part of oxygenated muriate of potash. Fill the vessel with water, and bring carefully into contact with the materials at the bottom of the fluid, three or four parts of concentrated sulphuric acid. This may be most conveniently done, by letting the acid fall through a long-necked funnel, reaching to the bottom of the vessel, or by causing it to pass down the sides of it. As soon as the decomposition of the water and that of the oxygenated muriate takes place, flashes of fire dart from the surface of the fluid, and the phosphoret illuminates the bottom of the vessel with a beautiful green light.”

ART. V. *Lectures on the Elements of Chemistry; delivered in the University of Edinburgh, by the late JOSEPH BLACK, M. D. &c. Now published from his Manuscripts, by John Robison, LL. D. Professor of Natural Philosophy in the University of Edinburgh.* 4to. Two Vols.

THE name of Dr. Black will probably be remembered as long as the science of chemistry exists: his two great discoveries of latent heat and of the cause of that difference observable between the properties of the mild alkalies and alkaline earths, and of these substances, when in a caustic state, must be acknowledged, by all philosophers, as having communicated the impulse, and pointed out the way to the splendid investigations of modern chemistry. These claims on the remembrance of posterity could never have been set aside, even if the present publication had not taken place. Still it is in a high degree satisfactory to possess a record of them in the words of their author, more especially as we by this means become acquainted with the manner, and may form some faint idea of the effect produced by the lectures of this celebrated teacher. Professor Robison, the former

pupil, and intimate friend of Dr. Black, was entrusted, by his executors, with the arduous and delicate office of revising the loose manuscript notes, from which Dr. Black delivered his lectures, and reducing them to a state proper for publication. The documents of Dr. Black's fame could not have been committed to abler hands: the volumes before us exhibit a very accurate representation, not only of the opinions, but, we doubt not, of the very words of the author; while the notes, which the editor has supplied, from the stores of his own knowledge, confer an additional value on the work.

A very interesting life of Dr. Black, by the editor, is prefixed, in which the progress of his discoveries is minutely and satisfactorily detailed, and a very equitable estimate formed of his philosophical merit. It was not to be expected that the friendly partiality of his biographer should touch otherwise than

very lightly upon the characteristic failing of Dr. Black's later years: it ought not, however, to have been either denied or justified: if a mean economy was allowed to interfere with his duty as a professor; if the laboratory establishment was scandalously deficient in apparatus of absolute necessity, what a strange proof of Dr. Black's "correctness and propriety of conduct" is it, to say, that "his house was spacious, his table plentiful and elegant, rather above than below his condition." The concluding scene of Dr. Black's life was most singularly calm and happy.

"His only apprehension," observes Professor Robison, "was that of a long-continued sick bed; and this, perhaps, less from any selfish feeling than from the humane consideration of the trouble and distress occasioned to attending friends; and never was this modest and generous wish more completely gratified. On the 26th Nov. 1799, and in the seventy-first year of his age he expired, without any convulsion, shock, or stupor, to announce or retard the approach of death. Being at table with his usual fare, some bread, prunes, and a measured quantity of milk, diluted with water, and having the cup in his hand when the last stroke of his pulse was to be given, he set it down on his knees, which were joined together, and kept it steady with his hand, in the manner of a person perfectly at ease; and in this attitude expired, without spilling a drop, and without a writhe in his countenance; as if an experiment had been required to shew to his friends the facility with which he departed." His servant opened the door to tell him that some one had left his name, but getting no answer, stepped about half way towards him, and seeing him sitting in that easy posture, supporting his basin of milk with one hand, he thought that he had dropped asleep, which he had sometimes seen happen after meals. He went back and shut the door; but before he got down stairs some anxiety, which he could not account for, made him return and look again at his master. Even then he was not satisfied, after coming pretty near him, and turned to go away; but again returned, and coming quite close to him he found him without life.

"So ended a life which had passed in the most correct application of reason and good sense to all the objects of pursuit which pro-

vidence had prescribed to his lot; with many topics of agreeable recollection, and few things to ruffle his thoughts. He had long enjoyed the tender and affectionate regard of parents whom he loved, honoured, and revered; with the delightful consciousness of being a dutiful son, and being cherished as such;—one of a family remarkable for sweetness of disposition and manners, he had lived with his brothers and sisters in terms of mutual love and attachment. He had never lost a friend but by the stroke of mortality, and he felt himself worthy of that constancy of regard. He had followed a profession altogether to his taste, and had followed it in a manner, and with a success which procured the esteem and respect of all competent judges, and set his name among the most eminent; and he was conscious that his reputation was not unmerited; and with a success, in respect of emolument which secured the respect, even of the ignorant; and gave him the command of every rational gratification, and enabled him to add greatly to the comforts of the numerous descendants of his worthy parents,—heirs not only of their name but likewise of their unambitious moderation; and amiable simplicity of character."

The contents of these volumes have somewhat of an air of confusion, arising in some degree, perhaps, from the imperfect state in which Dr. Black's manuscripts were found at his death, but principally from the partial adoption of new nomenclature and late discoveries. These appear to have been inserted in his lectures at various times, as each approved itself to his judgment, while the natural feebleness of old age, added to an originally delicate constitution, disabled him from remodelling the whole into a harmonious system. A large, we will not say a disproportionate share of the work, is devoted to the illustration of the author's own immortal discoveries, which are related with great minuteness and in a most engaging manner; and it is particularly satisfactory to behold on all occasions a most happy exemption from jealousy of his fellow-labourers in the inexhaustible mine of experimental knowledge, and the most scrupulous equity in assigning the fame of great discoveries to the rightful claimants.

## CHAPTER XXIV.

## MINERALOGY.

ART. I. *A Comparative View of the Huttonian and Neptunian Systems of Geology: in Answer to the Huttonian Theory of the Earth, by Professor Playfair.* 8vo. pp. 256.

THE work of Professor Playfair, to which this is a reply, was reviewed in our last volume, p. 903. We there took notice of a few of the fundamental objections to the Huttonian theory, and shall therefore content ourselves with simply announcing the book that lies before us.

All the geological theories that have ever been invented appear to us to labour under insurmountable objections; in the comparison, therefore, of any two, it is easy by bringing forwards the chief difficulties on one hand, and concealing them on the other, to incline the balance to which ever side we choose.

We do not find any new arguments, or any very superior mode of stating

them, in the present work. Mr. Kirwan's geological essays have been made very liberal use of, and the writer has shewn some judgment in omitting to bring forwards Mr. K.'s strange theory of the formation of coal, and certain other points, in the aqueous system of geology.

The demonstration of the falsehood of the Huttonian theory, from the diffusibility of heat, is strongly and, in our opinion, successfully urged; but it by no means follows, that fossils must have been formed by consolidation from aqueous solution in a chaotic fluid, because the appearances they present are incompatible with the supposition of their being formed by fire.

ART. II. *British Mineralogy, or coloured Figures to elucidate the Mineralogy of Great Britain.* By JAMES SOWERBY, F. L. S. 8vo.

WE are sorry to witness in this work the injudicious misapplication of ingenuity and talents, which we have often admired, and from which we have derived both pleasure and information. —The crystalline and other particular forms of minerals, together with their colour, in most instances may be represented by painting, and are so in the vo-

lume before us with considerable success; but the infinite gradations of lustre, the play of light, and the still more essential characters of fracture, it is utterly impossible for the best artist to delineate. Where the objections to a work are radical, it is useless to point out minuter imperfections.

## CHAPTER XXV.

## ARCHITECTURE AND THE FINE ARTS.

OUR intention in this chapter, is not to notice the various productions of the fine arts which have appeared during the last twelvemonth, but only those publications in which the principles of taste, and their application to general or particular cases is discussed. When, however, any work of transcendent merit appears, even though it should not strictly come within the limits of our plan, if it is calculated to be generally interesting, we shall, without scruple, take the opportunity of enriching our volume by its introduction. It is upon this principle that we have admitted into our present list Mr. Daniell's *Views and Antiquities of India*, as being a series of drawings that combine together masterly execution, fidelity of representation, novelty, and grandeur of form, in a higher degree than any work with which we are acquainted; and which place before our eyes, with a precision wholly beyond the power of language, the noblest specimens of architecture that characterize the ancient Hindoo natives, the Mahometan conquerors, and the present European lords of the Indian peninsula. Mr. Elsam's work on *Rural Architecture*, and Mr. Repton's on *Landscape Gardening*, are strictly within the limits of our plan, and therefore have a claim upon our notice which we cannot consistently overlook.

ART. I. *Oriental Scenery, or Views in Hindoostan*, published by THOMAS DANIELL, R. A. Howland-street, 3 parts, 24 Views in each.

*Antiquities of India*, by THOMAS DANIELL, R. A. 12 Views.

*Hindoo Excavations in the Mountains of Ellora, near Aurungabad, in the Decan*, 24 Views, published by THOMAS DANIELL, R. A. from the Drawings of Mr. WALES, large folio.

WE congratulate the public on the acquisition of a work of various and unrivalled merit: never before has oriental scenery been pictured with the vivacity, the accuracy, and beauty of nature. We are transported to another world, every thing denotes other skies, other manners; the palanquins, the elephants, and crowded retinue of Indian luxury, the naked native squatting in a veranda, or sauntering on a terrace, in prostrate adoration before his idol, or laying in the sacred Ganges;—the tufted palms, the banyan fig, parent of forests, and the impenetrable jungle creeping up the hills, and clothing the swampy margin of the rivers. Here we gaze on the gay and gilded magnificence of oriental palaces, or muse over the gigantic architecture of forgotten ages.

The views in the four first parts were taken by Mr. Daniell, with singular industry and perseverance, during a long residence in India: they contain the scenery of the country, British and Mahometan buildings, Indian pagodas, and the excavations of Elephanta and Salsette; the views of the excavations of Ellora, which form the fifth part, were executed from the drawings of Mr. Wales, who was prevented by death from finishing them himself. The whole are engraved in aquatinta, and coloured to the effect of drawings. The acknowledged skill of the painter is eminent in all the plates, and particularly because it is not obtrusive; too good an artist to seek for picturesque effects in the common arts of false lights, extravagant contrasts, and unnatural colours, Mr. Da-

niell represents objects as he saw them, clear, brilliant, and natural; hence his views have an air of truth and accurate detail, satisfactory to the judgment, and particularly valuable where the subjects themselves are so interesting. No one knows better how to characterize objects; the animals, trees, and plants, are studies for the naturalist; the Indian sky is marked with admirable clearness, and the representation of water is almost unrivalled in transparency and fluidity. Many of the views are highly beautiful and romantic landscapes; but the circumstance that gives this work a peculiar interest to the architect and antiquary is, the detail of buildings, which are given with an accuracy of perspective, and minuteness of drawing, that leave nothing to be desired. India is indeed rich in architecture; the palaces, mausoleums, and mosques of its Mahometan emperors, may be cited as models in the splendid and luxurious style, while the buildings, and especially the excavations of the Hindoos, most powerfully arrest attention from their grotesque singularity of form, the countless labour of their execution, and the mysterious antiquity of their dateless origin.

In the architectural objects contained in these volumes, we distinguish three styles; the ancient Indian, the Mahometan, and the mixed and modern style.

The most striking of the Indian remains, the excavated mountain of Ellora is among the wonders of human industry.

“Ellora is an ancient town of the Hindoos, distant from Auringabad in a N. W. direction about 18 miles, and from Bombay nearly E. about 230. The mountain containing these extraordinary efforts of human labour, accompanied by a very considerable degree of skill, is about a mile westward of the town of Ellora, of a semi-circular form. The antiquity of these excavations, which unquestionably must be, very great, is quite out of the reach of enquiry; the use of the greater number of them has evidently been for religious purposes. Many of the statues, basso-relievos, capitals of the pillars, and other decorative parts, are executed in a very good style. The rock in which they are wrought is hard red granite: much of the sculpture is by time decayed, and many parts have designedly been mutilated, some of which have been repaired, though very clumsily. Several of the temples have been painted of various colours, and their ceilings, which have had suitable decorations, are now generally become so black with the

smoke, from fires which of late years have been made in them, that scarcely any design can but in a few places be traced.”

Many countries possess excavated rocks, but none comparable in extent and regularity, in ornament and beauty, to those of India. These monuments belong to a period when the manual operations of quarrying, of masonry, and sculpture, had arrived to a high degree of excellence, while the arts of scientific construction were unknown, when the priest or the monarch could command the patient industry of a thousand hands, but not the skill of one intelligent head. Excavation, however, though the most inartificial method of construction, sometimes assumes forms of scientific architecture which might mislead a superficial observer; thus the caves of Ellora and Salsette present examples of vaulted roofs and arches in basso-relievo, but it is evident that these do not at all partake of the principle of vaulting; a solid ceiling gains no additional strength by being hollowed in the middle, neither is the execution more difficult than of a flat lintel.

The imitation of wooden building is remarkable in the Indian excavations; the ceilings are seemingly supported by architraves from column to column, the vaults are sculptured with ribs, and in the temple of Viswakarma, a gallery front is copied with all the detail of beams, joists, and planks. The internal form of these excavations is generally that of quadrilateral flat-ceiled halls, one end is commonly recessed, and contains a small pagoda enclosing the idol; the pillars are elaborately ornamented, and the walls are enriched with compartments of basso-relievos, representing the various adventures and transformations of Indian mythology: here the ten-handed Rouon supports Goura and Parwati with their heavenly suite, there Budder issues from the lingam of Maha Deva. The exterior of the excavated pagodas is in the same style with those which are erected, and it is probable that the last mentioned were the models of the others, on account of the cornices and some other members which have no natural use in excavation, while they are essential in building.

Among these plates we particularly remark the internal view of Indra Sabha, perhaps the most advantageous example of Indian architecture, where elaborate

decoration is so combined with simplicity and beauty of form, that it would hardly suffer on comparison with the most distinguished works of art; its general form is a square hall enclosing four porticoes, a broken pedestal occupies the middle, above which the central compartment of the ceiling displays an expanded lotus. But the most magnificent and extraordinary of these excavations is the "Kailasa, or Paradise of the Gods, and the abode of Cuvera, the God of Riches." This wonderful work bears the appearance of a grand edifice standing in a considerable area, the whole of which has been excavated; its form is that of a building of two stories, flat roofed, with a large central pyramidal pagoda, accompanied by five smaller pagodas; the sides are ornamented with rich piers and consoles of a most complicated composition, placed at regular spaces like pilasters, the intervals are occupied with small pagodas, or tabernacles and statues; but its "variety, profusion, and minuteness of ornament, beggar all description." The basement is sculptured with figures of elephants, lions, &c. "to give, it should seem, the whole vast mass the appearance of mobility by those mighty animals." The interior of the temple, which is approached through several porticoes and vestibules, and by walls loaded with mythological sculpture, is a grand square apartment, with a recess at the further end, containing the Lingam of Maha Deva, above which rises the larger pagoda. The area in which the temple stands, is surrounded with a portico, a pantheon of the Indian deities, whose actions and histories are displayed on the whole extent of wall.

The dimensions of a few of the principal of these excavations will give ideas of labour almost incredible, when it is recollected that the whole is executed in granite, and that the greater number of them are finished with the most minute delicacy and profuse variety of ornament. Kailasa; outer area, broad 138 feet, deep 88 feet; greatest height of the rock through which it is cut 47 feet. Inner area, in which the temple stands, length 247 feet, breadth 150 feet, greatest height of the rock, out of which it is excavated, 100 feet. Doomar Leyna; the cut or alley through the rock to the beginning of the cave, 100 feet long, 8 feet broad, from 31 to 61 feet high, length of the cave 126 feet, by a breadth varying from

50 to 135 feet, height 17 feet. Viswakarma, an area 45 feet square; length of the temple 79 feet, breadth 43 feet, height 35 feet to the top of the vault.

The religious *buildings* of the Hindoos have a general similarity of form, which is easily characterized; they consist of a tall pyramidal tower, containing the idol, to which is generally added a square flat roofed body, serving as a vestibule. These towers may be divided into two classes, the simpler of which are diminished by a curve line, giving the form of a truncated melon; they are in some instances ornamented with various projecting facets and carved facias; others are adorned with pannels inclosing flowers. They have a spreading umbrella-shaped termination. The other class of towers is enriched in a very extraordinary and elaborate manner, with series of pillars, cornices, niches, and statues; their shape is pyramidal, and they are terminated with a fantastic something quite beyond the power of description. This florid style is the style of the excavations of Ellora.

These remains of Indian architecture have considerable general resemblance to those of Egypt, particularly the interior of some of the excavations; in these we find the same massy proportions of columns and architraves, the same richness of ornament and profusion of sculpture, combined with the simple quadrilateral plan and flat-roofed elevation. The Indian style of decoration, however, is more florid and fantastic, the sculptures have greater variety of groups, more animation in attitude. They both astonish us with wonders of industry, but the mechanical state of the art was somewhat different. While the Egyptian transported and elevated masses that confound the mechanicians of modern times, the Indian was content with cowardly assiduity to stoop the rock and excavate the area of his temple. Their architecture has no principles of proportion and form; every Indian and Egyptian monument offers new compositions of capitals, new shapes of pillars, new mouldings and ornaments of entablatures; neither of these nations, therefore, can be said to have invented a style of architecture, and it is unreasonable, as some theorists have done, to derive from these sources Grecian architecture, founded on the principles of taste and good sense, and which has a natural origin in primitive con-

struction; individual mouldings and ornaments may have been adopted, but the style is original.

In the elaborate diversity and confused variety of Indian decoration, how shall we seize on general forms and characteristic ornaments—our readers must accept unconnected remarks and individual description. The shafts of the columns are very frequently circular in the upper, and square in the lower part, with or without bases. Many of the capitals consist of several tiers of circular mouldings: in one instance, the ashes of Ravana in Ellora, we observe volutes bearing some resemblance to the Ionic capital. Some octagon shafts occur, those of Viswakarma are quite plain, without any base or capital; but in the larger temple of Salsette the octagon shaft is terminated by a capital, consisting of a necking, a torus, and a very high abacus of several courses projecting regularly over one another; the base has the same mouldings as the capital reversed, above the capital is a plinth, on which is sculptured the figures of elephants and horses, apparently crouching under the weight of the ceiling. The plinth above the capital is usual in Indian, as well as in Egyptian remains, and is generally sculptured in both. Another member is almost universal, and may be considered as characteristic of Indian architecture: above the capital or the plinth, project consoles, the lateral ones supporting and lessening the bearing of the architrave, and that in front sustaining the cornice. This part in the excavations of Mauveliporam is sculptured with the figures of three horsemen; in other instances it is generally in the shape of a bracket. The entablatures are very simple, usually consisting of a plain massy architrave, and a cornice of one or two square members, which, with its great projection, serves the purpose, and evidently is merely a pent-house, to shelter from the tropical sun. The elephant and lion, the emblems of strength and courage, bear a conspicuous part in Indian decorations: sculptured in basso relievo, or detached from the rocks, we find them everywhere; they support the base of Kailasa, elephants sustain the columns of Jaganatha Sabha, and lions guard the pillars of Mauveliporam.

The Mahometan is a style of great merit, original and picturesque in its forms, regular and uniform in design,

and rich in ornament. The pointed and scalloped arch, which are essential to this style, give it a resemblance to the Gothic; from which, however, it differs materially in its projecting cornices, flat-roofs, and domes: the two first are marks of the climate; the latter may, as is illustrated in the modern buildings of Egypt and Arabia, have originated from the want of wood in the native country of Mahometan architecture, which deficiency led to the practice of roofing buildings with stone: to do which, the vault and dome are the only convenient and economical methods. The projecting balconied windows and open cupolas, the minars and pinacles, are striking objects in these buildings. The domes are frequently contracted at bottom, so as to give them the resemblance of a pear, an instance of absurd imitation, as displeasing to the eye as it is weak in construction. Large surfaces are generally ornamented with panneling of various forms, and patterns, and the bases, cornices, and facias, are frequently carved with leaves. The "style of finishing which prevailed very much at Agra, Delhi, and other cities of Hindostan: before the time of the emperor Shah Jehan, was covering the domes, friezes, minars, and other parts, with glazed tiles, of various designs and colours. These porcelain embellishments were often applied with great taste, and from the richness of their colours and enamelled surface, produced a very splendid effect."

The mixture of Hindoo forms, which has been adopted in many of these buildings, does not much affect their general appearance; it is marked by greater simplicity and massiveness, and particularly by the porticos, which are not Mahometan arcades, but Indian colonades, with the cantilever supports to the entablature before described.

The Mahometan buildings in this work consist of mosques, mausoleums, palaces, and gateways. The mosques are distinguished by their domes and minars: the most striking among them is the Jum-mah Musjed, or Friday Mosque, in Delhi, the grand cathedral of the empire of Hindoostan, a superb edifice, of which the following description is extracted from the Asiatic Researches, vol. 4. "This mosque is situated about a quarter of a mile from the royal palace; the foundation of it was laid upon a rocky eminence, named Jujula Pahar, and has been scarped

on purpose. The ascent to it is by a flight of stone steps, through a handsome gateway of red stone. The doors of this gateway are covered throughout with plates of wrought brass. The terrace, on which the mosque is situated, is a square of about 1400 yards of red stone; in the center is a fountain lined with marble for the purpose of performing the necessary ablutions previous to prayer. An arched colonade of red stone surrounds the whole of the terrace, which is adorned with octagon pavilions, at convenient distances, for sitting in. The mosque is of an oblong form, 261 feet in length, surmounted with three magnificent domes of white marble, intersected with black stripes, and flanked by two minarets of white marble and red stone, alternately rising to the height of 130 feet. Each of these minarets has three projecting galleries of white marble, and their summits are crowned with light octagon pavilions of the same. The whole front of the Jum-mah Musjed is faced with large slabs of beautiful white marble; and under the cornice are ten compartments, which are inlaid with inscriptions in black marble in the Nuski character, and are said to contain great part, if not the whole, of the Koran. The inside of the mosque is paved with large flags of white marble, decorated with a black border, and is wonderfully beautiful and delicate. The walls and roof are lined with plain white marble, and near the kibla is a handsome niche, adorned with a profusion of frieze work. The domes are crowned with cullises richly gilt, and present a glittering appearance from a distance. This mosque was built by Shah Jehan about 1650, at the expence of ten lacks of rupees."

The Mausoleums are uniformly buildings on an equilateral plan; they generally consist of several terraces and stories

rising on diminished bases, which gives the whole pile a pyramidal effect, and terminated with a dome. The mausoleum of Amir Khusero is remarkable for simplicity of form; and that of the Ranee, wife of the emperor Jehangire, for richness and beauty. The terraces of these buildings are generally ballustraded with marble lattice-work, many examples of which are very magnificent.

We observe several beautiful specimens of palaces and domestic architecture, particularly the Chalees Satoon, or forty pillars, and the palace built by Ackbar, which are in the mixed style of Hindoo colonades with Mahometan minars and cupolas. The palaces and mosques are surrounded with high walls, and the lofty gateways, which give entrance to them, are a remarkable feature in Mahometan architecture: these are piles of building of considerable size and magnificence; they are commonly equilateral in plan, with a very large arched gateway in the middle, which sometimes reaches nearly to the roof, though more frequently has an apartment over it for music. The square front of these edifices, with the enormous central arch, and upper and side balconied windows, the terraced roof, with cupolas at the corners, and the whole enriched with an exuberance of ornament, produce an effect of grandeur which scarcely any other entrance can parallel.

The exercise of the rite of ablution practised by the Hindoos has lined the banks of the Ganges with gauts or flights of steps, many of which have a striking effect: it has also produced the baolees or public baths, of which there is a fine example at Ramnagar. This is a square of buildings inclosing arcades and flights of steps, descending to a square bath in the middle.

ART. II. *An Essay on Rural Architecture, illustrated with original and economical Designs; being an Attempt also to refute by Analogy the Principles of Mr. James Malton's Essay on British Cottage Architecture, supported by several Designs. To which are added, rural Retreats and Villas in the Gothic Castle, Roman and Grecian Styles of Architecture, with Ideas for Park Entrances, a Mausoleum, and a Design for the Naval Pillar to immortalize British Naval Heroism: the whole comprising 20 Plates in Aquatinta, designed by RICHARD ELSAM, Architect. 4to. pp. 52.*

THIS is one of the many books of designs that have of late years been offered to the public, which deserve attention, rather as shewing the state of public taste in architecture, than from their intrinsic merit. Collectively speaking,

they possess convenience, æconomy, elegance; but they frequently exhibit servile imitation and unreasonable novelty, simplicity carried to meanness, and tawdry ornament, while the rules of good architecture are ignorantly neglected, or ab-

surdly despised. The rage for the picturesque is a mark of the prevailing taste, which has obtained the full command of ornamental gardening, and has deeply influenced the architecture of this kingdom: the avenue, the parterre, and fountain, have long yielded to the wood, the lawn, and the lake; and the house, no longer of primary and exclusive importance, no longer a center diffusing art and ornament over the subordinate garden, is dwindled to an object in the landscape, and made to partake of the picturesque character of the scenery. To this end the Gothic style is admirably calculated; but the monuments of this taste, striking and magnificent as they are, offer no proper models for a modern house: it is this want of definite models that has led the imitators of the Gothic style to the numberless absurdities which have justly drawn contempt and ridicule upon modern Gothic; and it will continue to be the stumbling-block of imitators, till they penetrate its elements of form, contained in its principles of construction, and cease to be the copyists of individual monuments; then we may have villas and mansions in a rational style of Gothic architecture, but not disguised into castles and monasteries.

The book before us, which contains several designs in the pretended Gothic style, abounds with the faults alluded to: "a villa in the style of an abbey;" "a villa in the castle style;" "a small house in the style of a chateau."—Away with these absurd descensions, why should a British villa resemble a castle or an Abbey? We will, however, acquit Mr.

Elsam, contrary to his own confession; for these designs are in a fantastic style of his own, and innocent of any likeness to abbeys and castles. "Two small houses in the Gothic style, with a Saxon gateway in the center." Can Mr. Elsam point out any use or advantage in this Saxon arch? We all know that ancient buildings, erected and repaired at different periods, frequently exhibit a medley of Saxon and Gothic forms; but is this to be copied? as well might we transcribe their dilapidations and water stains. Our author is fond of displaying his skill in various styles, but with singular ill success: the "mausoleum designed to the memory of the late Sir William Chambers, in the Grecian style of architecture," is both in plan and elevation, as unlike any thing Grecian as a Chinese pagoda. In short, we cannot compliment Mr. Elsam on the general merit of his labours: many of the plans are marked with whimsical singularity, and the elevations are subdivided to an excess inconsistent with simplicity and beauty. Some of the designs, however, are worthy of better company; among these we particularly remark plate 19, the plan and elevation of a villa to be erected in the county of Suffolk.

Accustomed as we are to very humble expectations of literary merit from works of this nature, we were yet rather surprised that any writer should disgrace himself with the faults of grammar and orthography which abound in this book.

The plates are tolerably drawn, and well engraved in aquatinta.

ART. III. *Observations on the Theory and Practice of Landscape Gardening; including some Remarks on Grecian and Gothic Architecture, collected from various Manuscripts in the Possession of the different Noblemen and Gentlemen, for whose Use they were originally written; the Whole tending to establish fixed Principles in the respective Arts.* By H. REPTON, Esq. 4to. p. 222.

THIS very expensive, (five guineas) very fine, and very pompous book demands our particular attention: more indeed for its tendency and probable effects on the public taste, than for its intrinsic merits. We shall, therefore, lay before our readers an analysis of its principal contents, with such extracts as will enable them to appreciate its true character, and the justice of our remarks. The work is inscribed to the king, after which follows an advertisement, succeeded by a preface: after that is a list of places referred to as examples, and next follows an introduction.

In the advertisement, the author states that

"Seven years have now elapsed since the publication of my *Sketches and Hints on Landscape Gardening*," during which, by the continued duties of my profession, it is reasonable to suppose much experience has been gained, and many principles established. Yet so difficult is the application of any rules of art to the works of nature, that I do not presume to give this book any higher title, than *Observations tending to establish fixed Principles in the Art of Landscape Gardening*."

This is a kind of paradox which we must leave our author to resolve. For it seems rather strange, that he should be unable to "establish fixed principles," when "much experience" has confirmed them. However, he apologizes for this inconsistency in the next sentence, by observing, that "after various attempts to arrange systematically the matter of this volume, I found the difficulties increase with the number of the subjects." This statement Mr. Repton completely contradicts in a subsequent part of his work, where he observes that "the whole" (of it) "has been written in a carriage, during his professional journeys from one place to another." He further informs us that, "being seldom more than three days together in the same place, the difficulty of producing this volume, such as it is, can hardly be conceived by those who enjoy the blessings of stationary retirement, or a permanent home."

What can we infer from these jumbled opinions, but that the author does not enjoy a "permanent home," that he is troubled with too much business, that he was under some obligation to produce a book, and that he wrote it, "such as it is," in "a carriage," or during his three days stay at "the same place." Dr. Johnson remarks, that "whoever is engaged in a multiplicity of business, must transact much by substitutes, and leave something to hazard." Thus it is with Mr. Repton; after he has given a few directions about planting, digging, levelling, &c. some gardeners and labourers are left to execute the whole: and the present volume, we presume, was "laid out" in a similar manner; for we seek in vain for system, arrangement, or plan. It appears to consist of a series of unconnected extracts from his *red books*\*. This indeed he acknowledges in the following passage:

"When called upon for my opinion," he observes, "concerning the improvement of a place, I have generally delivered it in writing, bound in a small book, containing maps and sketches to explain the alterations proposed: this is called the Red Book of the place; and

thus my opinions have been diffused over the kingdom in nearly two hundred such manuscript volumes. From many of these, with the permission of their respective proprietors, this volume has been composed; sometimes adopting the substance, and sometimes quoting the words of the Red Book."

In the latter end of the advertisement "*H. Repton, Esq.*" recommends in very warm terms his son, "*Mr. John Adey Repton*," as an architect of pre-eminent abilities, and gives a specimen of his designs, in a print, representing "a hall for a gothic mansion." This, like Mr. Repton's book, is very "pretty" to look at, but very expensive to execute, and though it might astonish the vulgar, it would offend the man of sense and taste, by being out of character for domestic architecture.

The preface professes to contain some observations on taste as relating to the laying out of grounds. Here the author, as in several other places, indirectly recommends himself. "Improvements," he observes, "may be suggested by any one, but the professor only acquires a knowledge of effects before they are produced, and a facility in producing them by various methods, expedients and resources. the result of study, observation, and experience. He ought to know what to adopt, and what to reject." An artist possessing good taste matured by experience, would know these things immediately, and in the improvement of a place would not merely calculate on present effects, but would anticipate the change of seasons, and the progressive operations of nature. 'Tis not sufficient for the landscape gardener (a title Mr. R. has assumed) to plant and alter for the present times, but if he wishes to raise a monument to his own fame, he should dispose his materials in a manner, that their harmony and utility should "grow with their growth, and strengthen with their strength." By such a system the "polite art" of landscape gardening would properly keep place and assimilate with the other polite arts, which, in England, have within the last fifty years made a rapid progress towards excellence.

\* When Mr. Repton is applied to for advice, or assistance in the embellishment of a place, he generally charges five guineas a day for travelling expences, a certain sum per day whilst visiting the party, and afterwards forty, fifty, or sixty guineas for a "Red Book." This book contains his opinions and observations on the present, and improvable state of the grounds, and his recommended alterations are displayed in two drawings, one representing its present state, and the other what it would be when completed, if seen in an advantageous light, and with the accidental grouping of cattle, deer, &c. in certain situations.

Recurring to Mr. Repton's observations on taste, and after attentively reading his few cursory remarks, we were greatly disappointed; for we sought in vain for some new ideas, or a new illustration of those already published. The author has however contrived a singular mode of giving his opinions, by a series of negative axioms; a plan which he adopts, he says, to avoid giving offence to those persons who may differ from him in opinion. "At the same time," he remarks, "I am conscious my opinion may, in some cases, be deemed *wrong*. The same motives which induce me to mention what I recommend, will also justify me in mentioning what I disapprove; a few observations are, therefore, subjoined to mark those errors or absurdities in modern gardening and architecture, to which I have never willingly subscribed, and from which it will easily be ascertained how much of what is called the improvement of any place in the list, may properly be attributed to my advice. It is rather upon *my opinions in writing*, than on the partial and *imperfect manner*, in which my plans have sometimes been executed, that I wish my fame to be established."

Mr. Repton's picturesque maxims are to be inferred from the ten following *objections*, as he terms them, though we cannot perceive the strict application of the term to some of the sentences.

#### OBJECTIONS.

No. 1. "There is no error more prevalent in modern gardening, or more frequently carried to excess, than taking away hedges to unite many small fields into one extensive and naked lawn, before plantations are made to give it the appearance of a park, and where ground is subdivided by sunken fences, imaginary freedom is dearly bought at the expense of actual confinement."

No. 2. "The baldness and nakedness round a house is part of the same mistaken system, of concealing fences to gain extent. A palace, or even an elegant villa, in a grass field, appears to me incongruous; yet I have seldom had sufficient influence to correct this common error."

No. 3. "An approach which does not evidently lead to the house, or which does not take the shortest course cannot be right."

No. 4. "A poor man's cottage, divided into what is called a pair of lodges, is a mistaken expedient to mark importance in the entrance to a park."

No. 5. "The entrance gate should not be visible from the mansion, unless it opens into a court yard."

No. 6. "The plantation surrounding a place, called a Belt, I have never advised; nor

have I ever willingly marked a drive, or walk, completely round the verge of a park, except in small villas, where a dry path round a person's own field is always more interesting to him than any other walk."

No. 7. "Small plantations of trees surrounded by a fence, are the best expedients to form groups, because trees planted singly seldom grow well; neglect of thinning and removing the fence, has produced that ugly deformity called a clump."

No. 8. "Water on an eminence, or on the side of a hill, is among the most common errors of Mr. Brown's followers: in numerous instances I have been allowed to remove such pieces of water from the hills to the valleys; but in many my advice has not prevailed."

No. 9. "Deception may be allowable in imitating the works of nature; thus artificial rivers, lakes, and rock scenery, can only be great by deception; and the mind acquiesces in the fraud after it is detected: but in works of art every trick ought to be avoided. Sham churches, sham ruins, sham bridges, and every thing which appears what it is not, disgusts when the trick is discovered."

No. 10. "In buildings of every kind the character should be strictly observed. No incongruous mixture can be justified. To add Grecian to Gothic, or Gothic to Grecian is equally absurd; and a sharp pointed arch to a garden gate, or a dairy window, however frequently it occurs, is not less offensive than Grecian architecture, in which the standard rules of relative proportions are neglected or violated."

"The perfection of landscape gardening consists in the fullest attention to these principles, Utility, Proportion, and Unity or harmony of parts to the whole."

We now come to the body of the work, the first chapter of which contains a few remarks on general principles, utility, and scale, with various examples of comparative proportion. The use of perspective is shown, and several examples of removing earth are adduced. The two first sentences in this chapter we lay before our readers to exercise their sagacity, for we have vainly endeavoured to comprehend the author's meaning.—

"The theory and practice of landscape-gardening have seldom fallen under the consideration of the same author, because those who have delivered their opinions in writing on this art have had little practical experience, and few of its professors have been able to deduce their rules from theoretical principles. To such persons (what persons?) had its practice been committed, that it required no common degree of fortitude and perseverance to elevate the art of landscape-gardening to its proper rank, and

among those which distinguish the pleasures of civilized society from the pursuits of savage and barbarous nations." We would ask Mr. Repton, what is the reason that other professors besides himself, could not take advantage of theoretical principles? Some gentlemen we know, have not disdained to read and profit by the works of Whateley, Mason, G. Mason, Walpole, Delille, Price, Gilpin, Knight, Sir William Chambers, &c. all of whom have displayed considerable taste and judgment in their observations on those scenes of nature, which are characterised by beauty, picturesqueness, or sublimity; and from some of whose works we derive more information on these subjects than from Mr. Repton's book. But our author seems too confident in his own taste and science to benefit by the advice of others; especially from some of these writers who, inculcating principles diametrically opposite to those espoused by him, we are not surprised at his disdaining their suggestions. Mr. R. wishes to make the scenery *pretty*, and wherever a rugged inequality presents itself, the axe and shovel are directed to the smoothing operations. In the first chapter many examples of this kind are produced from the grounds at the Fort near Bristol, from Wentworth House, and some other places. In the second chapter Mr. R. prints a letter, which, he says, is written by "one of the most able men of the age," upon the question, "At what distance does any object appear at its greatest height?"

The third chapter descants on the situation and character of water, stating that, "it may be too naked or too much clothed." It farther remarks that, "a river is easier to imitate than a lake—and that a bubbling spring may be imitated." The two following chapters treat of planting, with the different and diversified effects that can be, and are produced by clumps, combination of masses to produce great woods, and on the character and shape of ground which ought to be studied to produce the most beautiful effects. This will not be doubted by any man of observation, nor will he object to many other similar maxims. In this part of the work, is a minute detail of the drive, or park-road at Bulstrode, whose noble proprietor, the Duke of Portland, first patronized, and lifted our author into notice. In the subsequent pages are detailed a variety of plans, the execution of which is cal-

culated, according to our author's opinion, to produce beauty, elegance, and utility in the mansions and grounds of opulent landholders. The roads, walks, drives, lawns, waters, plantations, buildings, grounds, are all respectively considered; and in treating of each, the author endeavours to shew what is conformable, or in opposition to taste and beauty.

Even if we fully acknowledged the judgment of the author, and admitted his pretensions to sound taste, we should read his work with perpetual disgust, being constantly reminded, that any improvement and embellishment is only to be effected by *himself*. This is the continued theme, and we are repeatedly told, that no other person has combined *theory with practice*; consequently no other is competent to dress out nature in her most beautiful and captivating apparel. All his "Observations on Modern Gardening" tend to this one point—that H. Repton, esq. of Hare-street, near Romford, Essex, is the only scientific "landscape gardener" in Great Britain, and, that gentlemen who wish to have their parks and gardens beautified, or even want elegant and *appropriate mansions* for those parks, cannot display greater judgment than by applying to the man who has had "a *very large portion* of English scenery committed to his care for improvement."

In the preceding observations we have mostly dwelt on the defects of this volume; the pleasanter part of our duty remains behind. As a specimen of the best style and best taste of our author, we gladly extract the following passages which occur in his red-book at Corsham-house, Wiltshire, the magnificent seat of Paul Cobb Methuen, Esq.

"The following extract," he observes, "may serve to exemplify the impropriety of improving the grounds without previous attention to the style, character, and situation of the house."

"At the time Corsham-house was erected, instead of the modern houses now placed in the centre of parks, distant from every other habitation, it was the glory and pride of an English baron to live in or near the town or village which conferred its title on his palace, and often on himself. Nor was the proximity of the village attended with any inconvenience, so long as the house was disjoined from it by ample court-yards, or massive gates; some of its fronts might look into a garden, lawn, or park, where the neighbours could not intrude. Yet, even these views, in some

instances, were confined, formal, and dull, by lofty walls and clipped hedges.

"In determining the situation for a new house, it may often be advisable to place it at a distance from other habitations, that the modern taste for freedom and extent may be gratified; but in accommodating plans of improvement to houses already built, it requires due consideration how far such taste should be indulged, otherwise we may be involved in difficulties and absurdities; for it is not uncommon to begin, by removing walls which conceal objects far more offensive than themselves.

"When additions or alterations are made to an old house, internal convenience and improvement should certainly be the first objects of consideration; yet the external appearance and character must not be neglected. This is a circumstance which our ancestors seem to have little regarded, for we frequently distinguish the dates of additions to buildings by the different styles of architecture; and hence it often happens, that a large old house consists of discordant parts mixed together, without any attempt at unity either in date or character of building. This was of less consequence, when each front, surrounded by its court or parterre, became a separate and entire object; but since modern gardening, by removing those separations, has enabled us to view a house at the angle, and at once to see two fronts in perspective, we become disgusted by any want of unity in the design.

"The south front of Corsham is of the style called Queen Elizabeth's gothic, although rather of the date of King James. The north front is of Grecian architecture.

"The east front is in a correct, but heavy style of architecture; and to alter the old south front in conformity to it, would not only require the whole to be entirely rebuilt, but make an alteration of every room in that part of the house unavoidable. This not according with the intention of the proprietor of Corsham-house, the original south front becomes the most proper object for imitation.

"A house of Grecian architecture, built in a town, and separated from it only by a court-yard, always implies the want of landed property; because, being evidently of recent erection, the taste of the present day would have placed the house in the midst of a lawn or park, if there had been sufficient land adjoining; while the mansions built in the Gothic characters of Henry VIII, Elizabeth, and James, being generally annexed to towns or villages, far from impressing the mind with the want of territory, their size and grandeur, compared with other houses in the town, imply that the owner is not only the lord of the surrounding country, but of the town also.

"The valuable and celebrated collection of pictures at Corsham-house, in a modern Grecian edifice, might appear recent, and not the old inhabitants of an ancient mansion, belonging to a still more ancient family:

and although Grecian architecture may be more regular, there is a stateliness and grandeur in the lofty towers, the rich and splendid assemblage of turrets, battlements, and pinnacles, the bold depth of shadow produced by projecting buttresses, and the irregularity of outline in a large Gothic building, unknown to the most perfect Grecian edifice.

"Gothic structures may be classed under three heads, viz. the Castle Gothic, the Church Gothic, or the House Gothic: let us consider which is the best adapted to the purposes of a dwelling.

"The Castle Gothic, with few small apertures and large masses of wall, might be well calculated for defence, but the apartments are rendered so gloomy, that it can only be made habitable by enlarging and increasing these apertures, and in some degree sacrificing the original character to modern comfort.

"The more elegant Church Gothic consists in very large apertures with small masses or piers: here the too great quantity of light requires to be subdued by painted glass; and however beautiful this may be in churches, or the chapels and halls of colleges, it is seldom applicable to a house, without such violence and mutilation, as to destroy its general character; therefore, a Gothic house of this style would have too much the appearance of a church; for, I believe, there are no large houses extant of earlier date than Henry VIII, or Elizabeth, all others being either the remains of baronial castles or conventual edifices.

"At the dissolution of the monasteries by Henry VIII, a new species of architecture was adopted, and most of the old mansions now remaining in England were either built or repaired, about the end of that reign, or in the reign of Queen Elizabeth: hence it has acquired in our days the name of Elizabeth's Gothic; and although in the latter part of that reign, and in the unsettled times which followed, bad taste had corrupted the original purity of its character, by introducing fragments of Grecian architecture in its ornaments, yet the general character and effect of those houses is perfectly Gothic; and the bold projections, the broad masses, the richness of their windows, and the irregular outline of their roofs, turrets, and tall chimnies, produce a play of light and shadow wonderfully picturesque, and, in a painter's eye, amply compensating for those occasional inaccuracies urged against them as specimens of regular architecture.

"Although the old south front should be the standard of character for the new elevations of Corsham-house, yet I hold it not only justifiable, but judicious, in the imitation of any building, to omit whatever is spurious and foreign to its character, and supply the places of such incongruities from the purest example of the same age. For this reason, in the plans delivered, the Grecian mouldings are omitted, which the corrupt taste of King James's time had introduced,

and the true Gothic mouldings of Elizabeth's reign are introduced.

"The turrets, chimney shafts, and oriels, will be found in the examples of Burleigh, Blickling, Hampton Court, Hatfield, &c. or in most of the buildings of Henry the VIIIth and Elizabeth. The centre of the north front, although of the same character, being in imitation of a building somewhat earlier than Elizabeth, together with the peculiarity of its form, it is necessary to describe why it has been adopted. Here another principle arises, viz. that in designing any Gothic building, it is presumed that some fragments exist of the style we propose to imitate, otherwise it ceases to be an imitation.

"In pursuance of this principle, We\* looked for an instance of an octangular room projecting beyond the general line of the wall, in some building of that date. The chapel of Henry VIII, at Westminster, though not an octagon, was the only projecting regular polygon; this therefore be-

came our model for the centre room of the north front, and this example not only furnished a precedent for a projecting room, but other parts of its composition peculiarly suited our situation."

This volume is ornamented with about forty plates, one of which is a portrait of the author, and the others are chiefly aquatint-coloured prints, with strips of paper, or flaps. Some of these are drawn with taste, and many of the proposed alterations appear to be very judicious. Upon the whole, we can safely recommend this volume to the attentive perusal of men of discrimination, who may derive both information and amusement from its contents; and if Mr. R. publishes again, we would recommend a little modesty and humility, in the full persuasion that it will by no means depreciate his works.

\* "In speaking of this house I use the plural number, because the plans were the joint efforts of a connexion and confidence which then so intimately existed between Me and another professional person, that it is hardly possible to ascertain to whom belongs the chief merit of the design. Yet I claim to myself all that relates to the reasoning and principles on which the character of the house was adopted: to my son's knowledge and early study of the antiquities of England, may justly be attributed a full share of the general effect and proportions of the buildings; but we did not direct the execution of the work." This passage is strikingly characteristic of the arrogance which we complain of. We have been informed that Mr. Nash was employed as architect to this mansion, and that his designs were approved by the proprietor.

## CHAPTER XXVI.

## BIBLIOGRAPHY.

ART. I. *Bibliographia Poetica. A Catalogue of English Poets of the 12th, 13th, 14th, 15th, and 16th Centuries, with a short Account of their Works.* 8vo.

THIS article is the production of the late Mr. Joseph Ritson. The poets of England, from the earliest ages, are alphabetically arranged under the several centuries in which they flourished. To each name is subjoined, the year of the poet's birth, and of his death, where these could be ascertained, and an account of his works with the date of publication. Where the poems mentioned exist only in MS, or are very scarce, the reader is usually informed in whose possession they are to be found. This book, therefore, forms a manual which every antiquary and collector ought to possess, and which is indeed, indispensable to all who would study our ancient literature. The well known industry of the editor, insures the accuracy of information, which perhaps few, save himself, would have had patience to collect. It must mortify, or appal the poetical adventurer, to see how many hundreds of his predecessors survive only in such brief memorials as this.

Nixon, Anthony, wrote "The Christian Navy, wherein is playnely described the perfect course to sayle to the haven of happinesse," 1602, 4to. p. 287.—Even we ourselves, reviewers though we be, and little used to the melting mood, could scarce refrain from sighing, when we considered how few names of Mr. Ritson's long catalogue, have been rescued from the gulf of oblivion,

Son, come i Cigni, anco i Poeti rari  
Poeti che non sian del nome endegni  
Si perche il ciel de gli uomini preclari  
Non pate mai, che troppa copia regni  
Si per gran colpa de i Signori avari  
Che lascian mendicare i sacri ingegni.

ARIOSTO.

The information contained in Mr. Ritson's catalogue, is uncommonly mi-

nute and extensive. Some inaccuracies must necessarily be found in so laborious an investigation. Thus, Mr. Ellis is charged with having adopted, without authority, the anecdote of Chaucer's being fined two shillings for beating a Franciscan Friar in Fleet-street, which is termed a *bum* of Thomas Chatterton. In a subsequent note, Mr. Ritson acknowledges that this *bum* is as old as Fuller's Church History; and he might have added, that Speght quotes it on the authority of Mr. Buckely, whom he avers to have seen the record of the Inner Temple, where the fine is entered. Mr. Ritson seems also to have fallen into a mistake concerning the person alluded to, in the following beautiful verses on the death of Spenser, which we willingly embrace this opportunity of inserting.

"—Witness our Colin; whom though all the  
Graces  
And all the Muses nurst; whose well-taught  
song  
Parnassus' self, and Glorian embraces,  
And all the learned, and all the shepherd  
throng.  
Yet all his hopes were cross'd, all suits de-  
nied,  
Discouraged, scorn'd, his writings vilified;  
Poorly (poor man) he lived, poorly (poor man)  
he died.

"And had not that great Hart (whose hon-  
oured head  
Ah lies full low); piti'd thy woful plight,  
There thou hadst been unwept, unburied,  
Unblest, nor graced with any common rite.  
Yet shalt thou live, when thy great foe shall  
sink  
Beneath his mountain tomb, whose fame  
shall stink,  
And Time his blacker name shall blurre with  
blackest ink."

Mr. Ritson conceives that Daniel, the author of these verses, has found another

patron for Spenser's remains, than the earl of Essex, who, according to Camden's authority, rendered them the last honours. To us, it is clear, that Essex, and no other, is meant by the *great Hart*, a common way of spelling heart, as is obvious from the antithesis to head, and from the pathetic allusion to the disastrous fate of the gallant earl. But although we notice these trivial inaccuracies, they are such as must necessarily occur in a long treatise concerning a variety of obscure topics.

We now and then observe some specimens of Mr. Ritson's vein of satire, though the subject was sufficiently unfavourable for its display. In his aversion to churchmen, he descends to invective against poor Lydgate, whom he terms a voluminous prosaic and drivelling monk, his works stupid and disgusting productions, which by no means deserve the name of poetry, and himself a still more stupid and disgusting author, who disgraces the name and patronage of his master, Chaucer. Few Englishmen of the old stamp, will relish Mr. Ritson's character of queen Bess, and of her writings, which he terms most abominable compositions, "the muses having favoured her just as much as Venus or Diana." In a subsequent passage, the said venerable and royal virgin is termed "a green-eyed monster, the illegitimate spawn of a bloody and lustful tyrant, who not only imprisoned that most beautiful and accomplished princess, (to whom she had hypocritically and seductively offered a refuge), for the eighteen best years of her life and reign, but upon

the falsest suggestions, and the grossest forgeries, with a savage and malignant cruelty, unparalleled even in the furies or gorgons of antiquity, deprived of crown and kingdom, and deliberately shed the sacred and precious blood of her nearest relation, and even the presumptive heir to her own realm, to which, in fact, she had a better title than herself," p. 366. What would an "old courtier of the queen" have said to such blasphemy?

We must not omit to notice that this work is written in a strange perverted kind of orthography, which Mr. Ritson, for reasons best known to himself, thought proper to adopt in his later publications. We can neither discover reason nor analogy in the peculiarities of writing *mister* for master, *i* for I, doubling the *e* in the termination of some words, and clipping off a *l* from that of others, any more than in making the small *s* face about and march before the large one, instead of following humbly in the rear, as in the usual mode of printing. But we need not exclaim against innovations, which in all probability will die with their inventor.

Mr. Ritson had prepared for the press, previous to his death, a catalogue of Scottish poets, intended as a companion to the *Bibliographia Poetica*; and we understand there is a design of giving it to the public. We now take leave of the laborious Ritson. With all his wayward humours and peculiarities, we venture to prophecy that the post which he held among our investigators of antiquity, will neither be speedily nor easily filled.

ART. II. *A Bibliographical Dictionary, containing a chronological Account, alphabetically arranged, of the most scarce, curious, useful, and important Books in all Departments of Literature, which have been published in Latin, Greek, Coptic, Hebrew, Samaritan, &c.* Vols. 2, 3, 4. 8vo. pp. 912.

IN an advertisement prefixed to the fourth volume, the author appears to advert in terms of some dissatisfaction, to the account which was given in our last review (p. 537) of the former volume of his work. We beg leave to assure him that no part of that article was intended to be offensive to his feelings, and that it is our wish, cautiously to abstain from any expressions which can be justly considered as possessing that tendency.

With reference to the writers "*de re rustica*," we are still of opinion, that if it was proper to mention three inferior editions of the collection of those authors, it was proper to mention a greater num-

ber; and that this arrangement would also have been preferable to any other, for this obvious reason, that, if the writers are classed separately, as they are usually printed together, the editions must either be assigned arbitrarily, some to one author, and others to another, or must improperly, and inconveniently be repeated under different heads. But enough on a topic of but little moment. We would, however, recommend the editor, in future volumes of his work, to write *Palladius*, and not *Palladio*, as it has hitherto appeared.

We are sorry if we have under-rated the difficulties with which the editor has

had to contend; we should have wished to have seen his work rather more accurate, but are very willing to admit his profession, when he says that he labours intensely to make the inaccuracies as few as possible; and we believe that on the whole the present volumes are more correct than that which preceded them.

Vol. ii. p. 112. In a passage, perhaps extracted from Dr. Harwood, the merits of Rhodomannus and Dausqueius, in their notes on Q. Calaber, are not estimated with sufficient discrimination. The annotations of the former are, in fact, of great merit, and those of the latter, in a critical view, of much inferior value.

P. 117. The anonymous edition of Callimachus at London in 1741, is, we believe, by T. Bentley, nephew of Dr. Richard Bentley. The annotations of the latter on Callimachus, appeared nearly half a century before.

In p. 154, Heyne's third improved edition of Tibullus in 1798, may be added.

Vol. iii. p. 129. An edition of Dion Chrysostom is mentioned, of the date of 1476. We are aware that De Bure gives the same account; we are aware also of the danger in many cases, of opposing probabilities to statements of facts. That an edition, of a voluminous sophist, should have preceded by twelve years the publication of Homer, or any other considerable work of Greek literature, would however, be a singular phenomenon in the history of learning. If such a book exist, it was unknown to Reiske, Morelli, and other writers. If there is any foundation for the account, perhaps some single oration of Dion may have been pub-

lished that year as a praxis. Reiske's edition is here omitted; we observe, however, that it is afterwards noticed among the classic authors published by that editor.

P. 197. There is no entire edition of Euripides, printed *literis majusculis*. The edition which is here imperfectly described, is the same with that which occurs afterwards in p. 202, consisting of four plays. The plays published by Mr. Porson should have been mentioned. Dr. Harwood's disgraceful criticism of Musgrave's Euripides deserved severer censure.

Errors in dates may often be attributed to the printer; they are, we believe, in these volumes less frequent than in the first, we mention one, occurring in the last page of the fourth volume, merely because the book to which the article refers, happens to lie before us. This is the first edition of Gildas, printed in 1525 (not 26); a dedication is prefixed from Polydore Virgil, the editor, to Bishop Tonstall, dated viii Idum April. 1525, Londini.

That a bibliographical work of this extent should have made its appearance in a provincial town, we regard as at least a pleasing proof of the spread of a literary taste, a result of the same spirit which produced the liberal and munificent institution of the Athenæum. We trust that our second commercial town will soon become no less distinguished, by the cultivation of letters and the sciences, than it already is by its opulence, and the mercantile enterprize of its inhabitants.

**ERRATA**—In the Law Chapter, the Title of Art. III. p. 808, should be "*The Continuation of a Digest of Statute Law, by Thomas Walter Williams, Esq. Vol. III.*"  
Same Chapter, p. 815, read the Title of Art. XVI. "*An Abridgment of Cases argued and determined in the Courts of Law during the Reign of his present Majesty, by T. W. Williams. Vol. V.*"

END OF THE SECOND VOLUME.

# WORKS

PUBLISHED BY

T. N. LONGMAN AND O. REES, No. 39, PATERNOSTER-ROW.

SINCE THE PUBLICATION OF THE FIRST VOLUME.

## I.

**THE NEW CYCLOPÆDIA; or, UNIVERSAL DICTIONARY of ARTS, SCIENCES, and LITERATURE.**

Parts V. and VI. Price 18s. each.

Formed upon a more enlarged Plan of Arrangement than the Dictionary of Mr. Chambers; comprehending the various Articles of that Work, with Additions and Improvements; together with the New Subjects of Biography, Geography, and History: adapted to the present State of Literature and Science.

By ABRAHAM REES, D. D. F. R. S.

Editor of the last Edition of Mr. Chambers's Dictionary; with the Assistance of eminent professional Gentlemen.

Illustrated by New Plates, including Maps, designed and engraved for this Work by some of the most distinguished Artists.

\* \* Three, or, if possible, four parts will continue to be published in the year; and when the arrangements are fully completed, a more rapid publication will be adopted.

The Plates are chiefly executed by Messrs. Lowry and Milton, almost wholly from original Drawings; and as early impressions are very important in a work containing such numerous, highly finished, and beautiful Engravings, a few proofs are taken off, on Royal Paper with corresponding Letter-press, which are sold at 11. 16s. each Part.

The Public may be assured that no expence, or exertion will be spared to support the high character the Work has obtained, and that it may merit a continuance of the distinguished encouragement it has received.

The following Gentlemen are the principal Writers in this Work.

Abraham Rees, D.D.F.R.S. Editor; John Abernethy, Esq. F.R.S.; Mr. Arthur Aikin; C. Aikin, Esq.; Mr. E. Aikin; R. Bland, M.D. A.S.S.; Charles Burney, Mus. D.F.R.S.; William Blair, Esq. A.M.; John Bonnycastle; Henry Brougham, Esq. Jun. F.R.S.; Mr. John Britton; Mr. Bracy Clark, F.L.S. Veterinary Surgeon; Mr. E. Donovan, F.L.S.; R. W. Dickson, M.D.; Humphrey Davy, Esq.; Mr. Henry Ellis; John Flaxman, Esq. R.A.; Rev. William Hincks, of Cork; William Morgan, Esq. F.R.S.; James Macartney, Esq.; Andrew Mackay, I.L.D. F.R.S. Ed: Mr. Mussett; George Naylor, Esq. F.S.A. York Herald; Mr. William Nicholson; Mr. Peter Nicholson; John Opie, Esq. R.A.; Mr. William Owen, F.S.A.; Richard Pearson, M.D. F.S.A.; Mr. W. Symonds; Rev. William Foote, F.R.S.; Sharon Turner, Esq. F.S.A.; Mr. Charles Taylor; Mr. J. Thomson; and the Rev. W. Wood.

## II.

**THE SYNONYMES of the LATIN LANGUAGE**, alphabetically arranged; with a Critical Dissertation upon the Force of its PREPOSITIONS, both in a simple and compound State.

By JOHN HILL, LL.D. Professor of Humanity in the University, and Fellow of the Royal Society of Edinburgh.

In one large volume quarto. Price 11. 11s. 6d. in boards.

## III.

**VOCABULARY**, intended as an introduction to the Study of The SYNONYMES of the LATIN LANGUAGE.

By JOHN HILL, LL.D. Et Lit. Hum. P. In one volume small octavo, price 2s. bound.

## IV.

**AN ELEMENTARY and PRACTICAL TREATISE on the LANDED PROPERTY OF ENGLAND:** containing the PURCHASE, the IMPROVEMENT, and the MANAGEMENT of LANDED ESTATES.

By MR. MARSHALL, Author of different Works on RURAL ECONOMY.

In one volume quarto, elegantly printed, and illustrated by diagrams. Price two guineas in boards.

## V.

**AN EXCURSION in FRANCE**, and other Parts of the CONTINENT of EUROPE, from the Cessation of Hostilities in 1801, to the 13th of December, 1803; including a Narrative of the unprecedented Detention of the English Travellers in that Country as Prisoners of War.

By CHARLES MACLEAN, M.D.

In one volume octavo. Price 6s. in boards.

## VI.

THE HISTORY of the INVASION of SWITZERLAND by the FRENCH, and the Destruction of the Democratical Republics of SCHWITZ, URI, and UNTERWALDEN.

By HENRY ZSCHOKKE, National Prefect of the Canton of Basil.

Translated from the French of J. B. BRIATTE, Secretary of Legation to the Helvetic Republic at Paris.

By J. AIXIN, M. D. With a Preface and Supplement by the Translator.

Price 7s. boards

"The foreign presses do not often present us with a volume so instructive and interesting as the present. The author is an inhabitant of that country, to preserve the glory of which is the object of his labours; and he appears intimately conversant with the characters, measures, and scenes which are the subjects of his work. Our attention has been frequently drawn to these little Cantons, but we never met with a guide who was apparently so well informed and faithful.

"We had flattered ourselves that we had a tolerable acquaintance with the happy and estimable sequestered Shepherds of the Alps, their government, characters, and habits: but Mr. Zschokke has convinced us that we had many additional important particulars to learn, and which his candid and authentic pages impart to us. If in his details, the Alpine tribes be exhibited as mere human beings, sharing in the imperfections of their species; if the imagination be less gratified and enthusiasm less excited than in other representations, the figures are more within nature, the eye dwells longer on them, and the solid if less intense pleasures inseparable from the exhibitions of truth are felt. The picture still calls forth admiration; and we see that flattering artists have not drawn too strongly the features of heroism, patriotism, and genuine simplicity, which characterize the descendants of William Tell.

"The early struggles of these petty tribes for liberty and independence, the miracles of bravery which wrought their infant freedom, their long undisturbed possession of that blessing, and their final ill-fated undefended lot, will interest the curious and feeling bosom as long as any of the most precious memorials of history shall live."

*Appendix to Monthly Review, Vol. 38.*

## VII.

AN INQUIRY into the NATURE and ORIGIN of PUBLIC WEALTH, and into the Means and Causes of its Increase.

By the EARL of LAUDERDALE.

In one volume octavo. Price 8s. 6d. in boards.

## VIII.

INDIAN RECREATIONS; consisting chiefly of Strictures on the Domestic and Rural Economy of the Mohammedans and Hindoos.

By the Rev. WILLIAM TENNANT, LL. D. M. A. S. And lately one of His Majesty's Chaplains in India.

In two volumes octavo, with plates. Price 18s. in Boards.

"This book contains a great deal of curious and important matter: we have perused it with uncommon satisfaction, which was enhanced by the modesty of the Author, who did not raise our expectations to too high a pitch at the commencement. One important feature will be distinguished by the reader throughout the Work, which is that the Author writes with moderation. He neither rates too high, nor wishes to depreciate the Brancinical learning: neither conceals the defects of the British Government in India, nor under-rates the advantages with which it has certainly been attended to the native Inhabitants.

Upon the whole, these volumes contain much more information both curious and important on a variety of subjects, than the title of the book could possibly have led us to expect."

*Literary Journal, April 18*

## IX.

A DESCRIPTION of a PATENT HOT-HOUSE, which operates chiefly by the Heat of the Sun, without the aid of Flues, or Tan Bark, or Steam, for the purposes of heating it. To which is added, AN APPENDIX, containing Remarks upon a Letter from J. A. KNIGHT, Esq. on the Subject of Mr. FORSYTH'S PLASTER.

By JAMES ANDERSON, LL. D. F. R. S. F. A. S. E. &c.

Author of Essays on Agriculture, and several other Performances.

In one volume 12mo. Price 5s. in boards.

## X.

ESSAYS LITERARY, POLITICAL, and ECONOMICAL.

By JOHN GARDINER, M.D.

Fellow of the Royal College of Physicians, and of the Royal Society of Edinburgh, &c.

In two Volumes octavo. Price 16s. in boards.

These Volumes contain—Conjectures on the Origin of Language; on the different Races of Men; on the Formation of the Minds of Children, previous to a literary Education: on the principal Causes that promote or retard Population, being the circumstances from which the precise degree of Power in every State may be estimated; Historical Remarks and Observations on Government, and on the Causes which have at all times obstructed its advancement to a free Constitution; Observations on the principal Causes which promote or retard the advancement of Literature, Commerce, and the Arts.

## XI.

**THE HISTORY, Ancient and Modern, of the SHERIFFDOMS of FIFE and KINROSS, with a Description of both, and of the Firths of FORTH and TAY, and the Islands in them; with an Account of the Natural Products of the LAND and WATERS.**

By Sir ROBERT SIBBALD, M. D.

In one volume demy octavo, embellished with elegant Engravings, Price 9s. in boards, and on fine paper, royal octavo, Price 12s. in boards, a new Edition with Notes and Illustrations.

## XII.

**THE HISTORY OF SCOTLAND, from the Union of the Crowns on the Accession of James VI. on the throne of England, to the Union of the Kingdoms in the reign of Queen Anne. The second edition corrected, with a Preliminary Dissertation on the Participation of Mary Queen of Scots in the Murder of Darnley. By MALCOLM LAING, Esq. Four Volumes 8vo. 1l. 16s. boards.**

†† For the accommodation of purchasers of the former edition of the History, the Dissertation on the participation of Mary Queen of Scots in the Murder of Darnley, forming Vols. I. and II. of the present Work, may be had separate, price 16s. in boards.

## XIII.

**THE HISTORY AND LIFE OF KING JAMES SEXT, written towards the latter end of the sixteenth century. 8vo. Beautifully printed by BALLANTINE. 10s. boards.**

## XIV.

**AN ABRIDGEMENT of all the STATUTES now in force, relative to the REVENUE of EXCISE in GREAT BRITAIN, methodically arranged, and alphabetically digested.**

The SECOND EDITION, revised, and brought down to the end of the year 1803.

By JAMES HUIE, Collector of Excise.

In one volume octavo. Price 10s. 6d. in boards.

This Work is published under the patronage of his Majesty's Commissioners of Excise, who have ordered *One Thousand Copies* for the use of their officers—and it will be found highly useful to Merchants, Manufacturers, and in general to every person whose profession or trade is connected with this branch of the public revenue.

## XV.

**THE LIFE of TOBIAS SMOLLET, M. D. with critical Observations on his Works.**

By ROBERT ANDERSON, M. D.

The Fourth Edition, in one volume octavo. Price 7s. in boards.

## XVI.

**EVERSION, or the Refutation of the Principles of MUNDANE PHILOSOPHY.**

THOMAS CORMOULS, A. M. Editor.

In one volume octavo. Price 7s. in boards.

## XVII.

**THE HISTORY of FREE MASONRY, drawn from authentic Sources of Information; with an Account of the Grand Lodge of Scotland, from its Institution in 1736, to the present time, compiled from the Records; and an Appendix of original papers.**

By ALEXANDER LAURIE, Bookfeller to the Grand Lodge of Scotland.

In one volume octavo. Price 7s. 6d. in boards.

## XVIII.

**ELEMENTS of GENERAL HISTORY, translated from the French of the ABBE MILLOT.**

Part the first, Ancient History, in two volumes 12mo. Price 8s. in boards. Part the second, Modern History, in three volumes 12mo. Price 15s. in boards.

## XIX.

**AN ESSAY on NAVAL TACTICS, Systematical and Historical, with Explanatory Plates, in four Parts.**

By JOHN CLERK, Esq. of Eldin.

Second Edition, in one volume quarto. Price 1l. 16s. in boards.

## XX.

**THE DECAMERON, or TEN DAYS ENTERTAINMENT of BOCCACCIO. Translated from the Italian. To which are prefixed, Remarks on the Life and Writings of Boccaccio, and an Advertisement, by the Author of "Old Nick," &c. &c.**

The Second Edition, corrected and improved, in two volumes octavo. Price 16s. in boards.

\*\* An Edition in 2 volumes royal octavo. Price 1l. 4s. in boards.

"The Tales of Boccaccio are too well known to the public to render any critical account of their merits or demerits necessary, at this period. It is sufficient, therefore, to observe of the present Edition, that the translator has carefully improved the language of the former English Edition, and expunged many of the passages that were offensive to decency. The book too is extremely well printed, and to it is prefixed an engraved head of the Author from Titian, very well executed.

The Editor of this Work has displayed considerable diligence in research, and skill in application;

and has furnished the best life of his Author, now extant. In his "*Advertisement*" he briefly notices the defects of the former translation, and the improvements in the present, which are not more judicious than they were necessary." *Anti Jacobin Review, March 1804.*

## XXI.

ENGRAVINGS of the BONES, MUSCLES, and JOINTS, illustrating the first volume of the *Anatomy of the Human Body*.

By JOHN BELL, Surgeon.

In quarto, with about 200 pages of explanatory Letter-prefs. Price 1l. 11s. 6d. in boards.

## XXII.

A SYSTEM of DISSECTIONS, explaining the Anatomy of the Human Body; the manner of displaying the parts, and their varieties in disease. Vol. III. Part II. containing the dissections of the Arm, of the Neck and Face, of the nervous System of the Viscera, with a short account of the manner of dissecting the Brain and Eye; with Plates.

By CHARLES BELL, Fellow of the Royal College of Surgeons. Price 7s. 6d. in boards.

\* \* This Number completes the plan of the Work, which is intended chiefly to remove the difficulties which the student has to encounter in the study of Anatomy, and to direct his attention to the points of practical importance. The Publishers have to regret, that, owing to the other unavoidable avocations of the Author, they have not been sooner able to fulfil their engagements to the public.

## XXIII.

ELEMENTS of MATERIA MEDICA and PHARMACY.

By JOHN MURRAY, Lecturer on Chemistry, Materia Medica, and Pharmacy.

In two volumes octavo. Price 14s. in boards.

## XXIV.

AN ESSAY, MEDICAL, PHILOSOPHICAL, and CHEMICAL, on DRUNKENNESS, and its Effects on the Human Body.

## XXXIII.

A SERMON on INVASION, preached by the Rev. SYDNEY SMITH, A. M. before the Mary-Le-Bonne Volunteers, in Portman Chapel, Baker Street. Price 1s.

## XXXIV.

## WOMEN: their CONDITION and INFLUENCE in SOCIETY.

By JOSEPH ALEXANDER SEGUR. Translated from the French.

In three volumes 12mo. Price 12s. in boards.

"These Volumes will, probably, be received as a very acceptable present by our people of fashion; since, in the course of them, subjects of the first importance to these parties, though they may be considered as incidentally introduced, are treated very much at large. While, however, many of its parts will induce the Beaux and the Belles to regard this performance as solely designed for them, the Philosopher and the Statesman may not deem it altogether unworthy of their attention. Near the termination of this work, we are presented with a most interesting tale, founded on the loves of Elerz and Zulinda, and the adventures of Horvel; the object of which is to expose the folly and misery of libertinism, by contrasting it with virtuous love. A young Parisian supports the part of the libertine; and a pair in Delicaria, in the north of Sweden, display the charms, the pure enjoyments, and the unbroken felicity, which in sequestered scenes, ever attend love, innocence and competence. The address which is discovered in this little production, the delicate touches which occur in it, its structure, and its moral, prove the powers of the author to be of the first rate."

*Appendix to Monthly Review, Vol. 42.*

"These volumes contain entertaining anecdotes of the more distinguished characters of France, from the earliest period of French history to the present time. The first volume contains general remarks and anecdotes of the sex, and all will afford a reasonable share of amusement; some of the anecdotes are new, and related with a considerable degree of vivacity and interest."

*British Critic, Nov. 1803.*

## XXXV.

## THE SWISS EMIGRANTS, A Tale.

In one volume 12mo. Price 4s. in boards.

"A pleasing and entertaining narrative. The whole is apparently from the heart; and it will beguile the feeling mind of Pity's softest drops."

*Critical Review, March 1804.*

"This is an interesting, affecting, and instructive Tale, replete with good sense and good morals.

The narrative is ably written, the language is good, and the sentiments are unexceptionable."

*Anti Jacobin, Feb. 1804.*

## XXXVI.

## ST. CLAIR of the ISLES; or the Outlaws of Barra. A Scottish Tradition.

By ELIZABETH HELME, Author of "Louisa, or a Cottage on the Moor;" &amp;c. &amp;c.

In four volumes. Price 14s. boards.

## XXXVII.

THE ADVANTAGES of EDUCATION, or the HISTORY of MARIA WILLIAMS, a Tale, for very young Ladies.

By Mrs. WEST, Author of "A Gossip's Story," "Tale of the Times," "Infidel Father," &amp;c. &amp;c.

The second edition. In two volumes 12mo. Price 7s. in boards.

## XXXVIII.

## MODERN LITERATURE, A Novel. By ROBERT BISSET, LL. D.

In three Volumes 12mo. Price 13s. 6d. in boards.

## XXXIX.

THE HIGHLANDERS, or SKETCHES of HIGHLAND SCENERY and MANNERS: with some REFLECTIONS on EMIGRATION. A Poem in five parts; with POEMS on various subjects.

By MRS. GRANT, Laggan.

In one volume octavo. Price 10s. 6d. boards.

## XL.

ALFRED; an EPIC POEM, in Twenty-four Books.

By JOSEPH COTTLE.

The second Edition with considerable Additions. In two volumes foolscap octavo.

Price 10s. 6d. in boards.

"We observe, that Mr. Cottle has, with a laudable industry, availed himself of every relic of information, which is left upon record respecting the character and conduct of his hero. He has skilfully contrived to keep the interest of his readers awake by interweaving into his story the process and termination of his hero's domestic distresses. By the exhibition of the perilous adventures of Alfwita, his amiable Queen, and her infant son, he happily preserves throughout great part of his work, the pleasing, painful uncertainty of the drama. He seems to dwell with peculiar delight upon the representations of the gentler passions, and strives rather to melt the heart than to nerve the arm of heroism. He has adopted, as his model, the *Odyssæy* in preference to the *Iliad*."

*Critical Review*, Feb. 1801.

## XLI.

SCENES of INFANCY; Descriptive of Teviotdale. A Poem.

By JOHN LEYDEN.

With a Frontispiece, finely printed by Ballantyne of Edinburgh, in foolscap octavo.

Price 6s. in boards.

## XLII.

SOCIETY, a POEM, in two parts; with other Poems.

By JAMES KENNEY.

In one volume foolscap octavo. Price 4s. in boards.

## XLIII.

# WORKS IN THE PRESS

## I

UNDER the PATRONAGE of HIS MAJESTY.

ENGRAVINGS, with a descriptive Account in English and French, of EGYPTIAN MONUMENTS, in the BRITISH MUSEUM, collected by the INSTITUTE in EGYPT under the direction of BUONAPARTE, and surrendered to the BRITISH COMMANDER in CHIEF, LORD HUTCHINSON, by GENERAL MENOÜ.

In the number of these Monuments is the celebrated Stone with the *Hieroglyphic, Egyptian, and Greek Inscriptions*, found at ROSETTA; also the magnificent Sarcophagus of ALEXANDER the GREAT.

The Drawings have been made by Mr. ALEXANDER, with all possible fidelity, and are engraving by Mr. MEDLAND in the best style of the Art.

The whole Collection will be comprised in *Eight Divisions*, at a Guinea each; the first to be published in November, and the rest at intervals of Three Months in succession. Subscriptions are received by the Publisher; by Mr. Medland, Abingdon-Street, Westminster; and by Mr. Miller, Bond-Street, where Specimens of the Engravings may be seen.

In the List of Subscribers already received are

His Royal Highness the Prince of Wales.	W. Bosanquet, Esq.
His Royal Highness the Duke of York.	Hon. John Peachy.
His Royal Highness the Duke of Clarence.	George F. Stratton, Esq.
His Royal Highness the Duke of Cambridge.	Lord Spencer Chichester.
The Right Honourable the Earl of Liverpool.	Sir George Thomas, Bart.
Lord Hutchinson.	Hon. Thomas Coventry.
Alderman Boydell.	John Townley, Esq.
C. Townley, Esq.	

## II.

A TOPOGRAPHICAL DESCRIPTION of the PLAIN and SITE of TROY, together with such Parts of the Coast of PHRYGIA MINOR as have been Objects of Criticism. Dedicated, by permission, to her Grace the Dutchess of Devonshire.

By WILLIAM GELL, Esq. B. A. and F. A. S. late Fellow of Emanuel College, Cambridge.

In the work will be given about 45 etched and coloured Plates, taken from accurate Drawings made on the spot by the Author, and chiefly engraved by Mr. Medland. Each Plate will have its appropriate letter-press Description, in which every precaution will be taken, to render the Subject intelligible to the Reader. The Work is designed to afford an Opportunity to such as have not visited the Country, of forming their own opinions of the Topography of Homer. Those Verses of the Iliad and Odyssey will also be cited, which describe, or appear to describe, the particular Portions or Monuments of the Troad. The Views will consist of a Delineation of the whole Coast of Phrygia from Antandros in the Gulph of Adramyttium, to the Vale of Thymbra on the Hellespont, after which the following will be given to assist in forming an exact idea of the immediate Vicinity of Troy.

View of the Mouth of Simoeis and Scamander.

View of the Junctions of these Rivers.

View of the Ford of Scamander.

View 3 feet in length exhibiting the whole Plain from the Tomb of Antilochus.

View of the Tomb of Antilochus.

View of the Tumulus of Achilles.

View from the Summit of the Tumulus of Achilles.

View of the Tumulus of Æfyetes.

View of the modern Ford of Simoeis.

View of the Site of Troy.

View of the warm Springs of Scamander.

View of the cold Springs of Scamander.

Side View of the Hill of Troy.

View of Bounarbashi.

View Westward from Bounarbashi.

View N. E. from Bounarbashi.

View of the Hill from the Aga's House of Bounarbashi.

View of the Road to the West of Troy.

View of the Tumuli in the Acropolis.

View 3 feet in length of the Plain from the Acropolis.

View of the Foundations in the Acropolis.

View of the Vale of Simoeis behind the Acropolis.

View of the Foundations of the Walls of the Acropolis.

View of Acropolis from the Vale of the Simoeis.—

Map of the Site of Troy.

This work is printing in a folio Volume, that form being necessary for the Plates.

\* \* This Work is nearly ready for Publication.

## III.

AUBREY, a Novel. By R. C. DALLAS, Esq.

In four volumes 12mo.

\* \* \* This Work is nearly ready.

## XII.

THE PRINCIPLES of SURGERY, By JOHN BELL, Surgeon.

Vol. II. Part. I.

The Division of this Work which is about to be published, comprehends a most important Depart-  
ment of Surgery,—the Diseases of the Urinary Organs, illustrated with numerous Engravings of the  
Anatomy of the Parts, and Plans of the several Operations. It contains the following Treatises.

## SECTION I.

Studies of the Anatomy of the Parts contained within the Pelvis, with practical Inferences from  
the Structure, and Remarks on their various Diseases. This Part, the Anatomy of the Urinary  
Organs, is illustrated with a great Variety of splendid Engravings, drawn from Dissection, of the  
Size of Life.

## SECTION II.

Biographical, Critical, and Historical Sketches of the Lives of the most celebrated Lithotomists,  
with a Review of their several Operations; the Merits and Defects of which are fully explained,  
and every useful Inference from their Errors or Successes applied to the modern Operation. This  
Department is illustrated by Plans deduced from the true Drawings exhibited in the first Department,  
and each Plan serves as a Lesson on some difficult Point in the modern Operation.

SECTION III.

Contains the History of the Lateral Lithotomy invented by the English Surgeons, Proofs of its Excellence, with plain and simple Directions for performing the Lateral Operation, either with the Knife or with the Gorget.

This Department is illustrated with both Plans and Drawings, explaining, first, the various Properties of the Incision made with the Knife, and the Incision made with the Gorget. Secondly, the Posture of the Patient, the Form and Size of the Incision. Thirdly, Plans expressing, in a particular manner, the several Dangers of the Operation, and especially the most imminent Danger of the Gorget slipping from off the Staff.

SECTION IV.

In this Section is contained a View of the several Diseases of the Urinary Organs, Directions for the Cure of Inflammation, Contraction and Paralysis of the Urinary Bladder, of Strictures and other Diseases of the Urethra, of Fistula in the Perineum, of Strangury, and sudden Obstruction of Urine, with particular Instructions for the Use of Bougies, the Introduction of the Catheter, the Puncture of the Urinary Bladder, and all the lesser and more delicate Operations necessary to complete this Department of Surgery.

\* \* This Work is nearly ready.

XIII.

The fourth and last Volume of the ANATOMY of the HUMAN BODY.

By CHARLES BELL, Surgeon, Edinburgh.

\* \* This Work is nearly ready.

XIV.

NAVAL and MILITARY MEMOIRS of GREAT BRITAIN, from the Year 1727 to the Conclusion of the American War, 1783.

By R. BEATSON, Esq. Author of the Political Index to the Histories of Great Britain and Ireland. In six volumes, 8vo.

\* \* This Work will be published in the course of the Summer.

" Captain Beatson is already known as the Author of the Political Index to the History of Great Britain and Ireland. The present publication is of a higher kind. We are now to regard him as contributing not only to the information but to the amusement of the Public; and since he has exerted his attention and diligence for so commendable a purpose, we cannot but wish him success. His work bears the marks of veracity and a constant attention to the authenticity of the materials which he has industriously collected. The narrative is frequently intermingled with observations and reflections, which indicate the man of virtue and of public spirit. As we have perused the volumes with satisfaction, we are led to conclude that they will be acceptable not merely to those who are intimately conversant with military and naval affairs, but also to the Public at large. We regret that the limits to which our Work is confined, will not allow us to lay before our readers many interesting particulars which might be easily selected from these volumes: but we hope that the few which we have extracted from this entertaining Work, will not be unacceptable to our readers, and especially to the gentlemen of the navy."

*Monthly Review, Feb. and March, 1791.*

" The interesting nature of this work has forced us to exceed our intended limits; but we hope that our extracts will prove neither uninteresting nor uninformative. To the design and to the execution we must give applause, as being in no mean degree useful and meritorious. It is a work of utility and merit; and we shall be glad to see the remaining three volumes."

*Critical Review, April and May 1791.*

XV.

THE HISTORY of ENGLAND, related in Familiar Conversations, by a Father to his Children; interspersed with moral and instructive Remarks and Observations on the most leading and interesting subjects. Designed for the Perusal of Youth.

By ELIZABETH HELME. In two volumes 12mo.
